WALTER, HUBERT (c.1150–1205). An English statesman and ecclesiastic. In 1184 and 1185 he was a baron of the exchequer and in 1189 was one of the justices of the Curia Regis. Richard appointed Hubert Bishop of Salisbury, and he accompained the King on the Crusade and distinguished himself by his courage, astuteness, and charity. In 1193 Hubert Walter returned to England and superintended the collection of money for Richard's ransom. At the same time he was chosen Archbishop of Canterbury, and when at the end of this year King Richard returned from his German prison, he appointed Hubert justiciar of the realm, and left him virtual ruler of England. But the Cathedral Chapter objected to the employment of the Archbishop in the royal service, and in 1198 Innocent III compelled him to resign by forbidding priests to hold secular offices. Nevertheless Hubert still continued to exert considerable influence, and acted as a restraint on John, which was sadly missed after his death. Consult Kate Norgate, *England under the Angevin Kings*, vol. ii (London, 1887); William Stubbs, *Constitutional History of England*, vol. i (6th ed., Oxford, 1897).

WALTER, JOHN (1739–1812). The founder of the London *Times*. He was born in London, the son of a coal merchant, to whose business he succeeded in 1755. He was very successful and established the coal exchange. In 1781, however, he retired from the coal business in order to take up the vocation of an underwriter.

While at first successful, his speculations resulted in his failure in 1782. He succeeded in paying his creditors, who thereupon made him a gift of money. With this sum Walter purchased the patents of a new printing process and established the printing office in Blackfriars (1784), which is still the seat of *The Times*. On Jan. 1, 1785, appeared the first issue of *The Daily Universal Register*, which on Jan. 1, 1788, was changed to *The Times, or Daily Universal Register*, and on March 18 of that year became simply *The Times*. From the first it showed that attention to Parliamentary debates and that independence of attitude which have always been its distinguishing characteristics. Indeed, Walter was twice imprisoned and five times fined for libel, in consequence of the freedom of his comments. See TIMES, THE.

WALTER, MASTER. The title character in Sheridan Knowles's comedy *The Hunchback*. The rôle was created at Covent Garden, April 5, 1832, by the author himself.

WALTER, THOMAS USTICK (1804–87). An American architect, born in Philadelphia. He was the pupil of William Strickland in that city and of William Mason, the water colorist. Establishing himself in Philadelphia in 1830, he constructed the county prison at Moyamensing in 1831. In 1833 his design for Girard College was accepted; it was the most ambitious architectural effort of its time in the style of the Greek Revival. In 1836 he was sent by the directors to Europe to study the best methods of fitting up this institution. During the next ten years he designed the breakwater at La Guayra, Venezuela; St. George's Hall, the Preston Retreat, and several banks and churches, all in Philadelphia, and the Biddle and Cowperthwaite mansions on the Delaware. In 1848 he was commissioned by President Fillmore to undertake the enlargement of the Capitol at Washington and to superintend the work. He designed the fine north and south wings for the Senate and House and the imposing dome over the rotunda, though this was not completed until 1873. Walter also designed and completed the extensions of the Patent Office and Post Office, the hospital for the insane, and the Treasury building. He built marine barracks at Brooklyn and at Pensacola. After his return to Philadelphia in 1862 his only professional work was the supervision of the construction of the city hall, after the death of its architect McArthur. The American Institute of Architects, which he had founded in 1837, and assisted to reorganize in 1857, elected him president in 1876. Walter was the most accomplished architect of his time in America, a master of monumental design, and a consummate draftsman.

WALTER DE HENLEY. See HENLEY, WALTER DE.

WALTERS COLLECTION. One of the most important art collections in the United States, located at Baltimore. It was begun by William Thompson Walters (1820–94), merchant and capitalist, who had been art commissioner from the United States to the Paris expositions of 1867 and 1878 and to the Vienna Exposition in 1873. He acquired an extraordinary collection of modern French paintings, including many celebrated pieces, the most extensive existing collection of bronzes and water colors by the French sculptor Barye (q.v.), and a unique collection of Chinese porcelains, especially peach blooms, which he was the first Occidental collector to appreciate. His collection was much increased by his son Henry Walters, who constructed the building which was opened to the public in 1909. To him the museum owes its collection of ancient art, particularly Greek and Roman sculptures, Italian paintings, including the "Madonna of the Candelabra," Limoges enamels, and other departments. Consult: S. W. Bushell, *Oriental Ceramic Art-Collections of W. T. Walters* (New York, 1899), a manual of the subject with magnificent folio reproductions; R. B. Gruelle, *Notes Critical and Biographical—Collection of W. T. Walters* (Boston, 1895).

WALTERSHAUSEN, AUGUST. See SARTORIUS VON WALTERSHAUSEN.

WALTHAM wŏl'tham. A city in Middlesex Co., Mass., 10 miles west of Boston; on the Charles River and on the Boston and Maine Railroad (Map: Massachusetts, E 3). It is situated on both banks of the river and is well laid out. Among the institutions of the city are the Waltham Nurses' Training School, which is widely known for its development of the district-nursing system, the Waltham Hospital, the Massachusetts School for the Feeble Minded, the Waltham New Church School, Notre Dame Normal Training School, and the Leland Home for Aged Women. There is a public library with 27,000 volumes. The city has also several public parks, the largest of which is Prospect Hill. The Norumbega Tower is of interest. Waltham is chiefly an industrial city, and is especially noted for its watch-making interests, one of its watch factories, the American Waltham, being among the largest concerns of its kind in the world. There are also extensive manufactories of canoes. Other important establishments are iron and brass foundries and manufactories of watch tools, dials, church organs, aeroplanes, automatic machinery, automobiles, buckle-factory products, cotton cloth, bicycles, etc. According to the census of 1909 the invested capital in all industries was $12,871,000 and the output was valued at $7,814,000. Pop., 1900, 23,481; 1910, 27,834; 1915 (State census), 30,154. Until separately incorporated as a town in 1738, Waltham formed a part of Watertown. It was chartered as a city in 1884. Consult Rutter, *Historical Address* (Waltham, 1877), and Hurd, *History of Middlesex County* (Philadelphia, 1890).

WALTHAM (wŏl'tam) **ABBEY,** or WALTHAM HOLY CROSS. A market town in the county of Essex, England, on the Lea, 12 miles north of London (Map: London, A 8). The town takes its name from the Abbey of the Holy Cross, founded by King Harold, who is buried there. Of the magnificent Norman church only the nave remains, but this is held to be one of the finest specimens of this style in England. The reconstructed Temple Bar, which from 1670 to 1880 stood at the west end of Fleet Street, London, marks one of the entrances to Theobald's Park. The government gunpowder and flour mills, operated by the water power of the Lea, the celebrated government Enfield factory for rifles, etc., at Enfield Lock, and large cordite factories at Quinton Hill just outside the town, are the chief industrial establishments. Pop., 1901, 6547; 1911, 6795. Consult Stubbs, *Foundation of Waltham Abbey* (London, 1860).

WALTHAMSTOW, wŏl'tam-stō. A town in Essex, England, 6 miles northeast of St.

Paul's, London (Map: London, C 8). It is mainly a residential suburb of London and brewing is its chief industry. It contains a number of educational institutions, the most important of which is Forest School, a large public school for boys. Pop., 1901, 95,125; 1911, 128,051.

WALTHER, väl'tẽr, CARL FERDINAND WILHELM (1811–87). An American Lutheran theologian, born at Langenchursdorf, Germany. He studied at Leipzig (1829–33), held a pastorate at Braunsdorf (1837–38), and in 1839 came to the United States. Settling in Missouri, he became pastor of the Lutheran congregation at St. Louis in 1841, and in 1847 founded the Lutheran Synod of Missouri, of which he was president. In 1849 Walther became directing professor of the Synod's theological seminary, which was then transferred to St. Louis. He edited *Der Lutheraner* (1844–87) and *Lehre und Wehre* (1855–87), and was author of *Die rechte Gestalt einer vom Staate unabhängigen evangelisch-lutherischen Ortsgemeinde* (1863); *Amerikanisch-lutherische Evangelien-Postille* (1871; 9th ed., 1883); *Amerikanisch-lutherische pastoral Theologie* (1872); *Lutherische Brosamen* (1876); *Kasual Predigten und Reden* (1889).

WALTHER, väl'tẽr, WILHELM (1846–). A German Evangelical theologian, born at Cuxhaven. Educated at Erlangen, Marburg, and Göttingen, he was pastor in his native place in 1870–95, and thenceforth held the chair of the history of theology at Rostock. His writings include: *Luther im neuesten römischen Gericht* (4 parts, 1884–92); *Die deutsche Bibelübersetzung des Mittelalters* (3 parts, 1889–91); *Melanchthon als Retter des wissenschaftlichen Sinnes* (1897); *Adolf Harnacks Wesen des Christentums für die christliche Gemeinde geprüft* (1901; 5th ed., 1904); *Das Erbe der Reformation in Kampfe der Gegenwart* (3 parts, 1903–09); *Deutschlands Schwert durch Luther geweiht* (1914); *Friedenswünsche* (1915).

WALTHER VON DER VOGELWEIDE, väl'tẽr fŏn dẽr fō'gel-vī'de (c.1165–c.1230). A Middle High German minnesinger. Under Reinmar der Alte Walther learned the art of Minnesong (see MINNESINGER) at Vienna, where he seems to have remained till the confusion that followed the death of the German Emperor Henry VI in 1197 and of the Austrian Duke Frederick the Catholic in 1198, made him a wandering singer. Walther became a partisan of Philip, Duke of Swabia, who had been chosen King in March, 1198. After Philip's assassination (1208) he was for a while in the service of the Landgrave Hermann of Thuringia, and he was influenced deeply by St. Elizabeth of Hungary. By his songs he continued to influence the art and politics of his time, till at length Frederick II, in recognition of his services to the German national cause, granted him an estate near Würzburg (1220). It was for this Emperor's long postponed Crusade that Walther wrote (c.1227) his noble *Kreuzlied*. He may have taken part in the Crusade of 1227–28. He died at Würzburg, where his grave is still shown. In his poetry Walther passed from a period of introspective analysis, through a protest against the artistic conventions of traditional Minnesong to a virile criticism of literary sentimentality and social degeneracy, so that his maturer work is prevailingly ethical, politically or religiously didactic. His patriotism was broadly German. He appears at his best in the *Sprüche*, models of didactic compactness. But he is also a master of the pure lyric. Of these *Under der linde an der heide* is the most noted. His opponents called him a demagogue, and he certainly was a political agitator of unflinching courage, but he was also Germany's greatest lyric poet before Goethe.

Walther's *Works* are edited by Lachmann (Berlin, 1827), Wackernagel and Rieger (Giessen, 1862), Pfeiffer (Leipzig, 1864), Paul (Halle, 1882), and Wilmanns (ib., 1883). There are modern German versions by Simrock (Berlin, 1833), Schröter (Jena, 1881), and Menzel (Plauen, 1888); and *Lives* by Uhland (Stuttgart, 1822), Menzel (Leipzig, 1865), Wilmanns (Bonn, 1882), Schönbach (Berlin, 1895), Burdach (Leipzig, 1900); Hentschel (Vienna, 1908). Consult the *Bibliography* by W. Leo (i.e., Baron von Lütgendorf) (Vienna, 1880), and Hornig, *Glossarium* (Quedlinburg, 1844).

WALTON, wąl'ton. A village in Delaware Co., N. Y., 17 miles southwest of Delhi, on the Delaware River and on the New York Ontario and Western Railroad (Map: New York, E 6). There are a large condensed-milk plant and manufactories of children's carriages and toys, and iron castings. Pop., 1900, 2811; 1910, 3103.

WALTON, wąl'ton, BRIAN (1600–61). The editor of Walton's polyglot Bible. He was born, probably at Seymour, Yorkshire, studied at Cambridge, was ordained in 1623, and became rector of St. Martin's Orgar, London, 1628; and also of Sandon in Essex, 1636. He was deprived of his rectories by Parliament; but, undismayed, he planned the famous polyglot Bible, for which £9000 was subscribed. It was published in London in 1654–55. (See POLYGLOT.) He had various learned helpers, but the editorship devolved on himself. At the Restoration Walton regained his preferments, and was consecrated Bishop of Chester in 1660. Consult his memoirs by Todd (London, 1821).

WALTON, FREDERICK PARKER (1858–). A Canadian legal scholar. He was born at Nottingham, England, and graduated at Oxford, Edinburgh, and Marburg universities. He was admitted to the Scottish bar in 1886, was lecturer on Roman law at Glasgow University (1894–95), and was joint editor of the *Juridical Review*. Removing to Canada, he served as dean of the law faculty of McGill University from 1897 to 1912, when he was appointed one of the legal advisers to the British administration in Egypt. He published *The Workmen's Compensation Act, with Commentary* (1910).

WALTON, GEORGE (1740–1804). An American lawyer. He was born in Frederick Co., Va., began his career as a carpenter's apprentice, but devoted his leisure to study, and was admitted to the Georgia bar in 1774. He was very active in opposing the policy of the English government towards the Colonies, was a delegate to Congress, 1775, was a colonel of militia, and was wounded and taken prisoner when Savannah was captured by the British in 1778. He was released in 1779 and was elected Governor of Georgia; he was Chief Justice of that State, 1783–93, was a justice of the United States Supreme Court in 1793, and United States Senator 1795–96. He was one of the signers of the Declaration of Independence. He died at Augusta, Ga., in 1804.

WALTON, IZAAK (1593–1683). An English author. He was born in the Parish of St. Mary, Stafford, Aug. 9, 1593, and seems to have gone to London about 1611. The belief almost universally expressed by biographers until recent

years that he was a sempster or a linen draper is contradicted by the records of the Ironmongers' Company, which show that Walton was made a member of that company in 1618; and the license for his first marriage in 1626 describes him as an ironmonger. He was living in Fleet Street, London, in 1624, and the books of St. Dunstan's Parish show that from 1628 to 1644 his home was in Chancery Lane, where Dr. John Donne was his friend and neighbor. After a few years (until 1651) spent partly at Stafford and partly in visiting the families of the eminent clergymen of England, of whom he was much beloved, he took up his residence probably at Clerkenwell, where he was living in 1653, when the first edition of *The Compleat Angler* appeared. When the Restoration was effected he made his home for the most part with Bishop Morley of Winchester and Bishop Ward of Salisbury, and died at Winchester, Dec. 15, 1683.

The earliest of Walton's writings that we have is "An Elegie," added to the 1633 edition of Donne's poems. When Donne's sermons were published in 1640 they were prefaced by a *Life* from Walton's pen, revised and separately published in 1658. The affectionate intimacy of its tone, and its artless blending of simplicity, piety, and humor, well show why Walton was so lovingly regarded by Wotton, Hales, Drayton, and other famous contemporaries, and give ample credence to Boswell's statement that the book was a favorite of Dr. Johnson's. Similar in spirit are his biographies of Sir Henry Wotton (1651); of Richard Hooker (1665), which was prefixed the following year to Hooker's *Ecclesiastical Polity;* of George Herbert (1670); and of Robert Sanderson (1678). All save the last appeared in one volume in 1670. The work for which Walton is best known and loved is *The Compleat Angler, or the Contemplative Man's Recreation,* of which Lamb said, "It would sweeten a man's temper at any time to read it." It is a rambling dialogue—such at least in the first edition, though the 1655 edition sustains the conversation with three characters—on all that pertains to the angler's art, charming in its pastoral freshness and the archaic quaintness of its style, and full of the gentle, kindly, sincere spirit of the man. It is of little value now in its intended function of a treatise, but it will always survive as a fishing idyll of great beauty.

Appearing in five editions in Walton's lifetime, it has since been published more than 100 times; and the demand for "Waltoniana" has given a high value to the earlier copies. A supplement upon fly-fishing, by his close friend, Charles Cotton, was added to the fifth edition and now forms the second part of the work. Consult: R. B. Marston, *Life of Izaak Walton* (London, 1888); Westwood and Satchell, *Bibliotheca Piscatoria* (ib., 1883); R. B. Marston, *Walton and Some Earlier Writers on Fish and Fishing* (ib., 1894); Edward Marston, *Thomas Ken and Izaak Walton* (New York, 1908).

WALTON-LE-DALE. A cotton-spinning town in Lancashire, England, a suburb two miles southeast of Preston (q.v.) (Map: England, D 3). Pop., 1901, 11,271; 1911, 12,350.

WALTON-ON-THAMES. A favorite pleasure, angling, and residential resort in Surrey, England, 17 miles southwest of London. Pop., 1901, 10,329; 1911, 12,856.

WALTZ (Ger. *Walzer*, round dance, roller, from *walzen*, OHG. *walzan*, AS. *wealtan*, obsolete Eng. *walt*, to roll). A round dance, originally of French origin, but so modified in Germany as to belong really to that country. It became popular on the Continent at the beginning of the nineteenth century, and was introduced into England in 1812. It is danced to music of $\frac{3}{4}$ time by any number of couples, who wheel rapidly round on an axis of their own, advancing at the same time round the room. The great composers of the waltz are the two Johann Strausses (father and son). Waltzes written by some classical masters are not intended for dancing. They are high-art forms, having little relation to the dance other than the $\frac{3}{4}$ time. Chopin is the originator of this form of waltz. Many other composers have cultivated this form, generally adding some adjective to the title, as "valse noble," "valse characteristique," "valse mélancholique." Consult B. Weigl, *Geschichte des Walzers* (Langensalza, 1910).

WALTZ, vălts, JEAN JACQUES (1873–). A French writer and cartoonist, who used the pseudonym "Onkel Hansi." He was born at Kolmar, Alsace, and studied at the Beaux-Arts, Paris. He became a contributor to the journal *Durchs-Elsass,* and was made a chevalier of the Legion of Honor. For publishing a volume called *Mon Village* (he made Kolmar his home), with text and quaint pictures satirizing German characteristics, he was condemned by the German authorities in July, 1914, to a year in prison, but he escaped to France. During the European War he served in the French army. His *L'Histoire d'Alsace racontée aux petits enfants d'Alsace et de France* (1913), which, from an anti-German point of view, gives a history of Alsace for children, had an enormous sale in France. He published also a volume of caricatures and cartoons under the title *Professeur Knatschké: œuvres choisies du grand savant allemand et de sa fille Elsa* (1915).

WALTZEMÜLLER, MARTIN. See WALDSEEMÜLLER.

WALWORTH, wąl'wŭrth, REUBEN HYDE (1789–1867). An American lawyer. He was born at Bozrah, Conn., and early taught school. At 17 he began the study of law and in 1809 was admitted to the bar. In 1810 he settled at Plattsburg, N. Y., and in 1811 was made master in chancery. During the War of 1812 he served in the New York militia in the vicinity of Plattsburg. He was a member of Congress (1821–23), a justice of the United States Circuit Court (1823–28), and for 22 years chancellor of New York. His decisions are reported in the New York cases of Hill, Wendell, Denio, Barbour, and Page. He published *Rules and Orders of the New York Court of Chancery* (1829), and an elaborate genealogy of the Hyde family.

WAMBAIS, wäm'bīs *or* wŏm'bās. See GAMBESON.

WAMBAUGH, wŏm'bą, EUGENE (1856–). An American legal scholar. He was born at Brookville, Ohio, and was educated at Harvard (A.B., 1876; LL.B., 1880). Admitted to the Ohio bar in 1880, he practiced law at Cincinnati until 1889. He was professor of law at the State University of Iowa in 1889–92, and thenceforth at Harvard. In 1906–13 he was a member of the board of editors of the *American Political Science Review,* and in 1908–12 served as special attorney of the United States Bureau of Corporations. He was honored by the degree of LL.D. from several universities. His publi-

cations include: *The Study of Cases* (1892; 2d ed., 1894); *Cases for Analysis* (1894); *A Selection of Cases on Agency* (1896); *A Selection of Cases on Insurance* (1902); *Littleton's Tenures* (1903); *A Selection of Cases on Constitutional Law* (4 vols., 1914–15).

WAMPANOAG, wŏm'pà-nō'ăg (people of the eastern country). An important Algonquian tribe, sometimes known as Pokanoket from their principal village, formerly holding the eastern shore of Narragansett Bay, in the present Rhode Island and Massachusetts. Their principal village, Pokanoket or Sowams, was at the present Mount Hope, near Bristol. They also ruled over several smaller tribes east and south, including Marthas Vineyard. When the English first settled at Plymouth in 1620 the Wampanoag were said to have 30 villages, and they had several thousand warriors before the great pestilence of 1617, which nearly depopulated the southern New England coast. In King Philip's War (see PHILIP, KING) the Wampanoag and Narraganset were practically exterminated, and the survivors fled to the interior or to Canada. Many were sold into slavery. The few spared were settled with some friendly Indians at Saconnet, near Compton, R. I.; the entire body became extinct about 1800.

WAMPUM, wŏm'pŭm (from Algonquian *wompi*, white). A name adopted from the New England tribes to designate the aboriginal shell beads (see SHELL MONEY) used everywhere east of the Mississippi for dress ornamentation, for weaving into symbolic belts, and as a currency medium. The beads were of two colors, white and purple, the latter being the more valuable. They were drilled, shaped, and polished with great care, and were sewn upon shirts, moccasins, belts, and other garments in various ornamental designs. Having a fixed value and being of convenient carriage and in constant demand, they came to be recognized as a regular aboriginal currency among all the Eastern tribes as well as by the early colonists, who by various governmental enactments gave them a legal value in comparison with the English and Dutch coins then in circulation.

Perhaps the most important use of wampum was in the symbolic record belts and strings which gave the stamp of authority to every intertribal transaction. No message from one tribe or council to another was considered official without the delivery at the same time of a string or belt of wampum, which was thenceforth preserved by the recipients as the proof and reminder of the negotiation, the belt being handed over to the keeping of the hereditary or chosen custodian of the records. Such belts usually had the beads arranged in symbolic figures more or less suggestive of the transaction thus ratified. Wampum belts were used in the ratification of every important treaty negotiated with the Eastern tribes from the early Colonial period down to the great intertribal treaty of Prairie du Chien in 1825. In 1843, at the intertribal council at Tahlequah, the Cherokee produced the belts which attested the peace made with the Iroquois before the Revolutionary War. The Iroquois themselves still preserve several of their ancient record belts; and others of historic importance are preserved among the archives of New York State at Albany and elsewhere.

Wampum, as commonly understood, seems to have been unknown among the tribes of the plains and mountains, but shell ornaments of various kinds were made and used on the Pacific coast for decoration and as a currency medium.

WAMPUM SNAKE. See HOOP SNAKE.

WANAMAKER, wŏn'à-māk'ēr, JOHN (1838–). An American merchant and cabinet officer, born in Philadelphia, Pa. He received a common-school education, and for a time was an errand boy. In 1856 he entered mercantile life in Philadelphia and gradually built up an enormous retail business. In 1896 he reopened the department store founded in New York by A. T. Stewart. He was president of the Young Men's Christian Association in Philadelphia from 1870 to 1883, was one of the founders of the Christian Commission at the time of the Civil War, and was the founder of Bethany Sunday school, of which he was for many years the superintendent. From 1889 to 1893 he was Postmaster-General in President Harrison's cabinet.

WANDALA, wän-dä'lä. A negro kingdom of Africa. See MANDARA.

WANDEL, vän'dĕl, CARL FREDERIK (1843–). A Danish naval officer and explorer. He was director of the Naval Archives (1889–99), and became rear admiral (1899) and vice admiral (1905). He commanded the *Ingolf* surveying expedition to Davis Strait (1896) and participated in the Agassiz Deep-Sea Expedition. From 1890 he was a member of the Greenland Commission, of which in 1895 he was appointed chairman. Wandel gained distinction by his able administration of the scientific explorations of Greenland (q.v.), which were conducted on a grand scale, with such consistent success and judgment as to add enormously to arctic knowledge. The results were published, *passim*, in more than 50 volumes of the *Meddelelser om Grönland* (consult especially vols. v, vi, vii, and xvi). In 1896 Wandel's scientific work was honored by the Danish gold medal of merit. He retired in 1911.

WANDERING CELL. See PHAGOCYTE.

WANDERING JEW, THE. A legendary Jew doomed to wander over the earth until the Day of Judgment. According to the usual version of the story, which is probably ultimately Oriental in origin, Christ, while on his way to Calvary, stopped to rest for an instant before the door of a man named Joannes Buttadeus. This man drove the Saviour away, striking him and saying in mockery: "Go, why dost thou tarry?" At these words Christ, looking sternly on him, replied: "I go, but thou shalt tarry till I come." In consequence Buttadeus became undying, for at the end of each century he suffers a sickness which rejuvenates him to the age of 30. By the doom pronounced upon him his entire character was changed. Not only did he become gifted with supernatural wisdom, but his cruelty was turned to repentance, and in his journeys through every land he exhorted men to be mindful of their sins, and thus avoid the wrath of God.

The legend of the Wandering Jew is based apparently upon the account in John xxi. 21–23, where Christ says of John: "If I will that he tarry till I come, what is that to thee?" This passage is then confused with the account of the servant of the high priest, Malchus, whose ear was cut off by Peter for laying hands upon the Lord on the night of the betrayal (John xviii. 10; Matt. xxvi. 50–51; Mark xiv. 46–47). According to the Italian legend of the fifteenth century, however, Malchus was doomed to circle

forever beneath the earth about the pillar to which Christ had been bound when scourged. The legend is a comparatively recent one. The earliest mention of it is in the English chronicle of Wendover, who died in 1236. According to him, an Armenian archbishop, who visited St. Albans in 1228, had eaten and conversed many times with a certain man baptized as Joseph, but once known as Carthaphilus or Cartaphilus, who had been the doorkeeper of Pontius Pilate. The same story is told by Matthew Paris and by the Flemish chronicler Philip Mouskes (about 1243). The name of Carthaphilus, however, is practically unknown, the Jew being called almost universally in the Latin versions Joannes Buttadeus, or John the God-smiter. In Provence he was called Boutedieu, in Brittany Boudedes, in Belgium Isaac Laquedem, in Saxony Bedeus; but in Spain Juan Espera-en-Dios, and in Portugal João de Espera-em-Deos, or John Hope-in-God, the latter form of the name indicating a change in the point of view from which the legend was regarded. Here he bears a black fillet and a flaming cross which consumes his brain as fast as it is renewed. Although the wanderings of the Jew are vaguely stated to be world-wide, he resided, according to the version reported by the chronicler of Wendover, in Armenia. Italy seems, however, to have been his usual place of abode. In 1267 he was at Forli, and in 1400, according to the chronicle of Sigismondo Tizio, he passed through Siena. In 1542 Paul von Eitzen, the Bishop of Schleswig, declared that he had seen the Wandering Jew in the Church of Hamburg, where he said that he had been a shoemaker. In 1602 he was in Lübeck. He was also in Nuamburg, and early in the eighteenth century he visited France, Hungary, Holland, and England. In Germany his name is changed to Ahasuerus, and his wanderings are made to symbolize the wanderings of his people for their rejection of Christ. The legend gained wide currency in Germany through the publication in 1602 at Leyden of a chapbook entitled *Kurtze Beschreibung und Erzählung von einem Juden mit Namen Ahasverus*. The belief in the legend has survived until a comparatively recent time, especially in Germany, France, Belgium, Denmark, and Sweden, and is doubtless yet held in some of the remoter districts.

The legend of the Wandering Jew has been an attractive theme in literature. In Germany may be mentioned the epic fragment *Der ewige Jude* of Goethe in 1774, and *Die Wanderungen des Ahasverus* (also fragmentary) by Zedlitz (*Gedichte*, 5th ed., Stuttgart, 1855). Other poetic versions have been made by Mosen (Dresden, 1838), Giseke (1864), Heller (2d ed., Leipzig, 1868), Hamerling (*Ahasver in Rom*, 23d ed., Hamburg, 1892), and Carmen Sylva (*Jehovah*, Leipzig, 1882); besides a large number of briefer poems. Dramatic versions are the tragedy *Ahasverus* by Klingemann (Brunswick, 1827); the *Jerusalem* by Herrig (Leipzig, 1874); and *Der ewige Jude* by Haushofer (ib., 1886). In France, Quinet wrote a remarkable mystery *Ahasvère* (Paris, 1833), while the novel of Eugène Sue, *Le Juif errant* (ib., 1845), has won a world-wide reputation.

Schoebel, *La légende du Juif errant* (Paris, 1877); G. Paris, *Le Juif errant* (ib., 1880); M. D. Conway, *The Wandering Jew* (London, 1881); L. Neubaur, *Die Sage vom ewigen Juden* (2d ed., Leipzig, 1893); Josef Seeber, *Der ewige Jude* (Freiburg, 7th ed., 1899); Johann Prost, *Die Sage vom ewigen Juden in der neueren deutschen Literatur* (Munich, 1904); Albert Soergel, *Ahasver-Dichtungen seit Goethe* (Leipzig, 1905); Theodor Kappstein, *Ahasver in der Weltpoesie* (Berlin, 1906).

WANDERING JEW, THE. A work by EUGÈNE SUE. See JUIF ERRANT, LE.

WANDEROO, wŏn'dĕr-o͞o' (Singhalese *vandurā*, monkey, Hind. *bandar, bānar*, monkey, from Skt. *vānara*). The name of several species of monkey; usually applied to the purple-faced langur (*Semnopithecus cephalopterus* or more correctly *Pygathrix cephaloloptera*) of Ceylon. It feeds chiefly on the berries and buds of trees, and is seldom seen on the ground. Twenty or 30 are generally found together in a troop. When alarmed, they display marvelous agility in leaping, or rather swinging from branch to branch, using their powerful arms alternately. In captivity the wanderoo is remarkable for the gravity of its demeanor, and for an air of melancholy in its expression and movements which is completely in character with its snowy beard and venerable aspect. Its disposition is extremely gentle and affectionate; it is intelligent and docile, and very cleanly in its habits. The long-tailed monkey (*Macacus silenus* or *Pithecus albibarbatus*) of western India is often called wanderoo. See LANGUR; LION-TAILED MONKEY.

WAND OF MERCURY. See DIVINING ROD.

WANDSBEK, vänts'bĕk. A town of the Province of Schleswig-Holstein, Prussia, three miles northeast of Hamburg, of which city it is practically a suburb (Map: Germany, G 4). It has breweries, distilleries, oleograph establishments, and a large horse market. Pop., 1900, 27,966; 1910, 35,212.

WANG AN-SHIH (fl.1021–86). A Chinese economic reformer, who, after he became state councilor in 1069, instituted measures for nationalization of agrarian resources. A state monopoly in commerce was intended to dispose of the crops, lighten the burden of the farmer, and bring in a revenue to the government. A loan to farmers, which they would be forced to accept, was to bring the government interest at the rate of 2 per cent, and taxation of land was to be in proportion to fertility. Wang's policies, unpopular generally, were reversed by his successor.

WANKS, wănks. See SEGOVIA.

WANTAGE, wŏn'tāj. A market town in Berkshire, England, 13 miles southwest of Oxford, and 60 miles west of London (Map: England, E 5). It is noted as the birthplace of Alfred the Great, and of Bishop Butler. It has a fine statue of King Alfred by Count Gleichen, erected in 1877. Pop., 1901, 3766; 1911, 3628.

WAPAKONETA, wä'pà-kŏn-ĕt'à. A city and the county seat of Auglaize Co., Ohio, 84 miles south by west of Toledo; on the Auglaize River, and on the Cincinnati, Hamilton and Dayton, and the Toledo and Ohio Central railroads (Map: Ohio, B 4). The chief manufactures are wheels, chairs, refrigerator machines, furniture, hollow ware, cigars, and acetylene lighting machines. Wapakoneta was once a well-known Indian village. Pop., 1900, 3915; 1910, 5349.

WAPATO, or ATFALATI. See KALAPUYA.

WAPENTAKE, wŏp'en-tāk'. In English law, an equivalent of the word hundred, meaning a

subdivision of a county. Originally it signified a gathering of the male citizens of a district to prepare for a military expedition or defense, the word itself being derived from two Saxon words meaning to take or touch weapons. By popular usage the term was later applied to a district from which a certain number of men capable of bearing arms were raised. The term was also applied to a Saxon court held at regular intervals by the chief men of a hundred. The wapentake is obsolete as a subdivision of a county, although the word is sometimes used as a matter of description in speaking of a district. Consult Stubbs, *Constitutional History of England* (6th ed., Oxford, 1897); and Pollock and Maitland, *History of English Law* (2d ed., Cambridge, 1909).

WAPITI, wŏp'ĭ-tĭ (from Cree Indian, *wapitik*, white deer). A large North American deer (*Cervus canadensis*), closely allied to the European red deer (see DEER), but considerably exceeding it in size, being five feet in height at the shoulder and sometimes weighing 1000 pounds. It is a native of North America, and formerly was found all over the continent from the Carolinas to Alaska. But it has been so persistently slaughtered that it is now confined mainly to the northern Rocky Mountain region in the United States, and northward to the middle of Alberta. It is yellowish brown on the upper parts; the sides gray; a pale yellowish or white patch on each buttock, bounded by a black line on the thigh; the neck, a mixture of red and black, with long, coarse, black hair, falling down from it in front like a dewlap; a black mark at each angle of the mouth. The hair is crisp and hard, but there is a soft down beneath it. The antlers are large, much like those of the stag, but the first branch bends down almost over the face. The wapiti is usually called elk in America, although very different from the moose. (See ELK; MOOSE.) This fine deer was an inhabitant of plains and prairies rather than of the forest regions. It feeds upon grass rather than upon leaves. Its general habits resemble those of the gregarious deer, and it was accustomed in the autumn in the West to gather in bands in the foothills of the mountains, where it spent the winter, pawing down through the snow when necessary to get at the dried grass. These bands would join others until herds numbering many thousands would move about in company until spring. The animal was of great importance to the Indians as food, and its hide was used as material for covering their lodges. See Plate of DEER OF NORTH AMERICA; and consult authorities cited under DEER.

WAPPÄUS, vä-pā'ŭs, JOHANN EDUARD (1812–79). A German geographer and statistician, born at Hamburg. He was educated at the universities of Göttingen and Berlin, interrupting his studies in 1833–34 for a trip to the Cape Verde Islands and South America. Wappäus was the first to impress upon his countrymen the possibilities of South America as a field for national enterprise. In 1845 he was made professor extraordinary, and in 1854 professor, at Göttingen. His publications include: *Untersuchungen über die geographischen Entdeckungen der Portugiesen unter Heinrich dem Seefahrer* (1842); *Die Republiken von Südamerika* (1843); *Deutsche Auswanderung und Kolonisation* (2 parts, 1846–48); *Allgemeine Bevölkerungsstatistik* (2 vols., 1859–61); *Einleitung in das Studium der Statistik* (published posthumously by Gandil, 1881). The great work of Wappäus's life was the editing in 1847–71 of the seventh edition (10 vols.) of the monumental *Handbuch der Geographie und Statistik* by Stein and Hörschelmann. He himself contributed the introductory volume on universal geography (1849) and the three volumes devoted to the American continents (1855–67).

WAPPERS, văp'ĕrs, GUSTAVE, BARON (1803–74). A Belgian historical and genre painter. He was born at Antwerp, and studied in the Academy there, and under Van Bree and Herreyns. He then went to The Hague, Amsterdam, and Paris, where he studied the old Flemish, Dutch, and Venetian masters. At Paris he fell for a time under the classical influence, and in 1823 painted a "Regulus" in that manner. Upon his return to Antwerp in 1830 he exhibited "Burgomaster van der Werff at the Siege of Leyden" (Utrecht Museum), a picture which in its color and fullness of life showed the influence of the old Flemish masters, and he was hailed as the deliverer of Belgian art from French bondage. In 1832 he became professor and in 1840 director of the Antwerp Academy, and from 1846 to 1853 was president of the National Museum. In 1859 he removed to Paris, where he died. His "Episode of the Belgian Revolution of 1830" (1834, Brussels Museum) confirmed him as the leader of the reaction against classicism, a position corresponding to that of Delacroix in France. His fame has since declined. His pictures are chiefly to be found in the museums of Holland and Belgium. Aside from subjects illustrating historical events of the Netherlands he painted "Charles I Taking Leave of His Children," "Execution of Anne Boleyn," etc.

WAPPINGER, wŏp'ĭn-jĕr. See MANHATTAN INDIANS.

WAPPINGERS (wŏp'ĭn-jĕrz) **FALLS.** A village in Dutchess Co., N. Y., 7 miles south of Poughkeepsie, on the Hudson River (Map: New York, B 1). Interesting features are the old Mesier Homestead, the Grinnell Library, and Mesier Park. The manufactured products include overalls, print cloths, dyes, sheets and pillow cases, etc. Pop., 1900, 3504; 1910, 3195; 1915 (State census), 3742.

WAPPING (wŏp'ĭng) **OLD STAIRS.** An English sailor's song of the eighteenth century, by John Percy.

WAR. Definition. All definitions of war, in the sense of international law, may be said to agree in one fundamental essential, that war is a public and state act as distinguished from the acts of private individuals. The Supreme Court of the United States, in an oft-quoted sentence, laid down the following definition: "Every contention by force between two nations in external matters, under the authority of their respective governments, is not only war, but public war." (*Bas* v. *Tingy*, 4 Dallas, 37.) It is a contest between the armed public forces of independent states for the purpose of asserting rights or securing desired advantages. Where society does not exist—where there is no such institution as that which we call government—individuals, being strictly independent persons, may carry on war against each other. But whenever men are formed into a social body, war cannot exist between individuals. The use of force among them is not war, but a trespass, cognizable by the municipal law. War, then, whatever is done in the prosecution

of it, must be the act of a nation. "War," says Vattel, "is that state in which a nation prosecutes its right by force." The right of making war belongs to the sovereign power. Individuals cannot control operations of war, nor commit any hostilities (except in self-defense), without the sovereign's order. "The generals," adds that writer, "the officers, the soldiers, the partisans, and those who fit out private ships of war, having all commissions from the sovereign, make war by virtue of a particular order. And the necessity of a particular order is so thoroughly established, that even after a declaration of war between two nations, if the peasants themselves commit any hostilities, the enemy, instead of sparing them, hangs them up as so many robbers or banditti." (*United States* v. *The Active*, 24 Fed. Cas., 755.) These statements apply to hostilities between sovereign and independent nations, but they fail to include armed contention between different parts of the same nation, as in the case of the Civil War in the United States. A third decision, arising out of the circumstances of the Civil War, will supplement and complete the fundamental conception of war. "That they [the Confederates] were liable to be regarded as enemies is undoubtedly true. This implies the existence of war. But every forcible contest between two governments, de facto or de jure, is war. War is an existing fact and not a legislative decree. Congress alone may have power to declare it beforehand, and thus cause or commence it. But it may be initiated by other nations or by traitors, and then it exists whether there is a declaration of it or not. It may be prosecuted without any declaration; or Congress may, as in the Mexican War, declare its previous existence. In either case it is the fact that makes enemies, and not any legislative act." (*Dole* v. *Merchants' Mutual Marine Ins. Co.*, 51 Maine, 465; *Prize Cases*, 2 Black, 665.) A mere insurrection, however, is not war; to entitle the armed forces to the rights and privileges of belligerents it would seem that they should possess at least the power to make the issue doubtful, and that the government which they serve must be organized so as to be in a position to meet the duties necessarily resting upon belligerents, viz., to maintain law and order within the regions subjected to their control, and to carry on war on a large scale on land or sea. The parties to a civil war, such as the Civil War in the United States, have equal claim to the protection accorded by the modern law of war.

If the elements indicated are absent, the uprising is treated as a rebellion, and rebels as such have no rights. Within recent years, however, there has been developing a doctrine of insurgency, "a condition," as Lawrence calls it, "midway between belligerency and mere unauthorized and lawless violence." Such, e.g., are the periodic revolutionary outbreaks in certain Latin-American states. Those who struggle for political ends and respect the laws of war cannot be branded as outlaws or pirates, and hence the necessity for according a recognition of insurgency, which, while not relieving the parent state of responsibility for the acts of the insurgents, puts the contest upon a more regular basis and brings into operation the neutrality laws of the recognizing states.

Causes. The more obvious causes of war include economic, political, racial, and religious factors, and with these are psychological factors less readily analyzed. War may be due primarily to a desire for independence, as in the case of the American Revolution; for more complete nationality, as those preceding the formation of the German Empire or the Kingdom of Italy; to stamp out rebellion, as the American Civil War; to acquire colonies or zones of political and commercial influence, as the Italian war on Tripoli; to conquer and annex territory; to secure reparation for injuries suffered; to protect weaker peoples; or to maintain the prestige and independence of the sovereign state. In former times wars were due chiefly to racial or religious animosities or the ambitions of autocratic dynasties, but, even behind these, philosophical historians have frequently found the play of important economic interests. At the present time it is generally held that trade privileges and opportunities, especially trade restrictions and intensified commercial competition, are fundamental factors in modern wars. But with these are correlated intensified nationalism and the ease with which a blind patriotism may be aroused in the average citizen.

The social effects of war have been much discussed by students of sociology. Herbert Spencer has set forth the arguments pro and contra in his *Study of Sociology* and *Principles of Sociology*, and many writers since his time have elaborated his theses. The general conclusion is, that however war may have worked as a selective agency in the development of superior races, the system of conscription, with its resultant economic repression, retards the progress of civilization, without bringing permanent profit to any. Even the doctrine that war results in economic advantages, especially in the acquisition of colonies and areas of preferential trade, is attacked on the ground that all commercial advantages are by their very nature mutual and reciprocal, and that exploitation or repression are ultimately injurious to both parties.

The various classifications of wars given by publicists are practically worthless. War is a fact; its existence is proved as a fact, and both parties to the contest, whether equal or unequal in size, legally or illegally existing, enjoy equal rights. Examples of this are the Civil War, the South African War, the Balkan War of 1912–13, and the European War begun in August, 1914.

It is likewise immaterial whether the war begins formally with a declaration, or informally by an act of hostility. It is necessary, however, to fix the exact date of the outbreak; for the effect of war when once existing is wide reaching both as regards the belligerents and neutral nations. A nation may formally declare war, as in the case of the Transvaal ultimatum to Great Britain in 1899, or the German ultimatum to Russia in 1914. The nations may drift into war, as was the case with China and Japan in 1894; or the date of the war may be fixed by act or proclamation subsequent to the outbreak of hostilities, as was done by the Act of Congress of April 25, 1898. By Article 1 of the Hague Convention relative to the opening of hostilities, the contracting powers recognized that, before the actual commencement of war, there should be explicit warning "in the form either of a reasoned declaration of war or of an ultimatum with conditional declaration of war." See DECLARATION OF WAR.

The history of warfare is at best a sorry tale. In ancient times contending armies literally devastated with fire and sword the countries they overran, and either killed or enslaved their captives. The wars of the Middle Ages continued a scourge notwithstanding the doctrines of Christianity. As Sir Henry Maine says: "The Reformation brought with it a new fury of fighting, and the wars of religion were among the most ferocious that mankind had waged. Armies did not then so much consist of rival potentates, as of hosts in which each individual detested every man on the other side as a misbeliever. This ferocity is generally believed to have culminated in the storming of Magdeburg," when the whole town, with the exception of the cathedral and about 140 houses, was burned to the ground, and 30,000 of its 36,000 inhabitants were butchered without regard to sex or age. The Thirty Years' War fills us with horror, but a better day was dawning and the hour and the man were at hand. In 1625, in the very midst of this contest, Grotius (q.v.) published his immortal work, *De Jure Belli et Pacis*, at once a protest and a guide, in which he outlined the permissible and the infamous with a firm and masterly touch. Basing himself on the Scriptures, the principles of morality, and a supposed law of nature, he subjected the history of warfare to a careful examination, separated humane from ferocious precedents, and digested in an incomplete but admirable way the principles to be derived from their study. The weight of his influence gave to the result something of the consistency and the authority of a code. "The effects of the *De Jure Belli et Pacis*," continues Maine, "both in respect of its general influence and of the detailed propositions which it laid down, were exceedingly prompt and have proved extremely durable. At about the middle of his reign Louis XIV of France adopted two measures by which he was thought to have carried the severity of war to the furthest point. He devastated the Palatinate (q.v.), expressly directing his officers to carry fire and sword into every corner of the province, and he issued a notice to the Dutch, with whom he was at war, that, as soon as the melting of the ice opened the canals, he would grant no more quarter to his Dutch enemies. The devastation of the Palatinate has become a proverb of savageness with all historians, though 50 years earlier it might at most have been passed as a measure of severity, or might even have been defended; but the proclamation to the Dutch called forth a burst of execration from all Europe, and the threat to refuse quarter was not acted upon. The book of Grotius was making itself felt, and the successors of Grotius assure us that it was his authority which deterred the French King and the French generals from the threatened outrage." (*International Law*, p. 23.)

The book not only made its own way, but its principles were popularized by Grotius' successors, particularly Pufendorf, Bynkershoek, and Wolf. To Vattel, however (see VATTEL, EMMERIC DE), belongs the supreme merit of supplying a text which at the present day is appealed to by theorist as well as practitioner. Indeed, it is almost impossible to overestimate his services as a popularizer of a system of international law to which he contributed but little. Very slowly and laboriously, with the growth of international relations, the rules of warfare began to reflect the growing spirit of humanitarianism. Instead of the ruthless and wanton slaughter or indiscriminate capture of entire populations more and more weight was given to the distinction of soldier and civilian. The former when captured acquired the rights of a prisoner of war, and the latter an increasing immunity both of his person and his property.

At the present day the theory and practice of modern civilized nations in their dealings with one another regard useless slaughter as murder, and consider all slaughter useless, if not indispensable to the end in view, viz., the fair, manly, and open conduct of war in the interest of its speedy termination. To this end, cruel and pain-giving instruments are forbidden, for the purpose of the combatant is to wound or incapacitate rather than to kill if there be a choice of means, as in battle there can rarely be. Poisoning of streams and food supplies; the killing of non-combatants generally, not to speak of innocent women and children; the refusal to give quarter, even in the heat of battle, except as retaliation—have long been given over as barbarous and unworthy of men in any state of civilization. Nevertheless stratagems and deceits are allowable, if not involving perfidy. The entire world, however, was shocked by the reports of barbarities committed by different belligerents in the Balkan wars, by the Germans in Belgium, and by the Turks upon the Armenians in 1914–15. Modern opinion, moreover, has required that civilized nations in their military operations against uncivilized peoples or groups not yet included in the family of nations be governed by the rules of civilized warfare, as shown by Japan's treatment of China in 1894 and America's treatment of Filipinos.

As regards the prosecution of hostilities, war is waged on land and sea and in the air, and the difference in the elements necessarily gives rise to differences in the methods and means by which it is carried on. The usages, customs, and agreements of civilized nations formulate as it were a code or system of laws of war, the violation of which would convict the offending country of barbarism. Such laws are found in the convention respecting the laws and customs of war on land formulated by The Hague Conferences of 1899 and 1907, in the consensus of judicial opinion in leading countries, and in practices uniformly followed by military forces.

The United States, it would seem, was the first power to codify these various rules and regulations in the form of a manual, and the previously referred to *Instructions* of Dr. Lieber —known in army circles as *General Orders No. 100*—have been the basis of all subsequent codifications of the laws of land war. These were reissued in 1898 for the guidance of officers in the war with Spain, and required but slight modification to meet the purposes of the Hague Conference of 1899. The official book of the Prussian General Staff is *Kriegsbrauch im Landkriege* (trans. by J. H. Morgan, *The War Book of the German General Staff*, New York, 1915), and similar codifications have been issued by other countries. In June, 1900, the Navy Department issued a Naval Code—known as *General Orders No. 551*—prepared by Captain Charles H. Stockton. Article 54 of this enlightened work explains the relation between the land and naval codes, and the supplemental nature of the latter.

For the successive steps by which the mitigation of the hardships incidental to the conduct of war has been brought about and the

means and instruments of war have been changed, see GENEVA CONVENTION; RED CROSS SOCIETIES; ST. PETERSBURG, DECLARATION OF; and PEACE MOVEMENT. Under these appropriate headings it will be seen that the medical corps service on land has been neutralized; that the principles of the Geneva Convention establishing the immunity of hospital and medical corps on land have been extended to hospital ships on sea; and that the restrictions in the case of deadly weapons and explosives formulated in the Declaration of St. Petersburg have been further extended by the humanitarian spirit pervading the Hague Conferences.

The outbreak of war produces an immediate and widespread effect. In the first place, treaties of all kinds contemplating peaceful relations are suspended, while provisions in contemplation of war come into effect. Treaties intended to set up a permanent state of affairs, such as boundary stipulations, revive on the close of war; but it seems to be generally admitted that commercial treaties are wiped out of existence by war and do not revive on its termination unless there be a particular clause to that effect in the treaty of peace. (An interesting table showing the effect of war on treaties is given by T. J. Lawrence in his *Principles of International Law*, p. 365. See TREATY.) Ambassadors and diplomatic agents are recalled or dismissed; and all trade ceases between the belligerents, as trading would not only embarrass military or naval operations, but would enable the enemy to carry on the war itself. War makes the contending nations enemies, and their respective subjects or citizens share this quality, as do alien residents for the purpose of war. The same quality infects the products of enemy soil, as well as houses of trade, whether principal or branch. Consult the *Prize Cases*, 2 Black, 671, and *Bentzen* v. *Boyle*, 9 Cranch, 191.

A theory dating from Portalis would confine the enemy character to actual combatants. "War," he said in 1801, "is a relation of state to state, and not of individual to individual. Between two or more belligerent nations the private persons of whom those nations are composed are only enemies by accident: they are not so as men, they are not so as citizens, they are so only as soldiers. By Article 1 of the Hague Regulations of 1907 combatants must meet the following requirements: (1) command by a person responsible for his subordinates; (2) wearing of a distinctive mark, fixed and recognizable at a distance; (3) carrying of arms openly; and (4) conformity in all operations to the laws and customs of war. In earlier times private citizens were murdered, or enslaved, and their property pillaged and devastated without dishonor to the invading army; but to-day the inoffensive individual is as little disturbed in his private relations as the necessities of war permit. The combatant may be killed in battle, but if he throw down his arms he is entitled to quarter; he may be captured and held prisoner but is entitled to the honorable treatment accorded prisoners of war. The noncombatant may not be killed unless he resorts to military acts; he is then not entitled to quarter nor to the treatment of a prisoner of war but incurs the risk of the death penalty. Four classes of belligerents have been distinguished: (1) regular armies; (2) auxiliary forces; (3) organized civilians; and (4) individuals. The first two of these are everywhere considered lawful combatants. Moreover it is a matter for each state to determine what shall constitute its authorized forces. Even after war has begun a state may call a general levy of the entire population, and such would be entitled to combatant character if organized under responsible authority and otherwise meeting the conditions above mentioned. Volunteer troops raised on the spur of the moment, and acting without military commission or organization are not entitled to the privileges of regular soldiers according to the *Instructions*. But the Hague Regulations of 1899 as modified in 1907 extended the laws, rights, and duties of war to a population rising spontaneously to defend itself and its property, the levée en masse. The Regulations provided that, "The population of a territory not yet occupied, who, on the approach of the enemy, spontaneously take up arms in order to resist the invaders, without having had time to organize themselves in accordance with Article 1 (see above), shall be regarded as belligerents provided they carry their arms openly and respect the laws and customs of war" (Art. 2). The *Kriegsbrauch* however contends that regardless of the suddenness of an invasion, the resisting population is not entitled to combatant character unless organized under responsible leaders. Volunteer vessels, if captured, are entitled to treatment as prisoners of war, provided they had been acting under responsible military authority. The wounded, in all cases, whether in the land or naval forces, and of either belligerent, are entitled under the Geneva Convention and the Hagué Conventions to hospital service and medical treatment.

Undefended places are by the Hague Regulations (Art. 25) exempted "from bombardment or attack by any means whatsoever." This clearly includes aërial attack and is the only provision in the Hague Conventions applicable to aërial warfare. By Article 26 "The commander of an attacking force, before commencing a bombardment, except in case of an assault, should do all he can to warn the authorities of what is about to happen." In sieges and bombardments every care must be taken to avoid the destruction of "edifices devoted to religion, art, science, and charity, historical monuments, hospitals, and places where the sick and wounded are collected, provided they are not used at the same time for military purposes" (Art. 27). These rules are accepted by the *Kriegsbrauch*. Public property of one belligerent situated within the territory of the other is occupied, if it be realty, and administered for the benefit of the local state. If it be public movable property it is subject to confiscation and usually is confiscated. Private property of one enemy within the territory of the other may, indeed, by strict international law be confiscated; but this is usually no longer done and in the United States it may not be done except by positive legislative enactment to that effect. By the sixth convention of the 1907 Hague Conference "it is desirable" that merchant vessels found in enemy ports at the commencement of war be allowed a reasonable period in which to depart. A reciprocal agreement to this effect was arranged between Great Britain and Austria in 1914; Germany did not agree and her vessels in British ports were seized. But such vessels may not be confiscated.

They may be used or destroyed but compensation must be given. This convention does not apply to auxiliary cruisers. Cargoes are accorded the same right as vessels. By the *Naval Code* (Art. 15) enemy merchantmen in port when war begins are allowed 30 days in which to depart. Moreover enemy vessels that have already departed may proceed unmolested, unless they carry contraband. (Consult the cases of the *Buena Ventura*, 175 U. S., 384, and the *Panama*, 176 U. S., 535.) Even if they have sailed for an American port before war is declared they may enter, discharge their cargo, and depart to an unblockaded port. Coastwise but not deep-sea fishing vessels are granted immunity under the general principles of international law as well as by specific Hague convention, provided they are not in any way furthering the purposes of war. (Consult the *Paquette Habana*, 175 U. S., 677.) For the general status and conduct of naval and aërial warfare see INTERNATIONAL LAW.

Public debts due enemy citizens are never confiscated and the interest thereon is payable even during the war according to the practice of the United States in the war with Spain; private debts, i.e., debts due enemy citizens by private citizens, are, indeed, confiscable; but the weight of authority is against the exercise of this harsh right. They may not be collected during the continuation of hostilities, but may be after the termination of the war. In contradistinction, however, to debts or executed contracts, executory contracts, in which time is essential, do not revive at the end of the war. An insurance policy, e.g., on which premiums cannot be paid by reason of the existence of war, lapses under this rule, unless otherwise provided for in the contract of insurance, subject to the right of the insured to the equitable value of his policy with respect to the premiums already paid. (*New York Life Insurance Co.* v. *Statham*, 93 U. S., 24.)

The conqueror is a usufructuary of the realty, but private property is commonly not liable to seizure. This is, perhaps, stating the matter too broadly, for private property may be seized by way of contribution if in money; by requisition if in kind. In both cases receipts or quittances are given by the military commander, so that the dispossessed citizen may collect the property or its equivalent from his proper sovereign upon the return of peace. (See CONTRIBUTION; REQUISITIONS.) This appears clearly from Articles 31–39 of *Instructions*, but receives international formulation in the Hague Conferences of 1899 and 1907. "Art. 46. Private property cannot be confiscated. Art. 47. Pillage is formally forbidden. Art. 48. If, in the territory occupied, the occupant collects the taxes, dues, and tolls imposed for the benefit of the state, he shall do so as far as is possible, in accordance with the rules of assessment and incidence in force. . . . Art. 49. If . . . the occupant levies other money contributions in the occupied territory, this shall only be for the needs of the army or of the administration of the territory in question." Article 50 prohibits the infliction of any penalty, pecuniary or otherwise on the population for acts for which they are not collectively responsible. Article 51 requires that all contributions must be ordered by the commander in chief; must be levied in accordance with tax laws, so far as is possible; and must be acknowledged by receipt to each payer. "Art. 52. Requisitions in kind and services shall not be demanded from municipalities or inhabitants except for the needs of the army of occupation. They shall be in proportion to the resources of the country, and of such a nature as not to involve the inhabitants in the obligation of taking part in military operations against their own country." "Art. 53. An army of occupation can only take possession of the cash, funds, and realizable securities which are strictly the property of the state, depots of arms, means of transport, stores, and supplies, and generally all movable property of the state which may be used for military operations. All appliances, whether on land, at sea, or in the air, adapted for the transmission of news, or for the transport of persons or things, exclusive of cases governed by naval law, depots of arms, and, generally, all kinds of ammunition of war, may be seized, even if they belong to private individuals, but must be restored and compensation fixed when peace is made." "Art. 55. The occupying state shall be regarded only as administrator and usufructuary of public buildings, real property, forests, and agricultural estates belonging to the hostile state, and situated in the occupied country. It must safeguard the capital of these properties, and administer them according to the rules of usufruct. Art. 56. The property of municipalities, that of institutions dedicated to religion, charity, and education, the arts and sciences, even when state property, shall be treated as private property. All seizure, destruction of, or willful damage done to institutions of this character, historic monuments, works of art and science, is forbidden, and should be made the subject of legal proceedings."

"In war," said Mr. Chief Justice Waite, "the capture of property in the hands of the enemy, used or intended to be used for hostile purposes, is allowed by all civilized nations, and this whether the ownership be public or private. The title to movable property in hostile use, captured on land, passes to the captor as soon as the capture is complete; i.e., as soon as the property is reduced to possession. The absolute title to immovable public property owned by the enemy does not pass until the war is ended and peace restored. Then, unless provision is made to the contrary by the treaty of peace or otherwise the ownership is changed if the conquest is complete." (*Kirk* v. *Lynd*, 106 U. S., 315.) A fundamental difference, however, between property captured on land and sea is admirably stated by the late Justice Gray in *Oakes* v. *United States*, 174 U. S., 778: "By the law of nations, as recognized and administered in this country, when movable property in the hands of the enemy, used, or intended to be used, for hostile purposes, is captured by land forces, the title passes to the captors as soon as they have reduced the property to firm possession; but when such property is captured by naval forces a judicial decree of condemnation is usually necessary to complete the title of captors."

Public property on the high seas, i.e., vessels of war and public vessels generally—except those engaged in purely charitable or scientific pursuits, in voyages of discovery, or as hospital ships (*Naval Code*, Art. 13)—are always liable to capture. Enemy merchant vessels as well as enemy property thereon are likewise confiscable; but the title thereto only passes to the individual captor after adjudication in a

prize court. (*Naval Code*, Arts. 9–11; 14; 46–50.) (See PRIZE.) Enemy merchant vessels engaged in coast fishing "innocently employed" are exempt from capture (*Naval Code*, Art. 14), but this exemption does not apply to deep-sea fisheries. The transfer of an enemy merchant vessel to a neutral flag is always scrutinized and, if made to escape the consequences of war, is not considered valid in Anglo-American practice. Some states, notably France, do not admit the validity of any transfer made during hostilities, as was shown in the condemnation of the American ship *Dacia* by the French prize court, August, 1915.

On the outbreak of war trade of all kinds stops between enemies, that is to say trade across the lines, for a domiciled enemy may trade with the citizen untrammeled by any regulation. While the Hague Regulations are silent regarding such a resident, custom, and even the positive law in some states, permit him to remain. He owes temporary allegiance, and in consequence has the rights and privileges of other alien residents not incompatible with his enemy character. That is to say, he may carry on business; may sue and be sued as if war did not exist, for his enemy character is merged in that of a resident. An act of unfriendliness may lead to expulsion, and aid or comfort given to the enemy, that is his home government, is treason. While his temporary allegiance secures him protection, he may not be compelled to serve in the armed forces of his country of residence, for no government could well compel him to commit treason against the country of his paramount allegiance. In the great war the common practice was the internment of such aliens until the close of the war. It likewise follows that the resident enemy's property on the high seas bears the character of his residence or domicile and is seizable by the authorities of his home country as enemy property. Internal trade is thus assimilated to trade of citizens and does not depend upon enemy character. Foreign trade, i.e., trade beginning within one enemy country and crossing into the country of the other, is trading across enemy lines, and is strictly and absolutely prohibited. This inhibition may be removed by a general or particular license to trade, granted by the sovereign powers of the respective belligerents. Such a permission eliminates the war for the purposes of trade. But otherwise all contracts made between belligerents during the war are ipso facto void on the principle that an alien enemy does not possess the right to sue. "A state in which contracts cannot be enforced, cannot be a state of legal commerce. If the parties who are to contract have no right to compel the performance of the contract, nor even to appear in a court of justice for that purpose, can there be a stronger proof that the law imposes a legal inability to contract?" (Sir William Scott, later Lord Stowell, in *The Hoop*, 1 C. Rob., 196.) For a full and accurate account of this important subject, see the two leading cases of *The Sea Lion*, 5 Wallace, 630, and *Kershaw* v. *Kelsey*, 100 Mass., 561. For a short summary of the influence of war on trade in its various branches, see INTERNATIONAL LAW.

There are, however, some relations into which belligerents are permitted to enter. Indeed, these relations can only arise in war; and if provided for during peace, the agreements concerning them are made in contemplation of war. These matters pertain to flags of truce, passports, safe-conducts and safeguards, cartels, armistices, capitulations, and ransom bills. Negotiations between hostile forces are opened up by a flag of truce—a white flag—borne by a member of the opposing force who advances to the enemy. A passport is a permission in writing to an enemy subject to travel generally within belligerent territory from which he would otherwise be excluded. A safe-conduct, as also a license, differs from a passport in that it is a special permission to an enemy subject or vessel or goods to travel or pass within defined points; while a safeguard, as its name implies, is a guard granted for protection to enemy property or his person. Article 86 of the *Instructions* says, "All intercourse between the territories occupied by belligerent armies, whether by traffic, by letter, by travel, or in any other way, ceases. This is the general rule, to be observed without special proclamation. Exceptions to this rule, whether by safe-conduct, or permission to trade on a small or large scale, or by exchanging mails, or by travel from one territory to the other, can take place only according to agreement approved by the government, or by the highest military authority. Contraventions of this rule are highly punishable." Cartels are more formal matters, and, according to the most eminent authority of the day, they are "a form of convention made in view of war or during its existence in order to regulate the mode in which such direct intercourse as may be permitted between the belligerent nations shall take place, or the degree and manner in which derogations from the extreme rights of hostility shall be carried out. They provide for postal and telegraphic communication, when such communication is allowed to continue, for the mode of reception of bearers of flags of truce, for the treatment of the wounded and prisoners of war, for exchange and the formalities attendant upon it, and for other like matters." (Hall, *International Law*, § 193.) The term is most familiar in the form of cartel ships, and in this connection signifies a vessel sailing to defined points under a safe-conduct for the exchange of prisoners of war. The purpose and the safe-conduct exempt such vessel from capture; but the slightest hostile act, or engaging in an otherwise forbidden act, such as trade, forfeits the privileged character.

The Hague Regulations define an armistice as a suspension of military operations by mutual agreement between belligerents. "If its duration is not fixed, the belligerent parties can resume operations at any moment, provided always that previous notice, of such length as has been agreed upon, has been given to the enemy" (Art. 36). In case of violation of the conditions of the armistice the other party may denounce the offender or even renew hostilities without notice. As regards naval operations the provisions of the *Naval Code*, Articles 51–52, accord with the Hague Regulations. "Art. 51. A truce or capitulation may be concluded, without special authority, by the commander of a naval force of the United States with the commander of the forces of the enemy, to be limited, however, to their respective commands. A general armistice requires an agreement between the respective belligerent governments. Art. 52. After agreeing upon or signing a capitulation the capitulator must neither injure nor destroy the vessels, property,

or stores in his possession that he is to deliver up, unless the right to do so is expressly reserved to him in the agreement or capitulation." In addition to these more formal and indefinite suspensions of hostilities, truces for short periods are entered into for the burial of the dead.

As previously explained, war renders enemy property with certain specific exceptions liable to capture on the high seas. (See PRIVATEERING; PRIZE.) Just what constitutes enemy property is not always easy to determine. How, e.g., is the property of a neutral domiciled in one of the belligerent countries to be considered, when found by the other belligerent upon the high seas in an enemy vessel? What shall determine its character—domicile or nationality? Anglo-American practice adheres to the former principle, that of some other states to the latter. No preference was indicated in the Declaration of London, it being content with saying that "the neutral or enemy character of goods found on board an enemy vessel is determined by the neutral or enemy character of the owner." (See ALIEN; ENEMY.) On the time within which and the conditions upon which enemy property will, if recaptured, be restored to the original owner, see RECAPTURE.

Upon the termination of war, however brought about, the belligerents cease to be enemies, and the residents of both countries resume their peaceful pursuits as if the war had never happened. All rights and obligations existing at the outbreak of war may now be enforced, provided their nature is not such as to render their performance through lapse of time or change of circumstances useless or impossible. Statutes of limitation cease to run at the outbreak of war, and on the declaration of peace they begin again as at the time of the beginning of the war. In this way the war, legally speaking, is simply wiped out. Otherwise to hold would be manifest injustice; for one can hardly be blamed for not enforcing his right during the time of the statute when the court is closed to him. Official relations between the belligerents are resumed, for war of course puts an end to diplomatic intercourse. During the continuance of war it is customary for a neutral to offer its services so that the interests of the particular belligerent may not unduly suffer. In this way American ministers in Germany, Belgium, Turkey, and elsewhere served various nations in the European War of 1914.

War may terminate in three ways: by treaty; by cessation of hostilities; by conquest. The treaty is the usual method and is the best; for the parties to the war can, do, and should thus settle by a careful and formal document the various issues that caused the war, and provide for peaceful and harmonious relations in the future. In cases of war indemnity and cession of territory, a treaty is well-nigh indispensable. It should be said that, for purposes of public right or sovereignty, the treaty speaks from its signature; but private rights determine or vest from date of ratification. (*Haver* v. *Yaker*, 9 Wallace, 32.) See TREATY.

The cases of mere cessation of hostilities are exceedingly rare; for it is hard to conceive how nations willingly choose to go on after, as before, the war, with no precise and formal settlement of the outstanding difficulties or causes of the war. "The war between Sweden and Poland in 1716, and also the war between France and Spain in 1720, came to an end in this way. The war between Spain and her American colonies ceased in 1825, but no diplomatic relations were established with them till 1840, and the independence of Venezuela was not recognized till 1850. After the hostilities between France and Mexico (1862–67) no diplomatic relations were entered into till 1881." (Wilson and Tucker, *International Law*, p. 271.) In justice to neutrals, an official statement of the termination of hostilities should be made; otherwise the uncertainty of the exact status will seriously interfere with neutral trade. If, however, no treaty or declaration be made, peace may be established as a fact and dates from the last warlike act. As regards conquest made during the war, the principle of uti possidetis obtains, i.e., each belligerent retains what it holds or occupies at the conclusion of hostilities. If territory is thus occupied and possessed, the laws and customs remain in force until changed by the new sovereign, and the same is true in case of a treaty unless specific rules and regulations are agreed upon and incorporated into the document. In the case of conquest, the conquered state or territory is absorbed in the conqueror, and, succeeding to its rights and merits, the latter likewise assumes its debts and obligations. If part of a state or province be absorbed, the rights and duties are usually apportioned between the belligerents. In general, obligations that are personal to the ceding state remain with it, while local obligations, such as liens on the customs duties of certain ports, pass with the territory transferred. One of the articles of the Treaty of London in 1914, after the First Balkan War, provided for an international commission to meet at Paris to apportion the financial obligation resting upon the territory Turkey was ceding to the Balkan allies.

While the parties to a contest are more intimately concerned by its effects, third parties or neutrals are nevertheless interested. Their trade is necessarily interrupted and at times suspended; for military and naval operations do not accord well with trading and peaceful pursuits. The theory of neutrality is that the stranger to the contest takes no part whatever in it, and prevents its subjects directly or indirectly so far as possible from aiding either belligerent. Nor should it allow its ports to be used as a basis for hostile operations, supply stations, or ports of shelter. A neutral may, however, trade with either belligerent or both, in all articles except those denominated contraband of war. (See CONTRABAND OF WAR; INTERNATIONAL LAW.) The neutral should not seek to enter a blockaded port of a belligerent, for by so doing it interferes with military or naval operations and furnishes the blockaded port with supplies and articles of trade. (See BLOCKADE; INTERNATIONAL LAW.) To see that neutral vessels do not carry articles of contraband and that such neutral vessels are not destined for a blockaded port, belligerents possess and exercise the right to visit and search neutral vessels. This is strictly a war right and does not exist in peace. See SEARCH, RIGHT OF; NEUTRALITY; LONDON, DECLARATION OF.

For embargo, reprisal, retorsion, pacific blockades, military commissions, and martial law, see these articles.

Prisoners of War. "A prisoner of war is a public enemy armed or attached to the hostile army for active aid, who has fallen into the

hands of the captor . . . by individual surrender or by capitulation. All soldiers, of whatever species of arms; all men who belong to the rising en masse of the hostile country [not already occupied by an invading army; Art. 52]; all those who are attached to the army for its efficiency and promote directly the object of the war . . . ; all disabled men or officers on the field or elsewhere, if captured; all enemies who have thrown away their arms and ask for quarter [which may not be refused except in great straits or in retaliation; Arts. 60–66], are prisoners of war and as such exposed to the inconveniences as well as entitled to the privilege of a prisoner of war." (*Instructions*, Art. 49; similarly Hague Regulations, Arts. 4 to 20.) In addition, sutlers, editors, reporters of journals, or contractors may be made prisoners of war (Art. 50). Chaplains, officers of the medical staff, apothecaries, hospital nurses, and servants are not prisoners of war (Art. 53). Hostages, rarely given and accepted to-day, are treated as prisoners (Arts. 54–55); the Hague Regulations do not mention hostages, and most opinion is against the practice of taking them, but German experts advocate it because usually successful.

The recognized naval forces are as follows: "The officers and men of the navy, naval reserve, naval militia, and their auxiliaries; the officers and men of all other armed vessels cruising under lawful authority." (*United States Naval War Code*, Art. 9.) The personnel of all public unarmed vessels owned or in the enemy's service; the personnel of merchant vessels, who in self-defense and in protection of the vessel resist attack, as well as "the personnel of the armed forces or armed vessels of the enemy, whether combatants or non-combatants, are entitled to receive the humane treatment due to prisoners of war" (Art. 10). Hospital ships and their personnel if strictly neutral are not liable to capture (Arts. 21–25), and the religious, medical, and hospital personnel of any vessel captured during hostilities are inviolable, and on leaving ship may carry with them articles and instruments of surgery which are their private property (Art. 26).

In battle, the enemy may be wounded or killed; unresisting he has the right to quarter; as prisoner of war, his life, person, and property are placed under the protection of the captor. This applies to soldier and sailor; to the able-bodied, sick, wounded, or shipwrecked. The captured enemy is deprived of his arms and thus loses his enemy character. By the Hague Regulations he may not be treated as a criminal or kept in close confinement unless this be necessary for the safety of prisoner or captor. He may be required to work, if able-bodied, but must be paid at the same rate as a soldier of the captor country engaged similarly and cannot be employed on military work. He has a right to food, clothing, and quarters equal to those of soldiers of the captor country. He may be shot if he tries to escape and punished for breaches of discipline. The Regulations provide for the establishment by each belligerent of bureaus for the transmission of letters, money orders, and postal parcels to prisoners of war in other countries free of all charges. They should be treated with humanity and the sick and wounded receive medical treatment, according to the ability of the medical staff. By the Geneva Convention of 1906 it was provided that no distinction should be made in the treatment accorded by a commander to his own and to enemy sick and wounded. Moreover, robbing or molesting wounded lying on the field of battle is punishable as a crime of war.

The status of prisoner, once established, continues as long as the captor retains control of the person. It may end by successful escape; or by exchange, officer for officer of equal rank, private for private, and a stated number of inferior for superior officers, according to the cartel or formal agreement of the belligerents. Or the prisoners may be paroled, i.e., set free, upon an express promise not to serve in a military capacity against the captor during the continuance of the war. Only an officer may pledge his honor, i.e., give his word or parole for himself and soldiers; if the parole thus given be rejected by his government, officers and soldiers must return to the enemy. Violation of the parole is punishable, on recapture, by death. An escaped prisoner who joins his army is not punishable if subsequently captured. It should be noted that armed bands acting without commission or authorization of any kind are not treated as prisoners, but as highway robbers or pirates.

WAR, DEPARTMENT OF. An executive department of the United States government, created

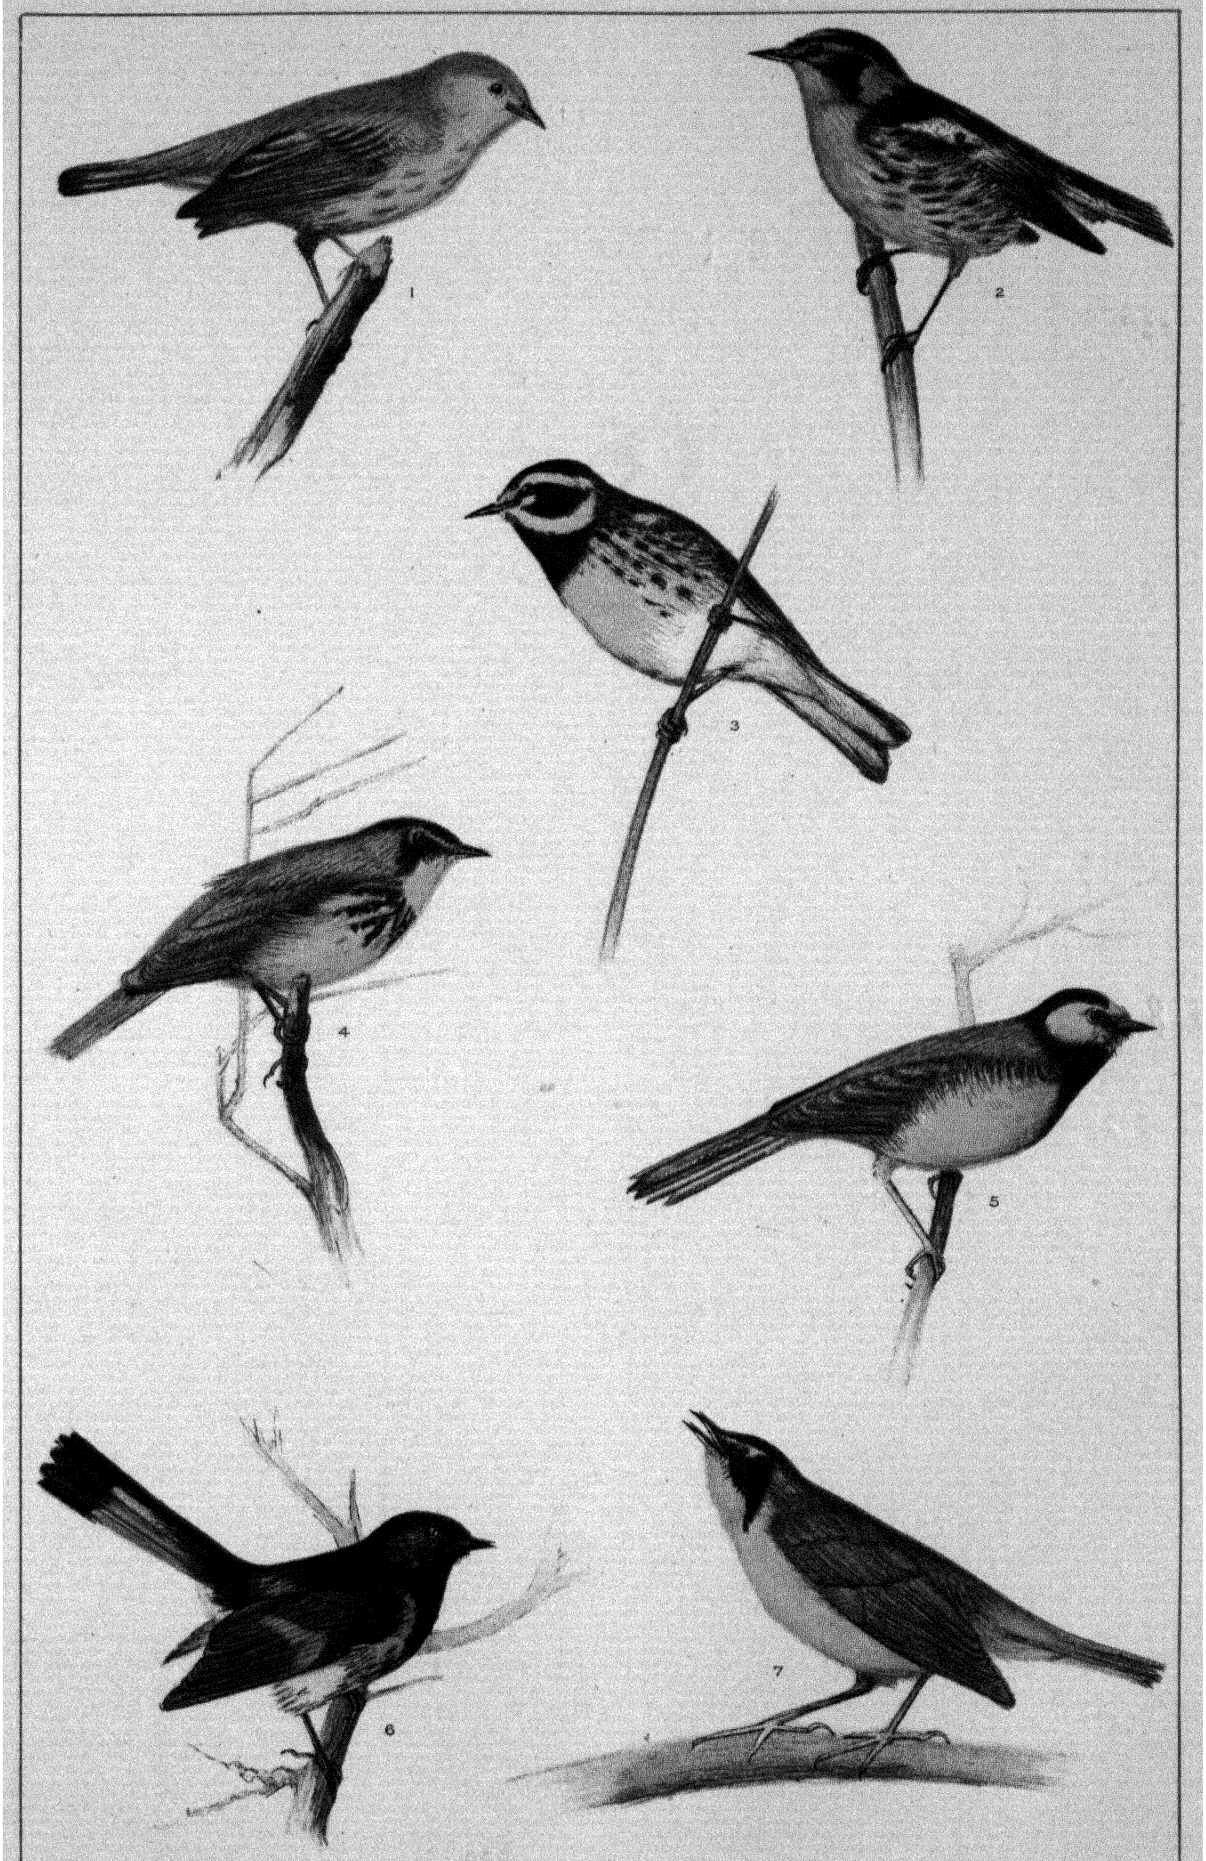
by Act of Congress of Aug. 7, 1789. It has at its head a secretary appointed by the President by and with the advice and consent of the Senate for a period of four years. He ranks third among the cabinet members in the line of succession to the presidency and receives a salary of $12,000 per year. He has charge of all matters relating to military affairs, subject to the direction of the President, the distribution of stores, the signal service, the survey and improvement of harbors, and the administration of the insular possessions. He is required to make an annual report of the conduct of the department showing the number and distribution of the military forces together with a statement of the expenditures, of contracts for supplies and services, river and harbor improvements, the administration of the insular territories, etc. The business of the War Department is distributed among a number of subdivisions or bureaus, each of which is under the supervision of a chief and under the general supervision of the chief of staff. These include: the headquarters of the army, through which the orders of the President are issued by the chief of staff; the office of the adjutant-general, which conducts the army correspondence, supervises the recruiting and enlistment service, receives reports from army officers, issues commissions, and preserves the records of the army; the office of the inspector-general; the office of the quartermaster-general; the commissary department; the office of the surgeon-general; the office of the paymaster-general; the office of the chief of engineers; the ordnance department; the signal office; the office of the judge-advocate-general; the record and pension office; and the Bureau of Insular Affairs. The last is charged with supervision of the administration of the recently acquired insular territories. Since 1890 the Secretary of War has been aided by an Assistant Secretary.

WAR, HONORS OF. See HONORS OF WAR.

WAR, LAWS OF. See WAR.

WAR, SOCIAL. See SOCIAL WAR.

WAR AND PEACE. An historical novel by Tolstoy (1865–68). The plot is laid in the reign of Czar Alexander I.



WARASDIN, vär'äz-dēn (Hung. *Varasd*). An Episcopal city of Croatia-Slavonia, 150 miles southwest of Budapest, on the left bank of the Drave (Map: Austria, E 3). The town has manufactures of tobacco, liquors, acetic acid, and anchors. Pop., 1900, 12,930; 1910, 14,752.

WARBECK, wär'bĕk, PERKIN (?1474–99). A pretender to the English throne, born at Tournay. In 1491 he went to Cork and agreed at the instigation of opponents of Henry VII to set up a claim that he was Richard, Duke of York, second son of Edward IV. For a while he received some support, especially among foreign powers hostile to England and Henry VII. James IV of Scotland even gave him his own cousin, Catherine Gordon, as wife in 1495. In 1497 he made an expedition into England, but was captured. He confessed his imposture and was allowed considerable liberty, but when he engaged in new conspiracies he was condemned to death and executed at Tyburn on Nov. 23, 1499. Consult James Gairdner, *Richard III* (London, 1898), and Henes and Briner, *A Historical Sketch of Perkin Warbeck* (New York, 1902). See HENRY VII.

WARBLE FLY. Any one of several species of flies of the family Œstridæ, which lay their eggs upon different animals, and whose larvæ eventually form a swelling or warble under the skin. The name "ox warble" is specifically applied to the swellings made by the bot fly of the ox (*Hypoderma lineata*); and the bot fly of the rabbit (*Cuterebra cuniculi*) produces similar warbles under the skin of rabbits. See BOT.

WARBLER (from *warble*, from OF. *werbler*, from Ger. *wirbeln*, to warble, whirl, turn, frequentative of MHG., Ger. *werben*, OHG. *werban*, to turn, twist). A small song bird; properly one of either of two passerine families, viz., the American Mniotiltidæ and the Old World Sylviidæ. The former includes the warblers of North and Middle America, numbering about 200 species, according to Ridgway, few of which are as much as six inches long. With few exceptions they are woodland birds, wholly insectivorous, and prettily if not gorgeously colored. The males are much more brilliantly colored than the females except in a few cases. They are highly migratory, and of the 60 or more species found in the United States all but one or two winter south of the Mason and Dixon's line and nearly all spend the coldest months in the tropics. As many of the species breed in the far north, they are the most striking feature of the migrations in many parts of the United States. They are extremely active birds, and only a few species resort to the ground for food. Although several species sing well, most have weak voices and make no pretense of singing. A few warblers are specially notable. Perhaps the most beautiful species is the prothonotary (*Protonotaria citrea*), the male of which has the whole of the head, neck, and under parts rich orange and the back greenish yellow. It is rarely seen north of Washington and winters in the tropics. The genus *Helminthophila* formerly included about 10 species known as the swamp warblers (q.v.), some of which are beautifully colored. The genus has recently been split up by some authors. The genus *Dendroica* is the largest group. The best known is the common yellow or summer warbler (*Dendroica æstiva*), familiar in orchards throughout nearly all North America. It is five inches long, bright yellow dimly streaked with rufous; it has a sweet, trilling song, and makes a nest of hempen materials, lodging it in an upright fork of the branches of a shrub or small tree. Another familiar and widely distributed species is the redstart (*Sctophaga ruticilla*), black and red, or in the female black and orange-yellow, which is notable for its lively manner and gay dress, and sings well. Very brilliant also is the orange, black, and white Blackburnian warbler (*Dendroica blackburniæ* or *fusca*), seen in passing to and from its Canadian breeding home. Townsend's warbler is a Pacific coast representative of this genus. Another noteworthy Western warbler is the hermit (*Dendroica occidentalis*), which breeds in the high mountains of California, forming an exquisite nest out of graybeard moss hanging from spruce boughs. The Maryland yellowthroat (q.v.) (*Geothlyphis trichas*) and its handsome relative the Kentucky warbler (*Oporornis formosus*) are similar in habits and method of nest making, keeping close to the ground. The striking manner in which yellow and black are often contrasted in the plumage of these charming birds is well displayed in the genus *Wilsonia*, two species of which are displayed on the accompanying Colored Plate of WOOD WARBLERS. See also CHAT; OVEN BIRD; REDSTART; ETC.

AMERICAN WOOD-WARBLERS

COPYRIGHT, 1903, BY DODD, MEAD & COMPANY

JULIUS BIEN & CO. LITH. N.Y.

1 SUMMER YELLOWBIRD (DENDROICA ÆSTIVA)
2 BLACKBURNIAN WARBLER (DENDROICA FUSCA)
3 TOWNSEND'S WARBLER (DENDROICA TOWNSENDI)
4 CANADA WARBLER (WILSONIA CANADENSIS)
5 HOODED WARBLER (WILSONIA CITRINA)
6 REDSTART (SETOPHAGA RUTICILLA)
7 KENTUCKY WARBLER (OPORORNIS FORMOSUS)

The warblers of the Old World are small birds of the family Sylviidæ, closely related to the thrushes and kinglets and gnatcatchers; many are known by separate popular names, as blackcap, nightingale, hedge sparrow, robin redbreast, redstart, whitethroat, etc. (qq.v.). About 100 species are catalogued—all belonging to the Old World, except one in Alaska. The best-known European species are the following: Grasshopper warbler (*Locustella nænia* or *locustella*), found in most parts of the centre and south of Europe. It is of a greenish-brown color, the centres of the feathers dark brown, producing a spotted appearance; the lower parts pale brown. It is a shy bird, hiding in hedges and bushes, but active, often darting out like a mouse from the bottom of the hedge, and receives its name from its chirping, grasshopper-like note. The sedge warbler (*Acrocephalus schœnobœnus*) is the most common British species, and is generally found where aquatic herbage is thick and strong. It is brown, with the chin and throat white and the under parts buff. The great reed warbler (*Acrocephalus arundinaceus*) is found in summer in marshy situations in many parts of Europe, and its range extends to the north of India. It is a uniform pale brown, with a tinge of chestnut; the chin and throat white; the under parts pale buff color. Its nest is remarkable; it is attached to the stems of three or four reeds, and formed by winding the branches of their panicles together with a little wool; it is conical and deep, so that the eggs or young may not be shaken out by the wind. The wood warbler or wood wren (*Phylloscopus sibilatrix*) is common in wooded districts of England in summer, particularly in old oaks and beeches. It is olive green, tinged with yellow, the wings brown, the primaries and secondaries edged with bright yellow, the tertials with a broader edge of yellowish white; the lower parts yellow and white. The willow warbler or wren (*Phylloscopus trochilus*) is common in the south of England in the summer. It frequents woods and bushes and builds its nest on the ground. It is of dull olive-green, the wing and tail feathers dark brown, the under parts whitish. The only American representative of this family is an Asiatic species (*Phylloscopus* or *Acanthopneuste borealis*), which regularly visits Alaska in summer, and is known to American ornithologists as Kennicott's willow warbler. See Plate of WRENS, WARBLERS; ETC.

The warblers are uniformly active birds and as such are extremely destructive to injurious insects, especially do they protect forest and orchard trees from the attacks of harmful Lepidoptera and Coleoptera. Their presence in a given locality during migration seems to be determined largely by the number of insects or insect larvæ abundant there. The Maryland yellowthroat feeds largely upon leaf hoppers and cankerworms, while the common black and white warbler eats various beetles. The yellow warbler prefers harmful caterpillars and the black-throated green warbler, grasshoppers. Thus practically each species has a slightly different diet of harmful insects.

For general references consult Newton, *Dictionary of Birds* (London, 1893–96), and other authorities cited under BIRD for the Sylviidæ; for the Mniotiltidæ, consult American ornithologies, especially Ridgway, *Birds of North and Middle America*, part ii (Washington, 1902), and Coues, *Birds of the Colorado Valley* (ib., 1878). For the economic importance, see Forbush, *Useful Birds and their Protection*, published by the Massachusetts Board of Agriculture (Boston, 1913). For the most recent monographic studies and researches consult F. M. Chapman, *The Warblers of North America* (New York, 1907), for Mniotiltidæ, and H. E. Howard, *The British Warblers* (London, 1907–14), for the Sylviidæ.

WARBURG, vär'bu̇r-y', KARL JOHAN (1852–). A Swedish writer, born at Göteborg. He took his Ph.D. at Upsala in 1877 and became professor at Göteborg (1891), librarian at the Nobel Library of the Swedish Academy, Stockholm (1900), and in 1909 professor in that city. Warburg wrote numerous essays on Swedish and foreign authors, and with Henrik Schück he wrote the important *Illustrerad Svensk Litteraturhistoria* (2 vols., 1896–97; 2d ed., 5 vols., 1912–16). In 1905–08 he was a member of the Riksdag.

WARBURG, wa̤r'bûrg, PAUL MORITZ (1868–). An American banker and financier, born in Germany. He graduated from the Realgymnasium at Hamburg, studied two years in France and two years in England, traveled extensively, and in 1894 became a member of his father's Hamburg banking house, M. M. Warburg and Company. In 1902 he became a partner in Kuhn, Loeb, and Company, New York, and was the representative of his firm in the five-power group that conducted unsuccessful negotiations for a Chinese loan in 1911–12. Warburg was a leader in the agitation for a central banking system for the United States, and his appointment by President Wilson to the newly created Federal Reserve Board in 1914 aided in gaining the approval of the great financial interests to the new currency scheme. He published *Essays on Banking Reform in the United States* (1914).

WARBURG'S TINCTURE. TINCTURA ANTIPERIODICA. A well-known preparation of quinine, the original formula of which contained over 60 ingredients, many of which are now not obtainable, once in great repute in India. The preparation now called by that name (after Carl Warburg, an Austrian physician in the English service) contains only 17 of the original ingredients, among them quinine, camphor, aloes, opium, and rhubarb. Warburg's tincture is given in the more chronic forms of malaria. See QUININE.

WAR'BURTON, ALEXANDER BANNERMAN (1852–). A Canadian political leader. He was born at Charlottetown, Prince Edward Island, and graduated at King's College, Windsor, N. S., in 1874. He was called to the bar in 1879, practiced his profession in Charlottetown, was elected a Liberal member of the Provincial Legislature in 1891, and was Premier in 1897–98. He was judge of Queen's County Court in 1898–1904, and was elected to the Dominion House of Commons in 1908.

WARBURTON, wa̤r'bûr-tŭn, BARTHOLOMEW ELLIOTT GEORGE (1810–52). An Irish miscellaneous writer, generally known as Eliot Warburton, born near Tullamore, King's County. He was educated at Queens' College and Trinity College, Cambridge, was admitted to the Irish bar at King's Inns in 1837, and in 1843 traveled extensively in Turkey and through Syria, Palestine, and Egypt. In 1851 he was sent by the Atlantic and Pacific Junction Company as its representative to make a treaty or come

to friendly understanding with the Indians of the Isthmus of Darien, and to carry on explorations there. On the way to perform this commission he met his death by the burning of the steamer *Amazon*. He edited the *Memoirs of Horace Walpole and his Contemporaries* (2 vols., 1851) and wrote: *The Crescent and the Cross* (2 vols., 1844, but dated 1845), descriptive of his Eastern travels; *Zoë: An Episode of the Greek War* (1847); *Memoir of Prince Rupert and the Cavaliers* (1849); *Reginald Hastings* (1850), a novel; and *Darien, or the Merchant Prince* (3 vols., 1852), also a novel. Consult the *Fortnightly Review*, vol. xvii (London, 1872).

WARBURTON, PETER EGERTON (1813–89). An English traveler in Australia, born near Norwich and educated at Orléans and Paris. He traveled through the northwestern part of Australia on camel back and several times was near to starvation in the desert. He wrote *Major Warburton's Diary* (1866) and *Journey across the Western Interior of Australia* (1875).

WARBURTON, WILLIAM (1698–1779). An English prelate and author. He was born at Newark and was educated at the school of his native town, and afterward at Oakham in Rutlandshire, which he left in the year 1714, returning home to prepare for the profession of law. He practiced as an attorney at Newark for some years, but his natural bent was towards literature and theology. He took orders in 1723, and in 1728 became rector of Brant-Broughton, in the diocese of Lincoln, where he remained for many years. He issued, in 1736, a treatise entitled *The Alliance between Church and State, or the Necessity and Equity of an Established Religion and a Test Law.* In January, 1737–38, it was followed by the first volume of the celebrated work, *The Divine Legation of Moses, Demonstrated on the Principles of a Religious Deist, from the Omission of the Doctrine of a Future State of Rewards and Punishments in the Jewish Dispensation.* In 1739 a new and revised edition of the first part of the work appeared. This was followed in 1741 by the publication of the second part. The third and concluding section was published posthumously in 1788 (10th edition of entire work, 1846). Becoming involved in the controversy which followed the appearance of Pope's *Essay on Man*, Warburton won the warm friendship of the poet by a series of seven letters, entitled *A Vindication of Mr. Pope's Essay on Man, by the Author of the Divine Legation* (1739–40).

In 1757 he was promoted to the deanery of Bristol, and in 1760 Pitt bestowed on him the bishopric of Gloucester. In the later years of his life his mind became impaired; and he was utterly prostrated by the loss of his only son, whom he did not long survive. He founded the Warburtonian lectures for the proof of religion by prophecy.

Warburton exhibits a keen and fertile mind, with an arrogance of tone, which tends, in his treatment of adversaries, to degenerate into truculence and scurrility. His scholarship was never deep or accurate, though he had wide reading and undoubted intellectual vigor. A complete edition of his works, in 7 volumes, was published in 1788 by his friend, Bishop Hurd, who prefaced it with a biography (new edition, 12 vols., 1811). Consult his biography by Watson (London, 1863); also an essay in Mark Pattison, *Essays* (Oxford, 1889).

WAR COLLEGE, UNITED STATES ARMY. A military institution situated at Washington Barracks, Washington, D. C., and under the immediate supervision of the Secretary of War and the General Staff. The War College aims to make a practical application of knowledge already acquired, not to impart academic instruction, and to direct and coördinate military education in the army and in civil schools and colleges at which officers of the army are detailed as instructors, as well as to extend opportunities for investigation and study in the militia of the United States. A further object is to provide facilities for and to promote advanced study of military subjects and formulate the opinions of the college body on the subjects studied for the information of the Chief of Staff. The permanent personnel of the War College consists of a president (a general officer of the General Staff) and one director. House Resolution 12,766 (signed June 3, 1916), "To increase the Efficiency of the Military Establishment of the United States," made some changes in the organization of the college. The "War College Division" of the General Staff was abolished, but the college itself remained "fully subject to the supervising, coördinating and informing powers . . . of the General Staff Corps," from which officers for duty as instructors, attachés, or students could be freely drawn, but, if so drawn, the director excepted, they should cease to be members of the General Staff. Student officers may be detailed to follow the courses (lasting one year) in such numbers and under such conditions as the Secretary of War may approve. The Navy and Marine Corps may also send one officer each. This courtesy may also be extended by the Secretary of War to a selected militiaman.

The Naval War College, a similar advanced institution, is situated at Newport, R. I. See NAVAL SCHOOLS OF INSTRUCTION.

WARD. An infant who has been legally placed under the care of a guardian, who stands in loco parentis. (See GUARDIAN.) So a ward in chancery is an infant under the direct supervision of the chancellor. The term "ward" is also employed to denote a subdivision of a city. It originated in the idea of warding or protecting a hundred under the old English law, and was formerly applied only to certain districts with reference to police protection. However, to-day most cities are divided into wards for many civic purposes, as convenient election districts, police districts, and for convenience in describing the location of property for taxation, etc.

WARD, SIR ADOLPHUS WILLIAM (1837–). An English dramatic historian, born at Hampstead, London. He was educated at Peterhouse, Cambridge, of which he was elected fellow in 1861; and he also studied in Germany. In 1866 he was appointed professor of history and English literature in Owens College, Manchester, and from 1890 to 1897 he was its principal. In 1900 he became master of Peterhouse. From 1911 to 1913 he served as president of the British Academy and in the latter year he was knighted. His *History of English Dramatic Literature to the Death of Queen Anne* (2 vols., 1875; rev. ed., 1899) is the standard work on this subject. Besides this book and numerous essays and appreciations, he published: a translation of Curtius' *History of Greece* (5 vols., 1868–73); *Chaucer* (1880) and *Dickens* (1882),

in the "English Men of Letters Series"; editions of Pope's *Poetical Works* (1869), Marlowe's *Doctor Faustus*, Greene's *Friar Bacon* (1878), and the *Poems of John Byrom* (1894–95); *Life of Sir Henry Wotton* (1897); *Great Britain and Hanover*, Ford Lectures at Oxford (1899); *The Electress Sophia and the Hanoverian Succession* (1903). He was (1902) made one of the editors of the *Cambridge Modern History* and (1907) of the *Cambridge History of English Literature*. The definitive ("Knutsford") edition of Mrs. Gaskell (1906), with its admirable critical introductions, is his.

WARD, ARTEMAS (1727–1800). An American soldier and jurist, born at Shrewsbury, Mass. He graduated at Harvard in 1748, served first as a major and then as a lieutenant colonel in the French and Indian War, and on May 19, 1775, soon after the outbreak of the Revolution, was appointed to the chief command of the Massachusetts forces. Until the arrival of Washington, he conducted the siege of Boston, and on June 17, 1775, was appointed by Congress first major general in the Continental army, next in rank to Washington, but ill health forced him to resign at the close of 1776. He became Chief Justice of the Court of Common Pleas at Worcester in 1776; served as President of the Massachusetts Executive Council in 1777; was for 16 years a member of the Massachusetts Legislature; and was a member of Congress from 1791 to 1795.

WARD, ARTEMUS. See BROWNE, CHARLES FARRAR.

WARD, BERNARD (NICOLAS) (1857–). An English Roman Catholic churchman, born at Old Hall, Hertfordshire. He was educated at St. Edmund's College, Old Hall (1868–75), and at Oscott College, Birmingham (1879–82). Ordained a priest, he was a master at St. Edmund's (1882–85), established and superintended a new mission at Willesden (1885–88), and held a mastership at Oscott (1888–90). He then served as vice president of St. Edmund's till 1893, and thereafter as its president. In 1895 he was domestic prelate to the Pope, and in 1903 Roman Catholic canon of Westminster. His publications include: *History of St. Edmund's College* (1893); *Commentary on St. Luke's Gospel* (1899); *Life of St. Edmund of Canterbury* (1903); *St. Edmund's College Chapel* (1903); *Catholic London a Century Ago* (1905); *The Dawn of the Catholic Revival* (1909); *The Eve of Catholic Emancipation* (3 vols., 1911–12); *The Sequel to Catholic Emancipation* (2 vols., 1915).

WARD, EDGAR MELVILLE (1839–1915). An American genre painter. He was born in Urbana, Ohio, and studied at the National Academy of Design in New York and in Paris under Cabanel. In 1883 he became a member of the National Academy and afterward was made a professor there. His paintings, which are soundly realistic in execution, include "Breton Washwomen" (1876); "The Sabot Maker" (1878); "The Collar Shop" and "The Quilting Party" (1892); "The Coppersmith" (Metropolitan Museum, New York).

WARD, EDWARD MATTHEW (1816–79). An English historical painter. He was born at Pimlico, London, and studied in the schools of the Royal Academy, at Rome (1836–38), and fresco painting at Munich under Cornelius. In 1839 he exhibited "Cimabue and Giotto," at the Royal Academy. In 1853 he painted eight historical pictures for the corridor of the House of Commons and in 1855 he became a member of the Royal Academy. In 1859 he was commissioned by the Queen to paint "Napoleon III Invested with the Order of the Garter" and the "Visit of Queen Victoria to the Tomb of Napoleon I." Other paintings include: "Dr. Johnson in the Anteroom of Lord Chesterfield" (1845), "South Sea Bubble" (1847), both in the National Gallery, London; "Charles II and Nell Gwyn" (1848, South Kensington Museum); "Dr. Johnson's First Interview with John Wilkes" (1865). His son LESLIE WARD was illustrator on the staff of *Vanity Fair* (1873–1909), under the pseudonym "Spy," and became well known also for his clever representations of well-known contemporary celebrities in the *World*.

WARD, ELIZABETH STUART PHELPS (1844–1911). An American philanthropist and author, the daughter of Austin and Elizabeth Stuart Phelps and granddaughter of Moses Stuart (qq.v.). She was born in Andover, Mass., where she lived until her marriage to Herbert D. Ward (q.v.) in 1888. She was widely known for her work in temperance reform as well as for her many books, often of a religious trend. Among her publications are: *Ellen's Idol* (1864); *Mercy Gliddon's Work* (1866); *The Gates Ajar* (1868); *Men, Women, and Ghosts* (1869); *Hedged In* (1870); *The Silent Partner* (1871); *Poetic Studies* (1875); *The Story of Avis* (1877); *An Old Maid's Paradise* (1879); *Doctor Zay* (1882); *Beyond the Gates* (1883); *Songs of the Silent World* (1884); *Jack the Fisherman* (1887); *The Gates Between* (1887); *The Struggle for Immortality* (1889); with her husband, *Come Forth* (1891); *A Singular Life* (1895); *The Story of Jesus Christ* (1897); *Within the Gates* (1901); *Trixy* (1904); *Walled In* (1907); *The Empty House and Other Stories* (1910).

WARD, FREDERICK TOWNSEND (1831–62). An American military adventurer, born at Salem, Mass. He was educated at the high school in his native town, became a sailor, fought with the French in the Crimea, and was with Walker in Nicaragua. He then became for a time a ship broker in New York, but went to China during the Taiping Rebellion. Having organized an irregular force of about 100 desperadoes, Ward offered his services to the local Chinese authorities, and for a reward of $200,000 recaptured Sungkiang, and garrisoned it. Having received a commission from the Chinese, he began drilling natives with foreign adventurers as officers, increased his following to nearly 4000, the nucleus of the force later known under Gordon as the Ever Victorious Army. Gordon succeeded to Ward's command after the latter's death. But it was the organization and discipline introduced by Ward, who was possessed of great military talents, which gave Gordon the necessary foundation for conquering the Taipings. This force, developed by Ward, was of great assistance to the British and French admirals in protecting Shanghai, and maintaining a neutral belt of 30 miles around the city. During a skirmish near Ningpo Ward was killed; he was buried at Sungkiang, where a shrine was erected to his memory in 1875.

WARD, GENEVIÈVE, COUNTESS DE GUERBEL (1838–). A singer and actress. She was born in New York, but from childhood lived much abroad, studying music both in New York and in Italy. After her romantic and unhappy marriage to the Russian officer Count Constan-

tine de Guerbel (1854), she made her début as an opera singer at Milan in 1856 under the name of Madame Guerrabella. She met with great success both on the Continent and in England. Soon after she came to America in 1862 she lost her voice through illness, and for a time gained a livelihood by teaching singing while she studied for the theatre. Her appearance as Lady Macbeth, at Manchester, England, in 1873, proved the beginning of her fame in many tragic rôles, among them Lucrezia Borgia, Queen Katharine, and especially Stephanie, in *Forget-Me-Not*. She first appeared on the American stage in 1878. In 1893 she was Queen Eleanor in the production of *Becket* by Irving at the Lyceum, and she continued with him till 1897, afterward residing in England. In 1910 she joined F. R. Benson's company, appearing in a repertory of Shakespearian plays. Consult: Wickoff, *Memoir of Ginevra Guerrabella* (New York, 1863); Gustafson, *Geneviève Ward* (Boston, 1882); W. Winter, *Shadows of the Stage* (New York, 1892).

WARD, Harry Marshall (1854–1906). An English botanist born at Hereford, and educated at Owens College, Manchester, and at Christ's College, Cambridge. In 1880–82 he was cryptogamic botanist to the Ceylon government. He was professor of botany in the school of forestry of Cooper's Hill College, Egham, from 1885 to 1895, when he became professor at the University of Cambridge. His works include: *A Popular Introduction to Forest Botany* (1892); *Timber and Timber Trees* (1894); *Grasses* (1901); *Trees: Handbook of Forest Botany for the Woodlands and the Laboratory* (5 vols., 1904–09). Aside from his general works on botany, his chief interest was plant pathology, in which field he was one of the pioneers.

WARD, Henry Augustus (1834–1906). An American naturalist, born at Rochester, N. Y. He attended Williams College and the Lawrence Scientific School, Harvard, where he was an assistant of Louis Agassiz. He traveled in Egypt, Arabia, and Palestine; studied for several years at the Jardin des Plantes, the Sorbonne, and the School of Mines in Paris, and at the universities of Munich and Freiberg; and afterward traveled in West Africa and the West Indies, making natural history collections. After his return to the United States in 1860 he was professor of natural science at the University of Rochester until 1865; and in 1871 was naturalist to the United States Commission to Santo Domingo. He then devoted himself entirely to the work of making natural history collections, and founded at Rochester, N. Y., Ward's Natural Science Establishment, a pioneer enterprise of its kind, which collected specimens, especially zoölogical, from all parts of the world, and then mounted and sold them to colleges and museums. He published: *Notices of the Megatherium Cuvieri* (1863), and *Description of the Most Celebrated Fossil Animals in the Royal Museums of Europe* (1866).

His wife (1845–), whose maiden name was Lydia Avery, was the widow of John C. Coonley, when she was married to Mr. Ward in 1897. Long resident in Chicago, she was president of the Chicago Woman's Club in 1895–96. Mrs. Coonley-Ward wrote: *Under the Pines, and Other Verses* (1895); *Singing Verses for Children* (1897); *Love Songs* (1898); etc.

WARD, Herbert (?–). A British sculptor, traveler, and author. He early became familiar with Africa, and was one of the survivors of Stanley's Emin Pasha (q.v.) relief expedition (1888). Later he became known especially for his bronzes of African natives, whom he had grown to understand and sympathize with. Among such sculptures are "The Idol Maker" and "Détresse." In Paris, where Ward made his residence, his work is represented in the Luxembourg. He became Chevalier of the Legion of Honor and a member of the Society of British Sculptors. In 1916 he lectured in the United States for the benefit of the work in Europe of the American War Relief. He published: *Five Years with the Congo Cannibals* (1890); *My Life with Stanley's Rear Guard* (1891); *A Voice from the Congo, Comprising Stories, Anecdotes, and Descriptive Notes* (1910).

WARD, Herbert Dickinson (1861–). An American author, born at Waltham, Mass., son of William Hayes Ward (q.v.). He graduated from Amherst in 1884, and married Elizabeth Stuart Phelps (see Ward, Elizabeth S. P.) in 1888. He wrote extensively for newspapers and periodicals, and was author of *The New Senior at Andover* (1890); *A Republic without a President, and Other Stories* (1891); *The Captain of the Kittiewink* (1892); *A Dash to the Pole* (1893); *The White Crown, and Other Stories* (1894); *The Burglar Who Moved Paradise* (1897); *The Light of the World* (1901), and joint author with his wife of *A Lost Hero* (1889); *The Master of the Magicians* (1890); *Come Forth* (1891).

WARD, (Thomas) Humphry (1845–). An English author and journalist. He was born at Hull, and studied at Brasenose College, Oxford, where he became a fellow in 1869, and a tutor in 1870. He contributed editorials to the London *Times*, edited *The English Poets* (4 vols., 1880), a notable anthology; *Men of the Reign* (1885); *The Reign of Queen Victoria* (1887); *English Art in the Public Galleries of London* (1888); and *Men of the Time* (12th ed.); and wrote alone *Humphry Sandwith, a Memoir* (1884), and jointly *The Oxford Spectator* (1868) and *Romney* (1904). For his wife see Ward, Mrs. Humphry.

WARD, Mrs. Humphry; maiden name, Mary Augusta Arnold (1851–). An English novelist, daughter of Thomas Arnold (1823–1900), granddaughter of Thomas Arnold (1795–1842), and niece of Matthew Arnold (qq.v.). She was born at Hobart in Tasmania. After attending schools in the Lake district and at Clifton, she began her literary career at Oxford. In 1872 she was married to Thomas Humphry Ward (q.v.). In 1880 they settled in London. Mrs. Ward contributed four biographical introductions to the first volume of her husband's *English Poets* (1880–81), and in 1885 she published a translation of *Amiel's Journal* (see Amiel, Henri). Her first great success was *Robert Elsmere* (1888), probably the best religious problem novel that had so far appeared in English. It caused a great sensation at the time because of its attack on Evangelical Christianity. Subsequently Mrs. Ward took up other phases of contemporary thought in religion and politics. Her concern with ethical problems is often so obvious as to detract from the artistic value of her work; but her characters are graphically drawn and the workmanship is of high order. After *Robert Elsmere* came: *The History of David Grieve* (1892); *Marcella* (1894); *The Story of Bessie Costrell* (1895); *Sir George*

Tressady (1896); *Helbeck of Bannisdale* (1898); *Eleanor* (1900); *Lady Rose's Daughter* (1903); *The Marriage of William Ashe* (1905); *Fenwick's Career* (1906); *The Testing of Diana Mallory* (1908); *Marriage à la Mode* (1909); *Canadian Born* (1910); *Lady Merton, Colonist* (1910); *The Case of Richard Meynell* (1911); *The Coryston Family* (1913); *Delia Blanchflower* (1914); *Eltham House* (1915). With C. E. Montague she wrote a memoir of her brother, *William Thomas Arnold, Journalist and Historian* (1907). In harmony with the scheme set forth in *Robert Elsmere*, Mrs. Ward took an active part (1890) in founding University Hall, a settlement among the poor of London. In 1916 she published *England's Effort, Letters to an American Friend.* Consult: Henry James, *Essays in London and Elsewhere* (New York, 1893); W. L. Phelps, *Essays on Modern Novelists* (ib., 1910); A. G. Gardiner, *Pillars of Society* (London, 1913).

WARD, JAMES (1769–1859). An English animal and genre painter and engraver. He was born in London, at the age of 12 was apprenticed to J. Raphael Smith, after which he studied for nine years with his brother, William Ward, a mezzotint engraver. He also studied painting, exhibiting his first picture in 1790, and afterward received the official title of painter and mezzotint engraver to the Prince of Wales. Ward's early paintings were principally genre pictures in the manner of his brother-in-law, George Morland, but he won high distinction in animal subjects, by the exhibition of his "Bull-Baiting" (1797) and the "Lioness" (1816). His paintings are treated in an original and vigorous style, and show a strong but peculiar feeling for color. Among the principal are the "Alderney Bull, Cow, and Calf," painted in rivalry with Paul Potter's "Bull," and a "Cattle Piece" (1807), in the National Gallery; the "Fighting Bulls" and "Donkey and Pigs," in South Kensington Museum. A very characteristic painting is his portrait of himself, painted when he was 79 years old (National Portrait Gallery). Among the best of Ward's plates are the "Centurion Cornelius," after Rembrandt; "Daniel in the Lion's Den," after Rubens; "Juvenile Retirement," after Hoppner; and "Mrs. Billington," after Reynolds. Ward was elected an Academician in 1811. A complete set of his engravings is in the British Museum. Consult his *Autobiography* (London, 1853).

WARD, JAMES (1843–). An English psychologist and metaphysician. He was educated at Berlin, Göttingen, and Trinity College, Cambridge, and worked for a short time in the physiological laboratory at Leipzig. He studied originally for the Congregational ministry. Ward rose to be lecturer of Trinity in 1881 and professor of mental philosophy in Cambridge University in 1897. Cambridge, Edinburgh, and Oxford gave him honorary degrees, and among other distinctions he received was election as corresponding member of the French Institute (1913). Besides numerous articles in the *Journal of Physiology, Journal of Speculative Philosophy, Mind, British Journal of Psychology, Journal of Education,* and other periodicals, he published: *Naturalism and Agnosticism* (1899; 4th ed., 1915); Gifford lectures at Aberdeen; *The Realm of Ends, or Pluralism and Theism* (1911; 2d ed., 1912), Gifford lectures at St. Andrews; *Heredity and Memory* (1913), Henry Sidgwick memorial lecture at Newnham College. His work shows the influence of Leibnitz and Lotze, and of the biological theory of evolution. Experience, accordingly, is interpreted as a unitary continuum in which distinctions take place gradually by the action of selective attention (conation). For list of Ward's writings through 1911, consult Titchener and Foster, *American Journal of Psychology,* vol. xxiii (Worcester, 1912).

WARD, JOHN QUINCY ADAMS (1830–1910). An American sculptor. He was born at Urbana, Ohio. He began the study of law, but in 1850 took up sculpture in Brooklyn, under H. K. Brown, with whom he worked for seven years, assisting in many important works, chief among which was the equestrian statue of Washington in Union Square, New York. In 1857–59 he worked in Washington, D. C., where he executed the busts of Alexander Stephens, and other prominent men, and in 1861 he opened a studio in New York City, where he soon achieved success. For the purpose of studying the American Indians, he visited the Western frontier in 1863, and the following year completed his "Indian Hunter," the first statue erected in Central Park. Other works by him in Central Park are the "Freedman" (1865), the "Private of the Seventh Regiment" (1868), "Shakespeare" (1870–71), and the "Pilgrim" (1885). Other public works of this early period are: the fine equestrian statue of General Thomas (1878, Washington); Lafayette statue (1883, Burlington, Vt.); the colossal George Washington (1883, Treasury Building, New York); the Garfield Monument (1887, Washington); Horace Greeley (1890, long in front of the Tribune Building, New York; placed in City Hall Park, 1916); and the H. W. Beecher statue (1891), in front of Borough Hall, Brooklyn. He also executed the successful "Crowning Group of Victory" for the Naval Arch, erected in New York City (1899) for Admiral Dewey's reception. Later works include: the bronze bust of George William Curtis (1903, New York Public Library); the marble pediment of the New York Stock Exchange (1903); the Soldiers' and Sailors' Monument in Syracuse (1907); an equestrian statue of General Sheridan (Washington, 1908); and the bronze equestrian statue of General Hancock (unveiled 1911, Fairmount Park, Philadelphia). His work is strong and virile, conceived along broad, simple lines. Throughout his long career it showed no diminution of force, or loss of technical excellence, though lacking, perhaps, in skillful surface manipulation. Ward was one of the founders of the National Sculpture Society (1893) and president from its incorporation (1896); a member of the National Academy of Design (1863), of which he was president in 1874; and a member of the American Academy of Arts and Letters (1898), the Architectural League of New York, and the American Institute of Architects. He took an active part in various art associations, federations, and civic societies. Consult Lorado Taft, *History of American Sculpture* (New York, 1905); Adeline Adams, *J. Q. A. Ward, An Appreciation* (ib., 1911).

WARD, LESTER FRANK (1841–1913). An American geologist, paleontologist, sociologist, and philosophical writer. Born at Joliet, Ill., his early life is obscure. After serving in the Federal Army during the Civil War he was graduated from Columbian (now George Wash-

ington) University in 1869, and two years later from the Law School of the same university. After seven years of work in the United States Treasury Department he became an assistant geologist under the United States Geological Survey, and after 1888 was a paleontologist of the Survey. Already for many years Ward had been deeply interested in the broader aspects of evolution, and especially in the problems of social evolution. Accepting in its broader outlines the philosophy of Spencer, he nevertheless vigorously opposed its laissez faire conclusions as a basis for social policy. In 1883 he published a large work in two volumes, entitled *Dynamic Sociology*, in which he outlined a complete system of cosmic philosophy, and set forth the possibilities to be realized by the conscious direction of social evolution. The psychological character of all social phenomena and the superiority of intelligence to nature were again expounded in *The Psychic Factors of Civilization* (1893; 2d ed., 1906). His social theories were summarized in *Pure Sociology* (1903) and *Applied Sociology* (1906). He was America's most distinguished sociologist; and in 1903 served as president of the Institut International de Sociologie. His last great work was his intellectual history, *Glimpses of the Cosmos: a Mental Autobiography* (8 vols., vols. i–iv, 1912–15). A bibliography of his writings includes more than 600 titles. Among his more important contributions to geology and paleontology are: *The Flora of Washington* (1881); *Sketch of Paleontological Botany* (1885); *Synopsis of the Flora of the Laramie Group* (1886); *Types of the Laramie Flora* (1887); *Geographical Distribution of Fossil Plants* (1889).

WARD, Lydia Avery Coonley. See Ward, Henry Augustus.

WARD, Nathaniel (c.1578–1652). An American Colonial clergyman and pamphleteer, born in Haverhill, England, best known as the author of the *Simple Cobbler of Aggawam*, published under the pseudonym of Theodore de la Guard. He graduated at Cambridge, studied theology, and in 1618 became chaplain to English merchants at Elbing, Prussia. Returning to England he lectured in London, and in 1628 was appointed rector of Stondon Massey, Essex. His pronounced Puritanism deprived him of his living in 1633, and he went to New England in 1634, and served as colleague to Rev. Thomas Parker at Ipswich, where he took a leading part in the compilation of the first code of laws, *The Body of Liberties* (1641). His notorious book, *The Simple Cobbler*, begun in 1645, printed in January, 1647, and speedily followed by three other editions, with important additions and changes (reëdited 1718 and 1843), and, with introductory essay by T. Waters, in 1905 (Ipswich Historical Association), was a partisan pamphlet and one of the most interesting productions of the Colonial period. In 1646 Ward left the Colony for England, and was made minister of the church at Shenfield (1648). He held that office till his death. For a good account of his fantastic book, which is full of extravagant satire, see Tyler's *History of American Literature*, vol. i.

WARD, Nathaniel Bagshaw (1791–1868). An English botanist, born in London. The principle of the Wardian case (q.v.) was suggested to him by noticing some seeds which had sprouted in a bottle. By means of these sealed cases plants were sent from one part of the world through extremes of temperature without being injured. Robert Fortune sent 70,000 tea plants from Shanghai to the Himalaya, sufficiently proving the utility of the cases. He published *On the Growth of Plants in Closely Glazed Cases* (1842).

WARD, Robert Plumer (1765–1846). An English politician, jurist, and novelist, born in Mayfair, London, and educated at Westminster School and at Christ Church, Oxford. From 1785 to 1790 he studied, with some interruptions devoted to travel, at the Inner Temple and at 30 had made a name by his *Inquiry into the Foundation and History of the Law of Nations in Europe* (1795). He sat in Parliament for many years, and held various important government offices. For years he kept a political diary, valuable because of Ward's close relations to Spencer Perceval (q.v.). Among Ward's works of fiction, *Tremaine; or the Man of Refinement* (anonymous, 1825) and *De Vere; or the Man of Independence* (1827) were long popular for brilliant style, good character analysis, and serious purpose. He also wrote *A Treatise of the Relative Rights and Duties of Belligerents and Neutral Powers* (1801) and *An Historical Essay on the Real Character and Amount of the Precedent of the Revolution of 1688* (1838). Consult Phipps, *Memoirs of the Political and Literary Life of Robert Plumer Ward, Esq.*, with selections from the diary (London, 1850).

WARD, Wilfrid Philip (1856–1916). An English essayist and biographer, born at Old Hall, Ware, a son of William George Ward (q.v.). He was educated at St. Edmund's College, Ware, Ushaw College, Durham, and the Gregorian University in Rome. He was lecturer in philosophy at Ushaw College in 1890, examiner in the Royal University of Ireland in 1891–92, and in 1901 was made a member of the Royal Commission of Irish University Education. In 1915 he lectured before Lowell Institute, Boston. He published, notably: *William George Ward and the Catholic Revival* (1893; 2d ed., 1912), *Witnesses to the Unseen* (1894), *The Life and Times of Cardinal Wiseman* (1897), *Aubrey de Vere: a Memoir* (1904), *Ten Personal Studies* (1908), *Life of John Henry, Cardinal Newman* (1912), *Men and Matters* (1914). In addition, he edited the *Dublin Review*, and contributed to the *Edinburgh, Quarterly, Contemporary*, etc.

WARD, William George (1812–82). An English philosopher and Roman Catholic theologian, born in London. He studied at Winchester College (1823–29), at Christ Church, Oxford (1830–33), and then at Lincoln College. He showed marked ability in mathematics and became famed as a debater in the Union Club. His theological views were ill-defined until he made the personal acquaintance of Newman, against whom he had previously been prejudiced, but who now by the single argument that the Catholic church of the third or fourth century could never have developed from anything resembling modern Protestantism made him an ardent Tractarian and a bitter assailant of Anglican Protestantism. He became a deacon in 1838, a priest in 1840, editor of the Tractarian organ, the *British Critic*, in 1839, and, after 1841, when he openly defended Newman's *Tract xc*, and was deprived of his lectureship at Balliol, an open advocate of union with Rome. His position was definitely stated in 1844 in *The Ideal of a Christian Church Considered in Comparison with Existing Practice*. The book was censured by the

Convocation of Oxford, and Ward was deprived of his degrees. This was in February, 1845, and in September of the same year he joined the Roman Catholic communion. He settled at St. Edmund's College, Ware, became professor of moral philosophy there in 1852, and held this chair until 1858. He was made Ph.D. by the Pope in 1854. In 1861 he returned to St. Edmund's. In the preceding year he had published *On Nature and Grace*, an able attack on agnosticism. He was editor of the *Dublin Review* in 1863–78, and a leader of the Ultramontanists and Infallibilists. His breadth of vision and sympathy is indicated by his place as a founder of the Metaphysical Society (1869), and a fellow member in it of Huxley, Martineau, and Tennyson; and by his friendship with Archbishop Tait, his antagonist even in university days, with Newman and Manning, in spite of the difference between his mental mold and theirs, and with John Stuart Mill, though their views were so divergent. His son, Wilfrid Philip Ward, wrote *William George Ward and the Oxford Movement* (London, 1889) and *William George Ward and the Catholic Revival* (ib., 1893; 2d ed., 1912). See OXFORD MOVEMENT.

WARD, WILLIAM HAYES (1835–). An American clergyman, editor, and Orientalist, born at Abington, Mass. He graduated at Amherst College in 1856, and at Andover Theological Seminary in 1859, and was pastor of a Congregational church at Oskaloosa, Kans., in 1859–60. From 1865 to 1867 he served as professor of Latin in Ripon College, Wis. Joining the editorial staff of the New York *Independent* in 1868, he became superintending editor in 1870, was editor in chief from 1896 to 1913, and honorary editor thereafter. He gave special attention to Oriental studies, and was director of the Wolfe expedition to Babylonia. He was lecturer on Assyriology at Yale University in 1878–79, and president of the American Oriental Society from 1890 to 1894 and again in 1909–10. His works include: *The World's Christmas Hymns* (1883), with his sister, Susan Hayes Ward; *Report of the Wolfe Expedition to Babylonia* (1885); *Biography of Sidney Lanier* (1885); *Cylinders and Other Ancient Oriental Seals in the Library of J. Pierpont Morgan* (1909); *The Seal Cylinders of Western Asia* (1910); *What I Believe and Why* (1915). For his son, see WARD, HERBERT D.

WARDE, FREDERICK B. (1851–). An American tragedian, born at Wardington, Oxfordshire, England. His first stage appearance was at Sunderland, England, in 1867, and he then played successive seasons at Glasgow, Leeds, and Manchester. Coming to the United States in 1874, he was leading man at Booth's Theatre, New York, for three years, and after 1881 starred especially in Shakespearean tragedies. From 1893 to 1903 he was in partnership with Louis James. After 1907 he lectured frequently on dramatic subjects. He published *The Fools of Shakespeare: An Interpretation of Their Wit, Wisdom, and Personalities* (1913).

WARDEN (OF. *guardain, gardain*, Fr. *gardien*, from *garde, warde*, guard, from *garder, guarder, warder*, to guard, from Ger. *warten*, Eng. *ward*). In England, an officer appointed for the naval or military protection of some particular district of country. In order to keep the districts of England adjoining Scotland and Wales in an attitude of defense, great officers, called lords wardens of the marches, were appointed, to whom the duty of protecting the frontier was committed. The custodian of Dover Castle was created by William the Conqueror, Warden of the Cinque Ports (q.v.) and guardian of the adjacent coast, an office originally comprising extensive jurisdiction, civil, naval, and military, the greater part of which was taken away by act of Parliament in 1855.

WARDEN, CHURCH. An official of the parishes of the Anglican communion. In the Church of England the churchwardens are a corporation intrusted with the care and arrangement of the goods belonging to the church of the parish. As a rule, two are elected in each parish; one usually is selected by the incumbent and one elected by the parishioners. Their principal duties are to see to the making of church rates, the levying of voluntary contributions for church purposes, to arrange for the seating of the congregation, to enforce orderly behavior in church and churchyard during service, to take care of the benefice during a vacancy, and to make presentments to the Bishop of the diocese in the event of the misconduct of the clergy. The wardens of parishes of the Episcopal church of the United States, two in number, are elected by the congregation at its annual meeting, and are ex officio members of the vestry. Their special duties are to see that all things required for the services of the church are provided, and in the absence of the rector or a vacancy in the rectorship that a clergyman is secured to conduct the services.

WARDEN, DAVID BAILLIE (1778–1845). An antiquary, born in County Down, Ireland. He studied theology at Bangor, but after taking part in the attempted insurrection of the Orangemen in 1796–98 emigrated to America, where he studied and taught. About 1805 he went to Paris as secretary of the United States Legation and afterward became consul. He had difficulty with the home government on two or three occasions, and was definitely replaced in 1814, but continued to live in Paris. He was an ardent antiquary. His chief publications are: *A Statistical, Political, and Historical Account of the United States of America* (1819); *Bibliotheca Americana Septentrionalis* (1820); *L'art de vérifier les dates, chronologie de l'Amerique* (1826–44); *Bibliothèque américaine* (1831); *Recherches sur les antiquités de l'Amérique* (1844).

WARDHOLDING (from *ward*, AS. *weard*, OHG. *warta*, watch, guard, from *wartēn*, to watch, guard + *holding*). In the Scottish feudal system, military tenure of land by which a vassal held of a superior lord on condition of rendering military services when required by the latter. When such lands descended to an heir who had not attained his majority, and who therefore could not render satisfactory military services, the lord was allowed the guardianship of his person and possession of his lands during his minority. This right was sometimes waived in consideration of an annual tax. The lord of such vassal was also entitled to the payment of a sum of money upon the marriage of the latter. The vassal could not alienate his fee without the consent of the lord, and the estate was forfeited if he attempted to do so. This form of tenure was abolished in 1747 by statute.

WARDIAN CASE. A nearly air-tight glass case in which plants are either grown for ornament or are transported upon long sea voyages. They protect plants from frost, salt spray, and

injurious gases, and conserve moisture, demanding little attention. It was found impossible to ship cinchona seedlings from South America to India until these cases were used. These cases were invented by N. B. Ward (q.v.) about the year 1836.

WARDLAW, ELIZABETH, LADY (1677–1727). A Scottish poet. She was born at Pitfirrane, Fifeshire, and was married (1696) to Sir Henry Wardlaw, of Pitcruivie. There was published in 1719 a ballad entitled "Hardyknute," which had been previously circulated by her as the copy of an ancient manuscript found in a vault at Dunfermline. The authorship of this work has never been satisfactorily settled, but as no one ever saw the original manuscript and certain of Lady Wardlaw's friends stated positively that it was of her own composition, it seems probable that such was the case. Even if a forgery, "Hardyknute" is a remarkably fine imitation of the genuine ballads. "Sir Patrick Spens" has also been ascribed to Lady Wardlaw's pen, but this attribution is untenable, though it is possible that she amended a copy of it as well as certain other ballads, such as "Gilderoy." Consult Child, *English and Scottish Popular Ballads* (Boston, 1882–96).

WARDLAW, RALPH (1779–1853). A Scottish Congregational minister. He was born at Dalkeith, in Midlothian, and studied theology in the school of the Associate Secession church. At the end of his course he became a Congregationalist. In 1800 he began to preach, and in 1803 settled in Glasgow as pastor of an independent church. In 1811 he was appointed professor of theology to the Congregational body in Scotland, and held the position, with his pastorate, till his death. Wardlaw was a voluminous author, often involved in theological controversy, and a prominent actor in the public religious and philanthropical movements of the day. The most important of his works are: *Essays on Assurance of Faith, and on the Extent of the Atonement and Universal Pardon* (1830); *Discourses on the Sabbath* (1832); *Christian Ethics* (1833); *Discourses on the Nature and Extent of the Atonement of Christ* (1843); *Congregational Independency* (1847); *Lectures on Systematic Theology* (1856–57). Consult the *Life and Correspondence of Ralph Wardlaw*, by Alexander (Edinburgh, 1856).

WARDLE, MR. See PICKWICK CLUB.

WARDROP'S OPERATION. See ANEURISM; BRASDOR'S OPERATION.

WARDSHIP AND MARRIAGE. An incident of a feudal tenure by knight service, consisting in the right of the lord to receive the income of the estate of a minor heir out of which the heir is supported, and to arrange the heir's marriage. See TENURE.

WARE. A market town in Hertfordshire, England, 2½ miles northeast of Hertford (Map: England, G 5). Malting and brewing are the chief industries. Ware is celebrated in Cowper's poem of John Gilpin, and at Rye House, 4 miles distant (the scene of the Rye House Plot in 1683), removed from one of the inns of the town, is still to be seen the famous bed of Ware mentioned in Shakespeare's *Twelfth Night*. Pop., 1901, 5573; 1911, 5842.

WARE. A town in Hampshire Co., Mass., 28 miles west of Worcester, on the Ware River, and on the Boston and Albany and the Boston and Maine railroads (Map: Massachusetts, C 3). Manufacturing is the most important industry, the leading products being cotton and woolen goods, and boots and shoes. Grenville Memorial Park is of great beauty. Pop., 1900, 8263; 1910, 8774; 1915 (State census), 9346. Settled about 1716, Ware became a parish in 1742 and a town in 1761. Consult Gay, *Gazetteer of Hampshire County* (Syracuse, 1888).

WARE, EUGENE FITCH (1841–1911). An American lawyer and poet, born at Hartford, Conn. When a boy he removed with his parents to Iowa. He served in the Civil War, rising to be captain, and was admitted to the bar at Fort Scott, Kans., in 1871. He won rapid recognition in his profession and took an active part in Republican State politics, serving for five years as a member of the State Senate (1879–84). In 1902–05 he was United States Commissioner of Pensions. He became widely known as a contributor to the magazines, particularly through the verse written under the pseudonym "Ironquill." His publications include: *Rhymes of Ironquill* (1885; 13th ed., 1908); *The Rise and Fall of the Saloon* (1900); *The Lyon Campaign in Missouri* (1907); *The Indian Campaign of 1864* (1908); *From Court to Court* (4th ed., 1909); *Ithuriel* (1909).

WARE, HENRY (1764–1845). An American Unitarian clergyman. He was born at Sherburne, Mass., and graduated at Harvard in 1785. He was pastor of the First Church in Hingham, Mass., from 1787 to 1805, when he was called to the Hollis professorship of divinity at Harvard College. This event precipitated the separation of Unitarians and Congregationalists, and led to the founding of Andover Seminary. Dr. Ware carried on a controversy with Dr. Leonard Woods, whose *Letters to Unitarians* he answered in *Letters Addressed to Trinitarians and Calvinists* (1820); *Answer to Dr. Woods's Reply* (1822); and *Postscript to an Answer, etc.* (1823). He also published *Foundation, Evidences, and Truths of Religion* (1842).

WARE, HENRY (1794–1843). An American Unitarian clergyman. He was born at Hingham, Mass., son of Henry Ware (1764–1845). He graduated at Harvard in 1812; was an instructor in Phillips Exeter Academy (1812–14); studied theology under his father, and in 1817 was settled over the Second Church (Unitarian) in Boston. He played a prominent part in organizing his denomination. He was professor of pulpit eloquence and pastoral care in the Harvard Divinity School (1830–42), and was one of the editors of the *Christian Disciple*, afterward the *Christian Examiner*, a Unitarian periodical (1819–22). Among his works are *Hints on Extemporaneous Preaching* (1824) and *Life of the Saviour* (1832). His select writings were edited by Chandler Robbins (4 vols., Boston, 1846–47). Consult his memoir by his brother John (Boston, 1846).

WARE, WILLIAM (1797–1852). An American romancer, born at Hingham, Mass. He graduated at Harvard, 1816, studied for the Unitarian ministry, and preached mainly in New York (1821–36), and later in Massachusetts. From 1839 to 1844 he edited the *Christian Examiner*. His reputation was chiefly gained by his historical romances, *Zenobia, or the Fall of Palmyra* (first published as *Letters from Palmyra*, 1836 and 1837), and *Aurelian* (first entitled *Probus*, 1838). *Julian, or Scenes in Judea*, appeared in 1841. Also among his writings are the *Life* of Nathaniel Bacon in Sparks's *American Biography* (1848) and *Lec-*

tures on Washington Allston (1852). His *Writings* were published in 1904.

WARE, WILLIAM ROBERT (1832–1915). An American architect, born at Cambridge, Mass., and educated at Harvard in the college and the Lawrence Scientific School. He studied architecture in the office of Richard M. Hunt (q.v.), and practiced in Boston from 1861 to 1881, in partnership with Henry Van Brunt after 1865. In 1866 he was commissioned to organize a school of architecture in the Massachusetts Institute of Technology in Boston. This, the first school of its kind in America, was opened in 1867, under Ware as its professor of architecture, in which capacity he directed the school until 1880. In 1881 he was called by Columbia College (now Columbia University) to establish a department of architecture, which he organized and directed until his retirement in 1903. He attained a high reputation in the conduct of important architectural competitions between 1883 and 1900. He was for 50 years a member of the American Institute of Architects, and was an honorary corresponding member of the Royal Institute of British Architects. His most notable designs were the First Church in Boston, Memorial Hall (Harvard), and the American School of Classical Studies at Athens, Greece. He wrote: *Modern Perspective* (1883); *The American Vignola* (1904); *The Georgian Period* (1904); *Architectural Shades and Shadows* (1912). He died at Milton, Mass.

WARE'HAM. A town in Plymouth Co., Mass., 50 miles south by east of Boston, on the Wareham River and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, F 5). The growing of cranberries and the manufacture of steel, horseshoes, and nails constitute the chief industries. Pop., 1900, 3432; 1910, 4102; 1915 (State census), 5176.

WAREHOUSEMAN. One engaged in the business of storing goods for compensation. The distinction between a warehouseman and an ordinary bailee of goods is to be observed both in regard to the degree of care and responsibility and in regard to the nature of the lien on the goods stored. A bailee in general has no lien for storage except by agreement, or for work done on the actual goods held, known as a workman's lien. Warehousemen having been held by the courts to exercise a public function in the same way as hotel keepers and carriers and to be subject to regulation by the legislatures of the several States, they have been given by statutes the right to a lien on the merchandise in their custody.

In law the degree of care to be exercised by a bailee is governed by the circumstances of the bailment, while that of the warehouseman is presumed to be somewhat greater, especially in the case of a public warehouseman, but is generally less than that required of a common carrier or hotel keeper. Thus, if the baggage is left at a station or depot for a certain time after it has reached its destination, the responsibility of the railroad becomes that of a warehouseman and is no longer that of a common carrier. He is not liable as insurer of the goods but is bound to exercise ordinary care. A receipt given by a warehouseman that he holds goods in storage is what is known as a warehouse receipt. At common law they were not negotiable, but they were assignable in the same manner as contracts, and delivery of the receipt had the same effect as delivery of the goods themselves. By statute in a number of States such receipts have been declared negotiable.

The method of enforcement of a lien of a warehouseman is usually fixed by statute. It consists in a public sale of goods after a certain period of time to meet delinquent storage charges. Any proceeds remaining over belong to the owner.

Public warehousemen are those who hold themselves out to the public as engaged in that particular business.

Bonded warehouses are usually private enterprises conducted under the direct supervision of a government storekeeper. They are in the United States designated by the United States Treasurer as depositaries for goods until the payment of duties. Goods are sent to them either at the request of the importer or during the determination of the amount of duties, but may be released under a bond to the government even before such determination or payment of duties. The government assumes no responsibility as bailee, that resting with the individual warehouseman. See BAILMENT.

WAREHOUSE RECEIPT. A memorandum given by a warehouseman acknowledging the delivery of goods and chattels to him for storage, and usually containing the terms upon which he receives them. In the absence of statute such receipts are not technically negotiable instruments but in spite of this fact an innocent purchaser for value would take the receipt free from any special or collateral agreement which might exist between the bailor and the warehouseman. By statute, generally known as the Warehouse Receipts Act, such documents are made negotiable in California, Colorado, Connecticut, Illinois, Iowa, Kansas, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Jersey, New Mexico, New York, Ohio, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Utah, Vermont, Virginia, Washington, Wisconsin, Alaska, District of Columbia and the Philippines. This statute ordinarily requires the receipt to state among other things: the location of the warehouse; the date of issue of the receipt; the rate of storage charges; a description of the goods; statement of any lien claimed by the warehouseman. If the receipt states that the goods are deliverable to a certain person it is not negotiable and if to bearer or order it is negotiable. Ordinarily the words "negotiable" or "not-negotiable" should be marked on the face of the receipt and if the warehouseman neglects to do this the purchaser may impose upon the warehouseman the same obligations as though it were negotiable.

As far as concerns the property interest in goods deposited with a warehouseman, the purchaser of the receipt only takes such property as the depositor had at the time of deposit. Hence if a thief deposits goods the claim of the true owner is paramount to that of the innocent purchaser of the negotiable warehouse receipt. Warehouse receipts are frequently delivered as collateral for loans of money. See BAILMENT, and consult the authorities there referred to.

WAREHOUSING SYSTEM. A plan for permitting the importer or manufacturer of goods which are subject to customs or excise duties to postpone the payment of such duties until withdrawal of the goods for consumption. Such goods must be deposited in warehouses, either public or private, but under the super-

vision and control of revenue officers. The advantages of such a system to merchant or manufacturer are the saving of interest on the sum of duty charges, the saving of duties on goods destroyed or damaged before withdrawal for consumption, and in the case of imported goods convenience in reëxportation. In continental European countries the same end was attained in the eighteenth century by the creation of free ports, where goods might be stored, manufactured, and reëxported without paying customs duties, and the same practice is in use in some European countries to-day. In the United States, up to 1842, credit for duties was granted the importer, provided he could furnish satisfactory security that the duties would be paid within a specified time.

The warehousing system was introduced in England and France towards the close of the eighteenth century. In France the system was established on a broad basis in 1832, and has undergone little change. Goods are stored in either public or private warehouses, the latter requiring official sanction and official supervision. The importance of the private warehouse in France is relatively far greater than in England or America, owing to the greater prominence of excise duties in French finance. To establish public warehouses wherever dutiable articles are manufactured would call for too great a cost to the national treasury. In England, during the latter half of the nineteenth century the warehousing system underwent a great development. The merchant with goods in bonded warehouse has practically the same control over his property as he would have if they were in his own storehouse. Such operations as repacking may be performed in the warehouse, as also bottling of liquors, roasting of coffee, etc. If any waste accompanies such processes, a corresponding deduction is made from the quantity of goods on which duties must be paid.

In the United States the warehousing system was established in 1846, when it was enacted that goods might be deposited in public warehouses for a period not exceeding one year. In 1854 the establishment of private warehouses was permitted. Since 1890 the period within which goods deposited in a public or private bonded warehouse may be withdrawn for consumption without payment of additional duty has been three years. After this period has expired the goods are forfeited and must be sold, the Secretary of the Treasury being authorized to pay the proceeds, over and above the duties and charges and expenses of sale, etc., to the consignee or owner of the goods.

Bonded warehouses for imported goods are classified under six heads. 1. Government bonded warehouses, the buildings being owned or leased by the government, and in the immediate custody of the Collector of Customs. 2. Importers' bonded warehouses—private warehouses, established by the Secretary of the Treasury as a special provision for a large importer. 3. Private bonded warehouses conducted by private parties who carry on a general storage business. Permission from the Secretary of the Treasury is prerequisite to the establishment of such warehouses, and the government retains control over them and the goods stored. 4. Private bonded warehouses consisting of yards or sheds for the storage of bulky products. 5. Private bonded warehouses consisting of bins, etc., exclusively for the storage of imported grain. 6. Private bonded warehouses exclusively for the storage of imported wines and spirits. Recent tariff acts have provided that the manufacture of articles for export from imported materials may be carried on in non-enumerated bonded warehouses. This avoids the internal revenue tax on material thus used as well as the import duty. But the manufacture of distilled spirits cannot thus be carried on. Special provision is also made for the smelting and refining of imported metals and ores. All such manufacturing is subject to closest inspection and regulation by treasury officials.

The rise of the internal-revenue system as a result of the Civil War made it necessary to establish warehouses where the home manufacturer might leave his products under bond, becoming responsible for payment of taxes only upon their withdrawal for consumption. The plan was defended largely on the ground that otherwise the importer would have a great advantage over his domestic competitor. Bonded warehouses for the storage of distilled liquors were established in 1868, under the name of distillery warehouses. The rise of the manufacture of brandies led to the establishment of special bonded warehouses for the storage of distilled spirits made from fruit. A third class, general bonded warehouses, was established in 1894, to be used exclusively for the storage of spirits distilled from materials other than fruit.

WARENNE, Earl of Arundel and. See Fitzalan, Richard.

WAR'FIELD, Benjamin Breckenridge (1851–). An American Presbyterian theologian, born at Lexington, Ky. He graduated from Princeton (1871) and from Princeton Theological Seminary (1876), and then studied at Leipzig. After teaching New Testament literature and exegesis in the Western Theological Seminary from 1878 to 1887, he was appointed professor of didactic and polemical theology in Princeton Seminary. He came to be known as a leader of the conservatives in the Presbyterian church. He published: *The Divine Origin of the Bible* (1882); *Inspiration* (1882); *Introduction to the Textual Criticism of the New Testament* (1886); *The Idea of Systematic Theology* (1888); *The Right of Systematic Theology* (1897); *The Significance of the Westminster Standard* (1898); *The Lord of Glory* (1907); *The Plan of Salvation* (1915).

WARFIELD, David (1866–). An American actor, born in San Francisco. His first connection with the theatre was as usher. He made his first appearance in 1888 in *The Ticket-of-Leave Man.* Two years later he went to New York, where he appeared at the Casino Theatre and at Weber and Field's Music Hall. In 1901 he was "discovered" by David Belasco who starred him in *The Auctioneer,* in which he played 1400 times, including a revival that extended over several seasons. He remained under the Belasco management. One of his best-known rôles was that of Anton von Barwig in *The Music Master,* which he played from 1904 to 1907, appearing in the part more than 1000 times. He created the title rôle in *The Return of Peter Grimm* in 1911. Warfield's position as a leading American actor in comedy was established by the masterly style in which he portrayed, in each of these plays, a kindly old gentleman who is pathetic in misfortune and amusingly eccentric. In 1916 he appeared in

Van der Decken, a play by Belasco, based on the legend of the Flying Dutchman.

WAR GAME. An imaginary military operation conducted upon a map with movable pieces to represent the contending forces. A battle or a campaign, a sea fight or an attack on a fortress or harbor, may be represented. The purpose of the game is to train officers to solve the problems that may occur in a campaign against an enemy whose plans are unknown. The war game, or *Kriegsspiel*, was invented by Herr von Reisswitz and elaborated by his son, an officer of the Prussian artillery. It met with favor among the Germans early in the nineteenth century, and was brought into its modern form by Meckel and Verdy du Vernois (1875–76). After the War of 1866 it was cultivated extensively in Austria, and the War of 1870 opened the eyes of all Europe to its importance. In the United States it was practiced extensively in the army after 1867 and in the navy after 1886. The war game is played upon a topographical plan, with small blocks representing the troops, which are proportioned to the scale of the map and occupy as much space upon it as the troops would occupy in the field. These blocks are moved simultaneously, under the direction of an umpire, and at rates proportioned to the mobility of the different arms which they represent. When the position of the blocks indicates that the hostile troops are within sight and range of each other, they may be supposed to open fire, if the players wish, and in this case it becomes the umpire's duty to decide the result upon the basis of experience. The rules of the game explain to him how to estimate the loss from this fire; e.g., it may have been found that, in similar circumstances, the number of killed and wounded has varied from 10 to 20; by throwing a common die he decides whether to assign a greater or a less result to the case in view. The rules of the game also explain to him under what circumstances troops have been dispersed by the result of fire, and what would be the probable result of a hand-to-hand fight.

Since the time of Von Reisswitz the game has been much modified and has assumed three different forms. The first form is conducted in accordance with a few arbitrary rules based upon general results. The second form is especially adapted to the Minor Kriegsspiel, in which but few troops are employed and minute records are kept of the losses of each company or fraction of a company. The third form is conducted by an umpire, who decides each case according to his own judgment. The method which has gradually been developed in the United States service, by the employment of several devices upon the plan itself, dispenses with the necessity of keeping records, while it offers facilities for instantly determining the results of calculations as minute as those of the Minor Kriegsspiel.

For naval operations the strategical game is played upon an ordinary chart and the tactical game upon a large table, the surface of which is divided into squares to facilitate the measurements of distances. The ships are represented in miniature and are moved over the table under the direction of the umpire, who calculates the effect of the gun, the ram, or the torpedo, and decides the result accordingly.

WARHAM, wär'am, WILLIAM (c.1450–1532). An English churchman and statesman. He was born in Hampshire; was educated at Winchester College and New College, Oxford, and then went to London, where he practiced as an advocate and whence he was sent on numerous diplomatic missions to Italy and the Low Countries in a professional capacity. In 1493 he was ordained, and from that time pursued the double career of churchman and jurist, in 1494 being appointed Master of the Rolls. From 1496 to 1502 he was Royal Ambassador in several important diplomatic affairs, notably the negotiations for the marriage of Prince Arthur to Catharine of Aragon and for a league with the Emperor Maximilian. In 1502 he was consecrated Bishop of London, and became Keeper of the Great Seal, and in 1504 became Lord Chancellor. Meanwhile, in 1503, he had been translated from the see of London to the archbishopric of Canterbury. He continued to be employed by Henry VIII on diplomatic missions, and throughout his long tenure of office as archbishop did his best to remedy and avoid ecclesiastical abuses. In 1509 he crowned Henry VIII and Catharine of Aragon at Westminster, and in 1515 presented Wolsey with the cardinal's hat as representative of the Pope. The same year he retired from office and was succeeded by Wolsey as Lord Chancellor. In 1527 he was drawn into the inquiry as to the validity of Henry's marriage to Catharine. His vacillation in this matter was not altogether commendable, but he finally rebelled against the course of proceedings and at the time of his death was engaged in a vigorous contest for the rights of the Church.

Warham was a generous patron of learning and from 1506 was chancellor of the Oxford University. His private life, as described by Erasmus, was simple and abstemious, while he was munificent in his public character. Consult: Campbell, *Lives of the Lords Chancellors* (London, 1845–46; new ed., New York, 1874–75); Dixon, *History of the Church of England*, vols. i and ii (London, 1884–91); Hook, *Lives of the Archbishops of Canterbury*, new series, vol. i (ib., 1868); J. Gairdner, *English Church in the Sixteenth Century* (ib., 1903).

WAR IN EUROPE. The various aspects of the great war which broke out in 1914 will be discussed under the following captions: I, Underlying Causes; II, Outbreak of the War; III, Military Operations; IV, Naval Operations; V, Aërial Operations; VI, Alleged Atrocities in the War; VII, Destruction of Art and Architecture; VIII, Neutral Nations; IX, Relief Measures; X, Financial and Economic Aspects; XI, Bibliography.

I. UNDERLYING CAUSES OF THE WAR

In July, 1914, the murder of Francis Ferdinand, a member of the Austrian royal family, set in motion a train of events which culminated in the terrible catastrophe of a great European war. It was clear, however, that this crime was not the real cause of the tremendous struggle which many of the statesmen and diplomats of Europe had anticipated and all had feared for many years. The underlying causes of this great War of the Nations reach far back into the past and cannot be reduced to any simple formula. Some knowledge of the important political and economic forces which have shaped the history of Europe during the past century is necessary for an adequate appreciation of the

causes of the great cataclysm. Among the many and complex influences which have been suggested as causes of the war, there are three forces which appear to have contributed most directly in bringing about the critical situation in Europe in 1914. These were (1) the clashing of national interests and ideals, (2) the maintenance of a system of military alliances, and (3) the economic rivalry among the nations of Europe.

National Antagonisms. Viewed broadly, the political history of Europe in the nineteenth century centres about two movements which were the inheritance of the French Revolution and the Napoleonic wars, (1) the growth of democracy and (2) the realization of national liberty. When the diplomats of the Great Powers met at the Congress of Vienna in 1815 to readjust the map of Europe, many expressed the hope that the Congress would be guided in its work by these two principles. There was much talk of "the reconstruction of the moral order," "the regeneration of the political system of Europe," of the establishment "of an enduring peace founded on a just distribution of political forces," and of the formation of an effective and permanent international tribunal. Unfortunately these fair promises were not realized and the Congress, instead of establishing a new era, did its utmost to restore the old one. The principles of popular freedom and national liberty were ignored wherever it was necessary to do so to satisfy the dynastic and personal influences which dominated the Congress.

In the first place, as an inheritance of the French Revolution these principles were anathema to the reactionaries and, in the second place, Metternich (q.v.), the Austrian Chancellor who dominated the Congress, realized that encouragement of the nationalist principle would endanger the heterogeneous Austrian dominions. (See VIENNA, CONGRESS OF.) There remained, at the close of the nineteenth century, a number of situations which clearly violated the principle of national sovereignty. The completion of German unity in 1871 was accompanied by the violation of the principle of French nationality in the annexation of the territories of Alsace (q.v.) and Lorraine (q.v.). (See FRANCO-GERMAN WAR.) It was an ever present challenge to the French people to attempt to regain these lost provinces and a constant reminder of the humiliation which they had suffered at the hands of Germany. On the other hand it was used by Bismarck (q.v.) and the Prussian military party to justify their programme of huge military armaments in Germany.

Nowhere else in Europe was the problem of nationality so acute during the nineteenth century as in Austria-Hungary. The very existence of the Austro-Hungarian Monarchy has been a constant challenge to the principle of nationality. Logically carried out this principle would mean the disappearance of Austria-Hungary and the distribution of its territory among the surrounding nations. The appreciation of this fact by the Austrian authorities made them apprehensive of all nationalist movements, and especially that of the southern Slavs. As will be seen it was the outgrowth of one of these movements which precipitated the crisis which led to the outbreak of the war.

The Balkan states presented a peculiarly vexing problem in the realization of the principle of nationality. The intricate mixture of racial groups in this region made it an almost hopeless task to arrange geographical boundaries to correspond with national lines. The problem was complicated, moreover, by the clashing of the interests of the great European Powers, especially Austria and Russia, in this territory. The condition of chronic disorder and strife in this region during the nineteenth century was a source of almost constant concern to the diplomats of the great European states.

While the triumph of the ideal of nationality has done much to advance European civilization, it has not been an unmixed blessing. Too often national patriotism became a fetish. Love of one's country meant a lack of appreciation of or a contempt for the people of other countries; a feeling that the "kultur" of one's country was not only different from but distinctly superior to that of any other country. From this it naturally followed that it was a laudable ambition to wish to impose one's superior civilization upon an inferior people.

"If it were possible," says Prince Bernhard von Bülow (q.v.) in his book on *Imperial Germany*, "for members of different nationalities, with different language and customs, and an intellectual life of a different kind, to live side by side in one and the same state, without succumbing to the temptation of each trying to force his own nationality on the other, things on earth would look a good deal more peaceful. But it is a law of life and development in history that where two national civilizations meet they fight for ascendancy. In the struggle between nationalities, one nation is the hammer and the other the anvil; one is the victor and the other the vanquished." Prince von Bülow's words really go to the root of the whole trouble in European politics. They show clearly that exaggerated idea of the inevitable antagonism of national interests which dominated European politics during the nineteenth century.

In its extreme form this national spirit has found expression in movements to unite various related ethnic and racial groups into one political group. Such movements have been more or less prominent in Germany, Russia, and the Balkan states under the names Pan-Germanism, Panslavism (q.v.), Pan-Serbianism, etc. It is doubtful whether any of these movements had passed beyond the state of vague aspirations held by a comparatively small group of people. As a contributing cause of the war the Panslavic and Pan-Serbian movements were of some importance. The growth of such propaganda was a source of concern to Austria-Hungary, with its large Slavic population.

Pan-Germanism.—The Pan-German movement was an outgrowth of German imperialism and of the exaggerated race consciousness of the Germans. Roughly stated, this movement conceives the German people wherever located as forming one great nationality. Some Pan-Germanists deny any political or territorial ambitions and assert that they wish merely to spread the knowledge of German culture throughout the world. Others, more radical, proclaim the ultimate domination of the world by the German race. The German authorities have repeatedly stated that the Pan-German movement has no official sanction and that it is the work of only a very small part of the German people. However, what the movement has lacked in numbers it has made up in activity. Prominent historians, scientists, and other writers have ex-

pounded its views, while numerous societies have been formed to advance German ideas of culture and civilization throughout the civilized world.

Military Alliances. The obsession of national jealousy led inevitably to the view that it was necessary to defend nationalism with huge armaments. The remarkable success of Bismarck in uniting Germany by a policy of blood and iron was used as an object lesson by the militarists of Germany and other nations. War was glorified as an institution in itself, not simply as a means to an end. Says Bernhardi,* one of the leading exponents of this school, "War is in itself a good thing. It is a biological necessity of the first importance." And again, "The inevitableness, the idealism, the blessing of war as an indispensable and stimulating law of development must be repeatedly emphasized." John Adam Cramb,† an English historian, predicted a war between Germany and England and warned England to prepare for it. Everywhere the doctrine of military preparedness was advocated and it bore fruit in the tremendous standing armies and huge navies of the different European countries. It led also to the grouping of the great European Powers into two hostile military alliances.

When the representatives of the European Powers met at the Congress of Vienna in 1815, there was organized the so-called Concert of Europe, by which it was hoped that the problems of European politics would be adjusted. For some years Congresses representing the Great Powers were held at which international questions were considered and efforts made to maintain the balance of power in Europe. After the middle of the nineteenth century, however, the influence of this Concert was materially weakened.

A political transformation of Europe occurred in the decade between 1860 and 1870, culminating in the creation of two new European states, Germany and Italy. The appearance of these two states in the family of European nations seriously disturbed the old political relations. Bismarck, who had been largely instrumental in the creation of the German Empire, adopted as his guiding principle a system of firm alliances rather than dependence upon the more loosely constituted European Concert. In an effort to isolate France, he first strove to unite Russia, Germany, and Austria in a defensive alliance. When Russia withdrew from this alliance on account of antagonism to Austria, Bismarck devoted his efforts to binding together more closely the two Teutonic Powers. Italy later (1882) joined with the Central Powers to form the Triple Alliance (q.v.).

This organization of the states of central Europe into a strong military alliance was an invitation to the other states of Europe to create an opposing alliance in order to maintain the balance of power. First France and Russia, drawn together by mutual hostility to Germany, formed a Dual Alliance (1895) and finally Great Britain, aroused by the threatening naval policy of Germany, abandoned her policy of "splendid isolation," and joined with France and Russia to form a second diplomatic group known as the Triple Entente (q.v.). The formation of these two rival military groups created a situation in Europe where every disturbance of the political or diplomatic status quo brought on a crisis. Since 1905 Europe has passed through several such crises, each one increasing the tension among the Great Powers and each making the maintenance of peace more difficult.

The first of these crises came in 1905 in a dispute over Morocco. A part of the understanding reached between England and France in 1904 provided that France should have a free hand in Morocco, while England was given a free hand in Egypt. Germany, which had abandoned Bismarck's policy of opposition to colonial expansion, was looking about for such stray portions of undeveloped land as had not been appropriated by England and France. Germany had to choose between two courses. Either she could frankly recognize the inevitable consequences of her geographical position and her late entrance into the field as a colonial power, which handicapped her development as a world state, or she might determine to challenge the more fortunately situated and longer established world Powers and create for herself a larger "place in the sun." She chose the latter alternative. With a rapidly increasing population, it became a question whether even her remarkable industrial development would accommodate the added millions of population. It is true that at this time Germany imported unskilled agricultural labor from Russia, and that there was no alarming emigration from Germany. But the future held out the prospect of a large emigration of Germans to other countries, and the Germans resented the loss of this good German stock to the Fatherland. Colonies where Germans might be kept under German control were felt to be the great need. Germany therefore determined not to stand quietly by and allow further colonial acquisitions by the other great European Powers without making an effort to share in the spoils.

The Russo-Japanese War (q.v.) (1904–05) had revealed the military weakness and inefficiency of Russia. This situation made Russia's support of France much less valuable and Germany felt that it was an opportune time to assert her position in regard to Morocco. On March 21, 1905, the German Emperor, while on a voyage to Constantinople, disembarked at Tangier and encouraged the Sultan to reject the scheme of reforms proposed by France. He, moreover, succeeded in forcing France to submit the whole Moroccan question to a conference of the Powers held at Algeciras (see MOROCCO, *History*), in January, 1906. England firmly supported France and let it be known that any interference with France's predominant position in Morocco would be resisted by her. Italy, moreover, refused to support her ally, with the result that France scored a distinct diplomatic victory.

One phase of Germany's policy of colonial and commercial expansion contemplated the exten-

* Friedrich von Bernhardi, born (1849) at St. Petersburg, son of a German diplomat; served in Franco-Prussian War; general of cavalry and commander of the Seventh Army Corps (1908); retired (1909), but in 1915, during the European War, assigned to field command at his own request. His writings, for which he is known internationally, are concerned with German military progress and with an expected war for the advancement of Pan-Germanism and expansion. In English have appeared: *Cavalry in War and Peace* (1910); *On War of To-Day, Britain as Germany's Vassal*, and *Germany and the Next War* (all 1914); *The New Bernhardi*: "*World Power or Downfall*" (1915), a collection of articles written during the European War.

† John Adam Cramb (1862–1913), educated at Glasgow and Bonn; from 1893 to his death professor of modern history at Queen's College, London; also lectured at other institutions and gave private courses; author of *Germany and England* (1914) and *The Origins and Destiny of Imperial Britain and Nineteenth Century Europe* (1915).

sion of Teutonic commercial and political interests in the Balkans and Turkey. In this "Drang nach Osten" Germany, in conjunction with Austria, hoped to create a great economic, if not political, sphere of influence extending through the Balkans to Constantinople and thence through Turkey in Asia to the Persian Gulf. German engineers and German capitalists began to develop Turkish resources. German military officials trained the Turkish forces.

In July, 1908, a revolution, led by the Young Turks, broke out in Constantinople. Taking advantage of this situation Bulgaria annexed eastern Rumelia and declared her complete independence of Turkey. Austria felt the time opportune to annex Bosnia and Herzegovina, which had been placed under her administration in 1878 by the Congress of Berlin (q.v.). This action of Austria irritated Italy and aroused Serbia, which latter had hoped to bring these provinces, closely related to her in blood, into a Greater Serbia. Russia protested against Austria's violation of the Treaty of Berlin, but Germany stood by her ally, and Russia unprepared for war was forced to submit. The Teutonic allies had scored a distinct diplomatic success and another European crisis was passed.

Once again in 1911, the Moroccan question brought Europe to the verge of war. Germany had not accepted with good grace her diplomatic defeat at Algeciras, and watched with an increasing irritation the extension of French influence and control in Morocco. Germany complained that France was not observing the policy of equal commercial opportunity for all nations and on July 1, 1911, the German cruiser *Panther* appeared off Agadir. Both England and France likewise sent ships there, and for several months European peace hung in the balance. A compromise was finally reached whereby Germany recognized France's predominant position in Morocco while in return Germany received a part of the French Congo.

Hardly had this second Moroccan crisis been passed when the delicate balance in European politics was disturbed by the Turco-Italian War (q.v.). Disappointed in her desire to obtain Tunis, Italy turned her attentions to the neighboring Turkish province of Tripoli and gradually extended her economic interests there. Friction developed with the corrupt and inefficient Turkish authorities and in September, 1911, the Italian government demanded that Turkey place the provinces of Tripoli and Cyrenaica under Italian control. Upon Turkey's refusal Italy declared war and after a long campaign succeeded in occupying the territory. Germany was placed in the difficult position of seeing her protégé Turkey despoiled by her ally Italy. She was, however, powerless to prevent Italy from carrying through her designs for fear that the latter might desert the Triple Alliance and join the Entente.

The Turco-Italian War was a prelude to a much more serious and far-reaching upheaval in the Turkish dominions. The policy of the Young Turks after the revolution of 1908, in attempting to build up a strong, unified Ottoman nation, stirred the smoldering embers of the rival nationalities in the Balkans. The Greeks, Bulgarians, Serbs, and Montenegrins resented the attempt to Ottomanize their fellow nationals in Macedonia and Albania. Putting aside for the moment their own rivalries these four Powers organized the Balkan League, and submitted to Turkey a demand for far-reaching reforms in Macedonia. The European Powers quickly saw the danger of a European war if the Balkan situation was disturbed and they served notice on the Allies that under no conditions would they allow a modification of the territorial status quo in the Balkans. Undeterred by this threat of European intervention the Allies declared war on Turkey in October, 1912 (see BALKAN WAR), and after a series of brilliant campaigns, completely routed the Turks and drove them to the gates of Constantinople. As the Allies had anticipated, the European Powers did not make good their threat to restore the status quo. When it came to a division of the spoils the old rivalries among the Allies once more appeared. Serbia had been thwarted in her desire to obtain Albania by the opposition of Italy and Austria. This led to a demand by Serbia for a modification of the agreement for the divisions of the territory made by the Allies before the war. To this Bulgaria would not consent and Serbia, Greece, and Montenegro combined against their former ally. Rumania and Turkey also joined Bulgaria's enemies with the result that Bulgaria's forces were quickly overwhelmed. The struggle closed in August, 1913, and Bulgaria was forced to give up a large part of the conquered Turkish territory.

The outcome of the Balkan wars was a bitter disappointment to Germany and Austria. Not only had their protégé Turkey been practically driven from Europe, but the creation of a greater Serbia and the strengthening of Greece and Bulgaria checked the plans of Austria to reach the Ægean Sea at Saloniki. Russian influence, too, had been greatly increased in the Balkans by the strengthening of the Slavic states.

That Germany appreciated the serious blow which had been dealt to Teutonic influence in the Balkans was indicated by the introduction in February, 1913, of a new army bill which increased the peace strength of the German army by more than 100,000 men and 19,000 officers. This was defended on the ground that the outcome of the Balkan wars had seriously disturbed the balance of power in central Europe to the detriment of Austria and Germany. France retaliated by increasing the term of military service in the French army from two to three years. Similar moves were made in Russia where it was proposed to increase the term of military service from three to three and one-quarter years, and in Austria where the standing army was increased by 100,000 men.

Thus at the opening of the year 1914, Europe was an armed camp. The Great Powers organized into two rival military alliances watched each other, waiting for the inevitable conflict.

Economic Causes. Some advocates of the economic interpretation of history seek to place all historical facts on an economic basis. To this school of historical writers this war is explained almost entirely on economic grounds. While it is quite possible to exaggerate this economic motive, there is no question that economic considerations played an important part in bringing about the situation which precipitated the European crisis. Some of these economic influences may be briefly stated.

At the close of the eighteenth century there occurred in Europe a complete transformation of industrial conditions known as the industrial revolution. The invention of improved

methods of spinning and weaving, the application of steam power, the substitution of the factory system for the former method of cottage industry, and the appearance of distinct capitalist and laboring classes were the most striking features of this revolution in industrial life.

England was the first country to feel the effects of this change. Factories began to turn out large quantities of manufactured commodities, more than enough to supply the home market. For a time England had a practical monopoly of the field, and had no difficulty in disposing of her surplus products in the markets of the world. But the industrial revolution in time reached other countries; France in the period after 1830, the United States in the period following the Civil War, and Germany in the period after 1880. The great industrial interests in these countries began to compete with those of England for the control of the markets of the world. England had the advantage of having vast colonial possessions which might serve both as a market for her manufactured products and as a field for the investment of surplus capital in the development of their natural resources. France and the United States, in a lesser degree, also enjoyed this advantage. Germany, on the other hand, because of her late appearance as a great power, was practically without colonial possessions of any potential value. She felt that her industrial development was being hampered through no fault of her own, but simply because the best parts of the world had been appropriated by other countries.

It has been argued, with considerable force, that a nation does not benefit commercially by the control of colonies or weak states. The case of Germany is cited to show how marvelously a state may expand commercially without colonies. But there is no doubt that certain economic interests within a nation do gain by national control of undeveloped parts of the world. There are government contracts to be let, franchises to be given, concessions to be granted, and possibly preferential tariffs to be established. The financial interests in close touch with the governmental authorities of a great power undoubtedly have a great advantage.

In the different crises which preceded the outbreak of the war it is urged, with much force, that economic considerations were predominant. German apologists insist that Great Britain welcomed the war as an opportunity to crush a dangerous commercial rival. It was pointed out that the adoption of preferential tariffs by the British colonies favoring British trade was an attempt to cripple German trade. The Moroccan disputes, it is maintained, were primarily due to the influence of German financial interests which felt that they were being discriminated against by the French authorities.

As to the Balkans, it is claimed that the economic rivalry of Austria (backed by Germany) and Russia was responsible, quite as much as the racial rivalry, for the state of chronic disorder in this region. It is maintained that the creation of the State of Albania at the end of the second Balkan War was primarily due to Austria, which country wished to thwart Serbia's effort to reach the sea and thus free herself from Austria's control of much of her export trade.

Again, the belief was prevalent in England that the forces behind the movement for the creation of a large German navy were the prominent financial interests which hoped to use this new weapon to overthrow British commercial supremacy. In Turkey the extension of German financial interests in the years preceding the war occasioned rivalry with similar interests of France and England. Finally it is asserted that the economic interests which would materially benefit by a war, such as the manufacturing of arms and ammunition, had deliberately fostered the national antagonism in Europe. Much color was given to this charge by the revelations made in 1913, by Karl Liebknecht (q.v.), the Socialist leader in the German Reichstag. It was shown that the Krupps, the famous gun and ammunition makers, had regularly subsidized French newspapers to print inflammatory articles against Germany, in order to stimulate the hostility between these countries. It is difficult to estimate with any degree of accuracy just how much weight is to be assigned to these various economic factors as a cause of the war. That their influence was considerable there would seem to be little doubt.

II. OUTBREAK OF THE WAR

On June 28, 1914, the Archduke Francis Ferdinand (q.v.) and his morganatic wife the Duchess of Hohenburg were assassinated by Serbian sympathizers while on an official visit to the town of Serajevo, the capital of Bosnia. It was generally believed in Austria that the crime was instigated by Pan-Serbian agitators, who had maintained a persistent propaganda for the acquisition of the provinces of Bosnia and Herzegovina ever since they had been annexed by Austria in 1908. These provinces had once formed part of the old Serbian Empire, and about half of the population was related to the Serbs in race and speech. Despite the fact that Serbia had agreed in 1909 to recognize the annexation of these provinces by Austria as a *fait accompli*, the Pan-Serbian movement was allowed to continue in Serbia, unhampered by the government authorities.

In Austria this movement was resented for two reasons. In the first place, Serbia had emerged from the second Balkan War doubled in size, and any further strengthening of this country ran counter to Austria's commercial interests in the Balkans. As it was, Serbia stood in the way of Austria's realizing her ambition of reaching the Ægean Sea at Saloniki. In the second place, the Pan-Serbian movement was a positive danger to the integrity of the Austrian Empire. If successful, it might encourage other racial groups within the Empire to disrupt completely the Hapsburg dominions. Austria had therefore good reasons for regarding the Pan-Serbian propaganda with fear and resentment. Investigations carried on by the Austrian officials at Serajevo led to the conclusion that the assassination of the Archduke had been planned by the conspirators at Belgrade and that the pistols and bombs used had been smuggled into Bosnia from Serbia with the connivance of Serbian officials. Having established these alleged facts, the Austrian government felt justified in proceeding in the most summary manner to crush once and for all the Pan-Serbian movement. With this in view there was presented to Serbia, by Austria, on July 23, 1914, an ultimatum couched in the most vigorous language. Count Berchtold (q.v.) was the Austrian Foreign Minister.

The note began by recalling the declaration made by Serbia on the 31st of March, 1909,

wherein Serbia recognized the *fait accompli* regarding Bosnia and agreed to renounce any attitude of protest or opposition to the annexation of Bosnia by Austria. The Austrian note then went on to complain that Serbia had not lived up to this undertaking, and had made it necessary for Austria to take action to protect herself against the Pan-Serbian propaganda. Austria insisted that Serbia should make an official and public condemnation of this propaganda and express regret at its consequences.

The note then submitted ten specific demands and required an answer from Serbia by six o'clock on Saturday evening, July 25, within 48 hours of its presentation.

These demands required that Serbia should suppress every publication which excited hatred of the Dual Monarchy; that the Serbian government dissolve certain societies accused of fomenting the propaganda hostile to Austria; that teachers guilty of instigating hatred of Austria be dismissed and that objectionable matter in the textbooks be eliminated; that Serbia dismiss from her army and governmental employ all officers and officials found taking part in the propaganda; that Serbia accept the collaboration of agents of the Austro-Hungarian government in suppression of the subversive movement against Austria; that Austro-Hungarian representatives be allowed to take part in the investigation of persons in Serbia accused of complicity in the murder of the Archduke; that Serbia take action against two specified officials, who were accused of complicity in the crime at Serajevo; that Serbia take effective measures to stop the smuggling of arms and ammunition across her border; and finally that Serbia give explanation of the expressions of hostility toward Austria-Hungary on the part of certain high Serbian officials.

The publication of this note immediately aroused great apprehension in the chancelleries of the European Powers. It was clear that Europe was confronted with another serious crisis.

It is a striking fact that each of the Powers of the Triple Entente was confronted by serious internal difficulties at this most critical time. Great Britain was threatened by serious disturbances in Ireland resulting from the passage of the Home Rule Bill (see IRELAND); St. Petersburg was involved in a great strike; in France the Caillaux affair (see FRANCE) had affected seriously the prestige of the government and the Minister of War declared that the army was in a deplorable state of unpreparedness.

The first move of Sir Edward Grey (q.v.), the British Foreign Secretary, was to urge upon Austria-Hungary the necessity of extending the time limit of the ultimatum. In this he was strongly supported by M. Sazonov, the Russian Foreign Minister. Germany, however, was not inclined to bring pressure upon her ally in this matter and Austria flatly refused any extension of time.

Failing in this move, the British and Russian Ministers turned their efforts to persuading Serbia to accept, as far as possible, the demands made by Austria. In this they were largely successful.

The Serbian Reply. Serbia's reply to the Austrian ultimatum was handed to the Austrian Minister at Belgrade on July 25, only two minutes before the expiration of the time limit. The reply began by stating that the Serbian government was not aware of any official action since 1909 protesting against the political status of Bosnia-Herzegovina, and that the only representation made by Austria, that concerning a school book, had been explained to the satisfaction of the Austrian government. To this the Austrian government replied in an official rejoinder that it was not sufficient to indicate that there had been no official action against Austria. It was the failure of Serbia to use energetic measures to suppress unofficial agitation directed against the territorial integrity of Austria of which complaint was made.

The Serbian reply further stated that the Serbian government did not consider that they could be held responsible for the opinions expressed by private individuals, such as articles appearing in the press and the peaceful proceedings of societies. Serbia agreed, however, to amend her constitution to permit the enactment of legislation to suppress such publications. Most of the other demands were agreed to by Serbia with slight verbal changes. There were two points, however, with which Serbia did not comply. In the first place, to the demand that Serbia accept the collaboration of agents of the Austrian government in the suppression of the subversive movement directed against the territorial integrity of the Dual Monarchy, Serbia replied that she did not understand exactly the meaning of the demand, but that she was ready to accept such collaboration as should conform to the principles of international law and criminal procedure. The Austrian rejoinder stated that it was not a question of international law but of the exercise of police powers which could be settled by agreement between the parties concerned. In the second place the demand made by Austria that Austrian officials be permitted to take part in the investigation relating to the judicial proceedings in Serbia against persons involved in the Serajevo crime, the Serbian government would not concede on the ground that such action would violate the Serbian constitution. The Austrian rejoinder accused the Serbian government of deliberately misrepresenting the Austrian demand, which contemplated simply a participation in the preliminary investigation to the judicial proceedings. Finally the Serbian government agreed, in case the Austrian government should find the reply unsatisfactory, to submit the disputed questions to The Hague Tribunal or the Great Powers for decision.

The representatives of the Entente Powers were satisfied that Serbia's reply was a substantial agreement to the Austrian demands. Austria, however, claimed to find the reply wholly unsatisfactory and in this view she was apparently supported by Germany.

From the time of the presentation of the Austrian ultimatum, it was recognized on all sides that the great danger was that any move on the part of Austria would precipitate a general European war. The delicate balance of interests in the Balkans could not be disturbed without involving serious consequences. Russia in particular felt that she was deeply interested in the fate of the small Slav nations in the Balkan Peninsula. The Russian Ambassador at Vienna stated on July 24 that "any action taken by Austria to humiliate Serbia could not leave Russia indifferent." (B.W.P. No. 7.) At Berlin, too, it was clearly recognized that Austria's action would probably involve Russia.

The German memorandum states that Germany was fully aware that "warlike moves on the part of Austria-Hungary against Serbia, would bring Russia into the question and might draw Germany into a war in accordance with her duty as Austria's ally." (G.W.B. p. 4.)*

Despite Austria's assurance that she had no intention of annexing Serbian territory or disturbing the balance of power in the Balkans, Russia felt that, apart from the acquisition of territory, the crushing of Serbia would reduce her to a vassal state of Austria, and that this would imperil the balance of power in the Balkans. In view of this situation the Russian Foreign Minister stated that Russia would mobilize against Austria on the day that the Austrian army crossed the Serbian frontier. (B.W.P. No. 72.)

This determined attitude of Russia made any efforts which the Powers might make to localize the struggle futile. The next question of vital interest was the attitude which Germany would take. How far was she prepared to support her ally Austria in her uncompromising position towards Serbia? In defining its position the German government declared "The attitude of the Imperial government in this question is clearly indicated. The agitation carried on by the Pan-Slavs in Austria-Hungary has for its goal the destruction of the Austro-Hungarian Monarchy, which carries with it the shattering or weakening of the Triple Alliance and, in consequence, the complete isolation of the German Empire. Our nearest interests, therefore, summon us to the support of Austria-Hungary." (G.W.B. exhibit 2.) And further "A morally weakened Austria under the pressure of Panslavism would be no longer an ally on whom we could count and in whom we could have confidence, such as we must have, in view of the increasingly menacing attitudes of our neighbors on the east and west." (G.W.B. memo. p. 5.) It is clear therefore that Germany felt that her interests as well as those of Austria were vitally affected. It was generally believed, and openly stated, that Germany knew the nature of the Austrian ultimatum to Serbia before it was sent and had urged Austria to precipitate a crisis by presenting demands which Serbia would not accept. This was categorically denied by the German authorities. (B.W.P. No. 25.) Nevertheless Germany thoroughly approved of the Austrian demands and insisted that the quarrel should be considered simply as an affair between Austria and Serbia.

Obviously it was of the utmost importance to prevent, or at least delay, the first hostile move by Austria against Serbia. On July 26, Sir E. Grey suggested a conference of the representatives of the four Powers, England, France, Germany, and Italy, for the purpose of discovering an issue which would prevent complications between Austria and Russia. (B.W.P. No 36.) To this suggestion France and Italy agreed. Germany, however, declined to fall in with this plan. The German Foreign Minister stated that "a conference such as Sir E. Grey suggested would amount to a court of arbitration and could not, in his opinion, be called together except at the request of Austria and Russia" (B.W.P. No. 43); and furthermore that "he did not think it [the conference] would be effective, because such a conference would in his opinion have had the appearance of an Areopagus consisting of two Powers of each group sitting in judgment upon the two remaining Powers." (B.W.P. No. 71; G.W.B. memo. p. 8.)

Direct negotiations between Russia and Austria were unsuccessful, Austria refusing to consider a modification of the terms of her ultimatum to Serbia. (B.W.P. No. 93; R.O.B. No. 45.) Further efforts on the part of England to have Germany propose some formula which would be acceptable proved unavailing (B.W.P. No. 111), and on July 28, 1914, Austria declared war on Serbia. This action on the part of Austria appears explicable on one of two grounds. Either she was convinced that Russia was bluffing and would back down as she did in 1908, or else that Austria was prepared deliberately to precipitate a European war.

Germany and Russia. The Russian government had very definitely declared that Russia could not remain indifferent to the fate of Serbia. It was generally believed in Russia that Austria's action was directed against her quite as much as against Serbia. (R.O.B. No. 75.) Consequently on July 29, 1914, Russia declared partial mobilization against Austria-Hungary. At the same time the Russian Foreign Minister stated that this action was in no way directed against Germany. (R.O.B. No. 49.) These military preparations stimulated the diplomats in their final efforts to find some solution which would prevent a European conflagration. Various formulas were suggested but none was acceptable. On July 29, Sir E. Grey urged that "the German government should suggest any method by which the influence of the four Powers could be used to prevent war between Austria and Russia. France agreed. Italy agreed. The whole idea of mediation or mediating influence was ready to be put in operation by any method that Germany thought possible, if only Germany would press the button in the interests of peace." (B.W.P. No. 84.) Germany did press the button to the extent of urging Austria to renew negotiations with Russia. At the same time Russia was requested to prepare a formula which would be satisfactory to her. M. Sazonov accordingly submitted the following suggestion: "If Austria, recognizing that her conflict with Serbia has assumed the character of a question of European interest, declares herself ready to eliminate from her ultimatum points which violate the principle of the sovereignty of Serbia, Russia engages to stop all military preparations." This formula was wholly unsatisfactory to Germany and Austria, and at the suggestion of Sir E. Grey the Russian formula was modified to read: "If Austria will agree to check the advance of her troops on Serbian territory; if, recognizing the fact that the dispute between Austria and Serbia has assumed a character of European interest, she will allow the Great Powers to look into the matter and determine whether Serbia could satisfy the Austro-Hungarian government without impairing her rights as a sovereign state or her independence, Russia will undertake to maintain her waiting attitude."

One final effort was made by England and Germany to prevent a break between Austria and Russia. Sir E. Grey, on July 31, said that if Germany would suggest any reasonable proposal which would preserve peace, and if France

* In referring to the official documents the following abbreviations are used: British White Paper, B.W.P.; German White Book, G.W.B.; Austrian Red Book, A.R.B.; Russian Orange Book, R.O.B.; French Yellow Book, F.Y.B.; Belgian Gray Book, B.G.B.; Italian Green Book, I.G.B.

and Russia rejected such a proposal, Great Britain would not support them, but on the other hand if no such proposal were made and France became involved, Great Britain would be drawn in. (B.W.P. No. 111.) Germany, on her part, brought pressure on Austria to agree to discuss with Russia the terms of the Austrian ultimatum, and at the last moment, on July 31, Austria agreed to do so. (A.R.B. Nos. 49–50.) This slim chance of preventing a break at the eleventh hour was nullified by the demand made by Germany that Russia should cease her military preparations and demobilize her army. At midnight on July 31, 1914, the German Ambassador delivered an ultimatum to Russia demanding that she demobilize her forces not only against Germany but also against Austria-Hungary. (R.O.B. No. 70.) As Russia returned no reply to this demand the German Ambassador was ordered on August 1, at 5 P.M., to notify the Russian government that Germany considered that a state of war existed between the two countries. (G.W.B. exhibit 26; R.O.B. No. 76.)

Germany and France. At the same time that Germany presented the ultimatum to Russia, a communication was sent to France informing her of Germany's action and asking what attitude France would take in the event of war between Germany and Russia. An answer was demanded within 18 hours. (F.Y.B. No. 116; G.W.B. exhibit 25.) To this demand the French Premier replied on August 1, that "France would take such action as her interests might require." (G.W.B. exhibit 27.) Despite this unsatisfactory answer the German Ambassador did not leave Paris until August 3. In the meantime charges and countercharges were made by the French and German authorities that warlike moves had been made on the frontier.

Great Britain and Germany. From the first it was evident that the question of England's attitude in the face of the great European crisis was of the most vital importance. In that most critical week following the presentation of the Austrian ultimatum, Sir E. Grey worked early and late to arrive at some peaceful solution of the difficulty. From the very beginning France and Russia had urged Great Britain to come out with a definite statement that if war was precipitated she would support them, pointing out that such a stand by Great Britain would deter Germany from entering the war. M. Sazonov, the Russian Foreign Minister, said "he did not believe that Germany really wanted war, but her attitude was decided by England's. If she took her stand firmly with France and Russia there would be no war." (B.W.P. No. 17.) The President of France, M. Poincaré (q.v.), went so far as to appeal directly to King George stating "I am profoundly convinced that at the present moment the more Great Britain, France, and Russia can give a deep impression that they are united in their diplomatic action, the more possible it will be to count upon the preservation of peace." Sir E. Grey did not accept their suggestions. It was his view that Great Britain could work most effectively for peace by playing the part of mediator. At the same time he made it clear to the German Ambassador that if Germany and France became involved "the issue might be so great that it would involve European interests and he did not wish him to be misled into thinking that Great Britain would stand aside." (B.W.P. No. 89.) Germany fully appreciated the importance of keeping Great Britain neutral, if possible. With this end in view the German Chancellor proposed that if Great Britain would remain neutral Germany would guarantee that no territorial acquisitions would be made at the expense of France. He was unwilling, however, to make a similar undertaking in regard to the French colonies. (B.W.P. No. 85.) This suggestion was declined by Great Britain on the ground that France might be so crushed as to lose her position as a great power, without having territory taken from her. Furthermore that other contingencies might arise which would justify Great Britain's entrance into the war. (B.W.P. No. 101.) A further request from Germany that Sir E. Grey formulate conditions on which Great Britain would remain neutral was declined. He stated that "he could only say that they must keep their hands free." (B.W.P. No. 123.) The British government, therefore, up to the very last day of European peace refused either to bind herself to come to the aid of France and Russia or to remain neutral.

Question of Belgian Neutrality. The Congress of Vienna in 1815 turned over the Austrian Netherlands, or Belgium, to Holland in compensation for certain Dutch colonial possessions retained by Great Britain. This union was opposed by the Belgians and at the first favorable opportunity (1830) they revolted. France was anxious to annex the provinces but Great Britain, following her traditional policy, opposed their union with any great power. This opposition was due to the proximity of the Belgian coast to her shores and also because of the important commercial interests of Great Britain in these rich provinces, which might suffer if they passed into the hands of some great European power. Great Britain's interests would be best served by erecting Belgium into an independent state and by guaranteeing the permanence of this independent status by making the country perpetually neutral. Accordingly in 1831 the principal European Powers, Great Britain, France, Prussia, and Russia, joined in guaranteeing the independence and perpetual neutrality of Belgium. This treaty was replaced by treaties signed in 1839 after Holland had agreed to recognize Belgian independence. When in 1870, at the outbreak of the Franco-Prussian War, it seemed possible that one or both of the combatants might violate the neutrality of Belgium, a separate treaty was signed between Great Britain and each of the belligerents, by which Great Britain agreed that if either belligerent should violate Belgian neutrality the other could rely upon England as an ally in defense of the treaty of 1839.

When on July 31, 1914, the outbreak of a European war seemed unavoidable, Sir E. Grey telegraphed the British ambassadors at Paris and Berlin to request the French and German governments to state whether they were prepared to respect the neutrality of Belgium so long as no other power violated it. To this the French authorities returned an affirmative answer. The German Secretary of State, however, stated that it was doubtful if Germany could return any reply without disclosing a certain amount of her plan of campaign. On Aug. 2, 1914, the German Minister presented to the Belgian Foreign Minister an ultimatum which stated that Germany had "reliable information . . . of the intention of France to

march through Belgian territory," that it was "an imperative duty for the preservation of Germany to forestall this attack." Germany agreed to evacuate Belgian territory as soon as the war was over and to indemnify Belgium for all damages if she would maintain an attitude of "friendly neutrality." In case of refusal Germany stated that Belgium would be considered as an enemy and the question would be left "to a decision of arms." (B.G.B. No. 20.) To this demand the Belgian government returned a flat refusal and stated that they were "firmly resolved to repulse by every means within their power any attack upon their rights." (B.G.B. No. 22.) At the same time Belgium called upon Great Britain, France, and Russia, as signatories of the treaty of 1839, to carry out the guarantee of Belgian neutrality. In response to this request Sir E. Grey on Aug. 4, 1914, sent an ultimatum to Germany demanding a satisfactory reply to her request that Belgian neutrality be respected and requiring an answer by midnight of the same day. Upon Germany's refusal to give such a guarantee Great Britain declared war on Germany. While the violation of Belgian neutrality was the ostensible reason for Great Britain's declaration of war, she had, as a matter of fact, intervened in the war two days before the dispatch of her ultimatum to Germany. In a speech made in the House of Commons on Aug. 2, 1914, Sir E. Grey stated that he had on that day assured the French government that the British fleet would protect the northern coast of France from any attack by the German fleet. By this act Great Britain had tentatively intervened in the war, and the violation of Belgian neutrality by Germany changed this partial and tentative intervention into full participation in the war.

German authorities clearly appreciated that Germany's action in invading Belgium would arouse public sentiment in most neutral countries and strenuous efforts were made subsequently to justify their action. In a speech in the Reichstag on Aug. 4, 1914, the German Chancellor, Theobald von Bethmann-Hollweg (q.v.), said, "Gentlemen, we are now acting in self-defense. Necessity knows no law. Our troops have occupied Luxemburg and have possibly already entered on Belgian soil. Gentlemen, this is a breach of international law." But other grounds than that of bald necessity have been advanced by German apologists to justify their action. It has been claimed that Prussia, and not the German Empire, signed the treaty of 1839 and hence the latter was not bound by its provisions. To this it has been answered that the German Empire succeeded to the obligations of its component parts and that all treaties survived that were not formally denounced. It has also been stated that the treaty of 1839 was superseded by the treaties of 1870 which latter had lapsed. From the debates in the British Parliament at the time of the proposal of the treaties of 1870 there is no indication that the treaty of 1839 was to be superseded but rather to be strengthened. Germany furthermore claimed that certain secret documents which were discovered among the papers of the Belgian government at Brussels go to prove that Belgium had by its own acts relieved Germany of the obligation to respect her neutrality. These documents contain an account of certain conversations between the Chief of the Belgian General Staff and the British Military Attaché at Brussels, relative to the sending of British military forces to Belgium in case of an invasion of the latter by Germany. The German authorities claim that this amounted to an Anglo-Belgian alliance against Germany. In answer to this charge King Albert (q.v.) of Belgium stated, according to an interview in the New York *World* (March 22, 1915), that the conversations referred to had been long known to the German authorities, having been communicated to the German Military Attaché at Brussels so as to avoid any semblance of entering into an unneutral agreement. Germany also complained that Belgian military preparations for the defense of her neutrality, instead of being impartially directed against the possibility of an attack from any of the Powers, were made entirely against Germany. To this it is answered that the fortress of Namur was directed against France as Liége was directed against Germany. Furthermore that if greater energy had been directed towards fortifying the German than the French frontier, this was but natural in view of the German activity in building military railways leading up to the Belgian frontier. Finally Germany declared that her invasion of Belgium was in response to violations of Belgian neutrality by France. But of this no satisfactory evidence has been produced. To the impartial observer, therefore, it would appear that German justification for the violation of Belgian neutrality must rest entirely on the ground of military necessity.

Italy's Position. At the outbreak of the European War, Italy found herself in a most trying position. To Austria and Germany she was bound by the defensive treaty of the Triple Alliance (q.v.). Her position as a member of this alliance had from the beginning been unnatural. Ever since Italy obtained national unity in 1870, there has been a strong movement to obtain the Italian-speaking provinces of Triest and Trentino, still held by Austria. This aspiration in Italy for what is called "Italia Irredenta," or unredeemed Italy, has been a source of constant friction between Italy and Austria.

The first indication of Italy's wavering in the support of her allies was when she threw her influence against Germany at the Algeciras Conference. Again in 1908 Italy was much irritated when Austria-Hungary annexed Bosnia-Herzegovina, thereby strengthening her position on the Adriatic Sea. But the most serious blow to the diplomatic group of the Triple Alliance was given by Italy in 1911 when she declared war on Turkey, a country which had come to be regarded as a member of the Triple Alliance group. Germany and Austria were forced to stand by and allow Italy to weaken the influence of the Triple Alliance by dismembering Turkey. All of these events indicated that Italy's attitude at the outbreak of a European war would be uncertain. Her position was made more precarious by her extensive coast line. Any war which involved Great Britain as an enemy would expose Italy to attack by the powerful British navy.

Apart, however, from questions of vital self-interest, Italy maintained that under the terms of the Triple Alliance she was not bound to come to the aid of Germany and Austria-Hungary, because, in her view, Austria-Hungary had been the aggressor and Italy's obligations under the treaty contemplated only a defensive war.

Accordingly on Aug. 1, 1914, Italy declared that she would remain neutral. Italy's declaration of neutrality did not, as the Italian Foreign Minister stated, "signify the relinquishment of Italian interests in the Balkans and in the Adriatic, but, on the contrary, the persuasion that such interests and aspirations shall be validly supported while the neutrality be maintained." (I.G.B. No. 2.)

Italy's next step was a most difficult one to determine. Should she remain neutral she could expect to gain little from either side, and she had to fear from her former allies, Germany and Austria, in case of their military success, a revengeful attitude. On the other hand to join the Entente allies was a difficult policy to pursue. In the first place it involved the moral question of turning against her former allies. In the second place the Russian and Serbian policy in the Balkans was not certain to be in agreement with Italy's ambition to control the Adriatic. Other considerations also caused Italy to hesitate before casting in her lot with the Entente allies. Such were the unfavorable financial condition of the country, the pro-German sympathies of the royal family, and the opposition of ex-Premier Giolitti (q.v.), who, with a strong personal following in the Italian Parliament, maintained that Italy should not enter the war.

For 10 months the contest between the neutralists and the interventionists went on in Italy. Great efforts were made by Germany and Austria, especially through Prince von Bülow and his Italian wife, to influence public opinion in Italy. It was clear, however, that there was a steady drift of popular sentiment in favor of the Entente. This movement was strengthened, too, by the death of the Marquis di San Giuliano (q.v.), Minister of Foreign Affairs, in October, 1914, who was popularly regarded as a strong sympathizer with Germany and Austria-Hungary. Baron Sidney Sonnino (q.v.), who succeeded him, is regarded as one of the most astute Italian statesmen since Cavour. In the meantime the Italian government had entered upon a series of communications with Austria-Hungary looking to a satisfaction of Italian aspirations and interests in the Balkans. The Italian Foreign Minister began by setting forth that, under Article VII of the Triple Alliance, Italy was entitled to compensations, in the event of any occupation of Serbian territory, even temporarily, by Austria-Hungary. The Austrian officials were not inclined to admit, at first, that Italy had any valid claim to compensations under the terms of the treaty of the alliances.

From this stand, however, Austria soon receded, probably under pressure from Germany, and conceded the principle that Italy was entitled to compensations. There followed several months of protracted negotiations. Italy demanded as the minimum that she would accept in the way of compensations "the district of the Trentino, a new district on the Isonzo, the special treatment of Trieste, the cession of some islands of the Curzolari Archipelago, a declaration of Austria's disinterestedness in Albania, and the recognition of our possession of Valona and Dodecanesia." To these demands Austria was willing to concede only a portion of the Trentino and was unwilling to make any cession before the end of the war.

These fruitless negotiations culminated in the declaration by Italy, on May 4, that she no longer considered herself bound by the provisions of the Triple Alliance. After three weeks of hesitation during which public excitement in Italy reached a high pitch, Italy finally declared war on Austria, May 24, 1915. Just before the final break, according to a statement made by the German Chancellor, Austria-Hungary made a last attempt to purchase Italy's neutrality offering (1) the Italian part of the Tirol; (2) the western bank of the Isonzo "in so far as the population is purely Italian," and the town of Gradisca; (3) sovereignty over Avlona and a free hand in Albania; (4) special treatment of Italian nationals in Austria and amnesty for political prisoners who were natives in the ceded provinces; (5) Triest to be made an Imperial free city, and to have an Italian University. Furthermore, it was stated that Austria would make these concessions at once and not wait for the conclusion of the war.

Japan's Position. Japan's entrance into the European War was due to her treaty of alliance with Great Britain. After the Chinese-Japanese War Japan was deprived of the fruits of her victory, when Port Arthur and the Liaotung peninsula had to be returned to China at the demand of Russia, France, and Germany. Smarting under this humiliation, Japan turned to Great Britain and in 1902 negotiated a treaty of alliance, according to the terms of which Japan agreed to come to the defense of Great Britain's Eastern possessions if she were attacked by more than one Power. Great Britain on the other hand insured Japan against a European coalition such as had intervened at the conclusion of the Chinese-Japanese War.

At the outbreak of the European War Japan saw her opportunity to revenge her humiliation at the close of the Chinese War. Actuated also by a determination to carry out her obligations to Great Britain, the Japanese representative in Berlin presented an ultimatum on Aug. 19, 1914, "advising" Germany to withdraw all warships from Asiatic waters and turn over to Japan the territory of Kiaochow before Sept. 15, 1914, which territory Japan promised eventually to restore to China. This port and surrounding territory had been obtained by Germany from China in 1897 as a compensation for the murder of two German missionaries. The Germans had fortified the harbor strongly and had made it a fine naval base. As Germany refused to reply to the Japanese demand, Japan declared war on Aug. 23, 1914. The Japanese Foreign Minister defended this action on the ground that Japan was bound by treaty obligations to come to the aid of her ally, Great Britain, and that Germany's position at Kiaochow gravely threatened the maintenance of peace in the Far East and the independence and integrity of China which Japan had bound herself to maintain.

Turkey. Germanic influence had for a number of years prior to the outbreak of the war been predominant in Turkey. It was natural, therefore, that Turkish sympathies would be with the Teutonic allies. But Turkey hesitated, at first, to make common cause with Germany because of her exposed position and the fact that her recent experiences in the Balkan wars had left her exhausted. Events, however, rapidly forced Turkey to abandon her attitude of quasi-neutrality. Shortly after the outbreak of the war two German warships, the *Goeben* and the *Breslau*, in order to escape capture by the British and French fleets, sought refuge in the Darda-

nelles. The demand of England and France that these ships should either be forced to put to sea or be interned was answered by Turkey stating that she had purchased the ships from Germany. Turkey also refused to remove the German crews of the two vessels. The Triple Entente also resented the action of Turkey in closing the Dardanelles and in serving notice that the "capitulations," under the terms of which the national subjects of various Powers were given special privileges in Turkey, would be revoked on Oct. 1, 1914.

When on October 29 the former German warship, the *Breslau*, bombarded the Russian Black Sea port of Theodosia, Russia accepted this as a declaration of war and the following day the Russian Ambassador at Constantinople demanded his passports. This action of Russia was followed by France and England declaring war on Turkey, Nov. 5, 1914. Turkey's entrance into the war aroused the hope in Germany and some fear in Great Britain and France that a Holy War would be proclaimed by the Sultan which would arouse the Moslem populations in India, Egypt, and Morocco. The Sultan's efforts in this direction proved unavailing, and no serious uprising occurred among the Mohammedan subjects of Great Britain and France.

The Balkan States. The opening of the European War found the Balkan Peninsula in the political shape given to it by the Treaty of Bucharest, Aug. 10, 1913, which closed the second Balkan War (q.v.). This treaty, which represented the latest effort on the part of the European Powers to adjust the Balkan situation, proved unsatisfactory to nearly all of the parties concerned. Turkey did not accept with good grace the loss of nearly all of her European territory. Bulgaria was bitter towards her former allies, Greece, Serbia, and Montenegro, who she felt had treacherously combined to deprive her of her just rewards. Serbia resented the action of Austria, Italy, and Germany in depriving her of an outlet to the Adriatic. Montenegro was disappointed in being forced to surrender Scutari. Finally Albania, the new state created by the Powers to thwart Serbia's ambition to reach the Adriatic, was in a state of ill-disguised anarchy under the shadowy control of Prince William of Wied. See WILLIAM OF WIED.

As has been seen, Serbia had been involved in the war from the beginning and Montenegro soon threw in her lot with her neighbor. The attitude of the other Balkan states was a matter of great concern to the diplomats of the allied groups. During the months succeeding the outbreak of the war, a diplomatic struggle ensued in these states, with the aim of winning their support to one or the other side.

In this struggle the diplomats of the Teutonic Powers had certain distinct advantages. In the first place the monarchs (Constantine I, Ferdinand I, Charles I, qq.v.) of the three states, Greece, Bulgaria, and Rumania, were related by blood and marriage with the Teutonic royal families. Moreover, as the British Prime Minister (H. H. Asquith, q.v.) indicated in a speech in the House of Commons, Germany had a distinct advantage in that she could conduct her negotiations with a singleness of purpose, as her interests and those of Austria-Hungary were identical. On the other hand, the Entente diplomats had to consider the interests, not always identical, of three and, later, four Powers. Finally the Entente allies were handicapped by the fact that Russian ambitions in the Balkans conflicted with the national aspirations of the smaller Balkan states; that Italy's territorial ambitions in Albania ran counter to the legitimate aspirations of Serbia, and that Greece resented the attempt of Italy to gain a foothold on the coast of Asia Minor, which was racially and historically Greek.

In view of these conditions it is not surprising that the efforts of the Entente diplomats, even had they been conducted more skillfully than they appear to have been, should have failed.

Bulgaria.—The second Balkan War left, as has been noted, a heritage of bitterness and hatred among the former Balkan allies. The Bulgars, smarting under the humiliation of the Treaty of Bucharest, welcomed the opportunity to revenge themselves upon their former allies. Completely disillusioned by their experiences of the past few years, they put aside all feeling of generosity or gratitude and frankly adopted a programme of "real politik." To the diplomats of the Entente and the Teutonic allies the Bulgarian authorities made it clear that all question of sentiment, so far as Bulgaria was concerned, was to be disregarded and that they were prepared to sell out to the highest bidder. Great Britain and France brought pressure to bear on Rumania, Serbia, and Greece to satisfy, in part, the territorial demands of Bulgaria. The Teutonic Powers made counter proposals promising Bulgaria a large part of Serbian territory in case of the success of the Central Powers. For more than a year Bulgaria hesitated, apparently weighing the relative advantages of the rival proposals. In the meantime the Bulgarian army was mobilized, in order to be prepared when the final decision was reached. It became increasingly evident as the months passed that the attitude of King Ferdinand and the military leaders was favorable to the Teutonic allies. Matters were brought to a head when, on Oct. 3, 1915, Russia notified Bulgaria that if she did not, within 24 hours, break with the Teutonic Powers, the Russian Minister would withdraw from Sofia. A similar demand was made by France, while Great Britain stated that if Bulgaria precipitated hostilities in the Balkans she would break off relations with her. On Oct. 8, 1915, Bulgaria replied, rejecting these demands and throwing her support to the Teutonic Powers. In a manifesto issued by M. Radoslavoff,* the Bulgarian Premier, there was set forth the reasons for Bulgaria's decision. He stated frankly that considerations of self-interest had dictated the step. He pointed out that Bulgaria's chief economic interests were with the Teutonic Powers and Turkey, and that these interests would be seriously menaced if Constantinople fell into the hands of Russia. In reviewing the proposals of concessions made to Bulgaria by the opposing groups, he held that the Teutonic proposals were more advantageous to Bulgaria. And finally he had reached the conclusion that the progress of the war indicated the probable success of the Central Powers, and it was vital to the interests of Bulgaria to be on the side of the victors.

Greece.—Conflicting influences and interests

* Vaseil Radoslavoff, born in Lowatsch; studied law at Heidelberg; at various times served as Minister of Justice, Minister of the Interior, and Premier; did much as Premier in 1913 to bring Balkan War to an end; became Premier and Minister of Foreign Affairs (October, 1915) during European War; made important declarations of Bulgarian policy; shot at twice (March, 1916).

complicated the situation in Greece at the outbreak of the war. On the one hand, the royal family was closely related to the Hohenzollerns, the Greek Queen Sophia being a sister of the German Emperor, William II (q.v.). On the other hand, the Premier Venizelos (q.v.) felt that the best interests of Greece would be served by joining the Entente allies. Popular sympathy in the country appeared to be with the Entente group, and especially with France. In addition, Greece was bound by a treaty of alliance with Serbia which obligated her to come to the aid of Serbia if she were attacked by Bulgaria. During the first months of the war the diplomats of France and Great Britain directed their efforts to winning all of the Balkan states to the support of the Entente. With this end in view both Greece and Serbia were urged to make territorial concessions to Bulgaria. These efforts were seconded by M. Venizelos, but the Greek King flatly opposed any territorial concessions and maintained that the best interests of Greece would be served by the observance of strict neutrality. The break between the King and his chief Minister led to the resignation of the latter in March, 1915. His return to office shortly after as a result of popular approval expressed in the elections to the new Chamber was hailed as a victory for the Entente, and it was generally expected that Greece would soon enter the war. The situation became acute when, in September, 1915, Bulgaria mobilized her army and Greece did likewise. Bulgaria's entrance into the war on the side of the Teutonic Powers raised the question of Greece's obligation under the treaty of alliance with Serbia. M. Venizelos maintained that Greece was bound to come to Serbia's aid, but the King once more interposed his objections, holding that the treaty contemplated only a local Balkan war and not one in which the Great Powers were involved. Again M. Venizelos resigned. In the meantime arrangements had been made by the Greek Premier with the Entente allies for the landing of French and English troops at the Greek port of Saloniki, which troops were to be used to aid Serbia. This use of a Greek port was a clear violation of Greek neutrality and the Greek government entered a formal protest. It was understood on all sides that this protest was purely formal, and the landing of troops continued. The resignation of M. Venizelos aroused some apprehension in France and England and pressure was brought to bear upon the new Premier, M. Zaimis (q.v.), to define his position. He stated that the attitude of Greece would be "neutrality, with the character of sincerest benevolence towards the Entente Powers." King Constantine, however, vigorously protested against the violation of Greek territory by Great Britain and France. He maintained that it was the sheerest hypocrisy for these countries to protest against the violation of Belgian neutrality by the Germans, while they themselves were violating Greek neutrality. He was strongly supported in these views by Stephanos Skouloudis,* who succeeded Zaimis as Premier and who also took the portfolio of Foreign Affairs.

Rumania.—Somewhat the same division of sentiment obtained in Rumania as in Greece at the outbreak of the European War. The King, Charles I, was a member of the Hohenzollern family, and it was rumored that there was a secret treaty between Rumania, Germany, and Austria-Hungary. The mass of the Rumanian population is composed of illiterate peasants, but among the educated classes there was a strong pro-French and especially pro-Italian sentiment. The Rumanians claim descent from Roman colonists; and there has always been a strong sentimental attachment to Italy among the Rumanians. Apart from conflicting sentimental influences, the question of the wisest policy for Rumania to pursue to advance her material interests was not easy to determine. On the one hand a large Rumanian population was included in the Austrian dominions in Transylvania, while on the other hand the Russian province of Bessarabia was equally Rumanian in nationality and more valuable economically than Transylvania.

At the head of the Rumanian ministry was John Bratianu, one of the shrewdest statesmen in the Balkans. He advocated a policy of waiting, with the intention of entering the war at the proper time when the greatest reward could be obtained by the least fighting. The death of King Charles in October, 1914, and the entrance of Italy into the war, were expected to influence Rumania to join forces with the Entente allies. But the failure of the Russian campaign in Galicia and Bulgaria's alliance with the Teutonic Powers caused Rumania to continue her policy of watchful waiting.

Portugal. Portugal was bound by a treaty of alliance with Great Britain, and at the outbreak of the European War Portugal stated that she was prepared to carry out her treaty obligations whenever Great Britain desired her to do so. However, Portugal did not enter the war until more than a year after the beginning of hostilities, although there were clashes between Portuguese and German troops in Africa. On Feb. 24, 1916, at the request of Great Britain, Portugal seized a number of German and Austrian ships lying in Portuguese harbors. On March 8, 1916, Germany declared war on Portugal, stating that the seizure of German vessels was done at the dictation of Great Britain, and could be regarded in no other light than as a hostile move against Germany.

For purposes of convenient reference the following dates of the declarations of war by the various Powers are given.

Austria against Serbia	July 28, 1914
Germany against Russia	Aug. 1, 1914
Germany against France	Aug. 3, 1914
Great Britain against Germany	Aug. 4, 1914
Austria against Russia	Aug. 6, 1914
Montenegro against Austria	Aug. 8, 1914
Serbia against Germany	Aug. 9, 1914
France against Austria	Aug. 10, 1914
Great Britain against Austria	Aug. 12, 1914
Montenegro against Germany	Aug. 12, 1914
Japan against Germany	Aug. 23, 1914
Austria against Japan	Aug. 25, 1914
Austria against Belgium	Aug. 28, 1914
Russia against Turkey	Oct. 30, 1914
Great Britain against Turkey	Nov. 5, 1914
France against Turkey	Nov. 5, 1914
Italy * against Austria	May 24, 1915
Italy against Turkey	Aug. 22, 1915
Great Britain against Bulgaria	Oct. 15, 1915
Serbia against Bulgaria	Oct. 16, 1915
France against Bulgaria	Oct. 16, 1915
Italy against Bulgaria	Oct. 19, 1915
Russia against Bulgaria	Oct. 19, 1915
Germany against Portugal	Mar. 8, 1916

* San Marino also declared war when Italy did.

* Stephanos Skouloudis, Minister of Foreign Affairs in the cabinet of M. Rhallis in 1897, when he did much to secure for Greece milder terms of peace from Turkey after the war of that year; signed peace treaty between Balkan states and Turkey at the London Peace Conference (1913); formed a cabinet, taking also portfolio of Foreign Affairs (Nov. 7, 1915). He resigned in June, 1916.

III. MILITARY OPERATIONS

The military operations of the great war, in which the Central Powers were by turns on the offensive and on the defensive, hinge on the plan of the German general staff according to which Austria, with a small German force, was to hold Russia in check, while Germany crushed France, both Central Powers uniting for the subsequent Russian campaign.

The strategy of the war from this viewpoint falls easily under the following main divisions: I, Introduction and discussion of mobilization; II, Western theatre, or campaign against France; III, Eastern theatre, or campaigns against Russia; IV, Southern theatre, or campaigns against Serbia (involving Bulgaria's entry into the war) and Italian campaign; V, Southeastern theatre, or Turkish campaigns, including Suez, Gallipoli, and Caucasus. In no theatre of the war was the strategy unconnected with events taking place or about to take place on other fronts.

I. **Introduction.** The war that broke out in 1914 involved three continents and the seven seas. Not only its combatants, but the killed and wounded, were to be numbered by millions. Every known resource of mechanical ingenuity was drawn upon, and old and forgotten methods of warfare were brought into play side by side with the most powerful modern artillery, while aëronautics for the first time had occasion to show its worth. (See section *Aërial Operations.*) The edifice of international law, of the conventions of warfare, so painfully built up after centuries of struggle, was toppled over as a thing of no account. With these considerations before us we must remark that in the space here available nothing but a statement of the principal facts can be attempted. But even so, the nature of the struggle on one front, the western, calls for a word or two. When both sides simultaneously reached the sea there began a siege over the whole front that gave the struggle in this theatre a character unique in military history. At certain places in the "line" 32 parallel lines of German trenches were discovered by reconnoissance. The trench systems of this front were estimated, after including communication trenches, to be 25,000 miles long. Frontal attack became a necessity, since flanks there were none, and yet these attacks all proved failures (May 1, 1916), for the experience gained under the new conditions had not as yet led to such a disposition of forces and resources as to carry them through to a decision. The most desperate efforts were made, first by one and then by the other side, to raise the siege, so to say, by a concentration at some selected point, and thus break through and end a situation that only a few years ago would have been deemed intolerable.

On the other fronts the phenomena of what may well now be called old-fashioned warfare were more or less reproduced, but even in their case a marked tendency to approximate to the conditions in France manifested itself—indeed may be said to have established itself on a part of the Russian lines and to a certain extent on the Italian. A marked feature of this war was the so-called mobilization of industries. So great was the draft made on the industrial resources of the countries involved that the struggle, other conditions equal, may be said to have resolved itself into a competition by each side to outstrip the other in supplies and munitions.

Mobilization and Concentration. When it became evident that the general European situation was becoming more and more serious, covering troops (*troupes de couverture*) were sent by the French government to the eastern frontier. These troops, five corps in all, or 200,000 men, with cavalry, began their movement on July 31 at 9 P.M., and had completed it on August 3 at noon. They were not to cross a zone 8 kilometers wide along the frontier, in order to prevent any clash with the Germans, so long as war was undeclared. On the German side the Emperor, on July 31, decreed the *Kriegsgefahrzustand*, or a sort of state of martial law, under which certain military measures could be adopted on the frontier, and the telegraph and railway services taken over by the military authorities.

Mobilization proper, however, began in both Germany and in France on August 2, in France at midnight. It was asserted that in Germany the operation was set afoot well before the formal date given above. In both countries it was carried on with the precision that the whole world had learned to expect of Germany, but of which, as regards France, it was somewhat doubtful. The purpose of mobilization, it may be recalled here, is to pass from peace to war footing. (See MOBILIZATION.) Each man liable to service reports on a given date at a specified point, draws his arms, uniform, and equipment, and joins a designated organization. Companies, battalions, regiments, etc., are thus brought up to war strength; transport material is requisitioned and train service prepared. The French mobilization, in two periods of ten and six days respectively, closed on August 18; the German, according to the French, on the 16th. German authorities, however, give the closing date as the 20th. Mobilization was followed by concentration.

The French armies began their concentration in the east of France from Belfort to the Belgian frontier, thus respecting the neutrality of Belgium and of Luxemburg. By this course the French, incidentally, gave the Germans choice of ground and freedom of manœuvre. It should be recollected, however, that the exact intentions of the German general staff were unknown; they might attack either on the right or the left bank of the Meuse, or attempt a demonstration by the Oise, or even risk a break from Nancy on to Verdun. Further, the possibility of the offensive had to be kept in view, and the offensive, for the French, was possible only in Alsace and Lorraine. In other words, the concentration of the French was both offensive and defensive; while guarding the approaches on the east, they would be ready to face in any direction. As a matter of fact, the plan of concentration could not be fully carried out; it had to be modified because of the German advance through Belgium. Hence, in general terms, the French armies were stretched out from Belfort north and then northwest towards the Sambre, to join hands, if possible, with the English and Belgians. Certain corps even pushed their way into Belgium itself.

The German problem of concentration was simpler, if, as there is reason to believe, their intention from the first was to smash their way through Belgium. They contented themselves with merely observing the strong eastern (French) frontier, and disposed their other armies northward through Trèves, etc., to Aix-la-Chapelle, in position to inaugurate and carry through a vast sweeping movement through Bel-

gium. They crossed the frontier of this country without waiting for either mobilization or concentration, using for this purpose troops kept immediately available near the frontier.

On the periods of mobilization and concentration of the other combatants it is not necessary to dwell. In Austria-Hungary the operation was merely a repetition of the German process, and, like that, carried out with promptness and accuracy. Russia was expected to be slow, but on the contrary was so energetic as to suggest a belief that she began before the formal declaration of war. England had no army to mobilize, but she prepared her "expeditionary force," crossed it over to the Continent, and got into position opposite the German right in time to offer a resistance that was invaluable to the Allied cause. See UNITED KINGDOM, *History*.

II. **Western Theatre.** The German armies, by a surprise thrust through Belgium in August, 1914, sought to paralyze the French army. This operation failed at the Marne (September).

Trench warfare resulted in the West, and from the North Sea to the Swiss border the line remained substantially unchanged to July, 1916, the battle of Verdun and the joint Allied offensive (July, 1916) forming the high-water marks of this fighting.

The detailed account of military operations on this front has six main steps: (1) The fortunes of the Belgian army up to its escape from Antwerp and safe retreat to the Yser Canal; (2) The relative dispositions of the rival armies of the French and German high commands up to and including the battle of the Marne; (3) The race to the seacoast which resulted in the establishment of the intrenched lines from Dixmude to Belfort; (4) The attempts of either side to break the intrenched line, including the battles of Ypres, Lille, Lens, and the Champagne drive inaugurated by Joffre to aid the hardly pressed Russians; (5) The battle for Verdun, in which the Germans sought a decision hoping not so much to shatter the French line as to shatter the morale of the French people and make a breach in Allied solidarity; (6) The Allied offensive in Picardy, in conjunction with the Russian and Italian activities in the East and South. It seems clear that Germany's plan of action was first to crush France and then to fall upon Russia. What was the shortest road to France? The frontier was heavily fortified; but even otherwise it would have left too narrow a front for the overwhelming armies which Germany intended to set in the field. Hence the shortest road lay through Luxemburg and Belgium. Of natural obstacles there were none; the three fortresses, Liége, Namur, and Maubeuge, were not in supporting relation to one another, the Belgian frontier was only 120 miles from Paris, and the way lay through the easy valleys of the Oise and of the Meuse.

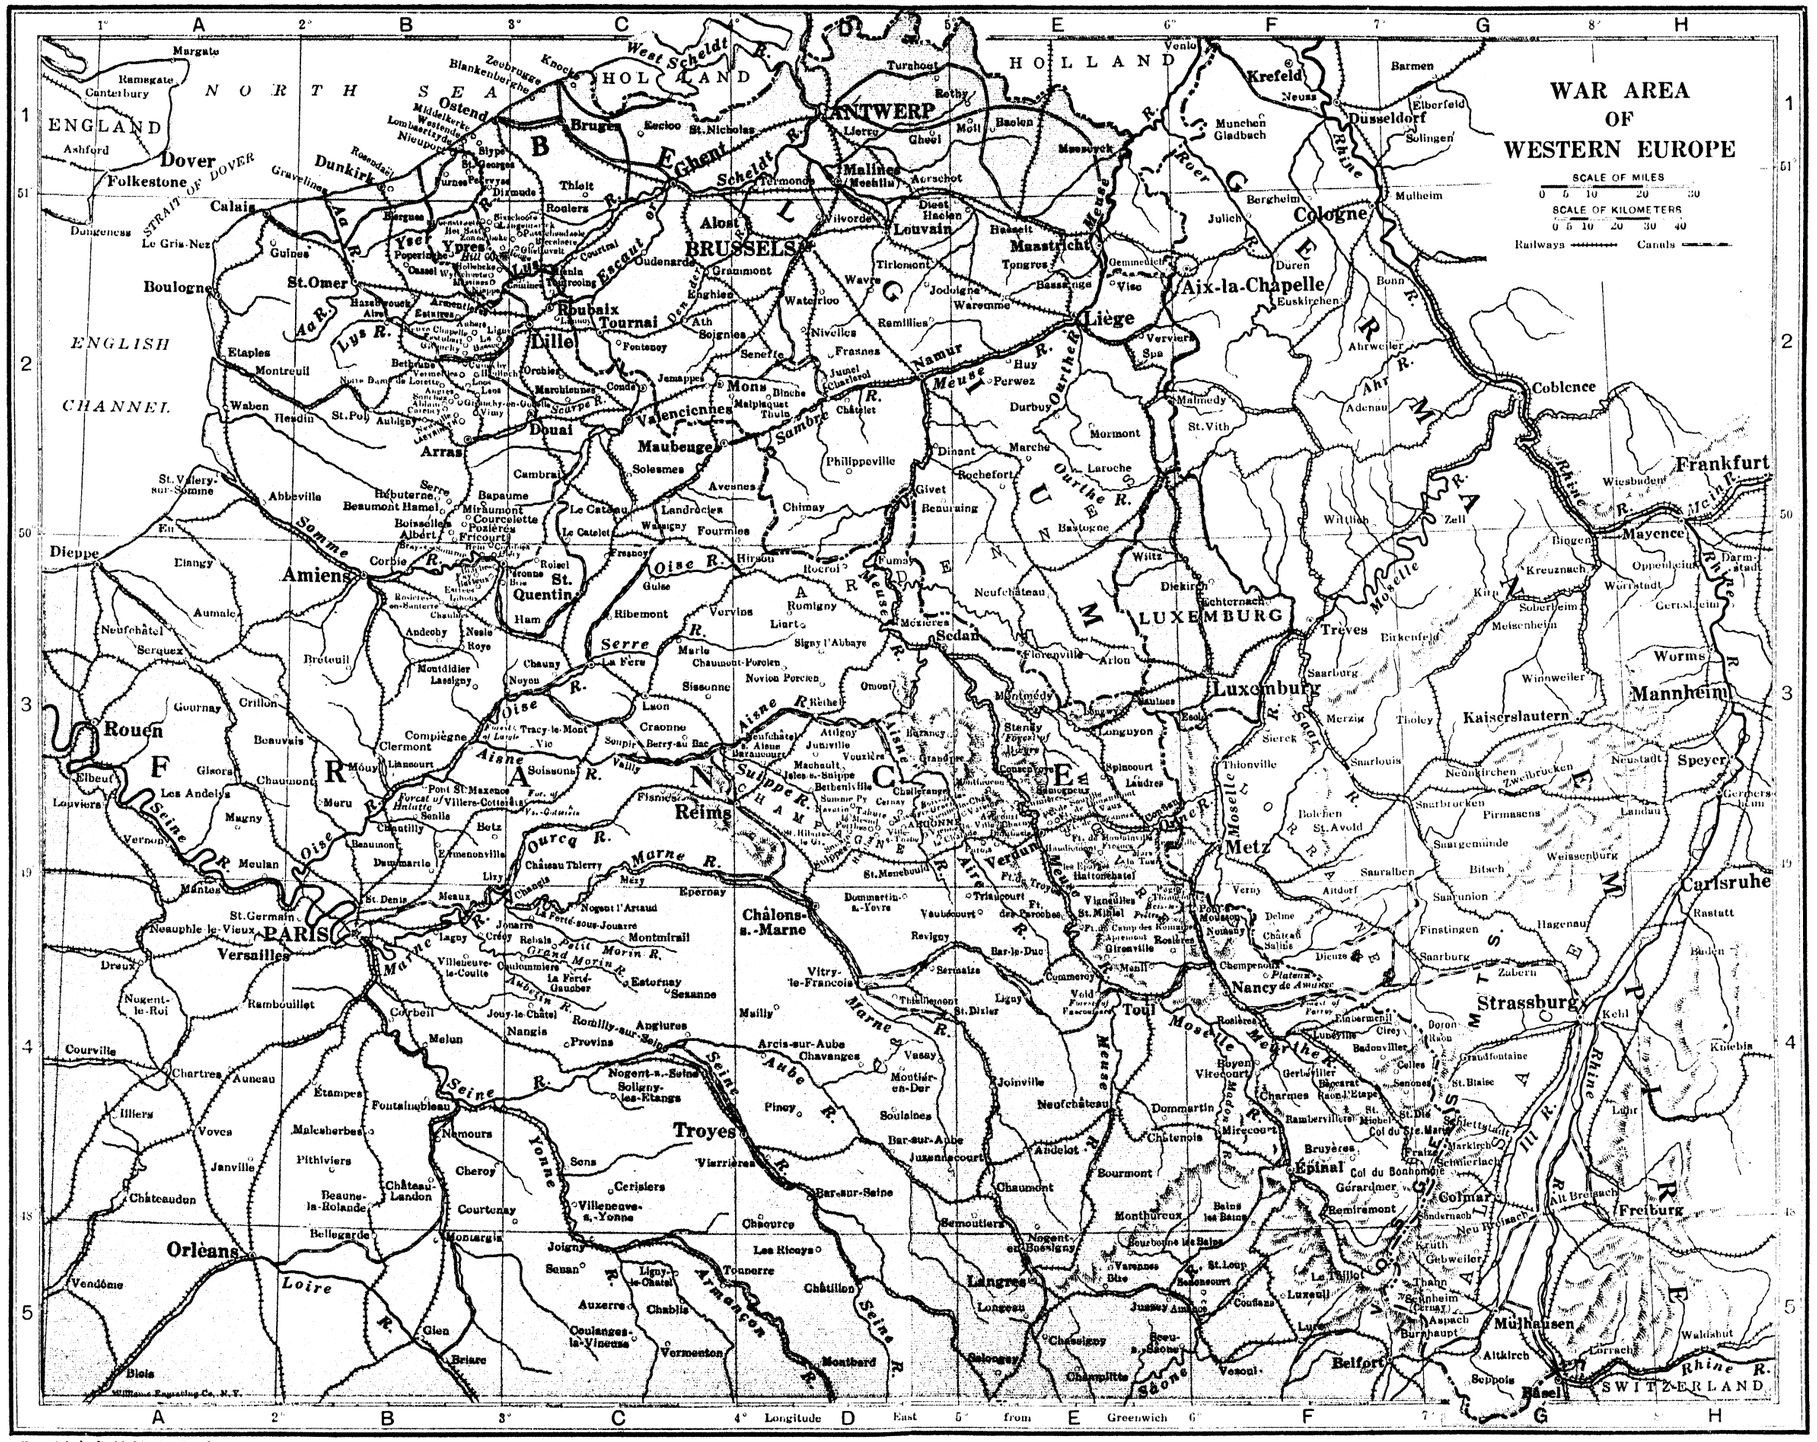
Accordingly the Germans, violating the neutrality of Luxemburg and Belgium, undertook a vast sweeping movement, with its pivot at Mont Donon and its marching flank flung beyond the Sambre and the Oise. The French, on the other hand, respecting the neutrality of the countries just mentioned, had planned to attack the Franco-German frontier directly, under the following distribution of armies: first army (Dubail)* from the Swiss frontier to Donon; second (de Castelnau)† from Donon towards Metz; third (Ruffey) in the Woëvre, facing the Metz-Thionville frontier region; fourth and fifth (Langle de Cary and Lanrezac) on the Belgian frontier.

Germany placed in line the following armies: first (Von Kluck) the marching flank; second (Von Bülow); third (Von Hausen); fourth (Duke of Württemberg;‡ fifth (Crown Prince of Prussia); sixth (Rupprecht, Crown Prince of Bavaria); § seventh (Von Heeringen); eighth (Von Deimling), to remain on the defensive in Alsace. What may be counted as a ninth army, under Von Emmich, made up of elements in immediate readiness, was to act as advance guard to the right wing, and carry Liége, on the expiration of the ultimatum addressed to the Belgian government.

As has been implied, Belgium declined to agree to the demand made by Germany to allow German troops to cross Belgian territory to the French frontier. August 3 and 4, all doubt as to German intentions having been removed, the Belgian authorities ordered bridges destroyed on all probable lines of advance, and the Belgian forces to move forward as follows: the first division from Ghent to Tirlemont; the second, Antwerp to Louvain; the fifth, Mons to Perwez; the sixth, Brussels to Wavre. The fourth was to remain at Namur, and the third in its position, Hasselt-Liége-Verviers. These movements were covered by the cavalry division (Waremme), by a mixed brigade at Tongres, and by another at Huy. The strength of this army was about 117,000 men, increased later by 18,500 volunteers, with the King in command. It was, if opposed by superior numbers, to hold good defensive positions barring the enemy's advance, and to await in these positions the arrival of troops from the British and French armies. But if this junction were impossible, then the Belgian army was not to run the risk of severe loss, but was to guard against being enveloped, and act so as to secure its communications, for the purpose ultimately of joining hands with the Allies. Opposed by equal numbers, it was to attack, if conditions were favorable. In any case, Liége, Namur, and Antwerp were to be defended.

Invasion of Belgium.—On August 4 two cavalry divisions crossed the frontier, advanced

* Augustin Yvon Edmond Dubail, born (1851) at Belfort; educated at Saint-Cyr, served in Franco-Prussian War, and later attended the Ecole de Guerre; general of brigade (1904); at Saint-Cyr was adjunct professor of geography (1874–76) and of military art and history (1880–85) and then commandant; wrote on his specialties; Commander of the Legion of Honor and possessor of various decorations; Military Governor of Paris during European War.



† Edouard de Curières de Castelnau, born in 1851; served in Franco-Prussian War; colonel attached to general staff (1896); served in Cochin-China and Algeria; commander of "Iron Division" at Nancy (1899); early in European War commanded Second Army of Lorraine and came to be known as the "savior of Nancy"; after battle of the Marne took command of the Army of the Somme; chief of the general staff (December, 1915); went to Greece and helped plan defenses of Saloniki.

‡ Albrecht, Duke of Württemberg, born (1865) in Vienna, son of Duke Philip of Württemberg and heir presumptive to the throne of the Kingdom; married (1893) the Archduchess Margareta Sophia of Austria; held commands in regiments of Uhlans, Grenadiers, Dragoons, cavalry, and infantry, rising to be general in command of the Thirteenth Army Corps; in command of German forces in Belgium (October, 1914) after its invasion and temporarily took over command of Crown Prince's army (February, 1916); received Order Pour le Mérite from the Kaiser.

§ Rupprecht, Crown Prince of Bavaria, born (1869) in Munich, eldest son of Ludwig (Louis) III, who became King in 1913; married the Duchess Marie Gabriele of Bavaria (1900); had a university education and military training in the Kriegsakademie; traveled extensively in India, Japan, China, etc. (1902–03); general, commanding the First Army Corps (1906); led Bavarian army in European War and received from the Kaiser the Order Pour le Mérite.

upon Visé, and there found the bridge destroyed. Behind the cavalry forces came an army composed of the seventh, eighth, ninth, and eleventh corps. At the same time two other corps were concentrated at and near St. Vith—thus making a force of about 300,000 men on the roads leading into Belgium and converging on Liége. On the 5th a demand was made on the governor of the fortress of Liége, General Léman, to allow an unopposed passage to the German army. This demand refused, the forts east and northeast of the town were attacked, but the Germans were repulsed. On the night of August 5 and 6 an attempt was made to break the Belgian line between the Meuse and the Ourthe, and succeeded in forcing the troops between the intervals of the forts to fall back. The mobile troops of the defense were now withdrawn to join the main army, leaving their garrisons in the forts. On the 12th large calibre fire was opened on the forts of the right bank, and by the 17th the last one had fallen to the Germans. During this time the main Belgian army had taken up a position on the Gette. On the 12th this stream was forced at Hælen, but an attempt to pass on was repulsed. Fresh troops came up and threatened to turn the Belgian left; on the south they occupied Tirlemont; on the 18th the Belgian position was critical. Hence but one course was open to the Belgians: they retired on the 18th at dusk to take a position on the left bank of the Dyle. But the Germans advanced so rapidly that the Belgians could not safely stop, and were forced instead to continue their way to Antwerp, which they reached on the 20th. The Germans entered Louvain on the 10th, Brussels on the 20th, and crossed the French frontier on the 24th.

Namur was taken under fire on the 20th and 21st of August; on the 25th the last fort, Suarlée, fell. Here, as at Liége, heavy calibres were used. The commander of the 4th (Belgian) division withdrew his forces on the night of the 23d and 24th of August, and succeeded 10 days later in entering Antwerp.

A new part now fell to the Belgian army. August 20 it had taken up a position resting on the forts of Antwerp with a detachment at Termonde. Its business now was to detain as large a force as possible, to take the offensive whenever an important engagement took place elsewhere, and to attack in the neighborhood of Antwerp whenever there was any chance of success. Accordingly a sortie was made August 25 and 26; on September 4 a German force that had driven its garrison out of Termonde crossed the Scheldt, but on the appearance of Belgian forces on the left bank crossed back, leaving Termonde once more in Belgian hands. After this date all hostile efforts to cross the river were checked and the line of retreat to the west kept open. Other operations took place, as on September 9, when the Belgians got as far as Louvain and forced the recall of a division from France to Antwerp. One effect of these operations was to delay for two days the march southward of a German corps, at the time when the retreat from the Marne had begun.

The fall of Antwerp was however only a question of time; the siege began on September 28, and in a very short time it became clear that the place could no more resist the German artillery than had Liége and Namur. A delicate question then presented itself: to hold Antwerp as long as possible without compromising the retreat. Day by day the Germans continued their work of demolishing the detached forts of the place and drew closer and closer. On October 5 Lierre was occupied and the river crossed below the town. On the 3d and 6th of October they tried without success to cross the Scheldt. Furthermore, in France, the German right was steadily approaching the sea; if they could reach it before the Belgians had made good their retreat these latter might be entirely cut off. The better to secure this retreat Ghent was occupied on the 9th by the French and British (7th division). The retreat however began on the evening of the 6th, and by the morning of the next day the entire Belgian army was across the river. The Germans had indeed crossed the Scheldt themselves, on the 6th at Schoonærde, but were unable to interrupt the retreat. On October 10 Antwerp capitulated, and on the 15th the Belgian army took its stand on the Yser, 82,000 strong. The subsequent fortunes of this army are bound up with those of the Franco-British forces on this front.

Invasion of France.—When it became evident that France was to be invaded from Belgium, the 3d (French) army moved up (August 10) to Longwy, with the 4th army taking a position further west, and the 5th stationing itself between the Sambre and the Meuse. General French (August 23) stood between the Sambre and the Scheldt, on the line Condé-Binche, with so much of the British expeditionary force, two corps and a cavalry division, as had crossed to the Continent. The German armies that had concentrated on the line Aix-la-Chapelle-Malmédy-Trêves-Metz-Strassburg now moved out, Von Kluck through Belgium, Von Bülow to the Sambre (Namur-Charleroi); Von Hausen and the Duke of Württemburg across the Ardennes on Dinant and Neufchâteau. The Crown Prince crossed Luxemburg. The Crown Prince of Bavaria marched against de Castelnau and in this region the general action opened on August 20, with the driving back of de Castelnau (invasion of Lorraine), who, however, brought up firm before Nancy, September 7. As early as August 15 some French troops had crossed the Belgian frontier and had engaged the Germans in minor affairs (e.g., Dinant). On the 22d Charleroi was taken by the Germans, who on the 23d attacked the French at this place and the British at Mons. As the 3d and 4th (French) armies were compelled to withdraw before an attack coming from Belgian Luxemburg, the right flank of the fifth army extending almost up to Namur was exposed, and that army withdrew. This in turn compelled the withdrawal of the English from Mons, and so the whole Allied army now retreated, vigorously pursued by the Germans, on the line Paris-Verdun. In spite of one or two checks suffered in the advance, as at Guise, it may be said that on the whole this movement was up to a certain point irresistible. That point was reached when the Allies turned on crossing the river Marne, and not only defeated the Germans, but forced them to retreat to the Aisne. The French generalissimo, Joffre, had constantly kept before him the plan of so turning in the retreat from the Belgian frontier, and had selected the line Paris-Marne-Verdun as the proper place, and Sept. 6, 1914, as the proper date.

On Aug. 20, 1914, General Joffre assumed command of the Allied armies in France. He had before him the infinitely grave problem of

developing suitable powers of resistance, mostly out of beaten and retreating armies, and of selecting the time, place, and manner of applying these powers, which he did at the Marne (to be described later). After that battle the Allied armies under his command successfully held off the Germans, thus upsetting their plans of crushing France before proceeding to conquests elsewhere.

The Approach to Paris.—During the retreat two new armies had been formed: one under General Foch* (the ninth), which took position between d'Esperey's (formerly Lanrezac's) and Langle de Cary's; and another (the sixth) under Manoury from Paris. This last army was to rest on the intrenched camp of the capital, face east on the right bank of the Ourcq, and attack Von Kluck's right. It is a sound principle of warfare that victory may be obtained only by beating the hostile army. When therefore the Allied armies passed into the Paris-Verdun gap, Von Kluck, sweeping down on Paris from the north, properly turned southeastward after the enemy. But he had not reckoned upon the formation of the sixth army sent out from Paris, in motor vehicles of every description to take its place on the battle front. Before, however, taking up the Battle of the Marne, we must very briefly describe what had in the meantime been taking place in eastern France; the pressure in this quarter, indeed, culminated in conflicts contemporaneous with and forming a part of the great battle of September 6. Before the sudden swerve of Von Kluck from Paris on September 4, it seemed as if the prediction that the Germans would be in Paris six weeks from the outbreak of war was about to be fulfilled. General Gallieni had begun to prepare the city for a siege. The noise of the battle could be heard by the Parisians.

Events before the Marne.—After the declaration of war the French invaded both Alsace and Lorraine. These invasions came to grief. The French twice occupied Mülhausen; the first time they were driven out, the second they retired of their own accord. They had also reached Saarburg and Saarbrücken. These invasions undoubtedly had a political end in view, conditioned of course by the possibility of military success. Incidentally, the Alsace operations were to contain troops that otherwise might have been used to resist the invasion of Lorraine. This invasion opened well enough: the French occupied Dieuze, Morhange, Château-Salins, across the frontier. But it came to naught at Morhange, in which the French, completely beaten, were driven back across the frontier, and were forced to settle down to the real business of protecting their eastern frontier. The Germans, early in August, occupied Cirey, Badonviller, and Baccarat. Farther north the army of Metz got to within 15 miles of Verdun. Still farther north the army of the Crown Prince, which had on August 22 crossed the frontier near Longwy (occupied the 27th), drove back the French, and finally took up a position between Bar-le-Duc and the Ardennes, facing eastward, and opposed by General Sarrail's army. To the west of the Crown Prince the Duke of Württemberg, who had crossed the Meuse near Mézières, formed up, facing south between the Crown Prince's army and Épernay. The first French army (Dubail) in front of Epinal faced the east; on its left General de Castelnau continued the line east and north of Nancy, along the Meuse, until it rested on the defenses of Verdun. The garrison of Verdun carried it on east, north, and west of the position until it joined with Sarrail's army.

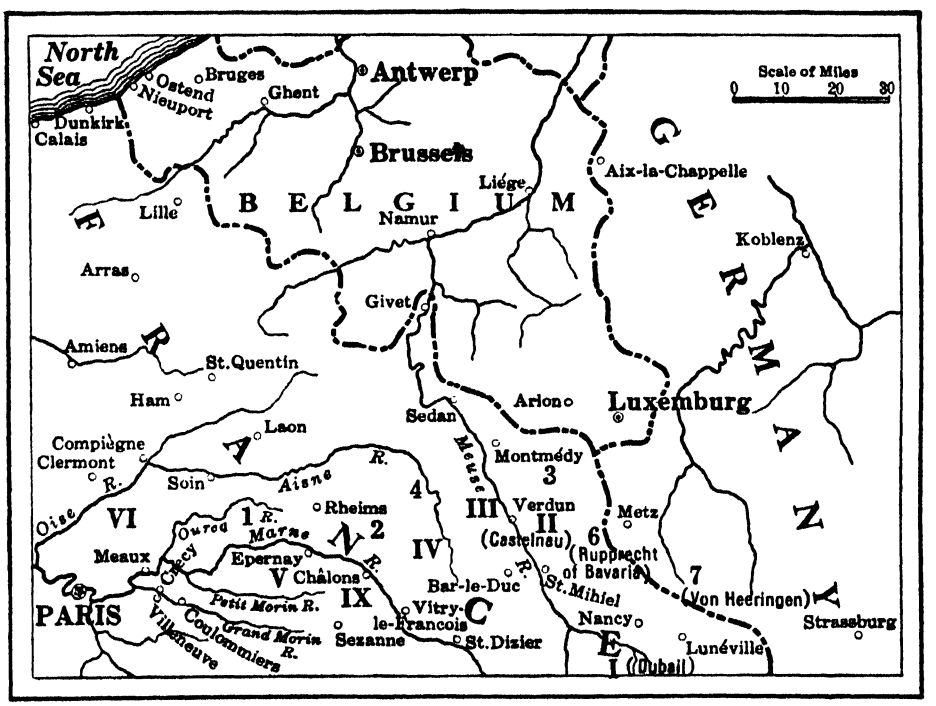
With the armies in these positions Nancy was attacked; its main natural defense in the chain of hills known as the Grand Couronne de Nancy. The Germans occupied various towns in the east, e.g., St. Dié, but not without some heavy fighting in the Vosges. On the north they pushed the French back to the Grand Couronne, but never got beyond it. The main army marched from Château-Salins and engaged the French in a series of stiff fights around the Forest of Champenoux. At the same time a part of the army of Metz, with its left resting on Pont-à-Mousson, joined in the attack. Six miles northeast of the city, on the plateau of Amance, de Castelnau had assembled his artillery. Before the troops from the north could coöperate with those from the east in attacking this position, Ste. Geneviève, 10 miles or so northwest of Amance, had to be occupied. Here Foch (August 22), with a modest force, defeated the Germans with fearful slaughter. The attack on Nancy from the east through Amance was equally unsuccessful. After much fighting along the entire position the bombardment of Amance began on August 30, 31 and lasted for more than a week. The contest over the entire line increased in intensity; indeed, from the German point of view, it could do no less, for now (September 7–8) their armies were being pushed back from the Marne, and it was vital to their success that they should break through. The Emperor himself was present at the great assaults, six in number, made on Amance, and all driven back with loss. Checked before Nancy, the Germans on September 10 evacuated Pont-à-Mousson, and on the 12th, Lunéville, St. Dié, and some smaller places. They now concentrated their efforts between Toul and Verdun, with the purpose of surrounding the latter place. To this end they bombarded Fort de Troyon on the Meuse south of Verdun and several times attempted to take it by assault. But the fort made an extremely gallant defense, and although almost reduced to extremities, managed to hold out. The final assault was delivered on the 13th of September. On the 20th a fresh advance was made on the fortresses from the east to cross the Meuse south of Verdun. The garrisons of Verdun and Toul respectively pushed out attacks on the German flanks, while the Germans themselves advanced in the centre and captured the point of St. Mihiel on the Meuse (September 25).

Grip on St. Mihiel.—The Germans crossed the river on the 26th and began to march northward towards the Aire valley. A situation was then developed that might have proved of the utmost consequence to the French. To meet it, Sarrail came down from the north, and the twentieth corps was hurried up from near Champenoux. At 5 P.M. of the 26th the advanced guard of the corps, which had crossed at Lironville, got contact with the enemy. After some extremely heavy fighting the Germans fell back to the Meuse and intrenched at

* Ferdinand Foch, born (1851) at Tarbes, Hautes Pyrénées, of a Basque family; served in the Franco-Prussian War as a subaltern; artillery captain at 26; professor of tactics in the Ecole de Guerre for five years and later, as general of brigade, its director; in command of various divisions before European War; during war commander of northern armies in France, gaining victories of the Marne and Ypres; known internationally as a strategist and author of *Principles of War* and *Conduct of War*, published in French, English, Italian, and German; received British G.C.B.

St. Mihiel, keeping their footing across the river at Camp des Romains.

While these operations were taking place on the east and south, the other German armies had proceeded southward in pursuit of the retreating French and English (as related elsewhere). On September 6, the Crown Prince's army stretched from a point southwest of Verdun to the neighborhood of Bar-le-Duc. Verdun was thus almost completely surrounded. But the tide turned with the German defeat of the Marne; they retreated northward and divided right and left at the forest of Argonne. This rocky, hilly forested ridge, about 30 miles long north and south and 8 miles wide, then became the scene of incessant close fighting all through the autumn and winter. In the northern part of the Argonne Forest the Aire runs west to fall into the Aisne. This pass, called the Gap of Grand Pré, pierced as it were by a railway, would have been useful to the French, and so was one objective kept constantly in view by them in the operations of this region. These now took on the character that prevailed farther in the west, trench warfare, with the French pressing the Germans slowly back. Farther south there was much fighting on both sides of the St. Mihiel wedge, and in the Bois le Prêtre to the eastward.



In Alsace, after the second evacuation of Mülhausen, the French took up and held an intrenched position in front of Belfort from Thann to Moos until winter, when they fell back a little nearer to Belfort. Trench conditions developed here also, except that there were desperate struggles to take and hold Hartmannsweilerkopf, a mountain about 2900 feet high some miles to the north of Thann, which changed hands several times. Apart from various thrusts and points at German territory, the main purpose of the French was to cover the great position of Belfort. In this they succeeded.

The Battle of the Marne.—Between the close of the retreat and the battle about to be described air reconnoissances, etc., had revealed the fact that Von Kluck had changed direction to the southeast. The Battle of the Marne opened on Sunday, September 6. On the 3d the British had fallen back of that river and later had taken up a position behind the Seine. About this time (September 4) Joffre had resolved to take the offensive, wheeling up the left flank of the sixth army, pivoting it on the Marne, to move on the Ourcq. The British were to fill the gap between the sixth and fifth French armies. German troops had been reported moving southeast along the left bank of the Ourcq on the 4th and were now halted and facing that river. Heads of columns were also seen crossing at Changis, La Ferté, Nogent, Château Thierry, and Mezy. The Allies' line on the 6th reached from Ermenonville, in front of the left flank of the sixth army, through Lizy on the Marne, Mauperthuis, to Esternay and Charleville, the left of the ninth army under Foch, and so along the front of the ninth, fourth, and third French armies to a point north of Verdun.

Recollecting, then, that the first and second French armies based on Belfort-Verdun were facing the German seventh and sixth, the French order of battle on September 6 was: the third army (Sarrail) Verdun-Bar-le-Duc, opposed by the German third (Crown Prince); the fourth (de Langle de Cary) across the plain of Champagne, south of Vitry-le-François, facing north, and opposed to the German fourth (Prince of Württemberg); the ninth (Foch) Mailly-Sézanne, opposed to the German second (Von Bülow); the fifth (d'Esperey) Esterney-Courtaçon, with Conneau's cavalry on his left. The sixth army (Manoury) held a line north and south, with its right at Meaux and its left near Betz. The fifth and sixth armies were to engage Von Kluck. The gap between the fifth and sixth (French) armies was held by the British five divisions and five cavalry brigades, Villeneuve-le-Comte to Jouy-le-Château.

Von Kluck left two corps (II and IV) on the east bank of the Ourcq to hold the sixth army, while he proceeded with III, IV, and VII to Coulommiers, Rébais, and La Ferté Gaucher to attack the left and centre of the fifth (French) army. He had pushed forward two cavalry divisions towards Coulommiers and Crécy to give notice of any attack possibly coming from that quarter, and had occupied the villages on the west bank of the Ourcq.

The battle began at daylight September 6 by

ARMIES AT BATTLE OF THE MARNE.

Roman numerals indicate French armies; Arabic figures German armies.
III, Sarrail; IV, Langle de Cary; IX, Foch; V, d'Esperey; VI, Manoury.
6 and 7, Heeringen; 3, Crown Prince; 4, Prince of Württemberg; 2, Von Bülow; 1, Von Kluck.

the advance of the sixth army against the villages just mentioned, and became general over the whole line from Paris to Verdun. In this struggle the British at once took a hand, and moving northeast, drove back Von Kluck's cavalry and advance guards. In the words of Sir John French, it must have been at about noon "that the enemy realized the powerful threat that was being made against the flank of his columns moving southeast." By night the British had reached the line Dagny-Coulommiers. This retreat of the Germans uncovering the west flank of the troops operating against the fifth army forced these to withdraw and enabled the fifth to reach the Grand Morin between Esternay and La Ferté Gaucher. In the meantime the struggle further east had been most serious. Foch was heavily engaged with Von Bülow, and on his right with Von Hausen. On the whole, the centre had all it could do to hold its own, while the right even fell back a little. The day closed with the balance leaning a little in favor of the Germans, except on their left, when Von Kluck began to realize that he must look to his right as well as to his front. September 7 was a day of desperate struggle, with the Allies progressing in the west, but not elsewhere. On the 8th the German right was definitely turned, and began to retreat. On this day, d'Esperey carried Montmirail, and thus made an opening on Von Bülow's right. Into this opening Foch pushed his left, and he is reported to have discovered a gap between Von Bülow and Von Hausen, of which he also took advantage. The third and fourth armies on this same day held on only by the most devoted courage in face of the equally devoted attacks made upon them. September 9 saw the scale turn in favor of the Allies. The line of the Ourcq was taken; French and d'Esperey joined hands at Château Thierry in the evening. Foch drove a part of Von Bülow's right into the marshes of Saint-Gond and attacked his left with success, while the Saxons on Von Bülow's left, after heavy losses, were pushed back towards Châlons. The third army still held. By the 10th there could be no doubt that the Allies had won a victory: the Germans retreated, and in good order, to the Aisne, where they occupied a line said to have been prepared in advance.

The Battle of the Marne must be regarded as a significant defeat for the German army. Flushed with success, having the initiative, opposed to troops supposedly dispirited by defeat after defeat during a long and exhausting retreat, the Germans found this check as unexpected as the French found it welcome. On the French side moral forces were developed whose intensity continued undiminished. The Germans, although not disabled, were nevertheless compelled radically to change all their plans of operation.

The German position on the Aisne extended from a point on the Heights of the Meuse north of Verdun, west across the Argonne country and the plain of Champagne to Rheims, northwest across the Aisne, west along the Heights of the Aisne to the Forêt de l'Aigle, north of Compiègne. This position was of great strength, carefully intrenched and thoroughly supplied. The Allied armies followed the Germans in their retreat. On the morning of the 13th the British advanced, and in spite of the resistance of the Germans passed the Aisne on pontoon bridges, a remarkable military achievement. The Allied lines, September 21, reached from the extreme south of Alsace through St. Dié, Lunéville, Pont-à-Mousson, Consenvoye, Grand Pré, Souain, Craonne, Noyon, to Le Catelet. Strong German forces held St. Quentin. In the east the Germans had pushed their way along the promontory of Hatton Châtel towards St. Mihiel and were shelling the forts of Camp des Romains and des Paroches. On the 26th they crossed the Meuse near St. Mihiel. Ypres was occupied on October 14 by the British seventh division, which had assisted the withdrawal of the Allied troops from Antwerp. A period of deadlock now followed on the Aisne, during which each adversary made the most determined efforts to outflank the other on the west.

From the Aisne to Flanders.—These efforts were logical for both sides. An attack on the German left, even if successful, would not interfere with their communications through northern France with Belgium and Germany. A frontal attack would have called for resources not then in the possession of the Allies. To turn their right, however, might result in cutting some of the communications, might even save Antwerp. It would in any case assist the retreat of the Belgians and British from that city. Moreover, it was not impossible that the Germans might strike at Calais and Boulogne; it was not inconceivable that they might even push their way as far southwest as Abbeville. Accordingly about September 20 an army was formed west of Compiègne, and its command given to de Castelnau, who was to fill the gap between the Oise and the Somme, and to push his lines north of the Somme; as objectives he had St. Quentin and La Fère. On the 21st de Castelnau's right had moved as far as Noyon; there was violent fighting around Lassigny. From Lassigny the French right moved towards Roye, while their left momentarily occupied Péronne. The Germans in the meantime concentrated a large force in the region, formed in part of troops drawn from the centre on the Aisne, and from Lorraine and the Vosges. On the 25th the French near Noyon were pushed back on that day and the next two, and the whole line as far as the Vosges was engaged. De Castelnau was driven from Lassigny, but during the next few days managed to hold his own. There was now some danger that the Germans would themselves outflank the French; to meet this possibility a new army (tenth, Maud'huy) was formed. De Castelnau was now merely to hold his position. Maud'huy's line ran from the Ancre through Arras and Lens to Lille, and his plan would be to move on Valenciennes. The Germans, who were in force in the region of Cambrai and Douai, planned to take Lille, turn on and force back Maud'huy; at the same time other forces would advance on Boulogne, Calais, and Dunkirk.

The battle opened October 1, and by the 4th the French had been pushed back west of Lens, and were beginning to retire to the hills behind Arras. On the 6th the Germans shelled Arras, and later attempted to take the town, in which they failed. They had succeeded, however, in repelling Maud'huy's offensive, and had prevented the turning of their flank. It was now decided to move the British force from their trenches on the Aisne to the left of Maud'huy, who now, like de Castelnau before him, would remain on the defensive. The situation of the Allies was critical. Antwerp was about to fall, the Lys had been crossed by the Germans and Ypres occupied by them (October 3). The channel ports as well as Lille were in danger.

The presence of Germans in the region about Hazebrouck and Ypres implied an attempt either to intercept the British and Belgians retreating from Antwerp, or to turn Maud'huy's left in the region of Lens. Joffre therefore decided to concentrate still another army between Lens and Dunkirk, which, with the British, was to form the extreme left of the Allies. This army was to be commanded by General d'Urbal, while Foch was to take general charge of the four armies—de Castelnau's, Maud'huy's, French's, and d'Urbal's. The transfer of the British forces was successfully accomplished; they were to take position north of the line Béthune-Lille, attack the enemy opposing Maud'huy's left wing west of La Bassée, and attempt to defend or recover Lille, as the case might be.

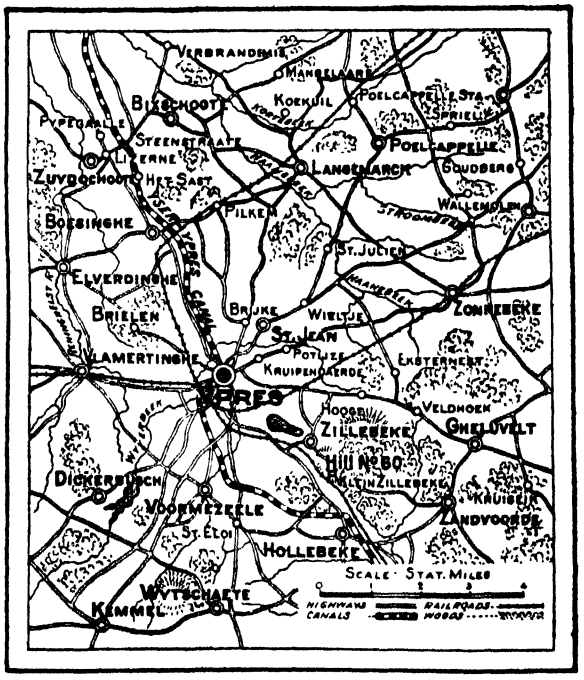
The country in which the operations of many months on the left of the Allies were to take place consists essentially of the plain of the Scheldt. This plain is broken by no natural obstacles but is intersected by many canals. The Scheldt bisects it roughly and receives the Lys at Ghent. On the western boundary of the plain rises the higher land running from Calais southeast to Péronne, at the base of which runs a series of waterways, mostly canals, forming as it were a wet ditch to the table-land to the westward. The ditch was held by the French. The Germans occupied Ghent, Bruges, and Ostend, and succeeded in capturing Lille, but were driven east of Ypres by the British. Further south, the Allies pushed the Germans back towards Lille between the Lys and the Béthune-Lille Canal. While these movements were going on the other French armies still further to the south were in conflict with the Germans from Béthune to Compiègne.

This period is signalized by Joffre's third attempt to turn the German right. Lille, although held by the French, was in danger of being cut off by the advance of the Germans west of the city south of the Lys, and the possibility was still strong that the Germans might make a rush for Calais and Dunkirk, or else try to crush the British and Belgians in retreat from Antwerp. Hence Lille was to be saved, if possible, and at any rate the other purposes of the Germans were to be negatived at any cost.

The offensive was taken up by d'Urbal's army, the British Seventh Division, and the main forces of the British coming up from the Aisne. On October 11 the Allies engaged the Germans in a position extending from Mont-des-Cats southwest of Ypres through La Bassée to Vermelles. Part of this position was carried, but the main purpose, to drive the Germans out of La Bassée and to save Lille, failed. On the 10th this city had been bombarded; on the 13th it was surrendered. To the north the Allies had met with some success, driving the enemy from Ypres as their comrades were entering Lille. On the 17th the Allies lay approximately north and south from the Forest of Houthulst, holding the villages of Langemarck, Poelcapelle, Passchendaele, and east from Ypres to Zonnebeke and south to Wytschaete and Nieppe.

Battle of the Yser.—On October 16 the Germans attacked Dixmude and opened the Battle of the Yser. The left wing of the Allies now stretched from Compiègne through Arras, Ypres, and Dixmude to Nieuport. With the command of the sea in the hands of the Allies, the efforts of the Germans were necessarily confined to the fronts Nieuport-Béthune and Béthune-Compiègne. The nature of the ground north of Béthune greatly influenced the character of the operations, at first rolling, and then, as the sea is approached, flat and open, filled with dikes and ditches. From Nieuport to Dixmude the line was held by the Belgians and French colonial infantry. Then from Dixmude past Zonnebeke came French Territorials and cavalry, then British, who continued on to Béthune. From Dixmude to Nieuport the Yser is canalized, and 15–20 feet above the ground to the west, across which runs the embanked railroad between the same points. As the country could be flooded, the bridge crossings were more than usually important. Off the roads the ground was difficult to cross, by reason of ditches, dikes, etc., and, moreover, was marshy, so that artificial cover could not be made. For eight days, by night as well as by day, the Germans assaulted the Belgian position only to be repulsed and beaten back. The British monitor fleet, mounting 6-inch rifles, did great service shelling the German right and rear, during which Knocke was partially destroyed. The conduct of the Belgians and the French colonial infantry during these eight days was beyond all praise: they had held their position against superior numbers backed by artillery under the most terrible and discouraging circumstances, and had successfully prevented the desperate efforts of the Germans to break through across the position to Dunkirk and Calais.

The plan of the Allies had been to fight a defensive battle on the Yser, and to attack with their centre and right in front of Ypres and south of the Lys respectively. French's specific objective was the capture of Menin on the Lys, halfway between Roulers and Lille, as necessary to an offensive that should take Bruges and thus cut the German communications. To hold the road Menin-Roulers-Ostend was essential to German success, because from it ran out westward all the roads leading to the Allied line between Ypres and the sea. Heavily reënforced on the 19th, the Germans themselves took the offensive, captured Roulers, most of the Roulers-Dixmude road, and all of the Menin-Roulers-Dixmude-Ostend road and railroad.



The Menin operation failed. The plan assigned to Sir Douglas Haig,* to push through and if possible to capture Bruges, became impossible of accomplishment, for the Germans, in spite of the most determined resistance, in spite of frightful losses, were gaining, and it became evident that the best the Allies could hope for was to hold on until reënforcements could come up. By the night of the 22d the Germans had crossed the Yser Canal at Tervaete, and north of Ypres had pierced the Allied lines. South of that city there was only a thin line, and the right of the Allies was withdrawing from the Givenchy-Radinghem ridge. But on the 23d the Allied prospect brightened. The Forty-second French Division (Grossetti) with howitzers had reached Furnes and relieved the Belgians in Nieuport. On the night of October 23–24, 14 assaults were made on Dixmude and

* Sir Douglas Haig, born (1861) in Fifeshire; educated at Brasenose College, Oxford; served with distinction in the Sudan and in South Africa; later held important posts of India, being chief of staff (1909–12); was general officer in command at Aldershot (1912–14); general in command in the First Army from landing of expeditionary force in European War (1914); distinguished himself in the retreat from Mons, at the Aisne, at Ypres, and Neuve Chapelle; succeeded Sir John French as commander in chief of British forces in France and Belgium (December, 1915); G.C.B. and Grand Officer of the Legion of Honor of France; author of *Cavalry Studies* (1907).

all repulsed. North of Ypres, British reënforcements had come up, moved on the enemy, captured their trenches, and beat back five attempts at recapture, and in the evening of this day a division of the French Ninth Corps was moved into the line.

So far the Germans had failed to break through. On the 24th the French on the left stormed Lombartzyde and moved on Westende, thus menacing the German right. To prevent this the Germans opened a determined attack on Nieuport, and along the Yser Canal as far south as Dixmude. These attacks failed. The next day the battle was renewed; guns were mounted on the dunes to beat off the fleet. So tremendous was the effort made that Joffre, October 25, resolved to flood the country. But the water was slow to spread over the meadows. In the meantime the Germans continued their attack, and on the 26th seemed to be in a fair way to reach Pervyse, halfway between Nieuport and Dixmude. On the 28th they attacked all along the line. But in the meantime Joffre was hurrying up reënforcements, and the water was rising. The next day attack after attack was made on Pervyse-Ramscapelle, and the latter place was captured that night. The 30th found the British fleet reënforced by five destroyers, the Germans in Ramscapelle and along the railroad, but between it and the canal embankment the water was mounting. All day the struggle continued for Ramscapelle, the embankment, and Pervyse. The 31st saw the Germans driven back across the railroad and the inundated region east of the canal.

Battle around Ypres.—The Battle of Ypres is not a separate event from the Battle of the Yser. They really overlapped, and are indeed only periods of increased intensity of combat distinguished by the prominence of a special objective on the part of the Germans, and of a special effort by the Allies to prevent the realization of that objective. Both of these battles are by the French denominated the battles in

YPRES BATTLE FRONT.

Flanders, a better name than Yser and Ypres. However this may be, operations on the Yser proper were checked by the inundation spoken of above and by the expulsion of the Germans from Ramscapelle. The scene now shifts to the southward, to the attempts made by the Germans to capture Ypres in the pursuit of the objective still held by them, to wit, to break through the Allied lines to the French channel ports.

On October 24 the Allied lines ran in a great arc from Dixmude through Langemarck, Gheluvelt, through the woods southeast of Ypres, along the eastern ridge of the Mont-des-Cats, across the Lys, to La Bassée. This position was energetically attacked on this day by the Germans, who very nearly succeeded in taking possession of Gheluvelt. Attacks on Mont-des-Cats were beaten off. At various other points likewise the Allies held. On the 23d a French division had entered Ypres, and for the first time East Indian troops entered the trenches to do battle for the Empire—Gurkhas, Sikhs, etc. They were afterward withdrawn, for climatic reasons, it was said. Fighting continued through the 25th, and on the 26th many attempts were made against Nieuport-Dixmude line. The advantage this day lay on the whole with the Germans, who had moved up the Menin-Ypres road, capturing Gheluvelt, and, south of the Lys, had got hold of part of Neuve Chapelle. On the 28th Gheluvelt was recaptured by the British, who also drove the enemy to the edge of Neuve Chapelle. Returning to the attack, the Germans recaptured the entire village, only to be driven out again, this time by a force composed in part of East Indian troops. Passing over the fighting of the next day or two, on the 28th a wireless was intercepted, saying that the Germans would attack next morning. On that day (the 29th) the French south of Béthune took the offensive so as to keep as large a force as possible of the enemy from joining in the struggle around Ypres. On the 30th and 31st French reënforcements continued to arrive.

The Allied position on the morning of the 31st ran from Zonnebeke on the north to Festubert on the southwest. The eastern ridges of Mont-des-Cats were still held by the Allies; south of this the line extended to the Lys, crossing it and curving around Armentières to Neuve Chapelle and thence to Festubert. The German plan was to hold on the flanks and to make their main attack on the centre to Ypres: if the centre could be broken, and the ridge of Mont-des-Cats captured, the Allied forces would be cut in two, and permit either an advance on Boulogne or an attack south of the Lys against the Allies intrenched there, or indeed both. At daybreak the Germans opened an intense fire on the lines southeast of Ypres and drove the British back into their reserve trenches. An equally violent attack was made across the Ypres-Comines Canal, which also drove back the British. At one or two points the lines were momentarily broken. In general the Germans had advanced in the centre and were within a very few miles of Ypres. In the north the French had taken Bixschoote and reached Passchendaele. On the Yser, at Ramscapelle, the Germans were hurled across the canal, and farther south the French pushed their offensive in the direction of Roulers. But in the centre a tremendous effort was made to crumple up the British line and capture the ridge of Mont-des-Cats and Ypres. The defense made by the British, outnumbered and outgunned, against the successive attacks of the Germans

will ever remain remarkable in their annals. These attacks came very near succeeding; the thin British lines, worn out by their efforts to hold, exposed to artillery fire, began to fall back, and the guns were even withdrawn to Ypres. The roads behind the Germans were filled with motor vehicles ready to take the troops to any point of the field. But at this moment the British stood their ground. The Germans coming up the Menin-Ypres road were stopped, and were driven out of the woods east and southeast of Ypres. To the south the defense was equally spirited, keeping the Germans from reaching the ridge of Mont-des-Cats. November 1 the Germans took Wytschaete and Messines, villages at the foot of the ridge, but failed to make the ridge itself. The struggle continued during the whole of this day; the Germans were driven out of Wytschaete, but the village was abandoned. On the 2d Neuve Chapelle was carried, but the attempt on Armentières failed. North of the Lys renewed efforts to gain possession of the ridge of Mont-des-Cats proved unsuccessful. On the 3d the French took the offensive from Dixmude-Nordschoote; the effect of this was to hold back forces that otherwise would have moved against the lines farther south.

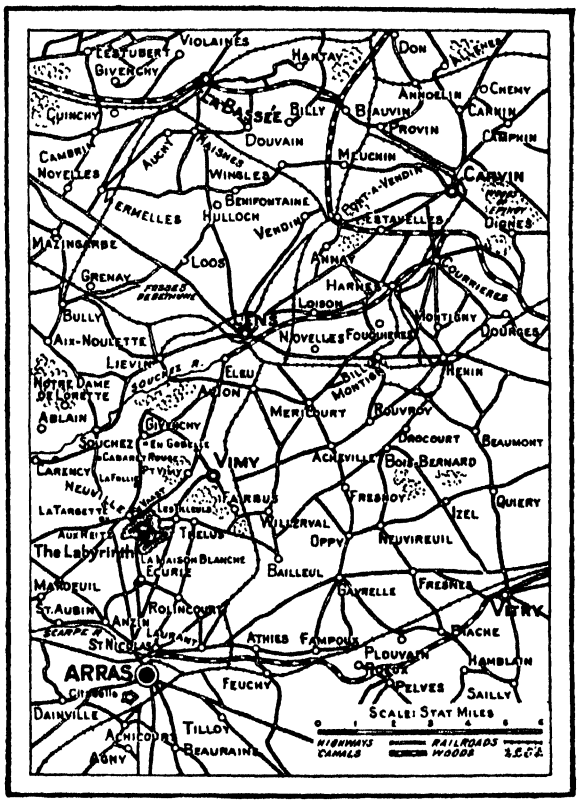
And so it went day after day. The Germans made another great effort on November 10, when they shelled Dixmude more heavily than ever before, blew up the French trenches and advanced against the town. After a terrible hand-to-hand fight the French withdrew to the west of the Yser. On the remainder of the front artillery played and assaults were made. The 11th opened with tremendous artillery fire from both sides of the Menin-Ypres road, lasting three hours. Immediately afterward 15 battalions of the Prussian Guard advanced from the east, while at the same time charges were undertaken by other troops. Everywhere north of the Lys the Allied front was attacked. Everything failed except the effort of the Prussian Guard, who got up to within a few yards of the trenches only to recoil and finally to retreat before the blasting fire that greeted them. The Battle of Ypres was over, after having lasted one month, with staggering losses on both sides. It must be accounted a German defeat.

The conclusion of the battles of Flanders, Nov. 11, 1914, marks the beginning of what may be called the long siege of the armies over the whole line from the sea to the Swiss frontier. It was a time of ceaseless watching, of hardship and trial, of continuous fighting with neither side able to advance at the expense of the other. Local advantages gained first by one and then by the other adversary in no way affected the issue, and indeed, as measured by the ground gained, could not be represented on an ordinary map. A word is perhaps not out of place in respect of the nature of the contest that now became the rule over the entire western front. Trench warfare over this front took the place of what may now be called old-fashioned operations in the open. Mining and countermining became the rule: the lines in reality were areas of parallel trenches protected by networks of barbed wire so thickly interlaid and interwoven that only long-sustained artillery fire proved equal to breaking them down in clearing the way for assault. The troops lived in and under the ground, so that the shrapnel, the ideal man-killing projectile against troops in the open, proved nearly useless, and was replaced by the high explosive shell, able to pierce overhead shelter and overwhelm the occupants. Operations degenerated into a struggle of wear and tear. So close did the lines draw to each other that antiquated methods and weapons sprang into new life: hand grenades, knives, and even clubs for close work. Trench mortars came into existence. Asphyxiating gases, in violation of The Hague Convention, were used. Artillery took a position of first importance, as was but natural, seeing that a state of siege warfare had developed. The reason of this state of affairs is to be found, in part at least, in the air service, making surprise well-nigh impossible, and allowing time for the threatened side to make ample preparations to resist any impending movement. It also greatly increased the efficiency of artillery by enabling batteries to correct their fire, and by discovering and assigning targets invisible from the batteries themselves. In this tremendous struggle some few encounters deserve passing notice before going on to the serious attempts made by the Allies to break through the German lines. Thus the French took Vermelles on December 7; later in the month there was some extremely heavy fighting in and near Givenchy, followed a few days afterward by the capture of St. Georges by the Allies (French and Belgians). Jan. 3–4, 1915, was marked by a French victory at Steinbach in Alsace. Soissons, too, became the scene of great activity. North of this city the French on January 8 captured Hill 132, and pushed their way eastward. The German counter attack, made in force, drove the French in from the east, and finally recaptured Hill 132. The French were compelled to cross the river. Under any other circumstances this action would have constituted a considerable affair; in reality it was only an incident.

The next action standing above the general level was that in the region of La Bassée. On January 25 a German demonstration was made along the whole front, from Festubert to Vermelles and as far north as Ypres. Béthune was shelled. This contest lasted several days and ended in the repulse of the Germans. The French won some success in Champagne during this period, in the neighborhood of Perthes (February 16), and on the whole had rather the better of it until the month of March.

Battle of Neuve Chapelle.—The event of this period is, however, the Battle of Neuve Chapelle, an operation carried out by the British. The immediate purpose of the Allies was to carry this village, as the first step in an effort to pass on and capture the ridge Aubers-Illies, held by the Germans, and curving westward between these two points. If this ridge could be taken, it was not impossible that the attack might even result in the capture of Lille, an event that would have been of the first importance to the Allies, as menacing the German position northward to the sea. Neuve Chapelle itself sits in the easterly angle of a lozenge formed by the roads breaking off from the main road La Bassée-Estaires. The village itself, with the eastern side of the lozenge, was held by the Germans; the western side by the British. Strongly reenforced, the British at 7.30 A.M. on the 10th of March opened a bombardment said to surpass in intensity anything ever heard before. It was effective everywhere except at the extreme north point of the front of attack, where it failed to break down the wire entanglement. After 35 minutes the fire was shifted to Neuve Chapelle, and the British infantry advanced.

In the village and south of it the attack succeeded, but to the northeast was held up by wire entanglement just mentioned. It held off the advance until the artillery succeeded in breaking it up. By 11 A.M. the whole village and wood leading from it northeast and southwest had been taken. So well directed was the artillery fire that the attempt of the Germans to bring up troops was completely stopped. The British, however, made no further progress.



The German fire had cut all or nearly all the telephone wires and communication with the rear became almost impossible. Furthermore the orchard north of the village had remained in German hands and so threatened the flank of the advance towards the Aubers-Illies ridge. There thus arose a delay of four and a half hours, which the Germans took full advantage of to repair their lines, organize fresh defenses in rear, and bring up reënforcements. When the British advanced again, they were stopped both north and south by machine-gun fire.

The next day found the British east of Neuve Chapelle, but the remainder of their plan had miscarried. On the 12th the arrival of German reënforcements put the British on the defensive. That night the British set to work to consolidate the positions won, some 1200 yards on a front of 4000. The 13th was taken up in beating off a few German counter attacks. On the 14th the battle died down on both sides. The British casualties were extremely severe, over 12,000 killed and wounded; so also were the German. The net result of the battle was undeniably a British defeat, in that they had failed to carry through their plans. But it is also undeniable that they had managed to break the enemy lines; whether the price paid was worth it, is doubtful.

After Ypres and Neuve Chapelle.—In the next month, April, 1915, the Germans made another great effort on a large scale to break through the Allied lines on the north and so gain the channel ports. In anticipation of their advance the British took the offensive themselves on April 17, with the result that, as before in the same region, the German plan was frustrated. The Allies were posted along an arc running from Steenstraate on the Yperlée Canal east, southeast, southwest, through Langemarck, through Broodsende-Becelaere, from which last point the line curved round to Hill 50 and to the Ypres-Comines Canal. The chord of this arc was formed by the Yperlée Canal to a point about a mile southeast of Hill 60. From this position the Allies were driven back to a line close to Ypres, with especially heavy fighting in and near St. Julien, where the Canadian contingent distinguished itself. The Germans even got across the canal at Steenstraate, and for a time the position of the Allies was precarious. In this particular battle of Ypres the Germans made use of deadly gases. By means of these the French troops defending the northern part of the arc were driven out; these gases were later again and again discharged against the British. Until respirators were furnished later, there was no living in the fumes let loose on the trenches under attack. Day after day the contest went on, the Germans attacking and the Allies resisting, with the utmost desperation. On the 30th a vigorous attack by the French pushed back the enemy on the north of the line. On May 8 a concentrated effort—one of many—was made to reach Ypres. Allied (British) attempts to push back the enemy coming up on both sides of the Ypres-Roulers road were unsuccessful. On the 9th, fresh but unsuccessful attempts were made on Ypres. On this day the French were successful at La Bassée (Carency), the English unsuccessful south of the Lys. On the 11th, Ypres was severely shelled. On the 13th, the British met with some success on the Ypres-Roulers railway, as well as towards the north. The French on May 15 recaptured Steenstraate and got up to the canal; by the 17th they were masters of the left bank.

In its entirety this battle of a month's duration must be regarded as a defeat for the Germans. Setting out to take Ypres and break through, they had, in spite of many local successes, largely at least at the outset due to their use of poisonous gases, failed to carry out their plan. They had lost many thousands in killed, wounded, and prisoners.

During the later part of the struggle around Ypres the British made a second attempt to carry the Aubers ridge with the capture of Lille as the principal objective. The battle opened May 9 and lasted until May 20. The net result was that the Allied lines were advanced some 600 yards over a front of 4 miles. This battle comprised two actions known as Aubers Ridge and Festubert.

ARTOIS BATTLEGROUND.

Battle of Artois.—Before the contest before Ypres, just described, had closed, the French began the tremendous Battle of Artois, on the plateau of Notre Dame de Lorette and south of it, or the line La Bassée-Arras.

If this operation could be carried through, German communications behind it would be threatened and there might be a chance of taking Lille. The German positions on this front were of the strongest.

They held the high ground around Loos, the ridges north of the Souchez stream, and most of the plateau running south of Lens to the banks of the Scarpe. Upon this position had

been expended every effort of modern military science to make it secure. Between Souchez and Arras was a network of trenches known as the Labyrinth (underground), about 2 miles square. The ridge of Notre Dame breaks off abruptly to the south in spurs, the eastern one of which, the Souchez spur, commands Ablain St. Nazaire and a sugar refinery between Ablain and Souchez, held by the Germans. From one of these spurs trenches had been constructed across to the Arras-Béthune road. South of Ablain are the heights of Carency, connected by trenches with Ablain and Souchez, and by another series, the "White Works" (white chalk), with La Targette on the Souchez-Arras road. East of La Targette is Neuville St. Vaast, like the Labyrinth, an underground fortress. In other words, not only was the surface of the ground admirably fortified by elaborate trenches and redoubts, supplied with ammunition, etc., but subterranean areas had been excavated to house troops and supplies, where, safe from aërial observation and overhead fire, they could be kept until needed, to repel the enemy already exhausted and reduced by his advance.

General d'Urbal was in immediate command, assisted by Foch and Joffre, but to General Pétain, later to distinguish himself at Verdun, belongs the credit of the reduction of the Labyrinth. Seven corps were engaged, and over 1100 guns of all calibres had been concentrated for the preparation. For months the French sappers had been occupied in mining the German defenses. The battle opened at 6 A.M. on Sunday, May 9, by the fire of the 1100 French guns. Three-quarters of an hour later the Carency mines were blown up, as were others on the Notre Dame ridge. The bombardment lasted three hours and at 10 the infantry moved out. All day the battle raged. Three of the five trenches on Notre Dame plateau were carried; when night fell the French dug themselves in. South of Notre Dame, at the same time, the French attacked Carency, took the trenches, but failed to take a work on the east. They nevertheless pushed on to Souchez. La Targette was taken, as was part of the White Works. Passing on, a part of Neuville St. Vaast was then captured. On the 10th the fighting continued. On the 11th the attack on Neuville St. Vaast reduced the cemetery, but the Labyrinth still held out. The next day Notre Dame de Lorette fell, as did Carency. From Carency the French pushed on to Ablain St. Nazaire. But the Germans still held on to a spur of the Notre Dame ridge, the spur of the "White Way." On the 21st, however, the spur was carried, as was most of Ablain. A few Germans, however, still held the cemetery, only to be dislodged on the 28th. Three days later the French took the Souchez refinery and in June captured the Labyrinth. Indeed, fighting went on in this region until the autumn. Each side is estimated to have lost 60,000 men in this tremendous battle. Having regard to the ultimate purpose of the French in taking the offensive, it must be admitted that they failed: they had not broken through the German lines. Lille was still in possession of the enemy whose communications were still open. In all probability, however, the Germans had been kept so busy as to have no troops to spare for the attempt on Ypres previously described. And it was further proved that with sufficient preparation by artillery and mining German positions could be carried to a considerable depth.

Simultaneously with the Battle of Artois, there was considerable activity further east in the Argonne region and on the St. Mihiel salient, on the western front of which the French succeeded in capturing Les Eparges. They also met with some success on the southern face, on the edge of the Forest of Apremont. Southeast of Lunéville in the Vosges the Germans took the Ban de Sapt on June 22. In July it was recaptured by the French, who also made some small advances in Alsace.

Battle of Champagne.—The French check in the Artois country was followed by fighting chiefly in the Vosges, mostly of a local character. This continued until September, when the French opened an offensive for which they had long been making preparations. Apart from the advantage that would accrue if this offensive should succeed, there were reasons of a political order that called for something more from the Allies than mere nibbling at the German lines. The German campaign in the east was meeting with success. To counterbalance this success, and at the same time to relieve the pressure on the Russians, it was regarded as necessary to deal the common enemy a mighty blow in the west. To keep him ignorant of the precise point at which the blow was to fall, for weeks previous substantially the entire German position was subjected to intense bombardment. Beginning in the middle of August, this bombardment was especially heavy on the Belgian front in the Souchez region, before Arras and Roye, along the Aisne, in Champagne, and finally in the Argonne and Woevre districts, and in Lorraine. As the time drew near for the infantry work, the bombardment increased in intensity over the front selected for attack. That front was in Champagne, between Auberive on the west and Ville-sur-Tourbe on the east, a distance of some 15 or 16 miles. The centre of the French line was defended by the 6th, 5th, and 4th armies. The front held by the 4th (Langle de Cary) was the one selected from which to deliver the offensive.

Some 4 or 5 miles behind the corresponding German position and roughly parallel to it, runs the Bazancourt-Challerange railway. If the French offensive could reach this railway a mischief would be done to the enemy, for this road communicated with Metz on the east. But the natural strength of the German position had been increased by the arts of the engineer. From Auberive this position followed the crest of the low ridge north of the Suippes River, rising, as it passed through Souain, then by Perthes, with Tahure behind (north of) it, and terminated at Massiges. To say that this whole position was intrenched is scarcely to do justice to the effort spent on its defensive organization; not only were there the usual trenches (lines) facing the enemy position, but cross trenches had been dug over the entire area, from which flanking fire could be delivered upon the enemy if he should succeed in passing the first and subsequent lines. There were really two positions, two miles or so apart, the first immediately in front of the French, the second on the reverse of the ridge. The area between them was a network of trenches and entanglements.

On September 22 the bombardment increased in intensity and was kept up until the 25th, when the French infantry broke out of its own trenches and gained practically the first line positions of the enemy by 12 o'clock noon. At some points, however, the Germans held, and the work therefore became in some sort a series

of isolated and detached actions. On the left the attack was exposed to the German artillery fire from the plateau of Moronvillers, in front it came up against the salients of the ridge. The first line was carried, however, and the right of this attack held all day, and later pushed on deeper and deeper into the German network. To the right of the St. Hilaire-St. Souplet road, much the same thing happened, the French left being stopped while the right managed to advance and took all four lines of trenches. Further east the enemy trenches were penetrated to a depth of about 500 yards, but machine guns stopped the advance. North of Souain the French met with pronounced success, carrying trench after trench almost to the Navarin Farm. Between Souain and Perthes the German position had been most solidly organized, but in its eastern portion the defenses were comparatively weak. Here the French delivered their main attack in this part of the front, the remainder (the left) playing a secondary part. The attack carried the French advance as far as the Souain-Tahure road. In the Mesnil sector (east of Perthes) the greatest difficulties were encountered, but still further east, north of Beausé-jour, the French had better fortune, pushing north as far as Maison de Champagne. On the extreme right (Massiges) the colonial troops reached the top of the plateau in an incredibly short time, but could not advance, because of the effective machine-gun fire here developed. The first day's fighting therefore had pushed back the enemy lines in the centre: the flanks had not been driven in, but the French managed to secure the ground gained. In the west, on the 27th, the French got up to the Epine de Vedegrange, but no farther. On the next day the fighting died down in this sector of the battlefield. In the Souain sector the French on the 28th made contact with the second German position in these parts. Between Souain and Tahure, in front of Perthes, contact with this second position was also established, but here the French remained, digging themselves in, until October 6.

While all these events were occurring in the centre and left, the most desperate struggle of all was going on to the north of Massiges. From the plateau three long spurs run down like fingers, whence the name given to them and to the plateau from which they spring, La Main de Massiges. These were strongly held by the Germans. The French accordingly attacked across the back of the hand, and got up on the plateau.

The general result of this battle, the local and separate contests of which were not over before October 4, was that the French gained the Massiges plateau, the Tahure ridge, and various points in the German second position. The elaborate intrenchments and work of the first positions were taken. The total number of prisoners officially given was over 23,000; many guns and much war material fell into the hands of the French. But as in all the other cases of real battles, as distinguished from the daily local strife, on the long front, the German lines were not broken; they were merely pushed back. Although, therefore, the Germans had suffered a defeat in that they had been driven out of their positions, yet it must be admitted, on the other hand, that the French had been disappointed of their purpose. This apart, there can be no question as to the thoroughness of the German defeat. The French staff estimated the German loss in killed, wounded, and missing at 140,000.

Battle of Loos.—While this great battle was going on in Champagne, the Allies were renewing their offensive in Artois, the British in the Battle of Loos, the French in that of Vimy. As before in this region, the objective was to push into the plain of the Scheldt. Reënforcements both of men and of guns had given the British the necessary elements to undertake the offensive. Thanks to this increased strength, they had extended their trenches southward to Grenay, opposite to Loos and Lens. It is apparent, therefore, that in the month of September the Allies undertook a general offensive, for in addition to their two mighty efforts in Champagne and Artois, the Germans were kept busy in other regions of the front, by demonstrations on the extreme left, in which the navy took a part, in front of Ypres and also in the Vosges.

In spite of the Battle of Artois, the Germans still held the eastern slopes of Notre Dame de Lorette; from this point their lines stretched north in front of (west of) the Loos-Hulluch-Haisnes ridge to the canal near La Bassée; south, they curved through Angres and Liévin to Souchez, thence eastward of the high road from Béthune to Arras. Between Haisnes and Hulluch lay the powerful Hohenzollern redoubt, a work more or less like the Labyrinth. Their general position thus formed a sort of salient oriented southwestward on the axis Souchez-Lens. The plan contemplated that the British should drive at the northern side of the salient (Loos-Hulluch-Haisnes), the French at the southern (Vimy Heights). The capture of either of these positions would force the evacuation of Lens. The terrain over which the British were to advance was covered with villages, pits, galleries, slag heaps, and mine works generally, all connected by trenches. Moreover, the industrial pits and galleries had been taken over and extended by the Germans for war purposes. The entire area had been defensively organized, and equipped with machine guns, artillery, and small works and trenches generally. In front of the French position, northeast of Neuville St. Vaast, lay the wooded heights of Vimy running northwest to Givenchy with hills 140 and 119 as conspicuous elevations.

Preparations for the great offensive were completed by September 24. Specifically the British were to capture Auchy, Haisnes, Pit No. 8, and the Hohenzollern Redoubt; further south the ridge between Hulluch was to be the objective, involving the capture of Loos, and Hill 70 to the east of the town. The French, as stated, were to attack the Vimy Heights. Amply provided with artillery, the British besides were to employ, for the first time, a gas that stupefied but did not kill. The action opened with artillery preparation on the 24th. During this day the entire German position within range was taken under fire by both the French and the British artillery. On the 25th this fire was renewed very early in the morning, and suspended two hours later in order to allow the infantry to advance. This they did at 6.30 A.M. The French, however, continued the artillery preparation until noon. On the extreme left, between the canal and Pit No. 8, the British met with a serious repulse. Part of the Hohenzollern Redoubt was carried, so was Pit No. 8. Haisnes was taken as early as 8 A.M., but had to be abandoned by 5 P.M. Loos, after a terrible struggle, fell to the English, as did Hill No. 70. A counter-attack by the Germans recovered most of Hill

70. As night fell, the British line ran around the south of Loos to the western part of Hill 70, past the west of Hulluch quarries to Pit No. 8, then east of Hohenzollern Redoubt, and so back to the original position. The fighting was renewed the next day with no material results on either side. By night the line ran back from Hill 70 to the Loos-La Bassée road, then north along this road, then northeast of Hulluch. The remainder of the line was unchanged. On the 27th the Germans recaptured Pit No. 8 and forced their enemies back to the eastern part of Hohenzollern Redoubt. The next few days were filled with desperate fighting, more or less localized. The net result, so far as the British were concerned, was the capture of Loos and a portion of Hill 70.

The French, on their side, advancing a little after 12 o'clock noon, had made but slight progress. They took the Souchez cemetery, but lost it later, and reached the lower slopes of Hill 119. The German garrison of Souchez retired to Hill 119. On the 28th Vimy Heights were attacked; the western slopes and a large part of the wood of Givenchy were taken.

This battle must be regarded as a failure on the part of the Allies. It would seem that the British had no reserves available to clinch the results obtained in their advance. The Germans thus had time to rally and counterattack. It would seem too that the French perhaps made a mistake in delaying their advance on the 25th by six hours. Had they moved out at the same time, the French left and the British right might have joined hands. The Allies' losses were very heavy. The British alone lost 50,000 men in this battle. Disappointed, however, as were the Allies in respect of the main purpose they had in view, both in Champagne and in Artois, they had, nevertheless, made some real gains. In the latter regions they were gradually pushing the Germans to the rim of the plain of the Scheldt. The British gain had, as it were, pushed a salient in between La Bassée on the north and Lens on the south, thus creating in some sort two German salients.

After the battle the French relieved the British from the French left up to and including the village of Loos and a part of Hill 70. The position of the Allies in this new salient of Loos was none too secure. But apart from this, it was clearly incumbent on the Germans to try to recover the terrain they had just lost. They accordingly, on September 29, attacked the northwest face of the British salient, but were beaten off. The French on their side advanced to Hill 140. The next day the German attempts on the northwest face were renewed. October 1 the French made more progress on Vimy Heights. October 3 was marked by a fresh attack on the northwestern face, and most of the Hohenzollern Redoubt was recaptured. On the 8th a counterattack was made on the British position. It was repulsed with loss, as were the attempts made on the French near Neuville St. Vaast. Later, October 13, these attempts on the French were renewed with very much the same results. On this day the British themselves took the offensive in an effort to extend the northern face of their salient. This effort very nearly succeeded in gaining the Hohenzollern Redoubt for the English, a part of which only was held, however. October 19 the British line ran from Auchez-Hohenzollern, St. Elie, and then, so as to encircle Loos on the east and south, back to the old trenches.

The close of the year 1915 saw the adversaries confronting one another on this as on other portions of the front. But in respect of the northern region it must be remarked that unsuccessful as the Anglo-French efforts to break through had proved, yet they had succeeded in pushing back the Germans to the last ridge of hills separating the area of conflict from the plain of the Scheldt. One more drive like the September one, and the Germans might be pushed into the plain and so lose this part of France. Hence they reënforced their hold by reenforcements estimated at 600,000, and throughout the winter obtained a few minor successes.

Verdun.—But these, as well as all the other events, gave way in February, 1916, to the most determined attempt yet made by any of the combatants on any front to win a decision. On the 21st of this month the Germans opened their assault on Verdun. But this place had changed its character since the opening days of the war. Warned by the fate of Liége, Namur, and Maubeuge, it had passed from the condition of fortress pure and simple to that of fortress related to an army in the field. Hence its reduction was no longer a matter of sufficient pounding by 42-centimeter guns. General Pétain* was summoned to conduct the offense.

The first German drive was delivered against the point of the Verdun salient by heavy columns, over a 7-mile front, from Consenvoye to Azannes. After a prolonged bombardment of heavy artillery—it is estimated that during the first four days no fewer than 2,000,000 shells were fired—these columns struck the French advanced lines, and at the end of a week had advanced 4 miles towards Verdun. The right, advancing along the Meuse, had reached Champneuville; the centre, after taking Beaumont, faced the ridge known as the Côte de Poivre; while the left, after capturing Ornes, threw itself against Fort Douaumont, the most northerly of the permanent forts of Verdun. After several costly repulses this fort was stormed and held by the 24th Brandenburg regiment.

The second phase of the attack shifts to the east. Pushed back to a line running west from Douaumont along the Côte de Poivre to the Meuse, the French now lost Mauheulle and Fresnes. From these points the Germans made their way across the Woevre plain to the edge of the plateau on which the permanent forts are constructed, and advanced to Eix, about 5 miles from Verdun. The total gains so far amounted to over 100 square miles.

Operations in this sector culminated in assaults on the fort and the village of Vaux, 2 miles southeast of Fort Douaumont. From conflicting reports it would seem that the German infantry finally won the village, but failed to carry the fort and the slopes to the east.

The Germans now turned their attention to the territory west of the Meuse. Their advance east of the river had found its flank exposed to artillery fire from the west. Moreover, it might be possible to cut the western railroad communication of Verdun. Opening in this region on March 6 the Germans, after taking Forges and

* Henri Philippe Pétain, born in 1857; delivered notable lectures at the École de Guerre, for which he was decorated by King Ferdinand of Bulgaria; at beginning of European War was colonel of the Thirty-third Regiment of Infantry at Arras; distinguished himself in the retreat from Charleroi to the Marne; promoted general of division; in command of an army corps took Carency, breaking through the German front; in 1915 was in command of part of the "Iron Division" of Colonials in Artois and Champagne; given command of armies around Verdun.

Regnéville found further progress barred by two fortified heights—the Côte de l'Oie and Le Mort Homme, both over 800 feet high. On the lower hills between these points is the wood known as the Bois des Corbeaux, strengthened with entanglements and batteries. Here, finally, the Germans made some gains, so that their advance, some 2 miles south of Forges, brought their line into approximate alignment with their positions farther east, and threatened the French line, strongly posted on Le Mort Homme. Moreover, they had some success as far west as Mélancourt.

In the fifth week of the campaign the point of attack was shifted still farther west, about 3 miles beyond Le Mort Homme. On March 21 the wood northeast of Avocourt, and on the 22d Haucourt Hill, were captured. This left the French positions at Mélancourt and Béthincourt exposed. The greater part of Le Mort Homme, as well as the woods that flanked it, was now held by the Germans.

On the night of March 30 the town of Mélancourt was attacked from three sides, and at dawn carried. The Béthincourt position was thus rendered still more precarious, though the French had succeeded in retaking a small section of Avocourt Wood.

In the meanwhile Douaumont ridge and vicinity were first shelled and then attacked by infantry. A sudden attack gave the village of Vaux to the Germans. The next day Caillette Wood, between Vaux and Douaumont, was penetrated by a strong German attack, but the French first lines, about 300 meters south of Douaumont village, held against a German assault, in which the attack was made in successive waves of great strength.

The struggle over Caillette Wood, the first week in April, although severe, yields in interest to the operations now resumed west of the Meuse. On April 5 the Germans took Haucourt, half a mile southeast of Mélancourt. The withdrawal from Béthincourt was now rendered inevitable, and skillfully made on April 8, with small losses; the new French line was established a mile to the south. Still keeping the offensive and continuing to make gains in this sector, the Germans penetrated the French lines on hills 265 and 295 (near Le Mort Homme), and captured a mile and a quarter of French trenches on Termiten Hill. This latter gain marks substantial progress towards Hill 304, the key position of this whole region. An interesting and novel illustration of the future powers of air craft in actual battle was furnished at Côte de Poivre. As the Germans were bringing up a battery to shell this ridge an air squadron came up and dropped bombs on the battery from an altitude of less than 1000 feet. The first round of bombs killed 9 horses and 30 men, and wounded and frightened so many others that the guns had to be abandoned. On June 15, 1916, the issue was still undecided, with the French successfully beating off all efforts to break through.

The purpose of the Germans in selecting Verdun as a point of attack gave rise to much discussion. The date of the attack was well chosen, in anticipation of a general Allied offensive on the western front, but Verdun itself had long ago ceased to be a fortress in the technical sense of the word. Hence the German effort falls into the same class as all others, whether German or Allied, to obtain a decision in the west. The effort made at Verdun might have produced better results if made nearer to Paris. Even if successful it would result, moral effect apart, in merely straightening the German lines (accompanied of course by a similar straightening on the French side), unless, indeed, it was believed that a real breach could be made, opening the way for a real advance into the heart of France. It is declared in some quarters that the determining condition of the selection was for political and dynastic reasons the need of a victory for the Crown Prince; and it is further declared that Von Hindenburg and Von Mackensen both opposed Verdun as the theatre of the new offensive. One thing stands out: the enormous losses of the Germans for the sake, so far, of a few square miles of French territory.

Campaign in Picardy.—The expected Allied offensive on the western front began in the last week of June by a continuous shelling of the German lines on the British front. The point chosen for the attack was at last seen to be the junction of the British and French lines near the Somme River.

On July 1, at 7.30 in the morning, the British advanced from the direction of Albert and the French captured trenches north and south of the Somme in the direction of Péronne. The Germans were unprepared for the French thrust which in a week carried General Foch's troops to within 2 miles of Péronne.

More stubborn resistance was met by the British, who, after capturing Montauban and Fricourt, were halted around Contalmaison and Ovillers. It took them nearly two weeks to straighten out this line before a new advance was possible in the general direction of Bapaume. It was estimated that in the first two weeks of the drive the Allies took 23,000 prisoners, the total German losses running near to 80,000 men. While the main Allied blow was delivered at the Somme, the German lines in Artois and in Champagne were kept on the alert by raids and feint attacks. A novel feature of the new Allied offensive was the method of trench raiding after prolonged shelling, the trench being abandoned as soon as its living occupants had been bombed or taken prisoners.

Meanwhile the German attack at Verdun lost nothing in violence. Around Le Mort Homme on the west and Fort Souville in the east, the German soldiers were sent in mass formation against the French, and slowly the German ring was brought closer to the ruined town.

The new Allied attack in the west was part of a general plan whereby the Allies attacking simultaneously on all fronts—France, Russia, Italy—hoped to deprive the Central Powers of the advantage they hitherto derived from their interior position of being able to move troops quickly from one threatened position to another. The success achieved in the early part of the new offensive proved the soundness of this plan.

III. **Eastern Theatre.** An unexpected blow by the Russians through East Prussia early in the war had almost upset the German plan, but for the superior generalship of Von Hindenburg (Tannenberg). Meanwhile the Austrian advance to hold the main Russian armies failed in the rout through Galicia, and October, 1914, found the Russians astride the Carpathians. To save the Austrians, Germany hurried troops from France and organized a counter-offensive through Poland, which developed during the winter and spring, 1914 and 1915, and drove the Russians far behind their own frontier.

Trench warfare marks this front during 1915–16 until June, 1916, when the Russians, finding Austria advancing in Italy and Germany engaged at Verdun, once more began a successful drive through Galicia that reacted on the Italian and Verdun fronts.

The detailed account of these military operations falls under the following heads: (1) Russian drive into East Prussia, outgeneraled by Hindenburg and culminating in defeat at Tannenberg; (2) Austrian advance through Galicia to cut the Kiev-Warsaw railroad; (3) defeat of this Austrian campaign and pursuit by the Russians to the Carpathians; (4) German advance in Poland, including first attack on Warsaw; (5) siege of Przemysl; (6) Austro-German advance in Galicia, with rout of Russians, including loss of Poland, and taking up of intrenched line from Riga to Dvinsk to Lutsk and down to the outer Bukowina border; (7) Brusiloff's drive into Galicia, June, 1916. The struggle on the east front was conditioned by a number of circumstances. We have first the German plan itself, to smash the French and then turn upon the Russians before they could get ready. A corollary of this proposition was the retention on the east front of but few troops. Next we must take into account the fact that the Russians mobilized and were in readiness far faster than any one thought they possibly could. Lastly, and of paramount importance, is the nature of the terrain and its organization in view of war, and then the configuration of the frontier itself. The striking feature of this configuration is that Russian Poland projects like a huge bastion between Prussia on the north and Galicia on the south. The political frontier separating the conterminous states is, on the whole, not a military frontier. Hence Russian Poland lies peculiarly exposed to attack from the north, west, and south. On the German frontier of East Prussia lie the Masurian lakes, forming a natural obstacle to invasion either east or west. On the south, and some distance from the political frontier, stretches the Carpathian Range, the natural protection of Hungary. Through this great central plain run many rivers; chief of these are the Niemen in Courland and Kovno, and the Vistula roughly bisecting Russian Poland. In Germany the foresight of the general staff had furnished a complete network of railways, but in Russia and in Russian Poland there were comparatively few. The German frontier was protected by important fortresses—Königsberg, Graudenz, Thorn, Posen. In Russian Poland, besides the fortified capital, Warsaw, there were Novogeorgievsk, northwest of Warsaw, and Ivangorod, southeast, and the line of fortresses along the Narew River terminating in Ossowiec (on the Bobr). East of Warsaw, at the junction of the railways from Petrograd and Kiev, lies Brest-Litovsk on the Bug. It stands on the western rim of a great stretch of almost impenetrable marshes, the Pripet Marshes.

Russia at once took the offensive. But it was plain that before she could advance, or attempt any great movement from her own domain of Poland, she would have to clear both East Prussia and Galicia of the Germans and Austrians respectively. The German idea apparently was to hold East Prussia and the remainder of the frontier to Galicia, while Austrian armies were to advance northwest into Poland, and eastward into Volhynia, and thus hold off or engage any Russian forces that might undertake operations in this region. The Russian commander in chief was the Grand Duke Nicholas (q.v.), until superseded by the Czar (Nicholas II) in September, 1915.

Invasion of East Prussia.—Whatever the motives that induced the course, the Russians opened the campaign by an invasion of East Prussia. Three railways cross the frontier of this province—the main line Petrograd-Berlin, at Wirballen; the Bialystok-Lyck railway; and the Warsaw-Danzig, through Mlawa and Soldau. The Germans had made no effort to fortify their frontier save in so far as the great positions of Königsberg and Danzig may be said to have fortified it.

In August, 1914, at the outset of the war, the Russians sent in two armies, one from the Niemen, resting on the fortresses of Kovno and Grodno, under General Rennenkampf (q.v.), and the other from the Narew under Samsonoff, each of them about 250,000 strong. Rennenkampf was the first to come into contact with the Germans under Von François, who, seriously outnumbered, fell back after fighting delaying actions to Gumbinnen, where on August 20 after a stubborn resistance he was defeated. He retired on Insterburg, but made no attempt to hold the place, which was entered by the Russians on August 24. Rennenkampf now continued his advance west and southwest, clearing the country, and approached closely to Königsberg, without however really menacing that formidable fortress. Samsonoff, marching northward, found only inferior numbers to oppose him, engaging them at Soldau, Neidenburg, Allenstein, and Frankenau. The result of the campaign so far had been to drive the Germans out of a great part of East Prussia, where two armies, totaling nearly 500,000, were about to join hands. Samsonoff's army occupied the line Soldau-Allenstein-Frankenau while Rennenkampf's ran northwest-southeast along the line Friedland-Angerburg. The situation was serious for the Germans, who had left but few troops (5 corps of the active army) in this region of the theatre of war.

After their initial successes in East Prussia the Russians pushed their cavalry patrols almost to the lower reaches of the Vistula. It was even reported that they had begun the investment of Königsberg. Apart from sentimental reasons, the permanent retention by the Russians of East Prussia would have paralyzed German efforts in that region, and affected the whole course of the war in the East.

The business of clearing the country of the enemy was intrusted to Von Hindenburg, a retired general thoroughly acquainted with the topography of the region. His first task was to assemble an army, which he did from the troops that had retreated before the Russians, from part of Von François' army and from the Vistula fortresses. He thus got together some 150,000 men, with whom he advanced into East Prussia. The two Russian armies had in the meantime become separated, Rennenkampf going down the railway from Insterburg towards Königsberg, while Samsonoff had got as far west as Osterode, where lay his right with his left further south along the Soldau-Ortelsburg Railway. Far outnumbering Von Hindenburg, Samsonoff could derive no advantage from his superior strength because his troops were, so to say, tangled up in the lake-and-swamp region in which they had become involved.

Von Hindenburg stood with his left near Allenstein, across the Osterode-Insterburg railway, his centre near Gilgenburg, and his right at Soldau. With his front protected by the nature of the ground, the roads on his flanks gave him opportunity, should it be necessary, to pass troops around either flank. Having, on August 26, repulsed the Russian attacks, Hindenburg on his right forced the enemy back towards Neidenburg, and thus got control of the road to Mlawa. To meet this German effort, Samsonoff strengthened his left, and on the 27th tried to win back the road. In this he failed; his centre at the same time fell back. Meanwhile Hindenburg had been sending men by the thousands northeast, past Allenstein, to envelop the Russian right. On the 28th and 29th there was severe fighting for the possession of Passenheim, on the railway from Ortelsburg to the main line, in which the Germans were successful. But one line of retreat was now open to the Russians, the road running east through Ortelsburg towards Lyck, with the Germans well to the eastward of Passenheim. The Russians by this time had both their flanks turned and their centre driven in, and that by an army markedly inferior in numbers. Accordingly on the 30th the retreat began, and on the 31st the destruction of Samsonoff's army was complete. He was himself killed, 90,000, and possibly more, prisoners were taken, 30,000 or more killed and wounded, guns lost by the hundreds, and all sorts of stores abandoned. Samsonoff had marched into a trap and there been crushed by inferior numbers compensated by superior generalship, extreme mobility, freedom of movement, and control of communication. Barely more than one corps of the five composing the army managed to escape. See TANNENBERG.

The battle over, Hindenburg set out northeastward. But Rennenkampf had fallen back towards the Niemen on hearing of Samsonoff's fate. He fought a rear-guard action at Gumbinnen, followed by more fighting at Augustowo, and retired behind the Niemen, September 23. Von Hindenburg tried the crossings, failed, was pursued by Rennenkampf, and after suffering severely in the Augustowo morasses (Oct. 1–9) was relieved to take command in Poland. In the meantime the centre of interest had shifted to Galicia.

Conquest of Galicia.—The German plan of campaign contemplated, as we have seen, the crushing of France, while Russia should be held by the Central Powers. In form, so far as Austria was concerned, this holding was to be an invasion of Russian Poland. South of the frontier two railways run roughly parallel to the boundary, and from these two run branch lines and feeders. The Russians were not nearly so well off in the matter of transportation. Given, therefore, the supposed slowness of Russia's mobilization and the poverty of her rail system, an invasion of Russian Poland seemed to be a promising undertaking. It would at any rate hold Russian forces in the region and thus prevent their coöperation with those invading East Prussia further north. The invasion was made by two armies, the first under General Dankl, of over 300,000 men, with its base on Przemysl and Jaroslav, and for its objective to push northeast to Lublin and Kholm, and cut and hold the Warsaw-Kiev railway. This done, Brest-Litovsk would be threatened and with it communication with Warsaw. To protect this army on the right and rear, a second army under General von Auffenberg* was to advance northeast from Lemberg. This army mustered also probably 300,000 men. A third, or reserve army, under the Archduke Frederick, was sent forward on Dankl's left in the direction of Kielce. If with this offensive we couple a German offensive coming down from the north, and the possibility of troops from Silesia joining hands with the 3d Austrian army, it must be admitted that the plan of attack was not without merits. But as a matter of fact, the Russians by the end of August, 1914, had brought into Galicia from Kiev and Odessa armies totaling more than 1,000,000 men. They allowed Dankl to advance, practically unopposed, almost as far as Lublin. There was a battle at Krasnik, in which the Austrians were successful. The real Russian strength all this time was gathering behind Lublin and Kholm, where two armies under Ivanoff waited for the moment to strike. When September came, the Austrians found opposed to them, in this region, forces at least as great as their own.

In the meantime Von Auffenberg had pushed on to Tomaszow, his purpose being, as already stated, to guard Dankl's right. Contact was established August 11 at Brody, and two days later at Sokal, where the Russians were successful. On the 17th began the general advance against Austria. The commander in chief on this front was Ruzsky (2d army), assisted on his left by Brusiloff† (3d army), who between them had over 600,000 men. On discovering the strength in front of him, Von Auffenberg drew reënforcements from the reserve army. It is possible that on both sides there were not far from 1,200,000 men, with the advantage slightly in favor of the Russians.

On August 17 Ruzsky attacked Von Auffenberg. He crossed the frontier on the 22d, as did Brusiloff further south. On the 23d Brusiloff drove the Austrians out of Tarnopol; they fell back on the Zlota Lipa, where they made a stand, but were finally beaten back in the direction of Halicz. Ruzsky in the meantime had been thrusting at the Austrian left and centre. The Austrians finally took up a strong position 70 or 80 miles long in front of Lemberg, and extending from Busk in the north to Halicz in the south. Here they were attacked on August 26–27 by Brusiloff and Ruzsky together, and beaten, their right having been turned at Halicz, and their left thrown back.

The result of this great battle was that Lemberg fell into Russian hands, and that the Austrians retired in disorder. The losses on both sides were very heavy. In prisoners, the Austrians are said to have lost 100,000. Lemberg, on account of its rail connections, was a valuable capture. On September 4, after the defeat of Von Auffenberg, the Russians opened on

* Moritz, Ritter von Auffenberg, born (1852) in Troppau, Silesia; became lieutenant (1871); field marshal (1905); Austro-Hungarian Minister of War (1911); general of infantry; commander of a corps at beginning of European War and won victory of Kamarow; retired soon after; accused of plot to sell military secrets to Russia and imprisoned at Spandau (1915).

† Alexei Alexeievitch Brusiloff, born (c.1860) at Kutais in the Russian Caucasus; of a family long distinguished in Russian military and political life; educated at Tiflis and in a military school; gained a reputation for horsemanship and was chosen aid to General Sukhomlinov, then head of the Cavalry School for Officers at St. Petersburg; with Grand Duke Nicholas he witnessed the French army manœuvres; rose to be general of brigade and of division, and after 1910 commanded an army corps, being stationed successively at Lublin, Warsaw, and Vinnitza.

Dankl. There had been more or less fighting before this date in the region between the two Austrian armies, e.g., at Tomaszow, where the Austrians were seriously beaten; the Russian front Lublin-Kholm had itself been attacked, but without effect. Under the pressure of the Russians, Dankl was forced to fall back on a front of 75 or 80 miles, with the Vistula on his left, to the river San (September 12), a retreat that was a running fight between the Austrian rear and the Russian advance. This struggle developed into genuine engagements at various points, as at Krasnik.

Auffenberg, after Lemberg, took up another position, Grodek-Rawa-Ruska. He had been reenforced, and his position was strong. But, nevertheless, his left (Rawa-Ruska) was crushed, after a most gallant resistance lasting over a week, and when Grodek was carried (September 14) his defeat was complete. The Russians pushed on vigorously, captured Jaroslav (September 21), and drove the fragments of Auffenberg's army into the defenses of Przemysl.

The passage of the San cost the Austrians very heavily in men, in supplies, and war material. A Russian force that had crossed the Vistula at Josefov marched up the left bank of that river, and reaching the San at the same time as the main body, defeated an Austrian force on this side and took Sandomierz.

The Russian campaign so far had been successful. Their victory at Tomaszow interposed them between the two Austrian armies. The defeat of the 2d had left the 1st in a serious situation, for which immediate retreat was the only remedy. This retreat was one succession of defeats. The general result was the crowding of the two armies into the region west of Przemysl, leaving the Russians in control of eastern Galicia, with its railways and cities. Przemysl itself was invested on September 26.

After their victories in east Galicia, the Russians by the beginning of October had crossed the three eastern passes of the Carpathians, and had advanced some distance toward Cracow, the possession of which would have wrought serious harm to the Central Powers. But the news of the offensive now forming against western Poland put a stop to these plans, and they fell back to the San.

First German Drive at Warsaw.—If, as has been noted, it was the German expectation that the Austrians would hold the Russians in Poland, and thus leave Germany free to throw her full weight on France, the Galician campaign must have proved a rude awakening. In spite of Tannenberg, East Prussia had again been invaded, and in the south Cracow would be the next objective of the Russians. But if Poland could be attacked directly and its great fortresses captured, the Central Powers would be in a position to menace the flanks of the Russian armies, and by seizing their communications force them to withdraw. And at any rate it was time to do something to check the Russians, whose efficiency had been as greatly underestimated as their victories had been unexpected. Accordingly the Central Empires opened their first offensive against Warsaw (September 27) with Von Hindenburg (a few days later) in command of the Austro-German forces. Four separate armies advanced—one from Thorn up the Vistula, another from Kalisch towards Lodz, and a third from Breslau towards Novo-Radomsk, the fourth from Cracow towards Kielce. These four armies numbered probably about 1,500,000 men, of whom two-thirds were Germans. The advance was rapid. On October 8 Lodz was occupied, by the 11th contact made with the Russians at Skierniewice. The southernmost army was on October 13 engaged in the neighborhood of Ivangorod. By the middle of the month the Germans were almost within siege-gun range of Warsaw. That city on the north was well protected by the Vistula and the Narew with their fortresses, but the Germans had turned, so to say, the position by advancing from the south and west. Apparently the Russians had not contemplated the possibility of the offensive now developing, and had made no adequate preparations to defend Warsaw. At any rate the northern army (Von Mackensen*) greatly outnumbered the Russians available for its defense. In fact there were but few Russians in central Poland. We have then by the 9th of October the following situation: an army at the gates of Warsaw, two others to the west to face any eventuality, and a fourth covering Ivangorod. Warsaw apparently was doomed, and possibly with it the whole of Poland. Such troops as held Warsaw were having the worst of it. But on the 18th Russian reënforcements appeared, and increased on the succeeding days. They crossed the Vistula at Novogeorgievsk, and advanced upon the Germans, who on the 21st were in retreat. Before withdrawing, however, they resisted strongly, but their left was turned at Sochaczew. The Germans succeeded in crossing at Josefov, but were annihilated on the 21st. At Ivangorod the Russians crossed the river (October 20–22) to the western bank, attacked the Austrian right, and after several days' fighting forced their entire army to retreat to Radom, which place, with Lodz, was reoccupied. At Kielce the Austrians on November 3 were severely beaten. The main German armies, after heavy fighting around Rawa, Skierniewice, and Lowicz, continued their retreat, and early in November were once more across their own frontier.

Second Offensive in Galicia.—At the same time with the main offensive in Poland the Austrian forces in Galicia, composed in part of Auffenberg's original army and in part of German troops, resumed the offensive, before which the Russians had fallen back behind the San. On October 18 the passage was attempted by the Austrians but failed. There was more or less fighting throughout this region: Bukowina had been cleared of Austrians and Czernowitz captured. On November 4 the Russians had recrossed the San, and two days later completely defeated the Austrians.

The Russians resumed their offensive against Cracow. The cavalry advancing westward passed Kolo November 9, and next day crossed the frontier. This showed that the Germans had no idea of making any stand on the Warta. Hence the Cracow movement was coupled with a movement against the Warta, directed against

* August von Mackensen, born (1849) at Haus Leipnitz, Saxony; served in the Franco-Prussian War; later studied at Halle; at various times attached to the general staff; colonel of the First Regiment of Hussar Body Guards (1894); raised to the nobility (1899); general of cavalry and general in command of the Seventeenth Army Corps (1908); wrote a history of the Hussar Body Guards and a military history; in European War received chief credit for directing the Austro-German drive which swept the Russians back from the Carpathians across the San and resulted in the recapture of Przemysl and later in the fall of Lemberg; received Order Pour le Mérite for early victory (1914) at Lowicz.

the left of the Germans, and a general advance began. By November 12 the Uzsok, Lupkow, and Dukla passes were occupied, and by December 6 the Russians had got to within 12 miles of their goal.

On the 8th, however, they were compelled, after a battle under the walls of the place, to fall back, and on the 12th the Dukla was recaptured. This called for a fresh withdrawal to the Dunajec-Biala line, past Tarnow to Krosno. The Dukla-Lupkow pass was the next to fall to the Austrians (probably Germans), but now the Russians counterattacked, and succeeded in taking the Galician entrances of the western passes.

Second Drive at Warsaw.—It was partly to relieve this serious threat against Cracow that Von Hindenburg opened his second offensive against Warsaw. By November 15, he had driven the Russians towards Kutno, who on the 18th crossed their left over the Bzura from Lodz westward. On the 19th, Von Mackensen had broken the enemy's lines between Lodz and Strykov. Into this gap he drove two corps; with the Russian army cut in two, it looked as though a decisive success were at hand. But reënforcements coming up just in time, reestablished the line; the two German corps, however, after a most desperate struggle, November 24–26, in which they suffered frightful losses, managed to break out to the north. The Russians on December 6 abandoned Lodz; on December there began a three weeks' battle for the possession of Warsaw. When it closed, Warsaw was still in Russian hands, whose line now followed the Bzura-Rawka River to the west of Kielce through Tarnow, joining the forces on the Dunajec. By taking up this position, Lowicz, Petrikov, Tomaszow, and other towns were abandoned to the Germans, but the line was better, and in war it is armies and not cities that count. The year closed with the repulse of German attacks upon this line of the rivers.

Russian Campaigns; Przemysl.—In the winter of 1914–15, fighting continued over the whole front from the Baltic through Poland along the Carpathians to Bukowina. A serious assault on the Bzura-Rawka line, including the considerable battle of Borzynov, ended in a German check. In the north, the Russians had to fall back across the East Prussian frontier, losing Lyck (Feb. 7–20). They, however, repelled the German attempt to reach the Warsaw-Petrograd (St. Petersburg) railway. Ossowiec continued to distinguish itself by resisting a renewed German attempt to take it, and the offensive in this region closed with no special advantage to the Germans. On the Narew, they were beaten (Feb. 26) near Prasnysz, which they had captured on the 24th, thereby threatening Ostrolenka.

In the south a vigorous attempt was made to relieve Przemysl. This involved the control of the Carpathian passes. One of these, Kirlibaba, was captured by the Russians, Jan. 17, 1915. They already had the crest of Dukla, controlled Lupkow and were in the foothills everywhere else. To turn them out, three Austrian armies attacked the positions. The left made little headway, but east of the Lupkow, all the passes were taken. At Koziowa, a battle lasted from February into March, in which the Austrian assaults were beaten off, thus saving Stryj and Lemberg, and preventing the relief of Przemysl. In Bukowina, the Austrians took Czernowitz, Kolomea, and Stanislau, only to be driven out of this latter place, and compelled to fall back to the Kolomea-Czernowitz line. No relief therefore coming, Przemysl, after a siege of seven months, fell on March 22, 1915. The Russians now renewed their attention to the passes; only by controlling them could they hope to invade Hungary, and whether they should attempt this or not, it was of the first importance to hold the passes in order to protect their flank against attacks coming from the south. As a result of their efforts, the Russians claimed (April 12–18) the capture of a considerable part of the principal chain. But these operations had little or no effect on the general situation, any more than the Russian capture of Memel (March 17), which they evacuated four days later. More serious was the German invasion of Courland; there was an affair at Shavli (April 29) and Libau was entered on May 8. The Germans had broken ground for severe efforts to be made later.

Russian Defeat and Withdrawal.—These and all other contemporaneous events in this theatre, however, pale into insignificance in comparison with the Austro-German offensive on the Dunajec line. Aroused by the unexpected success of the Russians so far, the Central Powers rose to the occasion, and by an application of their powers of organization prepared during the winter of 1914 and spring of 1915 for a campaign about the issue of which there was from the outset not a shadow of doubt.

At the end of April four German corps stood between the Middle Pilica and the junction of the Nida and the Vistula; on the west Galician front were at least 10 more corps, half German, half Austro-Hungarian, while the Carpathian front was held by 12. The leader of all these forces was General von Mackensen. Opposed to him the Russians had barely 14 corps, commanded by General Ivanoff, who had under him Dmitrieff and Brusiloff. The Austro-Germans for the approaching campaign had brought together a number of guns, and supplies of ammunition, more staggering to the imagination than their concentration of men. It is said that over 4000 guns were collected, of which over one-half exceeded 8 inches in calibre. The work of preparation, which perhaps is unique in military history, would perhaps have been impossible but for the admirable roads, both rail and ordinary, in the region to the south and west of the scene of the conflict. The campaign was planned by Erich von Falkenhayn.*

The end now sought by the Central Powers was to crush the Russians so thoroughly that they should no longer be a factor in the war. As early as April 28, Mackensen had advanced against Gorlice. Three days later (May 1) the tremendous batteries opened, and continued for several hours on the 2d. It is said that in this time 700,000 rounds were fired. The Russian first line was powdered out of existence. The

* Erich von Falkenhayn, born (1853) at Burg Belchau; entered the army in youth; military attaché to the Legation at Paris (1887); military instructor and favorite of the Crown Prince and Prince Eitel Friedrich (1889); chief of the general staff of the Ninth Army Corps (1898); served in China during Boxer Rebellion (1900); lieutenant general (1906); retired (1910), but became active again in the European War; Minister of War (1914), in which office he upheld the officers whose conduct in Alsace resulted in the Zabern disorders; succeeded Moltke as chief of the general staff (December, 1914), the youngest man ever to hold that office, and was made a general of infantry.

Austro-Germans crossed the Dunajec-Biala line at various points; once the front broken in, Von Mackensen advanced sending his right due east to reach Dukla Pass, hoping to catch the Russians in Hungary before they could make their retreat by it; his left and centre changed direction so as to face northeast. This manœuvre forced the Russians to abandon Tarnow and widen the gap already made in their lines near Gorlice.

The campaign that followed the defeat of the Russians in the battle of Gorlice and their dislodgment from the lines of the Dunajec, of the Wisloka, and of the San, respectively, consisted in a pursuit by the Austro-Germans that resulted in a withdrawal from the passes, in the evacuation of Bukowina (June 12) and in the recapture of Jaroslav (May 15), Stryj (May 31), Przemysl (June 3), and of Lemberg (June 22). Galicia was cleared of Russians.

But as may be inferred from these dates, the Russians offered a stubborn resistance at every point and sometimes, as at Opatov (May 15–17) and at the crossings of the Dniester, even repulsed their pursuers. The fact is that, although defeated and driven back, they had not lost their cohesion as troops and were ready, whenever circumstances favored, to give a good account of themselves. We are compelled to believe that in this tremendous campaign the Russians were taken by surprise, that the magnitude of the attack was unexpected by them. It seems to be reasonably certain, moreover, that they lacked the guns and shells to reply effectively to the terrible Austro-German artillery.

Entire Eastern Front.—The operations for the fall of Przemysl and Lemberg must be regarded as the prelude of a general offensive on the entire Russian front from the Baltic to the frontier of Rumania. The immediate effect of the Galician campaign was to force the withdrawal of the Russians in this part of the tremendous theatre to a defensive position behind the Zlota Lipa and the upper Bug, which remained the line of separation in this region until August 27. On the side of the Central Powers it was necessary in this region to guard against any counter offensive originating in Volhynia and menacing the right of the forces that turned northward against the line Lublin-Kholm in the general offensive that now gathered headway. This new offensive as just stated extended over the whole eastern front, along a line over 1000 miles long, and opened in the middle of July. But already, on June 28, the advance had been begun against Lublin-Kholm. This advance received a check, however, July 1–7, in the severe defeat of the Austrians at Krasnik, a victory from which, save in the important element of time gained, the Russians derived no benefit. The German campaign had for its main object to bag the Russian armies. It is clear that the Russian situation was most serious. Four lines of railway formed their lines of communication, the Petrograd-Vilna-Warsaw, covered by the Niemen and Narew; two interior lines, Siedlce-Warsaw, and Brest-Litovsk-Ivangorod, without any natural defenses; and the Kovel-Kholm-Ivangorod line in the south. These four lines are interconnected by three others running approximately north and south. If these railways could be seized by the Austro-Germans before the Russians could withdraw by them, a material part of the Russian forces in Poland could be cut off and surrounded.

Pressure was applied everywhere, thus robbing the Russians of the advantage of their interior line; specifically the Vistula and the Narew and Lublin-Kholm lines were to be forced. In the north Von Bülow was to renew his attacks; if successful, the Petrograd-Vilna-Warsaw line would be cut. In the south the Austrians were to cross the Dniester and roll up Ivanoff's left wing.

A week after the opening of the campaign the Russians had abandoned the line of the Bzura; Von Gallwitz had crossed the Narew between Pultusk and Ostrolenka, where he was held by the stubborn resistance of the Russians. Further north, Mitau and Shavli were captured. In the south the Austrians failed in the Dniester region; the offensive against Lublin-Kholm, renewed July 15, was successful, the Russians suffering a defeat at Krasnostaw. But they offered so stout a resistance immediately afterward, that it was not until July 30 that Lublin was reached.

Campaigns around Warsaw.—But the Austro-Germans were too strong for the Russians, who had managed, west of Warsaw, to hold the Blonie lines as late as July 26. On the 30th, however, the Germans crossed the Vistula, 20 miles north of Ivangorod. This fortress fell on August 4, and Warsaw was evacuated on the 5th. Novogeorgievsk, however, was not evacuated, as it was thought capable of delaying the German advance. It fell, however, under the fire of Von Beseler's guns on August 19. The necessity of abandoning Warsaw had been foreseen, and preparations made for withdrawal. Part of the forces retreated to the Narew, and part joined the forces on the south. This was the opportunity for the Austro-Germans. Could the forces pressing south and north from the Narew and Lublin-Kholm, respectively, join hands in the Siedlce-Lukow region, a lasting victory would have been achieved. But the Russians offered an extremely stiff resistance between the Narew and the Bug. They held so strongly on the Vyshkoff-Ostroff line that the Germans shifted their efforts to the northeastward between Ostrolenka and Vilna. Here they did break through on August 9 and on the 10th captured the fortress of Lomza. But even after this success their advance was slow; and in the meantime the Russians had succeeded in escaping. In the south an equally stiff resistance was offered. Here in the neighborhood of Lubartoff a serious battle was fought August 6–9; although a Russian defeat, it gained time for the withdrawal of the last forces further north and west.

The attempt made against Riga August 9 to September 8 came to nought, but on August 17 Kovno was taken and the line of the Niemen thus broken. The effect of this German victory was the abandonment of Brest-Litovsk and a withdrawal along the whole front from Ossowiec (abandoned Aug. 22) to Vladimir Volynski. Grodno was evacuated September 1–2. In the south, Kovel was (Aug. 23) entered by the Austro-Germans, and the Russians were compelled to evacuate their line of the Zlota-Lipa and the upper Bug. Pinsk was occupied.

Thus, four weeks after the fall of Warsaw, the Central Powers were in full possession of the entire line Niemen-Bug. They had failed to capture the Russian army, but Poland had fallen into their hands with its fortresses. They now directed their attention to the capture of the

railway running from Vilna to Rovno across the Pripet Marshes. East of this railway lies a vast stretch of marshland not traversed by any other north and south line; if this road could be taken from the Russians, the Austro-Germans would have a line of communication between their northern and southern theatres of operation, while the Russians would find their own forces cut in two by the marshes. The operations of the Germans north of the marshes were successful. On September 19, the evacuation of Vilna was ordered. In the south, on August 27, the Austro-Germans had renewed their offensive. The Russians withdrew into Volhynia, were beaten at and lost Lutsk, and forced to cross the Styr. Dubno was entered on the 7th. But on the 8th the Russians struck back, inflicting a defeat on the Austro-Germans at Tarnopol and again at Tremblowa. On the 23d they succeeded in recapturing Lutsk.

Baltic Campaign.—As may be imagined, the fall of Vilna did not end the Austro-German offensive. Once in possession of it, the Germans advanced eastward, sending five cavalry divisions towards Polotsk. Detachments of cavalry were also sent out against the Molodetchno-Polotsk railway, while strong forces were converging on Minsk. Just north of the Pripet Marshes another force undertook an enveloping movement against the line Minsk-Bobrinsk; that is, a movement over a front of 150 miles was initiated, partly to cut off, if possible, the retreating Russians, and partly to confirm the German hold on the Riga-Dvinsk-Vilna line. Contact was made in the region around Vileika. After several days' fighting the Russians managed to straighten their front, and even took the offensive. They cleared the Polotsk line, held on around Vileika and Molodetchno, and further south succeeded in checking the German advance. It is possible that the need of troops in Serbia and on the western front may explain the German failure to continue the offensive.

In the meantime an important attack was being made on Dvinsk. On September 24 a battle was fought between the Dvina and Lake Drisviaty, 20 miles south of Dvinsk, in which the Germans made no gains of any consequence. Later, October 4–18, they concentrated their efforts between Illukst, 15 miles northwest of the city, and Lake Sventen, five or six miles due west. There was severe fighting in this region, but with no particular advantage to the Germans until October 25, when they captured Illukst, and a day or two later made other advances. But these gains were more than neutralized by the Russian counteroffensive, which opened October 31, between Lake Sventen and Ilsen (battle of Platokovna, a village between the lakes), and resulted in a German defeat. The Russians followed up this victory by further advances to the north and northwest of Illukst, and towards that place itself. By the end of November, fighting ceased in this particular sector.

Riga.—The Germans were no more successful in front of Riga. This city, on the right bank of the Dvina, is protected on the southwest by the Tirul swamp, crossed by the railway and road from Mitau through Olai, which constitutes from this direction the only possible approach. The German lines about mid-October ran south from the sea along the river Aa to Mitau, and thence curved eastward to Friedrichstadt and Jacobstadt on the Dvina, halfway between Riga and Dvinsk. Three possible lines of attack existed—the Tukkum-Riga railway between Lake Babit (west of Riga) and the sea; the Mitau-Olai line; and one from the southeast, from an island (Dalen) in the river. On October 14 the Germans opened, and managed by October 20 to reach the river at Borkowitz, 20 miles up. But they failed to cross the river in spite of all their efforts. Their centre in the meantime had got to Olai, but could go no farther. During the first half of November they tried the first line mentioned above, but on the 10th the Russians, assisted by their fleet, beat them back, and later pushed on beyond Kemmern. These attempts to take Riga proved a failure.

In the beginning of December, 1915, the Germans captured the Borsemünde position on the Dvina, but at Dvinsk continued to lose ground about Lake Sventen and at Illukst. On the other hand they beat off with great loss an attack on Postavy, 50 miles south of Dvinsk.

During the last ten days of March the Russians developed without effect an offensive against the bridgehead at Jacobstadt and the railroad thence to Mitau. Similarly south of Dvinsk they were defeated near Lake Narocz, where their objective was Sventziany, on the Vilna-Dvinsk railroad.

Southern Sector.—We must now turn south to see what was happening in that region. Three days after taking Lutsk (September 23) the Russians abandoned it, and took up a position to the east extending from Rafalovka through Czartorysk and Kolki to a point south of Dubno. Rovno was behind them. The first attempt to converge on that place failed. Von Linsingen then early in October advanced against Sarny, where the Kovel-Kiev railway crosses the Vilna-Rovno line. The capture of Sarny would have meant the loss to the Russians of this latter railway. During the next two months Von Linsingen and Brusiloff were at grips on the middle Styr.

Along the line of the Styr River the struggle continued for the control of the left bank. At the end of the month the Russians took the offensive on the Bessarabian frontier, and advanced along two main lines—first, the Odessa-Czernowitz-Lemberg railroad; second, farther north, the Kiev-Kovel-Warsaw line. In the first region their efforts, centred on the capture of the Bukowinan capital, which had already changed hands five times in the course of the war, met with failure.

In the region of the Styr River, however, they had better fortune. Early in January they succeeded in crossing this line north of the Kovel-Sarny railroad, and in holding on to their position. Thereupon the village of Czartorysk became a storm centre, and was finally captured by the Russians by assault.

Early in February, 1916, they achieved some gain in the Lutsk-Rovno-Dubno sector; the Germans were reported as standing on the defensive along the Pruth, the Dniester, and the Sereth. Further Russian advances also were reported, the most important being the capture of Usciczko, on the Dniester, thus again threatening Czernowitz.

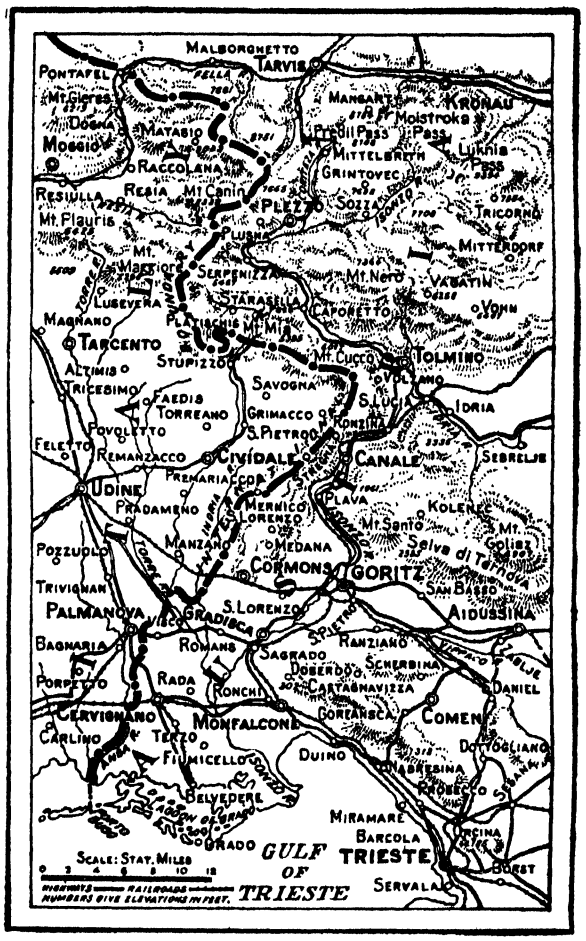
In April, 1916, Brusiloff succeeded Ivanoff in command of the armies from the Pripet Marshes to Rumania, and began preparations for a general offensive on this line. Heavily fortified as it was, the Austrians had believed it to be so strong that they had transferred many of its defenders to other fronts.

The Russians opened northwest from Rovno

through Lutsk towards Kovel; west along the Rovno-Lemberg railway towards Dubno; northwest from Tarnopol towards Lemberg; and south across the Pruth against Czernowitz. Great success attended the effort. Lutsk, abandoned by the Austrians, fell on June 6; Dubno on June 10, with 35,000 prisoners and 30 guns as additional prize; farther south on the same day Buczacz and Potok Zloty were entered and many more prisoners taken. But now the resistance of the Central Powers stiffened from Tarnopol to Kolki, and the Russian advance was checked, giving way to obstinate fighting by both sides. It is believed that the Germans came to the Austrian rescue on this portion of the front. Beaten at Dobronobtze (18,000 prisoners, 10 guns), the Austrians, June 17, abandoned Czernowitz. The effect of its fall was greatly to imperil Pflanzer's army. A small part of this army was pushed over the frontier into Rumania and interned; the main body, cut off from communication with Lemberg by the capture of Kolomea and the threat against Stanislau, was crowded against the flanks of the Carpathians.

In this great movement of the Russians the significant thing was the loss of the Austrians in prisoners (250,000) and in killed, wounded, and missing (unknown), an irreparable loss. Hungary alone admitted a loss of 600,000 men in this campaign. In ground gained, the Russians had recovered about 15,000 square miles of territory. By the middle of July (1916) the Russians were still some miles from the railroad centre of Kovel; and in their progress towards Lemberg, had reached the Zlota Lipa River.

IV. **Southern Theatre.** A. *Campaigns against Serbia.*—The campaigns against Serbia have two main stages: (1) Austrian campaign across the Drina (August–December, 1914), which failed owing to demands in the Russian field; (2) Austro-German-Bulgar invasion of Serbia, to open the road to Constantinople. This campaign ended in the conquest of Serbia and Montenegro (October–December, 1915).



The military strategy of this campaign develops on three fronts: (*a*) the Germans crossed the Danube and took the line of the Morava valley; (*b*) the Austrians crossed the Drina and moved up the Lim; (*c*) the Bulgars, sending one army to beat off Allied reënforcements from Greece, moved on Nish with another army. The Serb army was driven to the sea through Albania.

B. *Italian Campaign.*—Italy's entrance into the war in May, 1915, relieving Russia, has two main movements: (1) to the north, to close the passes of the Alps against invasion; (2) to the northeast, to cross the Isonzo and take Triest.

The Isonzo line was reached, but the operation was not completed. An Austrian invasion from the north (May, 1916) was checked mainly by an opportune Russian drive into Galicia.

The work before the Italians was therefore simple in respect of conception, difficult in point of execution. The configuration of the frontier at once fixed the nature of the task. It was absolutely essential to close the passes of the Alps from Switzerland eastward, in order to protect the flank and rear of their armies on the Isonzo line, and to prevent invasion of Italy. This condition secured, the task of the remainder of the forces was to cross the Isonzo, for it must not be forgotten that Italy's material objective was Triest with the Istrian Peninsula.

Four armies took the field, two on each frontier, the northern and eastern. A fifth force, composed of Bersaglieri and Alpini, was designated for operations in the Carnic Alps. Gen. Count Luigi Cadorna,* the chief of the general staff, was in general command. On May 24 the frontier of the Trentino was crossed. Two weeks later the Italians were well advanced in the Trentino and Tirol; the road to Verona was closed. It would seem that the Austrians during the opening days of the campaign in this region had opposed but slight resistance to the forward movement of the Italians. Further east a more severe struggle took place for the possession of the passes of the Carnic Alps.

Here the Italians took the Plöcken Pass and gradually extended their hold upon the peaks to its east and west, thus closing the gateways opening southward into the valley of the Tagliamento. The struggle continued in the mountains during the entire summer, and took place chiefly at high altitudes. In the Trentino as a whole the Italians managed to get control of most of the roads leading into their country. West of Lake Garda (Val Giudicaria) they pushed forward in the autumn and got close to Riva. On the east side of the lake, by the end of the year they were in the outskirts of Rovereto. Farther east, on November 7, Col di Lana was taken by Garibaldi, but later aban-

* Count Luigi Cadorna, born (1850) at Pallanza, son of Gen. Raffaele Cadorna; graduated from military academy at Turin (1868); colonel (1892); commander of Tenth Regiment of Bersaglieri; chief of staff of the Army of Florence; major general (1898); commander of the division at Naples (1907) and at Genoa (1910); designated commander of an army in case of war (1911); chief of the general staff; preparation for participation in European War worked out by him in detail and he became generalissimo of the entire Italian army; author of notable pamphlets on tactics.

doned, only to be recaptured in April, 1916. In the Carnic Alps the Austrians made desperate efforts to dislodge their adversaries from the passes seized by them in June, but to no avail; the Italians held. They failed, however, to get the Malborghetto works, but had better success in forcing the Austrians to abandon the Plezzo valley. South of Plezzo, Tolmino was invested, but without success.

The nature of events on the eastern frontier was almost wholly determined by the obstacle forming the line of separation between the contending armies, i.e., the Isonzo River. From its left (Austrian) bank rise ridges upon ridges, whereas the right bank, from which the attack must come, below Gorizia (Görz), is flat (the Friuli plain). In crossing the river, therefore, the Italians would be compelled to fight uphill. The rectangle Gorizia-Gradisca-Triest-San Daniele is occupied by the Carso (Karst) plateau, with hills from 150 to 1700 feet high. This plateau would have to be taken, or at least a passage opened through it, before Triest could be reached. On May 24 Italian troops occupied various small towns just across the frontier. Their troubles began when they undertook to cross the Isonzo, for soon after reaching it they found it in flood. It is said that their difficulties were increased by the failure of the cavalry to seize the bridges at Pieris. A dash for these bridges would have insured a crossing and might have given possession of a part at least of the Carso plateau. As it was, the Austrians blew up the bridges before any Italians got across. The flood subsiding on June 5, a crossing was made at Pieris and Monfalcone occupied. But now a fresh obstacle presented itself. The Austrians flooded the low country at the foot of the Carso plateau. The advance against the plateau was thus blocked, and operations along the entire line delayed. Another crossing had to be sought unaffected by the flood conditions. The point selected was just above Sagrado, where the river makes a great salient to the west; unsuccessful attempts were made on June 9, 15, and 23.

It was therefore decided to make a general advance along the whole line of the Carso, a movement which began June 18. By the 23d various villages at the foot of the Carso had been taken. A fourth attempt to cross succeeded on the 24th. The Italians by the 27th had got a bridgehead on the Isonzo and a line of advance to the Carso plateau. This struggle formed part of a general struggle over the whole line from Plezzo to the sea. The conflict was necessarily intensified at certain points, such as Gorizia, Plava, and Tolmino.

Gorizia.—Gorizia lies in a bend of the river, and is dominated by the hills behind it stretching away into the general mountain system. On the west bank Monte Sabotino, itself commanded by the hills on the eastern bank, likewise controls the position; from Sabotino run out the Podgora heights well below (south of) Gorizia. Between Podgora and Gorizia is open ground 3 miles wide, bounded on the southeast by the river. Sabotino and Podgora, thoroughly organized defensively by the Austrians, were unsuccessfully attacked by the Italians at the end of May. They were more successful at Plava. Back of the village stands Hill 383, and south of 383 a peak known as Kuk. The Italians hoped, if they could get across, to work down the left bank and menace Monte Santo, the bulwark of the Austrians on this bank in the Gorizia sector. Attempts to cross by bridging on the 8th and 10th of June were defeated, but on the 11th two battalions were got over by rafting and attacked Hill 383, securing a footing on the lower slopes. Reenforcements enabled the Italians on the 17th, after heavy fighting, to gain the summit. They held the hill thereafter in spite of the efforts of the Austrians to win it back, but were unable to extend their holdings on the left bank.

Tolmino.—At Tolmino the river turns 90 degrees from southeast to southwest. In the bend stand two hills joined by a saddle, Santa Maria and Santa Lucia. These were held by the Austrians, and formed with Sabotino and Podgora the only positions retained by them on the west bank of the Isonzo. North of Tolmino runs a range of high mountains, one of which, Monte Nero, rises over 7000 feet. Tolmino itself was a point of some military importance, probably because the Austrians, should the occasion arise, meant to use it as a point of departure in the invasion of Italy.

The resistance offered at Tolmino was more serious than apparently the Italians had expected. Their attempt to seize it by sudden attack failed, and they were compelled to proceed against the place by regular investment. In the meantime they were more fortunate 10 miles to the northwest at Caporetto, which they had occupied on the first day of the war. The heights across were turned by a column that crossed higher up, climbed the Polonnik ridge, and thus drove the Austrians back on the Monte Nero ridge. On June 2 the highest peak of the ridge was in the hands of the Italians. The occupation of Monte Nero was a necessary condition to operations directed southward against Tolmino, but Monte Nero itself was not safe unless Plezzo, an Austrian base and magazine, could be neutralized. By June 23, the Italians had succeeded in getting into positions from which they threatened the Plezzo valley. They now came down from the north against Tolmino. In August they attacked Santa Lucia and Santa Maria, but were compelled to resort to trench warfare. Later, in October, the offensive was resumed, without however succeeding in dispossessing the Austrians.

Plava.—The war had now lasted over five months without any result of magnitude on the Isonzo front. But on October 18, began a general bombardment from Plava to the sea, as a preparation for an extension beyond the Plava bridgehead in order to attack Monte Santo from the north, for the capture of Sabotino-Podgora, and for the occupation of the Carso plateau. Operations in the Plava sector proved unfruitful, owing to the inability of the Italians to capture Kuk. As long as this elevation remained in Austrian hands, it was useless to think of proceeding against Monte Santo. Hence the attack on the Gorizia front derived no help from the north. The fighting on this front lasted six weeks and at one time Monte Sabotino was actually taken but was not held. In December there was a lull but no cessation. As a result of their efforts the Italians had gained a little, and now turned their guns upon Gorizia itself. On the Carso plateau very little was achieved. Part of Monte San Michele was taken, as well as trenches on the northern slope of the plateau. But on the whole the Italian offensive had failed. The Austrian lines had held at all essential points.

At the end of the year 1915 Italy had gained one of her points. She had closed the gates of her northern frontier, and held the keys. A period of relative quiet then prevailed, but in the first week of February, 1916, a strong Austrian force, under cover of a thick fog, attacked the heights about Oslavia, northwest of Gorizia and captured some 1200 men and first line trenches, and in March made some progress at the Tolmino bridgehead. But hostilities on this front during the spring consisted chiefly of artillery duels and infantry combats of no consequence.

In May, 1916, the Austrians massed an army on the Trentino front that began a successful drive down the Adige valley, forcing the Italians back over their own frontier at many points and threatening a flank movement against the armies on the Isonzo. The Italian towns of Arsiero and Asiago were captured, and in their retreat the Italians lost many heavy guns and much war material.

This campaign against Italy was brought to a sudden halt by the Russian offensive in Galicia, and in a short time the Italians had regained most of the lost ground. In conjunction with their French and Russian Allies, the Italians renewed pressure on the Isonzo front in June, and July, 1916, found the Trentino front along its winter line, with a strong campaign on foot to cross the Isonzo and gain possession of Gorizia.

The Balkans. Serbia.—Serbia began her mobilization July 26, 1914, and two days later Austria declared war. There seems to be reason for the belief that Austria lost time in passing to actual hostilities. Apparently she could have seized Belgrade at once, and thus secured a footing on Serbian soil, some days before the Serbians were ready to strike back. She delayed, however, and when she did move, it was across the Drina, on the west. An invasion from the Drina would lengthen her lines, but if successful would enable her to strike at the heart of the country. The lack of good communications would tell on one adversary as much as on the other, and would be largely compensated by Austrian superiority in transport. Accordingly after demonstrations on the Danube, on August 12, she sent her first troops over at Losnitza on the Drina, on the same day she crossed the Save near Shabatz. Other troops crossed the Drina at Zvornik and Liubovia. The direct objective of the Austrians was to reach Valievo, and thence Kraguyevats, the site of the National Serbian arsenal. The commanding generals on the respective sides were Potiorek (Austrian) and Putnik (Serbian).

The line of the Austrian invasion being known, the bulk of the Serbians moved to meet it in the direction of the Jadar valley, while sending troops to the northwest to offset the invasion from Shabatz. In the meantime the Austrians moved up the Jadar, and the Serbians, or as many as had come up to join the sparse forces falling back before the advance, intrenched at Jarebitze, across the valley. The Serbian cavalry, sent to reconnoitre the Matchva plain, reported the Austrians present in force, and therefore received orders, with the Serbian right, to prevent the Austrians from the north from joining the troops that had crossed the Drina. The main body occupied positions extending well to the south of Jarebitze, while other forces were detailed to beat off attacks coming from Krupani, 15 miles south, and from Liubovia, another crossing of the Drina.

The battle opened in earnest August 16, on the Serbian right. The action, lasting all day, resulted in the defeat of the Austrians, and in bringing to nought their plan to join their forces on the Jadar. It also left the Serbians free to operate against Shabatz. On the 17th they pushed on to within 4 miles of that town, only to find it strongly defended; they therefore abandoned, for the moment, any further active efforts and awaited reënforcements. On the centre and left, the Austrians had better fortune, and succeeded in pushing back their adversaries. This was particularly the case on the Serbian extreme left. But on the 17th, the Serbians resumed the offensive, and captured two positions in the Tzer. Further south, however, the Austrians were again successful, and drove back the Serbians, who however intrenched, ready to move forward again the next day. On the 18th, the Austrians advancing from Shabatz, drove back the Serbs in front of the town, and at the same time prepared to resist the expected Serb attack on Kosannigrad, their main position on Tzer. This attack was successful, and the Serbs then turned their efforts against an elevation between the two mountain ranges (Rashulatcha) which was taken the following day, the 19th, on which the issue of the battle was decided. The Austrian right was beaten on that day, and the Serbs were now in possession of Tzer and Iverak. On the 20th, the Dobrava was crossed, fighting continued on the 21st, 22d, and 23d; on the 24th, the Serbs entered Shabatz. While these actions were going on, the Austrians farther south had been retreating to the Drina, and the invasion had failed. The losses on both sides in the battle of Jadar were heavy, probably 35,000 killed and wounded Austrians and 18,000 Serbs. The Serbs took 4000 prisoners, and gathered in a considerable quantity of guns, rifles, and military stores generally.

On September 1, the Serbs invaded Syrmia, a province lying between the Save and the Danube. On the whole, this step was ill-advised, and in any case of short duration, for now the Austrians were about to launch another invasion, like the first, from the line of the Drina, under the same general. About five corps composed this invading army. The attack opened over the whole line from Liubovia on the south to Jarak on the north. North of Losnitza the Austrians fared badly, save that they managed to acquire a strip of the Matchva plain. South of Losnitza, however, they established their crossing and drove back the Serbs to a line about 10 miles from the river, where they intrenched. Here they turned, and drove their adversaries out of the position. But no decisive result was achieved by either side, for in this region both settled down to trench work. A struggle ensued, however, for the Guchevo mountains, equally indecisive, for they were held by both.

After six weeks of position fighting the Serbs retreated, abandoning the Matchva and the Tzer. The Austrians followed over the whole frontier, entering Valievo on November 11. The Serbs now took up a position down the Kolubara River to the Lyg, up which their line turned to the southeast; the heights south of this position were occupied and protected by earthworks. On November 11, the Austrians attacked towards Lazarevatz, and a detached force

20 miles southwest guarding the valley of the western Morava. On November 20, the first of these attacks proved successful and drove in the Serb centre. By the 24th, the action had extended over the whole front with continued success falling to the Austrians, who later in the month got possession of the Suvobor mountains, dominating, as it were, the Serbian positions. They had now succeeded in extending their front to Belgrade, and had thus cut the region in two, driving back the Serbs in the direction of Kraguyevats, on a line from the Belgrade railway to the western Morava. The situation was now saved to the Serbs by a resumption of the offensive. On December 2, they attacked and, on the 5th, recaptured the Suvobor, and drove back the Austrian right and centre to Valievo. The advance was equally successful in the other sectors. Its result was an interposition between the three Austrian corps on the south and the two farther north. The three southerly corps retreated as well as they could on the frontier. The action now turned towards Belgrade, towards which the Austrians were steadily driven back. The evacuation of the capital occurred on December 14 and 15. Nearly 42,000 Austrians were taken prisoners; 60,000 were killed and wounded.

Bulgaria.—Serbia was once more in October, 1915, called upon to defend her territory, for Bulgaria had finally decided to cast in her lot with the Central Powers. Accordingly her armies crossed the Serbian frontier towards Nish, striking in conjunction with the Austro-German forces, which had already begun their invasion from the north. Meanwhile French and English troops, debarked at Saloniki, were hastening up along the Saloniki-Nish railroad. The importance of the new campaign centred in the strategic value of the railroad, as there was no other line from Austria to Constantinople that did not cross Rumanian territory. At Velika Plana, 25 miles from the Serbian frontier, the railroad forks, its two branches running respectively to Belgrade and to Semendria, with the latter route in the Morava River. It was up this line that the Austro-Germans advanced, after capturing Belgrade.

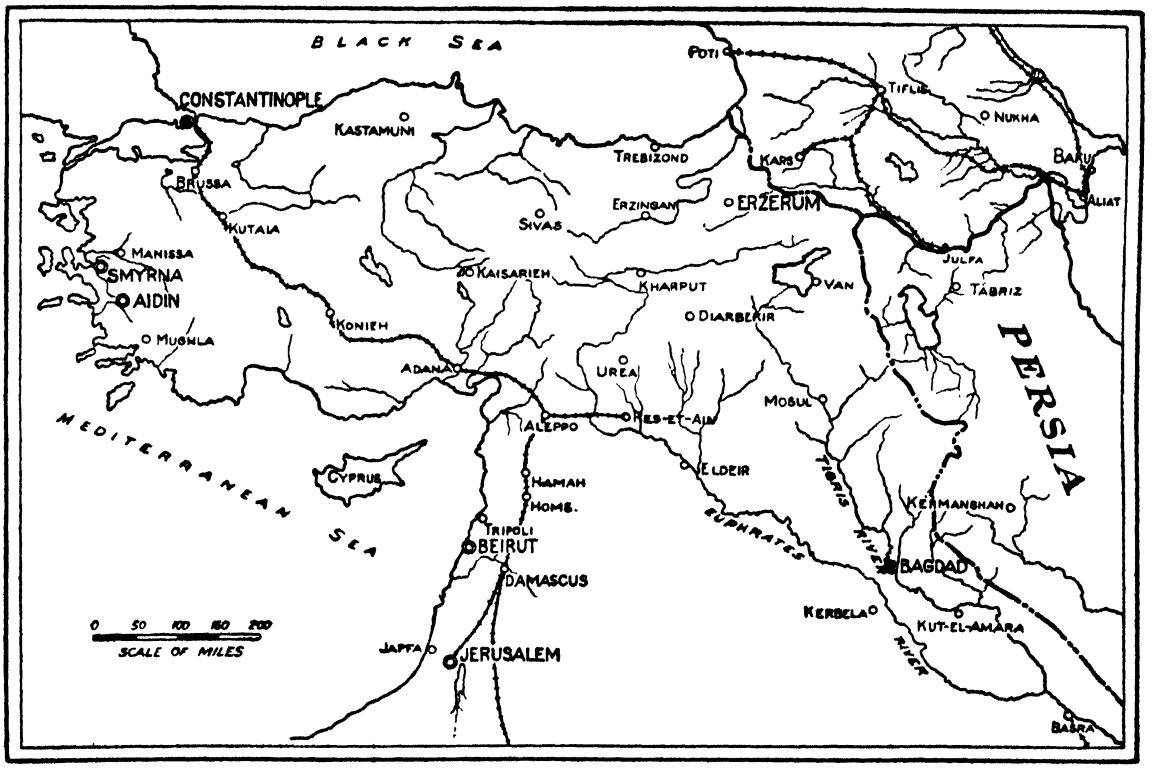
In the first week of October the Austro-German army, reported to be 300,000 strong, crossed the Danube near Belgrade and at Semendria, while other armies attacked farther west along the Drina and Save rivers. Among the commanders of the invading armies was Field Marshal von Mackensen, in command of the army east of Belgrade.

Bulgaria's first operations were directed towards Nish. But realizing the danger of the arrival of Allied reënforcements from Saloniki, the Bulgarians then developed their main attacks farther south against the railroad, at Vranya and Vilandovo. At the latter point, only five miles from the southwestern corner of Bulgaria, an army of 40,000 men threatened to cut the railway. Serbo-French troops, however, hurried up, and threatening the Bulgarian town of Strumnitza behind these troops, compelled them to fall back. At Vranya, however, some 60 miles south of Nish, the Bulgarians were more successful.

The advance of the Austro-German columns from the north was at first slow, for by the end of October they had gained, advancing on a 100-mile front, only from 25 to 40 miles south of Belgrade. Another column about this time crossed the Drina River at Vishegrad, and constituted a new army of invasion. In the south, however, the Bulgarians having seized the Nish-Saloniki railroad at Vranya, promptly confirmed their grip on the enemy's line of supplies by taking the important junction city of Uskub, and Veles, 25 miles farther south. And in the meantime, their columns directed towards Nish were making progress, and Pirot, on the Nish-Sofia line, was stormed after a four-day battle.

The Germans took the Serbian arsenal at Kraguyevats during the second week in November. In the meantime, the other Austro-German columns had reached the east and west line of the Western Morava, at Krushevats at Kralyevo, before the middle of the month. The fall of Nish was not long delayed, upon a heavy bombardment by the Bulgars. A route to Constantinople had already been opened via the Danube, when Germans and Bulgars joined hands near Orsova.

Meanwhile the Anglo-French forces from Saloniki held the railroad from Krivolak south to the frontier, and had gained some successes against the Bulgars around Strumnitza. But these, moving with ease around the French left to the Babuna Pass, 25 miles west of Krivolak, swept aside the small Serbian defending force, and descended through the mountains upon Prilep and Krushevo. The French were scarcely able to maintain their position on the Vardar and Cerna rivers, and the small British force was but little in evidence north of Doiran. An Italian supporting army was rumored to be about to land at Avlona.



The remaining strokes in Serbia's defeat followed quickly. Sienitza, Novibazar, Mitrovitza (the last the temporary Serb capital) fell in rapid succession before the Austro-German columns. Teutonic and Bulgarian invading forces joined hands at Prishtina, on the railroad branch south of Mitrovitza, which surrendered with 10,000 men. On the last day of the month, the two remaining cities of importance, Prisrend and Monastir, were lost to Serbia. Sixteen thousand prisoners were taken at Prisrend; the rest of the fugitive northern army was driven either into Montenegro or Albania.

At the beginning of December the main object of the German-Bulgar campaign in Serbia had been achieved. The Serbian army had been eliminated as a fighting force and the surviving Serb troops, fewer than 100,000 men, driven into Montenegro and Albania, where they were pursued by the Austrians, against whom they could make no stand whatever.

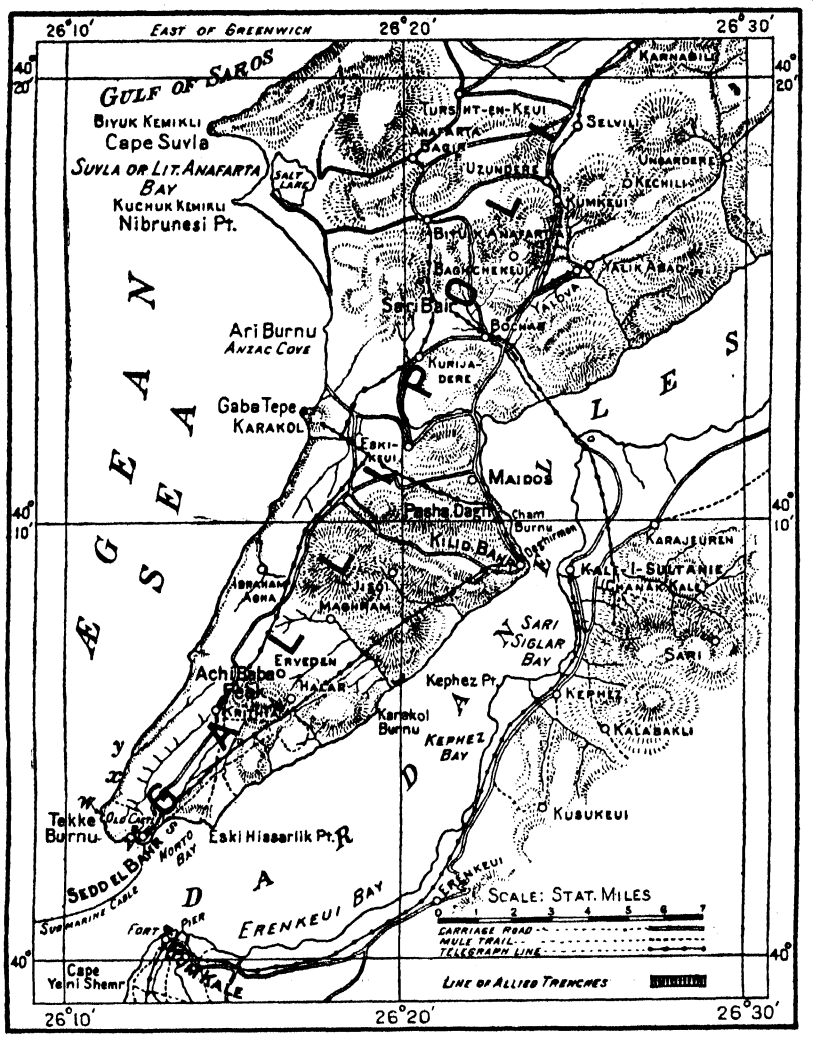
The retreat of the Serbs from Katchanik left the French left flank, on the Cerna River, in a critical position. The retreat of the Allies, however, was skillfully conducted, and they succeeded in escaping to neutral territory, where they fortified themselves at Saloniki, with the intention apparently of holding their position at all costs. Montenegro was conquered by the Austrians in January. The capture of Mount Lovcen, dominating Cettinje, determined the fall of the capital. The Austrians then proceeded to take Scutari in Albania (Jan. 25, 1916), and joined hands with the Bulgars at Elbasan, east of Durazzo, on February 17. The Italians abandoned the place February 26, and the Austrians now advanced against Avlona. The remnant of the Serbian army was transported by the Allies from the Albanian coast to the Island of Corfu to undergo reorganization. After

a few months' rest the refitted army of 100,000 men was taken to Saloniki to reënforce the French and British forces there and await developments in the Balkans calling for a new attack on the Bulgarian or Turkish allies of the Central Powers. Up to the middle of July, 1916, the military purpose of this force, usually estimated at 500,000 men, had not developed.

V. **Southeastern Theatre.** The strategic importance of Turkey from the Germanic point of view lay in keeping supplies from Russia through control of the Dardanelles. Turkish military activity manifested itself on four distinct stages. 1. Caucasus. (*a*) Turkish thrust against Russia (1914–15) which was weakened by Allied attack on Dardanelles; (*b*) Russian campaign (1916) forcing Turkish armies behind Trebizond, Erzerum, and Bitlis line to the west, and threatening Bagdad to the south. 2. Gallipoli campaign by Franco-British forces, which came to an end when Serbia was crushed and the road

from Berlin to Constantinople opened (December, 1915). 3. Turkish attack on Suez Canal. 4. British advance on Mesopotamia to aid the Gallipoli campaign.

Turkey, Caucasus, Egypt.—War was declared between Russia and Turkey on Oct. 30, 1914, and between England (and France) and Turkey on Nov. 5, 1914. But at the end of July, 1914, Turkey had already begun to mobilize; by the end of October it was estimated that she had some 500,000 men in her army with 250,000 more at the depots.



These troops were concentrated in three principal groups; near Constantinople and in Asia Minor, in the Caucasus, and in Syria. Without waiting for summer, the Turks under Enver Pasha,* at once opened a winter campaign in the Caucasus. Here, indeed, they had been anticipated by the Russians, who, crossing the frontier, captured, on November 13, a position near Koprukeui and Erzerum. From this they were compelled to withdraw, but returning to the attack recaptured the place November 20. What had been intended as a mere demonstration by the Russians was converted into a serious matter by the initiative and energy of the Turks. The two fortified positions in this region are Kars in Russia and Erzerum across the frontier in Asia Minor. The Russians would naturally advance by the Kars-Erzerum road. Hence the Turks, under German inspiration, purposed to hold the Russians on this road, while making an enveloping movement on the left against Kars and the Russian right. This plan came near succeeding. The Russians were pushed back from Koprukeui to Khorosan and were driven out of Ardahan on January 1. Two Turkish corps reached Sarikamish, the Russian railhead south of Kars, on December 25. But the weather and the season, together with the natural difficulties of the country, brought the plan to nought. One of the two Turkish corps was driven back from Sarikamish (January 1) and the other dislodged on the 3d. Ardahan was recaptured. The remaining body at Khorosan surrendered. Other detachments were beaten, as at Kara-Urgan and Yenisoi. Other fighting farther east was more or less indecisive, but the two Russian columns that had crossed the Turco-Persian frontier succeeded in defeating the Turkish troops opposed to them and on January 30 reëntered Tabriz, which had been occupied by the Turks early in January. Relieved from command in Europe and sent to the Caucasus, the Grand Duke Nicholas inaugurated a midwinter campaign, 1915–16, with an army estimated at 300,000 men. Defeating the Turks opposed to him, on February 16 he took Erzerum with 13,000 prisoners. The portions of the garrison that escaped fled to Trebizond, to

* Enver Pasha, born in 1882; statesman and military leader who in 1915, at the age of 33, became Turkish Minister of War and generalissimo of the Ottoman forces allied with the Central Powers in the European War; the German Kaiser decorated him with the Order Pour le Mérite.

the Van region and elsewhere, with the Russians in pursuit. One column captured Bitlis on March 3, and advanced south in the direction of Sert. Another column marched on Erzingan. In the direction of Trebizond the Turks were defeated at Kara Dere, and Trebizond itself was taken April 20–21. A Turkish attempt to turn the Russian left in the neighborhood of Trebizond was checked, and the Russians continued their march westward. Baron von der Goltz was in command of the Turkish troops. Two flying detachments in Persia carried on operations, one in the Urumiah district, the other from Kerman-Shah, taken by the Russians, towards Bagdad.

Simultaneously with the original Caucasian campaign mentioned above an expedition under Djemal Pasha was undertaken against the Suez Canal. The importance of this waterway to the Allies is self-evident. In anticipation of an attack upon it, troops had been collected in Egypt, consisting chiefly of East Indians and Colonials, with a few Imperial service units. In the canal itself several French and English warships took position to assist in the defense. Moreover, during the autumn and winter the position had been thoroughly strengthened by modern field fortifications; the defenses consisted of bridgeheads on the east covered by intrenched positions on the western bank at El Kantara, El Ferdan and Ismailia, Tussum and Serapeum, Shaluf and Kubri.

Dejemal Pasha formed his forces of 30,000 men into three columns. The northerly one, of about 6000 men of all arms, followed the caravan road from Rafa to El Kantara; the southerly, of 3000, the pilgrim road from Nakhl to Suez; the middle column, that from Kossaima to Ismailia. This last road happened to be practicable at this time because a rainfall had filled a pool on the line. Pontoon boats accompanied the expedition, whose march was well organized and well carried out. On January 26 the advance guards of the south and middle columns were reported near the canal. The Turks were completely beaten (February 2–3). The main attack (Tussum-Serapeum) was made by the middle column; that of the southerly (Suez) was a fiasco; the northern made a better though vain effort (Kantara); on the night of February 6–7 a general retirement began.

It must be admitted that this attack on the canal was miserably carried out by Djemal Pasha: among other things he brought into action only about one-half of his men. The British failed to counter-attack on the 4th, because they could not believe that the affair was over. It is in the highest degree likely, however, that if the Turks had attacked in full strength, they would have been beaten off with loss, so that, after all, the result was to save to Turkey a considerable body of troops for service elsewhere later. During the next few months there were minor engagements east of the canal, for operations now had simmered down to guarding the canal positions against raids. The Turkish garrison in Syria and the Sinai Peninsula did not exceed 25,000 men.

Dardanelles.—The Turkish arms thus came to grief in both the Caucasus and in Egypt. Better fortune waited upon them in the Dardanelles. The temptation to strike a blow at the vitals of Turkey by taking possession of the Dardanelles, and hence of Constantinople, was irresistible. Success here would have met with a rich reward. A way would have been opened to supply Russia with the war munitions she so sorely needed; the Balkan question would have been settled out of hand, and in a manner favorable to the Allies. But the entire campaign was mismanaged from the outset; the nature of the effort to be made was certainly not correctly estimated; efforts were scattered, time was lost.

For the naval campaign, reference should be made to the naval subdivision of this article. It opened on Nov. 3, 1914, and it was not until the following March that joint land and naval operations were decided upon. By that time the Turks had received ample warning, and here, as elsewhere, under German leadership, had made what turned out to be more than ample preparation.

In the Gallipoli peninsula nature was on the side of the defense. Furthermore the Turks enjoyed an advantage in their supply of men, for the bulk of their forces were in the neighborhood of Constantinople and could therefore be drawn on as needed. Gen. Sir Ian Hamilton was selected to direct land operations for the Allies. These were to be carried on by a French force under General d'Amade, drawn from north Africa, and by Colonials, Territorials, and some Indians from Egypt and Imperial troops.

On arriving at Tenedos (March 17), selected as his headquarters, Sir Ian made up his mind that the transports had been so badly loaded that he would not undertake any operations until the loading had been corrected. The transports were accordingly sent back to Egypt to be reloaded. Upon their return, five weeks had been lost to the Allies and gained to the Turks.

The British began their landing on April 25. How strong the force of the Turks was is not accurately known; it must have been well over 100,000. The German General Liman von Sanders had been appointed commander in chief of the Turkish forces at the Dardanelles. The chief landings were made at the tip of the peninsula. Once ashore, the advance was to be made against the village of Krithia, and the height of Achi Baba was then to be carried. At each of the beaches selected, the Turks were ready and received the landing party with tremendous fire. The Australian and New Zealand corps ("Anzac") near Gaba Tepe especially distinguished themselves by rushing the opposing Turks with the bayonet, clearing the slopes and securing a foothold on the top. The French landed a regiment on the Asiatic side, near Kum Kale, for the purpose of preventing an attack by gunfire against the transports at the nose of the peninsula. In this they were more or less successful, but at considerable loss to themselves. The result of the work of the 24 hours was that the Anzacs, isolated, were holding a semicircular line against an enemy ever increasing in numbers, other landings were abandoned, some forces were holding their own but isolated, while other landing parties had managed to join hands. The next three or four days were marked by severe fighting and an advance of the British from the southern beaches. By the afternoon of April 28 some of the troops had pushed up to within 1300 yards of Krithia, but could get no farther. The lines then dug in. On May 1, the Turks attacked at night, and there was a counterattack the next day. This is the first so-called battle of Krithia. The second occurred on May 6, and was an attempt to win the Krithia ridge; this attempt failed, but the British advanced their lines 500 yards. The third came off on June 4, with the same objective and the same result. The fourth was fought on July 12, and resulted in an advance of 300 yards more or less. Achi Baba still remained in Turkish hands. Meanwhile, the Turks were attacking the Anzacs (May 5–10) and were repulsed. They renewed their efforts in great force May 18, and were again beaten off with great loss. There were other engagements, as that of the French (June 21) who captured a work known as the Haricot Redoubt, and the English action of June 28, known as the battle of the Gully Ravine. And so it went until fresh British forces were landed at Suvla Bay on August 7, and the Anzacs advanced upon the ridges of Sari Bair.

But before the landing at Suvla Bay, the Allies on July 12 made a fresh attack in front of Krithia. It resulted in the capture of trenches and was followed on the next day by another general attack, resulting in a similar capture. But no really significant success was obtained.

The Suvla Bay landing and simultaneous operations at the tip of the peninsula and by the Anzacs constitute the last great attempt to drive the Turks off the peninsula. Sir Ian Hamilton in May had asked for two additional corps. By the end of July he got them. His plan was now to reënforce the Anzacs and direct them to make a drive to capture Sari Bair. A landing at Suvla Bay would surprise the Turks, and might enable the Anzacs after taking Sari Bair to push on to Maidos. The Turks at Krithia and on Achi Baba would thus be cut off. A containing attack was to be made at the tip of the peninsula. This attack was delivered on August 5 and failed. It was renewed on the 7th and resulted in minor local successes; its main purpose of keeping the Turks busy on the spot, and then preventing them from lending a hand elsewhere, may be said to have been realized. The Anzacs, reënforced, attacked on the 6th, and very nearly succeeded in their purpose; but on the 9th an assaulting column lost its way, and so arrived too late to clinch the positive gains already made on the spur to the southwest of the main elevation (Hill 305) of the Turkish position. During the attack on Sari Bair the landing at Suvla Bay was begun August 6 by night under the direction of Lieut. General Sir F. Stopford. It resulted in failure, for although the troops got ashore, yet once there they accomplished nothing. Apparently there was no well-thought-out plan of operations, or if there was, it was not carried out. Some of the troop units were landed at places other than those designated, others were late in moving out. Some local successes were obtained, however, and on the evening of August 7 the British extended in a semicircle around the bay. On the 8th the British stood fast and made no attempt to advance, and so lost their opportunity not merely to accomplish something on their own account, but to help their comrades farther south engaged in the desperate struggle of Sari Bair. The enemy were fewer in numbers than the British and were not in heart. The responsibility for the inaction of the 8th must rest with General Stopford, but Sir Ian Hamilton must come in for some part of the blame. There was more or less fighting during the next week; on the 15th General Stopford turned over the command of his troops to General de Lisle. Open fighting gave way to trench work. There was one more battle on August 21, when an attempt was made to take Hill 100, about two miles east of Suvla Bay. Sir Ian Hamilton was recalled in October, and the whole peninsula evacuated in December and January. See SIDD EL BAHR KALESI.

Mesopotamia.—The long-standing conflict between British and German interests in the Persian Gulf cannot be said to have had any immediate military bearing on the decision of the British government to open a campaign in the Mesopotamia. British interests, however, called for protection, and in particular the plant of the Anglo-Persian Oil Company on Abadan Island, with its 150-mile long pipe line, and the oil fields at Ahwaz on the Karun River. This

plant, intended to furnish fuel oil for the royal navy, was an enterprise in which the government was financially interested. Moreover, a successful campaign in the great valley would hurt Turkey's standing in the Mohammedan world, and from purely a military point of view would prove of assistance to the Allies. A small force had been sent to the Gulf before the outbreak of hostilities. On November 7 it reached the mouth of the river and took a small village, Fao by name, three miles up. Thence the expedition moved up river to Abadan, for the protection of the works already mentioned, and November 11 had a brush with the Turks on the Turkish side of the river at Saniyeh. Reenforcements joined this column on the 15th, and the combined forces, after some minor engagements, on November 23 entered Basra after its evacuation by the Turks; and on December 9, after getting into the rear of Kurna, received the surrender of its garrison, 50 miles up river. The British now took up an intrenched position astride of the river, and perhaps might have been content merely to hold the road down to the sea if it had not been for the Turkish counteroffensive in April, 1915.

Early in January of 1915 the Turks were found to be holding a strong position north of Mezera. An expedition drove them out of their lines. They next appeared at Ahwaz up the Karun River. A reconnoissance showed them to be in strength, and it was evident that they were contemplating an attack on the main British position. This attack occurred April 11–12 at Kurna itself, Ahwaz, and Shaiba. The action at Shaiba lasted three days and resulted in a serious Turkish defeat. During May but little happened, but on May 31 the British moved out and proceeded up as far as 75 miles from Kurna. From Amara a road runs to Ahwaz, the control of which assured the security of the oil region. The Turks had in the meantime withdrawn to Kut-el-Amara, 150 miles up the Tigris.

On May 31 a Turkish force north of Kurna was dispersed; on June 3 Amara was occupied. The Turks withdrew to Kut-el-Amara. From the Tigris at this point a cross river runs almost due south to join the Euphrates at Nasiriyeh. Unless this cross river were in British control the Turks could use it to menace the British left. Hence a force was sent against Nasiriyeh and on July 24 captured the place, the Turks retreating towards Kut. Early in August General Townshend went up the river marching on Kut, and on September 25 contact was made. A battle was fought on the next two days, and at dawn on the 29th it was discovered that the Turks had evacuated the position of Kut-el-Amara and retreated on Bagdad. They were pursued and considerable loss inflicted on them. By September 30 General Townshend was within 100 miles of Bagdad by road and 200 by river. He continued his march, and at Ctesiphon, about 30 miles down river from Bagdad, fought, November 22–25, an indecisive battle against superior numbers. At first victorious, he was compelled in consequence of his lack of reserves and his shortage of ammunition to fall back in the face of Turkish reenforcements. He retreated to Kut after having lost about one-fourth of his total 20,000 men. Here he intrenched and was besieged by the Turks.

All attempts to succor him having failed, and his supplies being exhausted, General Townshend on April 30 was compelled to surrender to the Turks, after a gallant defense protracted for 143 days. This surrender simply meant that the ill-advised expedition against Bagdad had failed; it was still the fact that the original purpose of the Mesopotamian campaign had been fulfilled. General Aylmer's relief expedition, setting out Jan. 6, 1916, after defeating the Turks in two battles, managed, January 21, to reach a point only eight miles from Kut-el-Amara. But floods now came to the Turkish rescue and Aylmer was forced to fall back. He set out again in February, better equipped with boats, and after meeting with a reverse at Felahie defeated the Turks at Umm-el-Heuna, April 5; the next day the capture of Felahie was announced. He was now within 23 miles of Kut; but the Turks in the meantime had occupied strongly intrenched posts to dispute any further advance, impeded as before by floods. Much fighting took place, and although some ground was gained the relief force was unable to gain any decisive success. General Aylmer's forces continued to hold their lines in the neighborhood of Kut during the summer of 1916, awaiting the development of the Russian movement towards Anatolia, and the Russian advance from Kerman-Shah.

Colonies. *Africa.*—As early as August 7 the British Imperial government telegraphed the South African government to suggest the desirability of seizing such parts of German Southwest Africa, "as would give them the command of Swakopmund, Luderitzbucht, and the wireless stations there or in the interior." But before operations could be carried on against German territory the local government found itself face to face with a rebellion in sympathy with, if not inspired by, Germany, and having for its end the establishment of independence. Maritz, one of its leaders, was, on October 26, completely defeated by loyalist troops under the direction of General Smuts, so that the rebellion came to an end in those parts. A more serious situation existed in the Union itself. But here too the loyalists prevailed. On October 27 General Botha took the field against General Beyers, the leader of the rebels, defeated him at Commissie Drift, and scattered his troops. On November 12 Botha routed De Wet at Mushroom Valley. A fugitive, De Wet was taken prisoner on December 1. Beyers, who in the meantime had collected another force, was again beaten December 7 and in escaping was drowned while trying to swim his horse across the Vail River. His death and De Wet's capture ended the rebellion, though small parties kept the field for some time afterward.

Togoland was taken in a campaign that lasted just three weeks, from Aug. 7 to Aug. 28, 1915. Surrounded on three sides by hostile territory, with the sea under British control, it could not hope to offer any resistance. The Allied base was the littoral; minor expeditions entered the country from the north, the east, and the west. The capital of the colony, Lome, fell on the sixth. The campaign thereafter had for its objective the powerful wireless station at Kamina, 125 miles from the coast. This point was entered, after some fighting by the Allies, on the 27th, and the colony surrendered by its Governor. The German forces could not have exceeded 1000, mostly natives.

Kamerun called for a more serious effort on the part of the Allies. Like Togoland, it was surrounded on all sides by hostile territory,

with the sea under Allied control. But its vastly greater area made operations more difficult and it was more strongly defended. Three expeditions from the northwest were defeated by the Germans in August and September, 1915. Attacking from the sea, however, the Allies took Duala (September 27) and from this point widened their holding. Early in October it was clear that the colony would be lost. Two columns pushed their way into the interior along the railways, one of which on October 26 took Edea, repelling six weeks later a counterattack for its recovery. The other column north of Duala captured the entire railway and advanced beyond its head. The French sent down troops from the Tchad, and others reënforced by Belgians from Equatoria. The result of all these efforts was that German resistance was well worn down, and came to an end with the surrender of Mora Hill early in 1916.

The situation in German Southwest Africa was complicated by the South African rebellion. This rebellion crushed, real operations began in January, Luderitz Bay having been occupied as early as Sept. 18, 1914. Swakopmund was occupied January 14. The campaign was directed against the capital Windhoek and carried on by two armies; the northern under Botha was to move from Swakopmund; while the southern under Smuts, divided into three columns, was to move east from Luderitz Bay, north from Warmbad, and west from Bechuanaland. By May 1, the end was near. On the 12th, Botha entered Windhoek and the struggle was practically over; for pushing on to Grootfontein, now the German capital, he there, on July 9, received the surrender of the enemy forces.

The most important colony in Africa, German East Africa, gave the British far more trouble than any of the others. Here the Germans disposed of some 8000 men, though all reports as to forces in the colonies are subject to caution, and the British forces at the beginning were insignificant, say 1200. During August, 1914, some successes fell to the British. For example, they demolished, August 13, the port of Dar-es-Salaam. On September 3, British reënforcements arrived in time to check German operations against the Uganda railway. September was taken up by German attacks without any special result. The British remained on the defensive, waiting for troops from India. These arrived November 1, and lay off the German port of Tanga. An attack made on the 4th resulted in a decided reverse for the British, who were compelled to reëmbark. The Germans now invaded British East Africa, but were pushed back to Jassin in German territory, where on January 18 they defeated the British, and forced a withdrawal of all the outlying posts in this region. They had, as early as September, 1914, invaded northeast Rhodesia, where they came into contact with Belgian troops. April, 1915, was spent in skirmishing. In July, 1915, the *Königsberg* was destroyed. This vessel, after doing much mischief, had been chased by British cruisers and had taken refuge (November, 1914) in the Rufiji River. Her guns, however, were removed and used in the defenses of Tabora, on the main east and west line of the colony. General Smith-Dorrien, later relieved by General Smuts, was sent out to take command of the troops in British East Africa and the invasion proceeded from that region, as well as from Nyassa on the south.

The British expedition commanded by Gen. Jan Smuts won an important victory at the Kitovo Hills, near the northern boundary of German East Africa. After five days of fighting (March 7–12) the Germans fell back to a position in the forest along the Rufu River. As a result of the operations that followed, the Germans, although reënforced, were compelled to abandon their positions and retire southward along the Tanga railway.

General Smuts later reported a victory by mounted troops under General Venderventer, in a surprise attack in the Arusha region. The German forces were supposed to have totaled about 3500 European and 16,000 native police.

The Portuguese made their first effort in the war by occupying Kianga, on the border of German East Africa.

The Pacific.—Japan, as Great Britain's ally, declared war on Germany Aug. 23, 1914, but confined her offensive to Germany's possessions in the Pacific. On August 27, she began the blockade of Tsingtao, and by the end of September, two Japanese armies and a few English troops had completed landing, one on the north, the other with the English at Rozan Bay. The German defenses consisted of three lines, the first of fortified hills, the second of 10 forts, the third of five. By September 28, the first two lines had been carried, and the siege was begun. October 31 a general attack was opened on the third line which was occupied November 6. The next day the place was surrendered with 201 officers and 3841 noncommissioned officers and men. The Japanese land forces engaged in the siege numbered 22,980 officers and men, with 142 guns. The British forces were far less numerous, 920 European troops and 450 Sikhs. The British casualties were insignificant, 12 killed and 62 wounded; the Japanese relatively very little greater, 236 killed and 1282 wounded. For the capture of other German islands in the Pacific see the section on *Naval Operations* in this article.

IV. NAVAL OPERATIONS

At the outbreak of the war the belligerent navies were constituted as shown in the subjoined tables. For the sake of space and conciseness, certain methods of lettering and abbreviation are used in the tables and throughout the article, viz.:

Abbreviations: *a.c.*, armored cruiser; *a.c.d.*, armored coast-defense vessel; *b.c.*, battle cruiser; *b.s.*, battleship; *c.*, cruiser (not armored); *des.*, destroyer; *Div.*, division (of a fleet or squadron); *g.b.*, gunboat; *Sq.*, squadron; *sub.*, submarine; *t.b.*, torpedo boat.

EXAMPLES AND EXPLANATIONS

First example: *b.s.* IRON DUKE (25d-10g13.5–22k).

Explanation: *b.s.* stands for battleship; small capitals indicate that the vessel is of the dreadnought type; 25d means 25,000 tons' displacement; 10g13.5, that the main battery consists of 10 guns of 13.5-inch calibre; 22k, that the maximum speed is 22 knots.

Second example: *des. Ferret* (0.75d-2g4,2g3-27k), *Hind* (same), *Hydra* (same).

Explanation: this means that the destroyer *Ferret* has a displacement of 750 (0.75 × 1000) tons, carries a main battery of two 4-inch and two 3-inch guns, and has a maximum speed of 27 knots; and that the *Hind* and *Hydra* are the same as the *Ferret* in all respects.

FORCES IN THE NORTH SEA AND ADJACENT WATERS

GREAT BRITAIN

FIRST FLEET (Admiral J. R. Jellicoe, commanding)

Flagship, *b.s.* IRON DUKE (25d-10g13.5–22k); tenders, *c. Sappho* (3.4d-2g6,6g4.7-20k), *des. Oak* (0.8-2g4,2g3-

32k); repair ships, *Cyclops* (11d–13k), *Assistance* (10d–13k).

1st Battle Sq., *1st Div.*: *b.s.* Marlborough (25d–10g13.5–22k), St. Vincent (19d–10g12–21k), Colossus (20d–10g12–21k), Hercules (same).

2d Div.: *b.s.* Neptune (19d–10g12–21k), Superb (same), Collingwood (same), Vanguard (same).

2d Battle Sq., *1st Div.*: *b.s.* King George V (24d–10g13.5–21k), Ajax (same), Audacious (same), Orion (23d–10g13.5–21k).

2d Div.: *b.s.* Centurion (24d–10g13.5–21k), Conqueror (23d–10g13.5–21k), Monarch (same), Thunderer (same).

3d Battle Sq., *1st Div.*: *b.s. King Edward VII* (16d–4g12, 4g9.2–19k), *Hibernia* (same), *Africa* (same), *Britannia* (same).

2d Div.: *b.s. Commonwealth* (16d–4g12,4g9.2–19k), *Dominion* (same), *Hindustan* (same), *Zealandia* (same).

4th Battle Sq., *1st Div.*: *b.s.* Dreadnought (18d–10g12–21k), Temeraire (19d–10g12–21k), Bellerophon (same), *Agamemnon* (17d–4g12, 10g9.2–19k).

2d Div.: Not organized; ships under construction.

Scouts: 1st Sq., *c. Bellona* (3.3d–6g4–26k); 2d Sq., *c. Boadicea* (3.3d–6g4–26k); 3d Sq., *c. Blanche* (3.4–10g4–26); 4th Sq., *c. Blonde* (3.4–10g4–26k).

1st Battle Cruiser Sq.: *b.c.* Lion (26d–8g13.5–28k), Princess Royal (same), Queen Mary (27d–8g13.5–28k), New Zealand (19d–8g12–27k).

2d Cruiser Sq.: *a.c. Shannon* (15d–4g9.2,10g7.5–23k), *Achilles* (14d–6g9.2,4g7.5–23k), *Cochrane* (same), *Natal* (same).

3d Cruiser Sq.: *a.c. Antrim* (11d–4g7.5,6g6–22k), *Argyll* (same), *Devonshire* (same), *Roxburgh* (same).

4th Cruiser Sq.: *a.c. Suffolk* (10d–14g6–23k), *Berwick* (same), *Essex* (same), *Lancaster* (same).

1st Light Cruiser Sq.: *c. Southampton* (5.4d–8g6–26k), *Birmingham* (5.4d–9g6–26k), *Lowestoft* (same), *Nottingham* (same).

Destroyer Flotilla of 1st Fleet: *c. Amethyst* (3d–12g4–22k), carrying flotilla commander.

1st Sq.: *c. Fearless* (3.4d–10g4–25k) and 20 destroyers (0.8d–2g4,2g3–28 to 30k).

2d Sq.: *c. Active* (3.4d–10g4–25k) and 20 destroyers (0.8d–2g4, 2g3–28k).

3d Sq.: *c. Amphion* (3.4d–10g4–25k) and 13 destroyers (1d–3g4–29k).

4th Sq.: *des. Swift* (2.2d–4g4–35k) and 20 destroyers (0.9d–3g4–32k).

Second Fleet

Flagship: *b.s. Lord Nelson* (17d–4g12,10g9.2–19k).

5th Battle Sq.: *b.s. Prince of Wales* (15d–4g12–18k), *Bulwark* (same), *Formidable* (same), *Irresistible* (same), *Implacable* (same), *London* (same), *Queen* (same), *Venerable* (same). Scout: *c. Diamond* (3d–12g4–22k).

6th Battle Sq.: *b.s. Russell* (14d–4g12–19k), *Albemarle* (same), *Cornwallis* (same), *Duncan* (same), *Exmouth* (same), *Vengeance* (13d–4g12–18k). Scout: *c. Topaze* (3d–12g4–22k).

5th Cruiser Sq.: *a.c. Carnarvon* (11d–4g7.5,6g6–22k), *Sutlej* (12d–2g9.2,12g6–21k), *c. Liverpool* (4.8d–2g6, 10g4–25k).

6th Cruiser Sq.: *a.c. Drake* (14d–2g9.2,16g6–23k), *King Alfred* (same), *Good Hope* (same).

Mine Layer Sq.: *c. Andromache* (3.4d–6g2.2–20k), *Apollo* (same), *Intrepid* (same), *Iphigenia* (same), *Latona* (same), *Naiad* (same), *Thetis* (same).

Third Fleet

7th Battle Sq.: *b.s. Caesar* (15d–4g12–18k), *Hannibal* (same), *Illustrious* (same), *Magnificent* (same), *Majestic* (same), *Mars* (same), *Victorious* (same), *Prince George* (same). Tender: *c. Doris* (5.6d–11g6–20k).

8th Battle Sq.: *b.s. Albion* (13d–4g12–18k), *Canopus* (same), *Glory* (same), *Goliath* (same), *Ocean* (same), *Jupiter* (15d–4g12–18k). Tender: *c. Proserpine* (2d–8g4–20k).

7th Cruiser Sq.: *a.c. Aboukir* (12d–2g9.2,12g6–21k), *Hogue* (same), *Cressy* (same), *Bacchante* (same), *Euryalus* (same).

8th Cruiser Sq.: Not organized.

9th Cruiser Sq.: *a.c. Donegal* (10d–14g6–23k), *Monmouth* (same), *c. Europa* (11d–16g6–21k), *Amphitrite* (same), *Argonaut* (same), *Challenger* (5.9d–11g6–21k), *Vindictive* (5.8d–10g6–19k), *Highflyer* (5.6d–11g6–20k).

10th Cruiser Sq.: *c. Edgar* (7.4d–2g9.2,10g6–20k), *Grafton* (same), *Hawke* (same), *Theseus* (same), *Crescent* (7.7d–1g9.2,12g6–20k), *Royal Arthur* (same), *Gibraltar* (7.7d–2g9.2,10g6–20k).

Patrol Flotilla. Consists of 6 scout cruisers as flagboats and the 6th, 7th, 8th, and 9th destroyer flotillas (79 boats — 360 to 1050 tons); 7 old cruisers and the 3d, 4th, 5th, 6th, 7th, 8th, and 9th submarine flotillas (3 boats of 210 tons, 36 of 320 tons, 8 of 630 tons, 6 of 825 tons); also 24 torpedo boats of 250 tons.

Coast-Defense Flotillas. These are separately organized for each port and consist of 21 destroyers (320 to 480 tons), 44 torpedo boats (75 to 750 tons), and 7 submarines (210 to 320 tons).

FRANCE

(North Sea and Atlantic Forces)

2d Light Sq.: *Armored Cruiser Div.*: *a.c. Marseillaise* (10d–2g7.6,8g6.4–21k), *Aube* (same), *Condé* (same).

Destroyer Flotilla: *c. Dunois* (0.9–6g2.5–22k) flagboat; three divisions of 6 boats each (310 to 340 tons, 26 to 27 knots).

Submarine Flotilla: Five divisions with 5 destroyers as flagboats, 18 submarines (550 to 810 tons).

Mining Flotilla: Two mine layers (600d–20k), 1 gunboat (950d–21k), 1 destroyer (300d–26k).

Schoolship Div.: *a.c. Gloire* (10d–2g7.6,8g6.4–21k), *Jeanne d'Arc* (11d–2g7.6,14g5.5–23k), *Gueydon* (9d–2g7.6,8g6.4–21k), *Dupetit Thouars* (same).

Coast Defense. The mobile defense of Cherbourg, Brest, Rochefort, Dunquerque, and Bidassoa consists of 2 destroyers, 7 torpedo boats, and 11 submarines.

RUSSIA

(Baltic Sea only)

Active Fleet (Admiral von Essen, commanding)

Battleship Sq.: *b.s. Czarevitch* (13d–4g12–18k), *Imperator Pavel I* (16d–4g12,14g8–18k), *Andrei Pervosvanyi* (same), *Slava* (14d–4g12–18k), *a.c. Rurik* (15d–4g10, 8g8–22k).

Armored Cruiser Sq.: *a.c. Gromoboi* (13d–4g8,22g6–20k), *Bayan* (7.8d–2g8,8g6–21k), *Pallada* (same), *Admiral Makarov* (same), *des. Novik* (1.3d–4g4–36k).

Destroyer Flotilla, *1st Sq.*: Base, Libau; 4 divisions of 9 boats each (350 to 580 tons, 26 knots).

2d Sq.: Base, Helsingfors; 2 divisions of 9 boats, 1 of 8 boats (350 tons, 26 knots).

Submarine Flotilla, *1st Div.*: Base, Libau; 2 boats of 370 tons, 1 of 150, 1 of 129.

2d Div.: Base, Reval; 4 boats of 450 tons.

Ships in Reserve, battleships: *Imp. Alex. II* (9d–2g12, 5g8–15k), *Petr Velikii* (10d–4g8–12k).

Armored cruiser: *Rossya* (12d–4g8,22g6–19k).

Cruisers: *Diana* (6.7d–8g6–20k), *Aurora* (same).

Destroyers and submarines: Many building; some completed.

Torpedo boats: About 20 (108 to 150 tons).

GERMANY

High Seas Fleet (Vice Admiral Ingenohl,* commanding)

Flagship: Friedrich der Grosse (25d–10g12–23k).

1st Battleship Sq., *1st Div.*: *b.s.* Ostfriesland (22d–12g12–21k), Helgoland (same), Thuringen (same), Oldenburg (same).

2d Div.: *b.s.* Posen (19d–12g11–20k), Nassau (same), Rheinland (same), Westfalen (same).

2d Battleship Sq., *1st Div.*: *b.s. Preussen* (13d–4g11–18k), *Schleswig-Holstein* (same), *Pommern* (same), *Schlesien* (same).

2d Div.: *b.s. Hannover* (13d–4g11–18k), *Hessen* (same), *Lothringen* (same), *Deutschland* (same).

3d Battleship Sq., *1st Div.*: *b.s.* Kaiser (24d–10g12–23k), Kaiserin (same), Pr. Reg. Luitpold (same), König Albert (same).

2d Div.: Ships not completed.

Cruiser Sq., *Battle Cruiser Div.*: *b.c.* Seydlitz (25d–10g11–29k), Von der Tann (19d–8g11–27k), Moltke (23d–10g11–27k), Derfflinger (28d–8g12–30k).

Light Cruiser Sq.: *c. Köln* (4.3d–12g4.1–27k), *Kolberg* (same), *Mainz* (same), *Rostock* (4.8d–12g4.1–27k), *Strassburg* (4.5d–12g4.1–27k), *Stralsund* (same), *Dresden* (3.6d–10g4.1–24k), *Stettin* (3.4d–10g4.1–24k).

Destroyer Flotillas: *1st Flotilla:* 12 boats (550 tons–2g3.4–32.5k).

2d Flotilla: 12 boats (570d–2g3.4–32.5k).

3d and *4th Flotillas:* each of 12 boats (640 tons–2g3.4–32.5k).

5th Flotilla: 12 boats (616 tons–2g3.4–30k).

6th and *7th Flotillas:* each of 12 boats (550 tons–2g3.4–30k).

Submarine Flotillas; *1st Flotilla:* 7 boats, *U-21* to *U-27* (910 tons).

2d Flotilla: 7 boats, *U-14* to *U-20* (295 tons).

3d Flotilla: 7 boats, *U-7* to *U-13* (255 tons).

Mine Layers Flotilla: *Arkona* (1970 tons), *Nautilus* (same), *Albatross* (2200 tons), *Pelikan* (2360 tons).

Reserve Squadrons

4th Battleship Sq.: *b.s. Wittelsbach* (12d–4g9.4–18k), *Zahringen* (same), *Schwaben* (same), *Mecklenburg* (same), *Elsass* (13d–4g11–18k), *Braunschweig* (same).

* Oscar von Ingenohl, born (1857) at Neuwied; spent half of his seafaring life in the Far East in command of various vessels; attached to Admiralty in Berlin (1897–1901); accompanied the Kaiser on many of his cruises and for a time commanded the royal yacht *Hohenzollern;* rear admiral (1908); commander of second squadron of the high-sea fleet (1910); served in command during early part of European War, but was removed (February, 1915).

5TH BATTLESHIP SQ.: *b.s. Kaiser Barbarossa* (11d–4g9.4–18k), *Kais. Wilhelm der Grosse* (same), *Kais. Wilhelm II* (*same*), *Kais. Karl der Grosse* (same).
ARMORED COAST-DEFENSE SQUADRON: *a.c.d. Siegfried* (4d–3g9.4–15k), *Beowulf* (same), *Frithiof* (same), *Heimdall* (same), *Hildebrand* (same), *Hagen* (same), *Odin* (3.5d–3g9.4–15k), *Aegir* (same).
SQUADRON OF INSTRUCTION, *Cadet* and *Seaman Schools: c. Freya* (5.6d–2g8.2,8g5.9–18k), *Hertha* (same), *Vineta* (same), Victoria Louise (same), *Hansa* (same), *b.s.* (old) *König Wilhelm* (10d–22g9.4–15k).
Gunnery School: b.s. Wettin (12d–4g9.4–18k), *a.c. Blücher* (16d–12g8.2–23k), *Prinz Adalbert* (9d–4g8.2,10g5.9–20k), *c. Augsburg* (4.3d–12g4.1–27k), *Danzig* (3.2d–10g4.1–23k), *Stuttgart* (3.4d–10g4.1–24k).
Torpedo School: b.s. (old) *Württemburg* (7d–6g10.2–16k), *a.c. Fürst Bismarck* (11d–4g9.4,12g5.9–19k), *Friedrich Karl* (9d–4g8.2,10g5.9–20k), *c. München* (3.2d–10g4.1–23k).
Old battleships: *b.s. Worth* (10d–6g11–17k), *Brandenburg* (same).
Destroyers and submarines: About 35 destroyers, 6 submarines, 50 torpedo boats and several old cruisers and coast-defense craft were in reserve or laid up.

BELLIGERENT NAVAL FORCES IN THE MEDITERRANEAN

GREAT BRITAIN

2D BATTLE CRUISER SQ.: *b.c. Inflexible* (17d–8g12–27k), *Indomitable* (same), *Indefatigable* (19d–8g12–27k).
1ST CRUISER SQ.: *a.c. Defense* (15d–4g9.2,10g7.5–23k), *Black Prince* (14d–6g9.2,4g7.5–23k), *Duke of Edinburgh* (same), *Warrior* (14d–6g9.2,10g6–23k).
Light cruisers: *c. Gloucester* (4.8d–2g6,10g4–26k), *Chatham* (5.4d–9g6–26k), *Dublin* (same), *Weymouth* (5.3d–8g6–26k).
5TH DESTROYER FLOTILLA: 24 boats (550 tons–27 knots).
Submarines: 6 boats of 320 tons.

FRANCE

FIRST FLEET (Vice Admiral Boué de Lapeyrère, commanding)

SECTION OF THE COMMANDER IN CHIEF: Flagship: *b.s.* COURBET (23d–12g12–21k), *b.s.* JEAN BART (23d–12g12–21k), *c. Jurien de la Gravière* (5.6d–8g6.4–23k).
1ST BATTLESHIP SQ., *1st Div.: b.s.* DIDEROT (18d–4g12,12g9.4–19k), DANTON (same), VERGNIAUD (same), FRANCE (23d–12g12–21k).
2d Div.: b.s. VOLTAIRE (18d–4g12,12g9.4–19k), MIRABEAU (same), CONDORCET (same), PARIS (23d–12g12–21k).
2D BATTLESHIP SQ., *1st Div.: b.s. Verité* (15d–4g12–19k), *Republique* (same), *Patrie* (same).
2d Div.: b.s. Justice (14d–4g12–19k), *Democratie* (same).
LIGHT SQ., *1st Div.: a.c. Jules Michelet* (12d–4g7.6,12g6.4–22k), *Ernest Renan* (13d–4g7.6,12g6.4–24k), *Edgar Quinet* (14d–14g7.6–23k), *Waldeck Rousseau* (same).
2d Div.: a.c. Léon Gambetta (12d–4g7.6,12g6.4–23k), *Victor Hugo* (same), *Jules Ferry* (same).
Supplementary Battleship Div.: b.s. Suffren (12d–4g12–18k), *St. Louis* (11d–4g12–18k), *Bouvet* (12d–2g12,2g10.8–18k).
DESTROYER FLOTILLA: *flagboat, des. Bouchier* (0.70d–2g3.9, 2g2.5–32k).
1st Div.: 5 boats (0.73d–2g3.9,2g2.5–32k).
2d Div.: 5 boats (0.4 to 0.45d–6g2.6–28k).
3d Div.: 5 boats (0.45d–6g2.6–28 to 31k).
4th Div.: 6 boats (0.33 to 0.4d–1g2.6–27 to 30k).
5th Div.: 6 boats (0.33d–1g2.6–29k).
6th Div.: 5 boats (0.75d–2g3.9,4g2.6–30 to 32k).
SUBMARINE FLOTILLA: flagboat, *des. Dehorter* (0.75d–2g3.9, 4g2.6–31k).
1st Div.: des. Arbalète (0.3d–1g2.6–31k), 3 submarines (550 tons).
2d Div.: des. Hallebarde (0.3d–1g2.6–27k), 2 submarines (550 tons).
3d Div.: des. Dard (0.3d–1g2.6–29k), 2 submarines (550 and 490 tons).
4th Div.: des. Mousqueton (0.3d–1g2.6–29k), 3 submarines (550 tons).
5th Div.: des. Sarbacane (0.3d–1g2.6–29k), 2 submarines (550 tons).
Mine layers: *Casabianca* (945 tons), *des. Baliste* (300 tons).
Schoolship Div.: b.s. Jaureguiberry (12d–2g12,2g10.8–18k), *Charlemagne* (11d–4g12–18k), *Gaulois* (same), *Marceau* (11d–4g13.4–16k), *a.c. Pottruau* (5.3d–2g7.6,10g 5.5–19k), *g.b. La Hire* (0.9d–6g2.6–22k), transport *Tourville.*
DEFENSE MOBILE. At Toulon, 3 submarines, several torpedo boats, 1 mother ship for aëroplanes; at Bizerta, 3 submarines and several torpedo boats.
Morocco Div.: c. Du Chayla (4d–6g6.4,4g3.9–20k), *Cassard* (same).
Levant Div.: a.c. Latouche Tréville (4.7d–2g7.6,6g5.5–18k), *Bruix* (same).
Miscellaneous: In addition to the active forces mentioned, there were 5 old battleships (1891–97), 4 old armored cruisers, and 10 old cruisers which were on special service, in reserve, or laid up; also about 12 destroyers, 17 submarines, and 115 torpedo boats.

RUSSIA

MEDITERRANEAN SQ.: *a.c. Bogatyr* (6.7d–12g6–23k), *Oleg* (same).

GERMANY

SPECIAL SQ.: *b.c.* GOEBEN (23d–10g11–27k), *c. Breslau* (4.5d–12g4.1–27k).

AUSTRIA-HUNGARY

BATTLE FLEET (Admiral Haus, commanding)

1st Div.: b.s. VIRIBUS UNITIS (20d–12g12–21k), TEGETTHOFF (same), PRINZ EUGEN (same).
2d Div.: b.s. Erzherzog Franz Ferdinand (14d–4g12,8g9.4–20k), *Radetzky* (same), *Zrinyi* (same).
3d Div.: b.s. Erz. Ferd. Max (10.5d–4g9.4–20k), *Erz. Friedrick* (same), *Erz. Karl* (same).
Cruiser Div.: a.c. Sankt Georg (7.2d–2g9.4,5g7.6,4g5.9–22k), *Kaiser Karl VI* (6.2d–2g9.4,8g5.9–21k), *des. Turul* (0.4d–1g2.8,7g1.8–28k), *Velebit* (same).
Scout Div.: c. Saida (3.4d–7g3.9–27k), *Novara* (same), *Ad. Spaun* (same), *Helgoland* (same).
COAST-DEFENSE SERVICE, *1st Div.: b.s. Hapsburg* (8d–3g9.4–19k), *Arpad* (same), *Babenburg* (same).
2d Div.: b.s. Wien (5.5d–4g9.4–17k), *Monarch* (same), *Buda-Pest* (same).
Cruisers: a.c.d. Kronprinz Erzherzog Rudolf (6.8d–3g12–16k), *a.c. Kaiserin Maria Theresia* (5.2d–2g7.6, 8g5.9–19k), *c. Kaiser Franz Joseph I* (4d–8g5.9–19k), *Aspern* (2.4d–8g4.7–20k), *Tegetvar* (same), *Zenta* (same), *Panther* (1.5d–2g4.7–18k).
Destroyer Flotilla: 6 boats (0.8d–2g4–32.5k), 10 boats (0.4d–1g2.8–28k); reserve: 1 boat (0.5d–6g1.8–26k), 6 boats (0.4 to 0.5d–misc.–20 to 23k).
Torpedo-Boat Flotilla: 12 boats (0.25d–2g2.8–28k), 24 boats (0.2d–4g1.8–26k), 12 boats (0.1d–2g1.8–28k), 6 boats (0.1d–2g1.8–26k), 11 boats (0.1d–2g1.4–19k), mother ship (13d–4g4.7–20k).
Submarine Flotilla: 2 boats (270 tons), 2 boats (300 tons), 2 boats (273 tons), 1 depot ship (1d–4g2.8–15k).

ITALY

NOTE.—Though Italy did not enter the war until later, for purposes of comparison the condition on Aug. 1, 1914, is given.

ACTIVE FLEET (Vice Admiral Marcello, commanding)

FIRST SQ., *1st Div.: b.s.* DANTE ALIGHIERI (19d–12g12–23k), GIULIO CESARE (22d–13g12–28k), LEONARDO DA VINCI (same), *c. Nino Bixio* (3.5d–6g4.7–29k).
1st Destroyer Flotilla: 4 boats (0.7d–1g4.7,4g3–30k).
3d Div.: b.s. Regina Margherita (13d–4g12,4g8–20k), *Benedetto Brin* (same), *Emanuele Filiberto* (10d–4g10–18k), *Ammiraglio di St. Bon* (same).
4th Destroyer Flotilla: 6 boats (0.4d–4g3–29k).
5th Div.: a.c. Giuseppe Garibaldi (7.2d–1g10,2g8,14g6–20k), *Varese* (same), *Francesco Ferruccio* (same), *Carlo Alberto* (6.4d–12g6–19k), *g.b. Coatit* (13d–12g3–23k).
5th Destroyer Flotilla: 6 boats (0.33d–1g3,5g2.2–30k).
SECOND SQ., *2d Div.: b.s. Regina Elena* (12.5d–2g12,12g8–22k), *Vittorio Emmanuele III* (same), *Roma* (same), *Napoli* (same), *c. Quarto* (3.2d–6g4.7–28k).
3d Destroyer Flotilla: 6 boats (0.7d–1g4.7,4g3–30k).
4th Div.: a.c. Pisa (10d–4g10,8g7.5–23k), *Amalfi* (same), *San Giorgio* (9.7d–4g10,8g7.5–23k), *San Marco* (same), *c. Marsala* (3.5d–6g4.7–29k), *g.b. Agordat* (1.3d–12g3–23k).
2d Destroyer Flotilla: 6 boats (0.4d–4g3–29k).
IN RESERVE OR ON SPECIAL SERVICE IN THE MEDITERRANEAN: Battleships: *b.s.* CONTE DI CAVOUR (22d–13g12–23k); old battleships, *b.s. Dandolo* (12d–4g10–16k), *Duilio* (same), *Sardegna* (13d–4g13.5–20k), *Sicilia* (same), *Re Umberto* (same).
Armored cruiser: *a.c. Vettor Pisani* (6.4d–12g6–19k).
Cruisers: *c. Libia* (3.7d–2g6,8g4.7–22k) and 6 old cruisers (2200 to 3500 tons).
Destroyers: About 14 (300 to 700 tons).
Torpedo boats: About 93 (34 to 215 tons).
Submarines: 20 boats (110 to 463 tons).
SHIPS IN FOREIGN WATERS:
China Seas: a.c. Marco Polo (4.5d.–6g6,10g4.7–19k).
Red Sea and Indian Ocean: c. Piemonte (2.6d–10g4.7–22k), *Calabria* (2.5d–6g4.7–16k).

TURKEY

NOTE.—Though Turkey did not enter the war until later, for purposes of comparison the condition on Aug. 1, 1914, is given, adding the GOEBEN and BRESLAU. The battleships building in England were taken over by Great Britain at the outbreak of war. So far as known the Turkish navy had no fleet or squadron organization. The vessels were as follows:

Battle cruiser: SULTAN SELIM JAVUZ (ex-*Goeben*) (23d–10g11–27k).

Battleships (old): *Kheyr-ed-din Barbarossa* (10d–6g11–17k), *Torgut Reis* (same).
Old *b.s.* reconstructed as *a.c.*: *Messudieh* (10d–2g9.2,12g6–16k).
Coast-Defense vessel: *Muin-i-Zaffer* (2.7d–4g6–12k).
Cruisers: *Medillu* (ex-*Breslau*) (4.5d–12g4.1–27k), *Hamidieh* (3.8d–2g6,8g4.7–22k), *Medjidieh* (3.4d–2g6, 8g4.7–22k).
Destroyers: 4 boats (0.6d–2g3.4–35k), 6 boats (0.3d–various–25 to 28k).
Torpedo boats: 10 boats (96 to 165 tons–27k).
Submarines: none. Many small gunboats.

Belligerent Naval Forces in the Black Sea

RUSSIA

Active Fleet (Admiral Eberhard, commanding)

Battleship Sq.: *b.s. Panteleimon* (13d–4g12–16k), *Tri Sviatitelya* (13d–4g12–17k), *Joann Zlatoust* (13d–4g12, 4g8–16k), *Sviatoi Evstafii* (same), Repair ship *Kronstadt* (16d–13k).
Destroyer Flotilla: 1st Div.: 6 boats (615 tons, 25 knots); 2d Div.: 6 boats (360 tons, 26 knots); 3d Div.: 6 boats (250 tons, 26 knots).
Submarine Div.: 2 boats (240 tons), 2 boats (150 tons).
Mine layers: *Beresany* (5d–12k), *Prut* (same).
Submergible mine layer: *Krab* (500 to 700 tons).
Reserve Ships: *b.s. Georgei Pobiedonosetz* (11d–6g–12–16k), *Sinop* (same), *Rostislav* (9d–4g10–16k), *a.c. Kagul* (6.7d–12g6–23k), *Pamyat Mercuria* (same). Torpedo boats, 10 (88 to 164 tons).

Belligerent Naval Forces in the Pacific and Indian Oceans

GREAT BRITAIN

Battleships: *Triumph* (12d–4g10,14g7.5–20k), *Swiftsure* (same).
Armored cruisers: *Minotaur* (15d–4g9.2,10g7.5–23k), *Hampshire* (11d–4g7.5,6g6–23k).
Cruisers: *Newcastle* (4.8d–2g6,10g4–26k), *Glasgow* (same), *Yarmouth* (5.3d–8g6–26k), *Dartmouth* (same), *Fox* 4.4d–2g6,8g4.7–19k), *Philomel* (2.6d–8g4.7–16k), *Psyche* (2.1d–8g4–20k), *Pyramus* (same), *Pelorus* (same).
Submarines: 3 of 320 tons.
Australian navy: *b.c.* Australia (19d–8g12–27k), *c. Melbourne* (5.4d–8g6–26k), *Sydney* (same), *Encounter* (5.9d–11g6–21k), *Pioneer* (2.2d–8g4–20k). Destroyers: 3 boats (0.7d–1g4,3g3–26k). Submarines: 2 of 825 tons.

FRANCE

Armored cruisers: *Montcalm* (9.5d–2g7.6,8g6.4–21k), *Dupleix* (7.6d–8g6.4–21k).
Destroyers: 3 boats (0.3d–1g2.6–30k).

RUSSIA

Cruisers: *Askold* (6d–12g6–23k), *Jemtchug* (3.1d–6g4.7–24k)
Destroyers: 1st Div.: 8 boats (0.35d–26k); 2d Div.: 7 boats (0.24d–26k).
Submarines: 1 div. of 5 boats (175 to 200 tons).
Reserve: 4 torpedo boats, 3 submarines, 2 mine layers.

GERMANY

Armored cruisers: *Scharnhorst* (11.4d–8g8.2,6g5.9–23k), *Gneisenau* (same).
Cruisers: *Emden* (3.6d–10g4.1–24k), *Dresden* (same), *Nürnberg* (3.4d–10g4.1–24k), *Königsberg* (same), *Bremen* (3.2d–10g4.1–23k), *Leipzig* (same).
Miscellaneous: Many unimportant gunboats, 500 to 1600 tons, of no fighting value.

Belligerent Naval Forces in the North Atlantic

GREAT BRITAIN

Temporary Squadron: *a.c. Monmouth* (10d–14g6–23k), and several old and unimportant cruisers.
Canadian navy: *c. Niobe* (11d–16g6–20k), 1 mine layer, 1 transport.

GERMANY

Cruiser: *Karlsruhe* (4.8d–12g4.1–27k).
Miscellaneous: Several fast passenger steamers which were turned into auxiliary cruisers.

FRANCE

Temporary squadron of two cruisers in Mexico.

Operations in the North Sea and the Waters about Great Britain. At the end of July, 1914, the German High Seas fleet was off the coast of Norway and nearly the whole of the British Grand fleet lay at Spithead off the Isle of Wight. As the probability of war increased, more and more definite steps were taken to prepare for mobilizing the entire British naval force and putting into full commission all ships in reserve and laid up. On August 2, German troops invaded Belgium and the same day the British Grand fleet was ordered to proceed to an unknown destination in the North Sea. On August 4, Great Britain and France declared war and mobilization of both fleets was directed. Within four hours of the declaration of war, British scouting squadrons were sent towards the German fleet and coast, one submarine flotilla exploring the Helgoland bight.

The German High Seas fleet, being vastly inferior to the British forces facing it, was hastily withdrawn behind the defenses of the German coast at Kiel and in the Kaiser Wilhelm Canal which had fortunately been completed a couple of months before.

The laying of mines now proceeded with indescribable rapidity. It is supposed that the Germans had begun as early as July 29, but this is uncertain. Not only were the German harbors and the vicinity of Helgoland protected but the whole eastern part of the North Sea was planted with mine fields where they were most likely to be useful and the approaches to the Baltic were closed except a narrow strip along the Swedish coast in Swedish territorial waters and the channels through the mined area which were known only to German and Danish pilots. Denmark was forced to lay mines in her own waters by Germany which sent her an ultimatum stating that if she did not place them Germany would. According to British reports the German fields were extended over the whole southern part of the North Sea above a line joining the Hook of Holland with Harwich, England. The separate mine areas were small or narrow but were so numerous as to make navigation dangerous. The British thereupon closed the Strait of Dover by a mined area with boundaries consisting of the parallels of 51° 15′ and 51° 40′ N. latitude and the meridians of 1° 35′ and 3° E. longitude.

They then began a systematic search for German mines, mine layers, and protecting forces, and also dispatched their mine-sweeping groups of trawlers as fast as work was found for them. It was in connection with mine planting that the first naval action of the war was brought about. On August 5, H.M.S. *Amphion* (3400t–25k), with the third destroyer flotilla, was carrying out a prearranged plan of search when a suspicious ship was reported by a trawler. This was the German mine layer *Königin Luise*, and she was chased and sunk; but early the next morning the *Amphion* struck a mine and was herself destroyed.

On August 9, the First Light Cruiser Squadron was attacked by three or more German submarines, showing only their periscopes. A lucky shot destroyed the periscope of one boat and the splash of countless projectiles blinded the view from the periscopes of the others. All except the injured boat disappeared and retreated but she came to the surface after a time quite close to the cruisers. Just as her

conning tower appeared sufficiently to note her name, *U–15*, a shot from the *Birmingham* tore a hole in its base and the boat sank like a stone. None of the British vessels was injured. For more than two weeks following this incident the British continued their scouting and dragging for mines. Frequent clashes took place between the patrol vessels but no serious damages were inflicted on either side.

On August 26, the Eighth Submarine Flotilla (eight boats), two destroyer flotillas, and their flag cruisers and tenders, were ordered to proceed to reconnoitre Helgoland and the waters to the southward. They were followed by the Battle Cruiser and First Light Cruiser Squadrons at a distance of 20 to 30 miles. On August 28, the destroyer flotillas, when about 25 miles from Helgoland, and not much farther from Wilhelmshaven, found the enemy in superior force and were compelled to fall back. Admiral Beatty* promptly sent the First Light Cruiser Squadron to their assistance but, as the enemy's force seemed strong, he soon decided to follow with his heavy vessels. The advent of the battle cruisers quickly decided matters. In a short time, the German vessels were retiring along the whole front. The light cruisers, *Mainz*, *Köln*, and *Ariadne*, and the destroyer *V–187* were sunk. No British vessels were lost but the *Arethusa*, flagship of the destroyer fleet, was severely injured and had to be towed to England. As soon as his light vessels were safely withdrawn, Admiral Beatty retired the battle cruisers as he was operating in the vicinity of mine fields and was exposed to attack by submarines, several of which were seen. The *Queen Mary* was twice attacked and the *Lowestoft* once, but high speed in each case made the attempt abortive. The short range of the torpedoes used in German submarines was first noticed in these attacks.

The month of September was a particularly eventful one. On September 3, the British gunboat *Speedy* was destroyed by a mine and, on September 7, the light cruiser *Pathfinder* was sunk by the German *U–21*, the first surface vessel to fall a victim to the dreaded submarine. On September 9, the White Star liner *Oceanic*, now a naval transport, was run ashore in a fog and wrecked. On September 28, there came an event which startled the world and added greatly to the prestige of the submarine. About daylight that morning, the British armored cruisers *Aboukir*, *Hogue*, and *Cressy* were on patrol duty in the North Sea and steaming at moderate speed in column. At 6.25 A.M., the *Aboukir*, which was leading, was struck by a torpedo from a submarine and began to sink slowly. The *Hogue* and *Cressy* came up to her assistance, stopped, and attempted to save life. A little before 7 A.M., a torpedo struck the *Hogue*. She quickly capsized and sank; probably the torpedo exploded a magazine. About 7.15, the *Cressy* was hit by a torpedo and 15 minutes later by another. The reports indicate that, of the personnel of the three ships, 1067 were saved and about 1133 drowned. All were sunk by the German submarine *U–9*, a 300-ton boat commanded by Kapitan-Leutnant Weddigen. The ease with which he performed his work was due to the lack of a destroyer screen and the folly of the *Hogue* and *Cressy* in stopping their engines in the known presence of submarines. The frightful loss due to this error caused the Admiralty to issue orders forbidding large vessels to proceed to the assistance of others under such circumstances.

After the *Aboukir-Hogue-Cressy* catastrophe the war against submarines was intensified. New types of mines were devised. Air craft began to scout for them and finally to destroy them by dropping bombs on their decks or in their hatches. Huge wire nets were built. Some were supported by floating buoys, others by buoys which were kept below the surface by the moorings. While it was expected that some submarines would become inextricably entangled in the nets, this was not relied upon. The nets were watched and when an entangled submarine came to the surface she was destroyed by gun fire. It was soon found that this watching could well be performed by very fast motor boats carrying 1, 3, or 6 pounders or a short 3-inch. Hundreds of these were built—many purchased in the United States. The speed was high—well over 20 knots in all cases and as near 30 knots as the size and condition permitted. By means of these and of nets stretching almost from shore to shore and in several places, the channel was kept nearly free from the enemy's submarines during the transport of troops and munitions of war to France.

During the month of October, the Germans lost a destroyer and a submarine; the British, a submarine, an old cruiser, and the dreadnought battleship *Audacious* by a mine. On November 3, a German scouting expedition along the Yorkshire coast destroyed a British submarine and slightly injured a gunboat. The armored cruiser *Yorck*, returning from this service, struck a chain of mines in entering the Jahde estuary and was sunk. A week later the gunboat *Niger* was sent to the bottom by a German submarine in the Downs north of Dover. On the 16th, the German auxiliary cruiser *Berlin* was interned at Trondjem; on the 20th, *U–18* was rammed by a patrol boat and foundered; on the 23d, the German destroyer *S–124* was sunk in collision with a Danish steamer; and on the 26th, the old British battleship *Bulwark* was blown up in Sheerness harbor. The loss of the *Bulwark* was due to some form of interior explosion in which her magazines were involved. The explosion was tremendously violent, only 14 of the complement of 815 escaping; and the ship sank in three minutes.

During the month of November, naval vessels were used to support the army by attacking the enemy's right flank wherever it reached the coast. Three small river monitors, purchased from Brazil, were found to be of great service in this work, their light draft of four and one-half feet enabling them to get close in shore.

On December 16, a German battle cruiser squadron, supposedly consisting of the *Derfflinger*, *Seydlitz*, *Moltke*, *Von der Tann*, and *Blücher*, raided the Yorkshire coast, bombarding the harbors and cities of Hartlepool, Whitby, and Scarborough (qq.v.). Nearly 100 noncombatants were killed and 500 wounded. None of the towns has forts or defensive works of any kind.

On Christmas day, a squadron of seven naval

* Sir David Beatty, born (1871) in County Wexford, Ireland; entered navy (1884); served with Nile flotilla (1896) and in the advance on Peking (1900); aid-de-camp to King Edward VII (1908); naval secretary to First Lord of the Admiralty (1912); commander First Battle Cruiser Squadron (1912); K.C.B. (1914); vice admiral (1915), youngest officer ever to reach that grade; married a daughter of Marshall Field of Chicago.

seaplanes delivered an attack on Cuxhaven naval base but did no damage of importance; four of the aëroplanes were lost, though all the operators were saved. Bombs were dropped on or near the German warships lying in Schillig roads but none were materially injured. The only value of the raid seems to have been a gain in experience and some information of the enemy's condition.

The year 1915 opened with the sinking of the old battleship *Formidable* on January 1, by a German submarine in the Channel off Plymouth. This feat is specially remarkable as it took place at night and in a heavy sea, both conditions being very unfavorable to submarine operations. She was not, however, accompanied by destroyers and this enabled the submarine to approach on the surface without being seen.

On the morning of January 24, the fast cruiser fleet, in command of Vice Admiral Sir David Beatty, was patrolling in the North Sea (approx. Lat. 55° N., approx. Long. 5° E.). This fleet consisted of the First Battle Cruiser Squadron, *Lion*, *Tiger*, *Princess Royal*, *New Zealand*, and *Indomitable;* the First Light Cruiser Squadron, *Southampton*, *Nottingham*, *Birmingham*, and *Lowestoft;* and two destroyer flotillas. About 7 A.M., the cruiser *Aurora*, one of the destroyer flagships, sighted the German light cruiser *Kolberg* and a destroyer flotilla and, at 7.25, action began between them. About this time the German fast squadron (Rear Admiral Hipper), steering northwest, was sighted from the destroyer flotillas. This consisted of the battle cruisers *Derfflinger*, *Seydlitz*, and *Moltke* and the large armored cruiser *Blücher*. As soon as the information was signaled to Admiral Beatty, he headed for the enemy which had changed course to southeast as soon as they perceived the British battle cruisers. At 8.52, the *Lion* (flagship) opened fire on the *Blücher*, the rear ship of the German column, at a range of a little less than 20,000 yards but did not effect a hit until 9.09. The German vessels began to return the fire at 9.14; the *Tiger* began at 9.20, the *Princess Royal* a few minutes later, and the *New Zealand* at 9.40. The *Indomitable*, the slowest of the British ships, apparently did not get near enough to any of the German ships to open fire until after the *Blücher* was disabled. The last named had much less speed than the other German vessels and slowly dropped astern. About 10.48, she fell out of line and turned to the northward with a heavy list. The *Indomitable* was ordered to attack her and the others of the British fleet pushed forward after the main body. At 10.54, submarines were reported on the starboard bow of the *Lion*. The British fleet at once changed course towards the left. At 11.03, the *Lion* received a shell in her engine room which disabled her port engine and she hauled out of action, but Admiral Beatty was unable to transfer his flag to the *Princess Royal* until 12.20. The British squadron was now retiring, having pursued the enemy as close as possible to the areas protected by mine fields and submarines. The German losses are not exactly known. Of the *Blücher's* total complement of 885, about 200 were saved by British destroyers; and they were bombarded by German aëroplanes and a Zeppelin while engaged in this work. The German reports of the injuries to their three battle cruisers are not in agreement. One says that but a single battle cruiser was injured while another congratulated the navy that none of the injuries received would require the ships to be docked. The British casualties were reported in full. The *Lion's* machinery was disabled by destruction of the feed tank; after trying to steam with one engine, that began to give trouble through priming so she was taken in tow by the *Indomitable*. On the *Lion*, 17 men were wounded; on the *Tiger*, one officer and nine men were killed and three officers and eight men wounded.

About January 26, the French torpedo boat *No. 219* was sunk off Nieuport. On March 4, *U–8* was rammed and sunk off Dover, the crew being made prisoners. On March 10, the auxiliary cruiser *Bayano* was torpedoed by a German submarine and all hands lost. On the same day, *U–12* was rammed and sent to the bottom by the destroyer *Ariel* and about the same date *U–29* was sunk. The captain of this boat was Commander Weddigen who torpedoed the *Aboukir*, *Cressy*, and *Hogue*. On May 1, the British destroyer *Recruit* was sunk by a submarine and about May 7 the *Maori*, a much larger boat, was destroyed by a mine off Zeebrugge. On May 27, the British auxiliary cruiser *Princess Irene* was blown up in Sheerness harbor, only one of her crew escaping. Like the *Bulwark*, she was loading ammunition and it is supposed that a shell may have dropped from the upper deck to the hold and struck point down among many other projectiles.

On June 10, the British torpedo boats *Nos. 10* and *12* were sunk by a German submarine and about the same time *U–14* was destroyed and her crew made prisoners. On June 24, the armored cruiser *Roxburgh* was torpedoed but the damage was not so serious as to prevent reaching port; on July 1, the destroyer *Lightning* received injuries of similar gravity from a mine or torpedo, and, although the boat escaped to port, 15 of her crew were lost.

Early in July *U–30* was accidentally sunk, but was raised within 48 hours and only one of the crew was found dead. On August 8, the patrol boat *Ramsey* was sunk by the German auxiliary cruiser *Meteor*, but before the latter could escape she was discovered by some British cruisers and was blown up by her commander to avoid surrender. On August 9, the destroyer *Lynx* struck a mine in the North Sea and immediately foundered; and, on August 12, the auxiliary cruiser *India* was sunk by a submarine while on patrol duty. During the early part of August the coast of Belgium was repeatedly bombarded by British vessels to assist military operations. It was reported that at Zeebrugge, which the Germans made a naval port, a number of vessels, including submarines and destroyers, were destroyed by the bombardment.

On August 19, British submarine *E–13* grounded on the Danish island of Saltholm in the Sound. Two German destroyers, which sighted her in this position, violated Danish sovereignty by firing upon her in Danish waters. On August 23, a German destroyer was sunk by English boats near Zeebrugge and about the same time *U–27* was lost—cause unknown.

Between October 1st and 4th, the Belgian coast was again bombarded to assist military operations. On October 28, the armored cruiser *Argyle* ran ashore and was wrecked. On November 4, German submarine *U–8* was disabled off the Dutch coast and was towed into port where she was interned. This is apparently a

new boat with an old number as the *U-8*, reported sunk on March 4, was visibly destroyed and her crew made prisoners. On the same date (November 4), a German submarine of new type (length, 250 feet) was captured by being caught in a British wire net. On November 13, the yachts *Aries* and *Irene* were sunk while on patrol duty (circumstances not reported), and on November 17, the hospital ship *Anglia* was sunk by a mine in midchannel with a loss of 100 lives —chiefly of wounded men. On November 28, a German submarine was sunk off the Belgian coast by a bomb from a seaplane. On December 30, the armored cruiser *Natal* was destroyed by an internal explosion while at anchor. Of the complement of 725, 400 were saved. On Jan. 9, 1916, the *King Edward VII* was sunk by a mine. This battleship belonged to a class that was one of the last and best of the predreadnoughts.

On May 31, 1916, began the greatest naval battle of the war up to that time. About four o'clock in the afternoon the British fast battle squadron of seven battle cruisers and four battleships met the German High Seas fleet of five battle cruisers and 24 battleships off the northwest coast of Denmark. The British engaged the enemy but fell back before the vastly superior force in the direction of their main fleet. In this part of the action they lost the battle cruisers *Queen Mary*, *Invincible*, and *Indefatigable*, and three armored cruisers—all of which were sunk; eight destroyers were sunk during the night attacks. The British Grand fleet came up about six o'clock, and soon afterward the Germans began to retire, pursued by the British. The action continued until after midnight, the night attacks being chiefly those of destroyers and submarines. The German losses are not definitely known but include the following, which are admitted by the German Admiralty: battleship *Pommern*, battle cruiser *Lutzon*, four fast cruisers, and five destroyers. The losses of officers and men were about: British, 5000; Germans, 3500; among the British were Rear Admirals Hood* and Arbuthnot.† The Germans were favored by misty weather, the close proximity of their own coast (which injured vessels could quickly reach), and by the fact that, a few minutes after the arrival of the main British force, mist and darkness obscured them from the enemy. Both the British and Germans claim that additional vessels of their opponents were destroyed. As regards the British losses, the ships alleged to have been sunk have been seen by disinterested observers; as to further German losses there is no proof.

On June 5, 1916, the British cruiser *Hampshire* was destroyed either by a mine or torpedo near the Orkney Islands. Lord Kitchener of Khartum and his staff lost their lives. The Secretary of State for War was on a secret mission to Russia.

* Hon. Horace Alexander Lambert Hood (1870–1916), second son of the fourth Viscount Hood and great-great-grandson of the great Admiral Hood, the first Viscount (q.v.); entered the navy (1883); served in Sudan and Somaliland expeditions and received various medals and prizes; naval attaché at Washington and married an American woman (1900); Distinguished Service Order (1904); in command of Royal Naval College, Osborne (1910–14); rear admiral (1913); naval secretary to First Lord of the Admiralty (1914); in early part of European War commanded torpedo fleet in operations off Ostend.

† Sir Richard Keith Arbuthnot (1864–1916), entered navy (1877); succeeded father as fourth Baronet (1889); rear admiral (1912); at beginning of European War in command of second battle squadron.

Operations in the Baltic. Mine laying by Germany and Russia began in the Baltic at least as early as in the North Sea. As stated in the remarks upon North Sea operations, the Danes were forced by Germany to close the Baltic by mining their own waters, leaving passages only known to the German and Danish pilots, except close in to the Swedish coast. German mine fields were very freely spread over the southern part of the Baltic in addition to covering the approaches to all German ports. Of the Russian fields less is known, but it is certain that a very large number of Russian mines were placed, particularly in the gulfs of Riga and Finland, and merchant vessels and others were warned of fields covering the Russian coast and harbors south of Lat. 58° 50′ N. and east of Long. 21° E.; also of mines in the channels of the Aland Archipelago. The difficulty of defending Libau and Windau against the German army was thoroughly understood and the ships, stores, and munitions held at these ports were transferred to Reval, Helsingfors, Kronstadt, and Riga. At Libau there is a dockyard of considerable importance, second only to Kronstadt in its capacity for repairs, but Windau was a torpedo-boat base only.

As soon as the relations with Russia became strained, German ships began to patrol the coast from Memel to the Gulf of Riga; on August 4, the light cruiser *Augsberg* bombarded Libau without effecting serious damage, and on the same day, a German expedition took possession of the Island of Aland, which lies in the straits connecting the Gulf of Bothnia with the Baltic and is only a short distance north of the Gulf of Finland.

On August 27, the German cruiser *Magdeburg* ran ashore in a fog on the Island of Odensholm and was blown up to avoid capture by an approaching Russian naval force. It was reported that early in September Admiral von Essen, who commanded the Russian fleet, painted a number of his vessels to imitate German ships, hoisted German colors, and contrived, in foggy weather, to join a German scouting expedition unsuspected. At a convenient moment he opened fire, sank one German cruiser (said to be the *Augsburg*), and badly damaged another, while his destroyers severely handled the smaller craft. Before the Germans fully recovered from their surprise, he withdrew his force and escaped without material injury. On September 24, a German scouting expedition of about 40 vessels of all kinds appeared before Windau, but after firing a few shots retired.

On December 12, the German armored cruiser *Friedrich Karl* was sunk by a mine and on the 25th the old cruiser *Hertha* and a mine layer were attacked by Russian cruisers and reported sunk. The Russian submarines were now becoming effective and, notwithstanding the ice, were cruising in the Baltic; their first victim was a German torpedo boat sunk off Cape Moen, and, at about the same time and place, the German cruiser *Gazelle* was torpedoed and badly injured. During the remainder of the winter and the early spring the ice interfered with prosecuting operations of importance.

In June, 1915, the Germans began operations along the coast in support of the land forces. While endeavoring to lay mines in the way of the German fleet a Russian mine layer was discovered and sunk. On July 2, a Russian cruiser squadron drove off a German light

cruiser of the *Augsburg* class and several destroyers and forced the mine layer *Albatross* to run ashore in a sinking condition. On the same day a British submarine is reported to have sunk a battleship of the *Pommern* class.

During the spring and summer of 1915, the Germans busied themselves in repairing and re-equipping Libau as a naval base and from there began operations against Riga. During the month of August they made several attacks in force, but all failed. The Russian gunboats *Sivoutch* and *Koreetz* were destroyed and at least one German destroyer was sunk. British submarines had now reached the Baltic in considerable numbers, passing under the mine fields or through the Sound and along the Swedish coast. Their presence acted as a strong check on German operations, especially after the German armored cruiser *Prinz Adalbert* was sunk (October 23) off Libau. Early in November, a British cruiser squadron escorted a flotilla of submarines (estimates of observers range from 10 to 25) as far as the Skaw (north point of Denmark). From there they were accompanied by a destroyer flotilla until well past Elsinore and safely inside the Baltic. The Germans learned of the operation too late to prevent it. They had already placed a new mine field at the entrance to the Sound but the British seemed to have been able to avoid it.

The large number of British and Russian submarines in the spring of 1916 in the Baltic were said to have not only stopped German operations to the eastward of Danzig, but to have effected a completely successful blockade of the German coast against vessels coming from Sweden, many of which had been captured and sunk, or warned and turned back (if neutral), while a large number were loaded in Swedish ports but were afraid to venture out. This practically completed the British naval cordon about the Central Powers.

On October 28, the Russian submarine *Albatross* captured a German merchant vessel and took her into port. On November 7, a British submarine sank the German cruiser *Undine*, and on December 19, another boat sank the German cruiser *Bremen* and a torpedo boat.

Operations in the Mediterranean. On the day after war was declared the German naval force in the Mediterranean bombarded undefended seaport towns in Algeria, the battle cruiser *Goeben* firing upon Philippeville and the light cruiser *Breslau* upon Bona. They then proceeded to Messina, Sicily, where they arrived on August 5. Being in a neutral port, they were required to depart within 24 hours; so, on the 6th, they left, steering south. Evading the British fleet which was seeking them, they were next heard of in the Dardanelles, where they arrived on August 11. Here they behaved to neutral steamers in a high-handed way which indicated German control of the Turkish government and foreshadowed the course taken by Turkey a short time later. To avoid immediate trouble for the Ottoman authorities they were supposedly sold to Turkey and renamed *Sultan Selim Javuz* and *Medillu*, but they apparently continued in command of German officers and retained a part at least of their German crews.

On August 9, Austria declared a blockade of the Montenegrin coast and bombarded Antivari. About the same date the French and British fleets established a blockade of the Austrian coast at the Strait of Otranto. The Austrians had placed mine fields all along their coast, but their first victim was one of their own ships, the *Baron Gautsch*, which struck a mine on the 14th and sank at once with a loss of 67 lives. About the middle of August, the French and British forces swept up the Adriatic, driving the Austrians to the northward. They then attempted to take Cattaro for a naval base, but lacked the military force for a garrison and shore operations, and therefore failed. After a few weeks of futile bombardment of Cattaro and the Austrian positions on the Dalmatian coast they returned to the vicinity of Otranto Strait but continued to send scouting expeditions up the Adriatic.

The peculiar behavior of Turkey and the reported mining of the Dardanelles caused a British force to be maintained in that region. While on this duty the armored cruiser *Warrior* ran ashore and was injured on September 7. On the 10th, Turkey abrogated the capitulations with foreign governments and, during the latter part of October, permitted her vessels to sink Russian ships of war and attack Odessa. De facto war was begun by the Entente Allies on November 1; on the 5th, Great Britain formally declared war on Turkey and annexed the Island of Cyprus. On December 18, England declared a suzerainty over Egypt. On the 21st, the French submarine *Curie* was sunk while scouting along the Austrian coast. On November 24, Italy landed a force at Avlona to assist her protégé Essad Pasha against the Albanian insurrectionists.

In January, 1915, a Turkish army of about 12,000 men and six batteries of artillery attempted to seize the Suez Canal and then invade Egypt, where an insurrection had broken out fostered by Turkish emissaries. French and British vessels patrolling the canal succeeded in stopping the Turkish advance, and the operations at the Dardanelles then forced the recall of all available Turkish troops for the protection of Constantinople.

On February 24, the French destroyer *Dague* was sunk by a mine off Antivari. On April 28, the French armored cruiser *Léon Gambetta* was torpedoed by the Austrian submarine *U–5* and sank in 10 minutes. Rear Admiral Senes and all the officers were drowned, but 108 of the crew were picked up by French destroyers.

On May 24, Italy declared war on Austria; on the same day Austrian torpedo boats, supported by the light cruiser *Novara*, made a raid on the Italian coast, where they were first met by Italian destroyers and finally driven off by Italian cruisers. The Italian destroyer *Turbinia* was sunk early in the action. On June 10, the Italians captured Monfalcone with its shipbuilding yards.

On June 17, occurred a duel between an Austrian and an Italian submarine. As they approached, neither had any intimation of the presence of the other. The Italian boat, the *Medusa*, came to the surface first, swept the horizon with her periscope and, finding the vicinity clear, emerged. A few minutes later the Austrian decided to come up. When she sent up her periscope she saw the Italian boat close at hand and immediately torpedoed her. An officer and four men of the *Medusa* who were on deck when she sank were made prisoners. On July 1, the Austrian submarine *U–11* was sunk by a French aëroplane. *U–11* (860 tons) was lying on the surface when the aëro-

plane swooped down to within 45 feet of the water and dropped two bombs on the deck which caused her to sink almost instantly.

On July 7, the Italian armored cruiser *Amalfi* was sunk by an Austrian submarine while scouting in the upper Adriatic; nearly all the officers and crew were saved. On July 18, the armored cruiser *Giuseppe Garibaldi* was sunk by an Austrian submarine and a few of the crew were drowned.

The advent of Italy into the war completed the control of the Adriatic by the Entente Allies and, on July 6, Italy clinched the situation by a proclamation closing it to all merchant vessels not possessing special permits. Soon after the loss of the *Garibaldi* the operations of the Austrian submarines were much hampered by the destruction of their base on Lagosta Island by the French destroyer *Bisson*.

On or about August 13, the Austrian submarines *U–3* and *U–12* were sunk by the Italians. *U–3* was destroyed by gunfire, but *U–12* was sunk in a duel with an Italian submarine which torpedoed it. According to a report from Berlin, German submarines in the Mediterranean had, up to October 17, sunk 23 vessels, including four British transports.

On September 28, a fire broke out on the Italian battleship *Benedetto Brin* while she was lying at anchor in Brindisi harbor. The fire was quickly followed by an explosion which destroyed the ship. Of her complement of over 800 officers and men, only 8 officers and 379 men are known to have been saved.

On November 1, British torpedo boat *No. 96* was sunk in collision at Gibraltar. On November 3, the British transport *Woodfield* was sunk by a submarine off the coast of Morocco; 6 passengers were killed and 14 wounded. About the same time the transport *Mercian* was attacked by gunfire from a submarine which probably had expended all its torpedoes. The *Mercian* was not sunk, but the casualties on board included 23 killed, 50 wounded, and 30 missing. On November 4, the French troopship *Calvados* was sunk by a submarine and between the 6th and 8th a submarine on the African coast sunk three small steamers, two Egyptian and one British. So far as reported only 53 of the 800 troops on the *Calvados* were saved. On December 5, the French submarine *Fresnel* ran aground while endeavoring to attack an Austrian light squadron. She was destroyed and her complement made prisoners. The Austrians report that at the same time they destroyed a small Italian cruiser.

During the month of December, the Italians landed a large force of troops in Albania. The expedition was most efficiently guarded against submarines and the only losses were the destroyer *Intrepido* and the troopship *Re Umberto*, which struck drifting mines. The loss of life in the two accidents was 43. In January, 1916, a cruiser of the *Novara* type was sunk by the French submarine *Foucault*.

The Austrian and German submarines in the Mediterranean had, up to Jan. 1, 1916, inflicted very serious losses upon the Entente Allies. The Central Powers asserted that 8 troopships, 25 transports, and 34 merchantmen of a total tonnage of 225,325 were sunk during the last two weeks of October and the month of November, and a large number had been destroyed since. Counter operations were more difficult than in the North Sea, but it was believed that more submarines had been sunk than were reported. The Entente Allies hoped to close the Strait of Otranto to the escape of any more Austrian boats and to neutralize the ones outside those limits by destroying their bases of supply.

Operations in the Black Sea and Dardanelles. There are strong grounds for the belief that, at the outbreak of war, the Turkish cabinet was opposed to taking part in it, but that, as time went on, the German influence increased until the opposing members were won over, silenced, or driven from power. Among other significant facts it may be noted that the mining of the Dardanelles was not reported until August 19, eight days after the arrival therein of the *Goeben* and *Breslau*. On October 10, Turkey abrogated the capitulations with foreign powers concerning the jurisdiction of Turkish courts. By this time doubtless the cabinet had agreed upon its action, but much time was required to mobilize the army, and it is doubtful if the cabinet was ready to act when the operations of the *Goeben* and the Germanized fleet in the Black Sea precipitated matters. The commander in chief of the Turkish navy was now Admiral Souchon (late of the *Goeben* and the German Mediterranean squadron), while hundreds of German officers and 3000 men were distributed among the vessels of the fleet.

The first operations took place on October 29, when the Turkish squadron bombarded several Russian ports. A destroyer entered Odessa harbor, torpedoed and sank the gunboat *Donetz* and badly injured the *Kubanetz* (a sister to the *Donetz*), four merchant steamers (three Russian and one French), then fired upon the suburbs for the purpose of destroying oil tanks, but set fire to a sugar factory instead. On the same day the *Medillu* (ex-*Breslau*) bombarded Theodosia, seriously injuring the cathedral and other buildings; and the *Hamidieh* threatened to bombard Novorossisk if the city refused to surrender, but contented herself with embarking the Turkish consul. On their way to Sebastopol the Turkish destroyers sunk the Russian mine layer *Pruth*. The next day (October 30), accompanied by destroyers, the *Goeben* bombarded Sebastopol. By the return fire of the forts she was so badly injured that the admiral collected the squadron and returned to Constantinople. On November 7, the *Medillu* bombarded the small Russian town of Poti, but did no great damage. On the same day Russian forces shelled the Turkish ports of Zonguidak and Koslu, sinking at the former place three transports loaded with aëroplanes, artillery, and uniforms for 60,000 men; a colonel of the general staff, various German officers, and 248 soldiers were made prisoners. On November 17, the Russian squadron bombarded Trebizond, but without inflicting much damage.

On November 18, occurred the most important naval action that so far had taken place in the Black Sea. The Russian battleship division, returning from a cruise off the Anatolian coast, was about 30 miles from Sebastopol when the *Goeben* and *Breslau* were sighted. The *Evstafi* opened fire at about 8000 yards; the other ships following suit quickly. The Russians say that the *Goeben* was badly injured by the *Evstafi's* first salvo and was slow in opening fire; and that, after an action lasting 14 minutes, she and her consort retreated towards Constantinople, being able to escape through their su-

periority in speed. As the *Goeben* did not appear in the Black Sea for some months afterward, the report of her injuries was possibly correct, though Turkish advices stated that, some little time after this battle, the *Goeben* was injured by striking a mine.

Early in December British submarines began to make their way through the Dardanelles. On December 13, the *B–11*, in command of Lieut. Norman D. Holbrook, entered the Dardanelles, dived underneath five rows of mines and torpedoed and sank the Turkish battleship *Messudieh*. This brilliant exploit was soon followed by others of a similar character.

During January the Russian fleet sank several Turkish vessels in the Black Sea, including a number of troopships and transports, and shelled the Turkish naval station at Sinope. On the 17th the French submarine *Saphir* was sunk by a mine in the Dardanelles.

About the middle of February the combined British and French fleets began their fruitless attempt to force a passage of the Dardanelles. No operations in the whole course of the war were so poorly conceived and so inefficiently carried out. It is hard to understand the folly of the British government in embarking upon such an expedition. If there is one thing that is well understood in naval war it is the absurdity of attacking strong forts by ships without adequate military support. Even if the ships can drive out the garrison it will return as soon as the bombardment ceases. Unless the fortifications are badly placed they cannot be wholly destroyed and the ravages of bombardment can be largely restored by a few days' work. Permanence of victory can only be obtained by occupying the works as soon as the defenders are expelled.

But this was not all. The Turks are an unready race. When the operations began they had not more than 10,000 men on the Gallipoli Peninsula, and these were inadequately supplied. The persistent attack of the Allied fleet showed the Turks that their enemies were in earnest in their endeavor to open the straits. Therefore the army on the peninsula was immediately increased in numbers until it is believed to have reached a strength of over 200,000 men, and supplies of all kinds were rushed to them. When the Allies finally landed their army it was too late; the defenders were ready for them. Even in their landing the Allies violated all strategic principles. Instead of coming with an overwhelming force and landing near the neck of the peninsula, where they could interrupt if not destroy the Turkish communications, they landed inadequate numbers near its extremity. Any gains made merely drove the Turks nearer to their base and strengthened their means of resistance. This fatal mistake was not due to the army or navy on the ground, but to the lack of equipment of the expedition which needed water tanks, water carts, hose, pumps, and other means of supplying water and other necessaries and, above all, more men. The net loss to the Allies was 100,000 men, six battleships, seven submarines, and many other vessels; also a tremendous loss of prestige, the addition of Bulgaria to the list of their enemies, the loss of Greece and Rumania to their side, the opening of Turkey to supplies of men and munitions from Germany, a vital hampering of Russian operations through the failure to open the straits for their grain and supplies, a renovation of the Turkish army, Turkish courage, and Turkish determination, the destruction of Serbia, and a prolongation of the war by many months. The only gain was a temporary recall of the Turkish troops sent to invade Egypt. As this expedition was as ill-planned as were the British operations at the Dardanelles, its success was impossible and its recall unimportant.

As already stated, the operations began in February. Several bombardments of the forts were carried out and considerable injury inflicted upon them. The ships, much hampered by bad weather outside, then entered the straits for closer work. On March 18, the British battleships *Ocean* and *Irresistible* and the French battleship *Bouvet* were sunk by mines and the British battle cruiser *Inflexible* badly injured by gunfire. The plan of forcing the passage by battleships was then given up and the second phase of the operations soon began. In the meantime the British submarine *AE–2* was sunk in the Sea of Marmora, the *E–15* run ashore and destroyed in the Dardanelles, and the Turkish cruiser *Medjidieh* sunk by a mine near Odessa (she was refloated in May by the Russians). Late in April the British and French troops were landed under fire at the Dardanelles. On May 12, the British battleship *Goliath* was sunk by a Turkish destroyer in a night attack; the battleships *Triumph* and *Majestic* were sunk by submarines a few days later, the former on the 22d, the latter on the 27th. The British submarines were very active at this time in the Black Sea and Sea of Marmora, sinking many vessels, chiefly transports and troopships, but on August 8 they sank the old Turkish battleship *Kheyr-ed-din Barbarossa* and the Turkish gunboat *Berk-i-Satvet*. The commander of one submarine swam ashore and destroyed a bridge on the Turkish line of communications; this was done in the actual presence of the Turkish patrol. In June the German *U–51* was sunk in the Black Sea and the German submarine base at Smyrna destroyed.

About August 1, the French submarine *Mariotte* was sunk. During the summer many British transports and troopships were destroyed by German submarines, the most important being the troopship *Royal Edward*, which was sent to the bottom on August 14 with the loss of 800 lives; but the sinking of the troopships *Ramazan* (Br.) and the *Marquette* (Fr.) were disasters almost equally great.

In the Black Sea the Russians seemed to have been unable to blockade or capture the *Medillu* (ex-*Breslau*) or the *Hamidieh*. In October the *Sultan Selim Javuz* (ex-*Goeben*) appeared again in the Black Sea but accomplished nothing of importance and seemed to be partly disabled. On November 3, the French submarine *Turquoise* was sunk by gunfire in the Sea of Marmora; on the 5th the British submarine *E–20* was reported missing and *E–7* as sunk. On November 10, the British destroyer *Louis* was sunk.

The Dardanelles operations were now admitted to be a failure, and the British began to transfer their troops to Saloniki to reënforce the French and thus form an army to check the onrush of the Central Powers through Serbia.

The operations in the Black Sea still continued, but by the summer of 1916 had become of no special importance. The Turkish navy had been reduced to impotence and the Russian fleet was concerned chiefly in assisting military operations.

Cruiser Operations in the Atlantic, Pacific, and Indian Oceans. At the outbreak of war the only German vessels beyond the reach of home ports were the battle cruiser *Goeben*, the armored cruisers *Scharnhorst* and *Gneisenau*, the fast cruisers *Karlsruhe*, *Breslau*, *Emden*, *Dresden*, *Nurnberg*, *Königsberg*, *Leipzig*, and a number of small cruisers and gunboats. To these were quickly added several fast merchant steamers, the *Kaiser Wilhelm der Grosse*, *Kronprinz Wilhelm*, *Prinz Eitel Friedrich*, *Cap Trafalgar*, and *Spreewald*. These had their armaments on board or in German colonial ports.

The operations of the *Goeben* and *Breslau* are described elsewhere in this article. The *Scharnhorst* and *Gneisenau* were, after the *Goeben*, the most important vessels on the list and were under the command of Vice Admiral Count von Spee, the only German flag officer outside of European waters. After the commencement of hostilities these vessels were first heard of at Tahiti, where they bombarded the port of Papeete and sunk the French gunboat *Zélée*. The *Nurnberg*, after cutting the America-Australia cable at Fanning Island, joined Von Spee's squadron. He then proceeded to the west coast of South America, where he met the *Dresden* and *Leipzig*.

On the afternoon of Nov. 1, 1914, Rear Admiral Sir Christopher Cradock,* with a squadron consisting of the armored cruisers *Good Hope* (14d–2g9.2,16g6–23k) and *Monmouth* (10d–14g6–23k), the fast light cruiser *Glasgow* (4.8d–2g6,10g4–26k), and the armed merchant steamer *Otranto*, was off the Chilean coast searching for German cruisers. The old battleship *Canopus* (13d–4g12–18k) was near at hand and proceeding to a rendezvous to join the squadron. About 4.20 P.M. smoke was seen to the northward and soon afterward Von Spee's squadron, consisting of the *Scharnhorst* (11.4d–8g8.2,6g5.9–23k), *Gneisenau* (same), unarmored cruisers *Dresden* (3.6d–10g4.1–24k), *Leipzig* (3.2d–10g4.1–23k), and *Nurnberg* (3.4d–10g4.1–24k), was sighted heading south. Cradock seems to have much overestimated the fighting power of his squadron (especially in the heavy sea which was running) or underestimated that of the Germans. At any rate, he sent a wireless message to the *Canopus* at 6.18 saying: "I am going to attack the enemy now," ordered the speed increased to 17 knots, and headed to the southeast, the Germans being between the British and the coast. At 7.03, the enemy opened fire at about 11,500 yards, quickly followed by the British. The superiority of the German ships was at once apparent. The heavy seas made it almost impossible to work the British 6-inch guns on the lower decks (and most of them were on that deck), and one of the *Good Hope's* 9.2-inch pieces was put out of action very early in the fight. Fires broke out in the forward turrets of the *Good Hope* and *Monmouth* at about the third German salvo, possibly from accumulated ammunition. At 7.50 a tremendous explosion occurred on the *Good Hope* amidships, the flames reaching an altitude of 200 feet. The *Monmouth* was already out of action, down by the head, and leaking badly. The night had become so dark that for some time the Germans aimed at the flames on the doomed vessels, both of which had ceased firing altogether before 8 o'clock. A rain squall coming up added to the difficulty of pointing the guns, so Von Spee signaled the light cruisers to attack the enemy's ships with torpedoes. The *Good Hope* could not be found and had probably gone down, but the *Nurnberg* discovered the *Monmouth* and, by gunfire at close range, caused her to capsize. In the darkness and thick weather the *Glasgow* and *Otranto* got away without difficulty. As this fight took place in a very rough sea, it is doubtful if the *Good Hope* could use more than four of her sixteen 6-inch guns or the *Monmouth* more than five of her 14. The disabling of one of the 9.2-inch guns of the flagship by a lucky shot hastened the catastrophe.

The result of the action created a profound excitement in Europe, particularly in England, and added much to the prestige of the German navy. The British Admiralty immediately took steps to meet the situation by secretly dispatching a squadron under Vice Admiral Sturdee in pursuit of Von Spee. This consisted of the battle cruisers *Invincible* (17d–8g12–27k), *Inflexible* (same), the armored cruisers *Carnarvon* (10.8d–4g7.5,6g6–23k), *Cornwall* (same as *Monmouth*), *Kent* (same), the fast cruiser *Bristol* (sister to the *Glasgow*), and the *Macedonia* (10,500 tons), supply steamer. At some rendezvous on the South American coast they were joined by the *Canopus* and *Glasgow*. About 8 o'clock on the morning of December 8, while Sturdee was coaling in the adjacent harbors of ports William and Stanley, Falkland Islands, the leading ships of the German squadron were sighted. Knowing nothing of the battle cruisers, the Germans came leisurely on, apparently intent upon destroying the wireless station. At 9.20, they were within 11,000 yards and the *Canopus*, still at anchor, opened fire on them over the lowland. They then turned to the southeast to rejoin the main body which immediately proceeded to the eastward at full speed. At 9.45, the British squadron came out and started in chase. About 1 P.M., the *Invincible* and the *Inflexible* began firing on the rear ships of the German column and a little later were able to reach the armored vessels and leave the others to the cruisers. About 3.30, the *Scharnhorst* changed course about 10 points (112.5 degrees) to starboard, presumably to bring her starboard battery into action, because of injury to her port guns, or to repair damages. At 4.04, she began to list heavily to port and at 4.17, sank with all hands. The *Gneisenau* continued the hopeless fight, though after 5 o'clock she was hors de combat. At 6 P.M., she heeled very suddenly and sank. About 100 survivors were picked up. These state that the ammunition had given out, although by the time it was exhausted over 600 of the complement had been killed or wounded. Of the German light cruisers, the *Leipzig* was sunk by the fire of the *Glasgow* and *Cornwall* about 9 P.M. and the *Nurnberg* by that of the *Kent* at 7.27. Seven officers and 18 men were saved from the two ships; many others lost their lives through being chilled by the coldness of the water. The *Dresden*, which escaped, was discovered off the island of Juan Fernandez on March 14, 1915, by the *Glasgow*, *Kent*, and auxiliary cruiser *Orama*. After an action of five minutes' duration she surrendered, but was on fire and soon afterward blew up. The *Dresden's* cruise as a commerce destroyer was not very eventful. After

* Sir Christopher Cradock (1862–1914), born at Hartforth, Yorkshire; served in the Sudan, China, etc.; rear admiral (1910); K.C.V.O. (1912); commander of training squadron (1912); received several awards for saving life; published *Sporting Notes in the Far East* (1889), *Wrinkles in Seamanship* (1894), *Whispers from the Fleet* (1907).

leaving the West Indies she sank the British steamer *Hyades* off Pernambuco about August 22 and the *Holmwood* near Rio de Janeiro, August 29. After her escape from the battle of the Falklands, she sank the *Conway Castle* off Chile on February 27.

Of all the German cruisers the *Emden* (3.6d–10g4.1–24k) had the most spectacular and successful career. On August 1, she left Tsingtao. On the 6th she captured a vessel of the Russian volunteer fleet and sent her into Tsingtao. She then went to the southward. On September 16, the British S.S. *Kabinga* arrived at Calcutta with the crews of 5 others that had been captured and sunk by the *Emden* which was now accompanied by the German auxiliary cruiser *Markomannia* and the Greek collier *Pontoporos*. Several British and French cruisers were at once started after her. On September 16, she coaled in False Bay and on September 18, sank the *Clan Matheson*. On the 22d, she appeared off Madras and shelled and set fire to the oil tanks of the Burma Oil Company. On the 24th, she reached Pondicherry after sinking five more British steamers. On her way around Ceylon, in three days, she sank five British steamers and captured a collier with 7000 tons of Welsh coal. She then went to the Maldive Islands which she left on October 1. She spent the 5th to the 10th at Diego García, Chagos Islands, cleaning her bottom and boilers. Leaving her tenders to proceed to some unknown rendezvous, she went to the vicinity of the Laccadive Islands where she sank five steamers and a dredger, and captured another collier, but sank it also after filling her bunkers. On October 16, her tenders were captured by the British cruiser *Yarmouth*. At early daylight of October 29, with a dummy fourth smokepipe she entered Penang harbor (1700 miles from the Laccadives), her hostile character wholly unsuspected, sank the Russian cruiser *Jemtchug* and a French destroyer, and escaped without injury. On November 9, she approached the Cocos Islands to destroy the wireless station. Before she could effect a landing, the operators signaled her appearance broadcast and the report was picked up by the convoy of some Australian troopships bound to the Suez Canal and not far away. The cruiser *Sydney* (5.4d–8g6–26k) was detached to chase her, and came in sight while the *Emden* was waiting for her landing party. Leaving these men behind, she attempted to escape, but the *Sydney* was faster and carried a heavier battery so that in a short time she was badly injured and forced to run ashore. Of the 361 in her complement, all except 10 officers and 198 men were killed or drowned. Among those saved, fortunately, was her distinguished captain, Commander Karl von Müller, whose conduct throughout the cruise was brave, skillful, and chivalrous. During her remarkable career of 94 days the *Emden* captured or sank 30 vessels, destroyed $25,000,000 worth of enemy property, almost paralyzed the commerce of the East, and had 19 war vessels of the enemy seeking her.

The *Königsberg* (3.4d–10g4.1–24k) was less successful. After a cruise of two months along the South African coast, in which she destroyed several British merchant ships and the small cruiser *Pegasus*, she was blockaded in the Rufigi River, German East Africa. After several attempts, she was finally destroyed by a British expedition on July 11, 1915.

The *Karlsruhe* (4.8d–12g4.1–27k) operated in the Atlantic. Her career was almost equal to that of the *Emden*. Up to Oct. 24, 1914, she had captured and destroyed 17 British vessels, her exploits spreading over the whole Atlantic from New York to Rio de Janeiro. After sinking a few more vessels, she apparently disappeared from the ocean and her end was enveloped in mystery.

Of the German armed merchant steamers, the *Spreewald* was captured by the armored cruiser *Berwick* on September 12. The *Kaiser Wilhelm der Grosse* had a still shorter career, being sunk on Aug. 7, 1914, by the British cruiser *Highflyer*. On October 14, the *Cap Trafalgar*, which was beginning to interfere with the British trade to South America, was sunk by the British armed steamer *Carmania*, late of the Cunard line. The *Kronprinz Wilhelm* and the *Prinz Eitel Friedrich*, after long and successful cruises as commerce destroyers, entered United States waters and were interned at Norfolk—the latter on April 7, 1915, and the former on April 29.

Immediately after war was declared, the Entente Allies began perfecting arrangements for the capture of German colonies. On Aug. 7, Togoland was seized by land forces. On Aug. 27, Japan declared a blockade of Kiaochow, and on Nov. 7, Tsingtao, the German stronghold in China, surrendered to the Allied forces—chiefly Japanese. Early in August, a New Zealand expedition sailed for Samoa. At Noumea, the convoy—which was a weak one—became strengthened by the battle cruiser *Australia* (19d–8g12–27k) and the cruiser *Melbourne* (sister to the *Sydney*) of the Australian navy, and the French armored cruiser *Montcalm* (9.5d–2g7.6,8g6.4–21k). The expedition arrived at Apia on August 30 and the German Governor surrendered at once as he had practically no means of resistance. On its return from Samoa, the Australian squadron captured Herbertshöhe, the capital of the Bismarck Archipelago, and, on September 27, took possession of the town of Friedrich Wilhelm in Kaiser Wilhelm's Land (German New Guinea). During September and October, Australian and Japanese expeditions seized the remaining German possessions in the Ladrone, Marshall, and Caroline Islands.

For a discussion of blockade and the submarine warfare against noncombatants, see the section in this article headed NEUTRAL NATIONS.

Naval Strategy of the War. There is much reason to believe that Germany strongly hoped for the continued neutrality of Great Britain and her original naval plans are said to have been based on this supposition. The High Seas fleet was off the coast of Norway, leaving behind it in the Baltic a sufficient force to hold the Russian navy in check. Had England not entered the war, the High Seas fleet would have proceeded to the west coast of France, defeated the inferior French fleet, and established a base for the landing of an army of large size in the French rear. The advent of England changed all this. The High Seas fleet was withdrawn to the Kaiser Wilhelm Canal and a submarine warfare begun. With this, it was hoped to reduce the British forces to a size that would render victory possible. But the British battle fleet kept behind defenses that were submarine proof and instituted a blockade and antisubmarine warfare by means of unimportant vessels. Raids in force on the British coast only served to bring into view the battle-cruiser squadron and its speed and skillful handling prevented sub-

marines from scoring. In the meantime, the British were building battleships, cruisers, and submarines at a rate of speed that the Germans could not equal. After six months, during which the naval conditions were becoming less and less favorable to Germany, submarine warfare against British commerce was commenced, but this failed seriously to check British trade and was almost as costly to Germany as to her enemies. The Mediterranean field was then exploited as affording a better chance to avoid antisubmarine warfare and giving some support to the Balkan and Asiatic operations; but this transfer of submarine activity did not seriously hamper the Entente Allies or facilitate their own work.

The total effect of the German naval strategy upon the conduct of the war therefore was small and that strategy may be regarded as a failure. Should England strip herself of effective troops too closely at any time, an invasion might be attempted as a last resort. A preliminary success would add to the invading army all the German prisoners in England and they would only need arms and ammunition to create a serious condition of affairs. To secure such a result, the sacrifice of the German fleet might not be too great.

The main principles of British naval strategy appeared to be: (*a*) to hold the German fleet blockaded and be prepared at all times to give battle and bring into action forces superior to any which may have to be met; (*b*) to protect the British coast against an invasion in force; (*c*) to effect a commercial blockade (not declared) of Germany and prevent the importation of supplies of any kind or the exportation of wares, which could be sold for cash or exchanged for a desirable equivalent; (*d*) to protect British trade and destroy all German cruisers or other vessels that might interfere with it; (*e*) to facilitate and assist in the military operations of the Entente Allies and hamper those of the enemy.

The tactical operations occasionally failed but the strategical objectives were attained except in the case of the Dardanelles. The mistakes made in this dismal failure are elsewhere considered. See *Operations in the Black Sea and Dardanelles*.

Some Naval Lessons of the War. *Submarines.*—The exact value of the submarine as a weapon of war is not yet determined though it is unquestionably great. It is certainly an antagonist to be feared by all surface ships, but it is by no means so dangerous as many once thought it. Its most serious weakness is its vulnerability. If rammed with much force or struck by a single small shell it will sink, but double hulls and submerged water-tight decks may, in future large boats, greatly improve their ability to stand punishment. While it is being improved and rendered more effective and dangerous, so are its foes. The most important of these are the destroyer and the aëroplane; but under certain conditions the wire (in many cases, tubing) net and the swift motor boat are most efficient. As the immediate cause of destruction of submarines the destroyer ranks first, but the aëroplane can sight a submarine when too deeply immersed to show her periscope and thus warn surface vessels of her exact locality; and, in three instances during the war, aëroplanes sunk submarines by dropping bombs on them. Among the important qualities of the submarine are its suitability for secret scouting, its capacity for defense against a close blockade, and its availability for protecting surface ships against the enemy's submarines.

Battleships and Battle Cruisers.—Battleships have had as yet no proper test in the war. Battle cruisers are in great favor and are found to be of inestimable value in many ways, but they are not able to stand very much punishment.

Torpedo.—The German short-range torpedo, with its enormous bursting charge, is a very deadly weapon, rarely failing to sink the enemy. Long-range torpedoes of the future are likely to be larger than existing types and have heavier bursting charges. Against the disruptive effect of so great an amount of explosive no method of subdivision of hull is adequate and some other means must be devised if surface battleships are to continue in use. On some of their old cruisers the British built external coffer dams along the sides. These greatly reduce the speed and their efficiency against torpedoes was not tested so far as known.

Old Battleships and Cruisers.—All the belligerent navies have found much use for old ships that were no longer fit for their designed purposes. In future, such craft are likely to be retained much longer than was hitherto considered desirable.

Monitors.—As a support to military operations, light-draft monitors have proved to be valuable. Their low speed in connection with small draft renders possible adequate hull protection against torpedoes, and their draft enables them to get close in shore where the ordinary battleship could not operate.

Light Cruisers are all now fitted with thin armor belts at the water line and the value of this is said to have been demonstrated, especially when scouting against destroyers. The necessity of the highest practicable speed is unquestionable and the battery, instead of many small guns, should consist of a less number of larger ones.

Bombardment of Forts.—The futility of bombarding forts with ships, unless an adequate landing force is available to take advantage of the work of the ship's guns, has been conclusively shown in the past and received another convincing proof at the Dardanelles.

Air Craft.—The value of air craft as scouts for their fleet was clearly demonstrated, and further important uses indicated, though as yet untried. As detectors of submarines, aëroplanes are invaluable adjuncts to a fleet. Airships are also valuable, but as constructed at present, large ones can only operate from a base on shore. See section on AËRIAL OPERATIONS.

Big Guns and High Angle of Elevation.—Perhaps the most definite of the lessons of the war was the dominance of the big gun. Its greater range and destructive power gave the victory in every instance at sea in which the fight lasted to a finish. But, in the battle off the Falklands, the high elevation which it was possible to give the German 8.2-inch guns enabled them to open fire almost as soon as the 12-inch pieces of their opponents; and, in the battles in the North Sea, the advantage of high angle of elevation was again noted.

V. AËRIAL OPERATIONS

The outbreak of the war found the Great Powers of Europe ready and anxious to make

immediate application of aëronautics to their respective military and naval operations. That all were inadequately prepared on the score of equipment and trained personnel the opening weeks of the war soon showed, and early the demands likely to be made on the aërial services were clearly indicated. But in no field did developments follow more rapidly, and as early as the Germans undertook the invasion of Belgium and France it was realized that aëroplane and airship had worked materially to change the nature and scope of military operations and to render obsolete tactics and movements that long had prevailed in warfare. By affording to scouts and intelligence officers a complete view of the enemy's territory, the disposition and movement of his troops and fleets, and his permanent or even his most temporary defenses, surprise or flanking movements were rendered practically impossible. With both sides adequately informed as to the forces of their adversaries through constant aërial scouting and reconnoissance, the tendency towards trench fighting and the protracted sieges and bombardments of the western front was as pronounced as it was inevitable. The direction and control of fire from an observation or kite balloon or aëroplane early became an indispensable feature of the work of the artillery. The tactical changes wrought by the use of air craft were stupendous, and the service of security and information by aërial observers and range finding for the artillery became essential features of the everyday work of the forces in the field. In addition there were raids by aëroplane and airship to drop explosive or incendiary bombs on fortified positions, moving columns, railway trains, supply depots or munitions works, or on warships, submarines, and transports.

Such activities on the part of the airmen soon became so valuable in a military sense that the prevention of these efforts was essential, and this naturally led to the development of the purely combative side of aërial warfare, which soon passed from individual duels in the air to savage actions often at close range participated in by a number of aëroplanes of different types, where battle tactics of an elementary form were evolved as a result of training and drill to secure harmony of action.

Naturally this led to increased armament and armoring of the aëroplanes, and the calibre of the rapid-fire gun that soon took the place of the automatic pistol became greater, so that by 1916 an air battle was indeed a serious matter, and the protection of fuel tanks and machinery and the design of machines to withstand as much penetration of the wings as possible figured prominently, as indeed did the entire question of design and construction for power, carrying capacity, speed, ease of manœuvring, and general reliability. Remarkable advances were realized, along with wholesale demands which taxed the facilities for manufacture in the belligerent nations as well as in America.

Flying corps existing in armies and navies were on the outbreak of the war greatly augmented and preparations made to train vast numbers of aviators. It was estimated that the various belligerent nations on the outbreak of the war possessed about 5000 aëroplanes and 109 dirigibles. Naturally Germany, where some 12 Zeppelins and about 23 Parseval and Gross airships and about 1000 aëroplanes were available at the beginning of the war, was preëminent as regards numbers and trained pilots and observers; but here the policy of standardization and organization contributing so much to her efficiency in other fields was not of corresponding avail. A year's service, even less, demonstrated that much of the equipment so carefully assembled and standardized soon became obsolete and inferior with respect to the rapid developments that war conditions were bringing out for the Allies.

While the Germans had trained men in their aviation corps the French, with perhaps some 31 airships of nonrigid or semirigid types and possibly 1200 military aëroplanes of different design, had fewer enrolled aviators at the outbreak of the war in actual service, but had a large number of expert civilians and their machines to call upon, so that soon there was organized a body of men whose equipment, both available and rapidly supplied, represented the note of progress ever peculiar to the French in this field. The organization and drill of the various units was done with remarkable military skill and care.

Great Britain, distinctly inferior in organization and equipment as well as numbers, for its aëroplanes hardly totaled 500, and its dirigibles but 15, at the beginning of the war endeavored speedily to repair these deficiencies, and while the defensive efforts to repel the Zeppelin raids were crowned with but moderate success, British aviators at the front and at sea achieved a good record. Russia with 16 small airships and perhaps 800 aëroplanes, many of which were in poor shape, suffered from an inadequacy of equipment, while in Austria and Italy from the outset aërial war was waged by both Powers with a fair degree of preparation.

Aërial activity in war became not only important but indispensable under modern conditions, yet it did not have a direct and primary effect on the progress of the war itself comparable, let us say, to the activity of the submarine. Indirectly the influence of air craft on warfare proved enormous, but two years of experience indicated that there was but little direct military advantage in the attempts at wholesale destruction of noncombatants, buildings, and material by aëroplane and dirigible, although in the summer of 1916 the discharge of high explosives on the German trenches aided considerably the attacks of the Allies. The numerous air raids over Great Britan resulted in little positive military advantage, and the "frightfulness" that they were to inspire soon gave way to a feeling of intense irritation on the part of the invaded. That they were solely for the purpose of destruction by way of reprisal or otherwise was not believed by many military and naval authorities, even British, who urged that the raids were a part of an elaborate and highly developed system of reconnoissance carried on in connection with naval operations, especially by submarines and raiding cruisers, with whom they were in communication through wireless. Nevertheless these raids were of special significance, as they indicated future possibilities in the way of invasion and a menace that was ever at hand, and naturally they bulk large in any history of the war. Accordingly it may be desirable to consider some of the more effective raids on the great cities and at considerable distances from home bases.

Early in the war various places were attacked

with bombs dropped from aëroplanes and dirigibles, and naturally such incidents aroused widespread interest for their novelty. At first some pretense was made to comply with Article 25, Annex to Hague Convention, Oct. 19, 1907, which declared "The attack or bombardment, by whatever means, of towns, villages, dwellings, or buildings which are undefended, is prohibited." The addition of the words "by whatever means" was for the purpose of making it clear that the bombardment of these undefended places from balloons or aëroplanes was prohibited. This rule was ratified without reservations among other countries by Belgium, France, and Great Britain, as well as the United States, and with reservations by Germany, Russia, and Austria. The declaration (Oct. 18, 1907) to prohibit "for a period extending to the close of the Third Peace Conference the discharge of projectiles and explosives from balloons or by other new methods of a similar nature" was ratified among other nations by Great Britain, Belgium, and the United States. Germany, France, Austria, and Russia refused to ratify. See INTERNATIONAL LAW, *International Law in War.*

It was claimed that cities like Paris and London were in reality fortified camps, or equivalent thereto, and as such were liable to attack without warning; while if civilians were killed when towns supposed to contain supply stations, railway centres, palaces, or headquarters were bombed the injuries were to be considered incidental rather than intended. The raid of the Allies on Freiberg, e.g., which was said to be unfortified, was considered by the Germans an act in violation of the rules of war and led to reprisals. The bombing of hospitals and buildings protected by Red Cross flags figured also in the charges and recriminations that these aërial attacks provoked.

In the early weeks of the war a Zeppelin dropped bombs over Antwerp, and at the end of August and on September 1, 2, and 3, 1914, Taube monoplanes made daily visits to Paris, where, as in London, all street and other lights were extinguished and means hastily improvised to defend the city by searchlight and anti-aircraft guns as well as to organize special fire-fighting facilities to deal with the results of incendiary bombs. On Oct. 11, 1914, another raid was made on Paris and bombs were dropped, some of which fell on the cathedral of Notre Dame, while others damaged streets, sewers, and the underground railway, besides causing the deaths of some three persons and injuries to 14. In the meantime the aërial defense of the city was being developed, but on March 22, 1915, another raid was made on Paris, which, while resulting in little damage, nevertheless emphasized the need of a more complete system of defense. This was organized under General Hirschauer, former chief of the aëronautical department, and after it had been developed Paris was free from attack for many months. There was a system of central control with the battle front, aviation parks, and other stations connected by telephone, and frequent anti-aircraft batteries, many mounted on high-speed motors, not to mention searchlight and observing stations equipped with microphonic detectors, were provided at carefully chosen points. There were a number of completely equipped aëroplane stations each ready to send aloft its complement of machines at a moment's notice. A patrol was maintained with the aëroplanes flying at different levels, drilled to intercept a hostile machine from both above and below.

Naturally an air attack on the British Isles was the goal aimed at by the Germans. Various reconnoissances were made by the Germans in connection with the flights on the western front and the observation of the British navy, but it was not until Dec. 5, 1914, that the reporting of a German aëroplane over Dover brought home to the British the reality of aërial danger. On December 24, bombs were dropped on Dover, and the following day a German biplane dropping bombs near Chatham was engaged by three British machines and was driven down the Thames, presumably to its destruction, as later the body of a German aviator was found near the river mouth. But the first serious raid on Britain was on the evening of Jan. 19, 1915, and was directed against Yarmouth, Sandringham, and other points on the Norfolk coast. This raid evidently was designed to test the capabilities of the Zeppelins for extended service, yet even at the time it was thought by English naval critics to be for the purpose of securing information as to the British fleet and for possible bomb dropping on shipyards and ironworks. This raid was but a beginning, for by June 1, 1914, the metropolitan section of London was reached and considerable damage was done, four lives being lost, while on June 6 another raid attended by casualties was made on the east coast of England, and again on June 15, on this last 16 persons being killed and 40 injured. Little of this nature then happened, save for a raid on Harwich, until Aug. 9, 1915, when a raid in considerable force was made, and bombs were dropped on warships in the Thames, on London docks, on torpedo boats near Harwich, and on military posts on the Humber. This raid was the forerunner of the activity promised by Count Zeppelin in the previous spring, when he stated that by the following August there would be available 15 airships of a new type. The casualties of this raid, on which some five airships started, were stated at 25, about half of which were deaths, while a number of fires were set.

Following this raid came one on the night of August 12 against Harwich, where 6 were killed and 17 wounded, while a squadron of 4 Zeppelins in another raid over the English east coast killed 10 and wounded 36 besides damaging various houses and other buildings. This was the eighteenth raid on Great Britain, making a total of 85 killed and 267 injured by bombs. The attacks of the Zeppelins reached perhaps a climax on September 8–9 when the heart of London was reached, and the Zeppelins flying over Trafalgar Square were distinctly visible from the street. The casualties of this raid were given as 20 killed, 14 seriously injured, and 74 slightly wounded, while the material damage was considerable. These raids continued during September over parts of the eastern counties. On October 13–14 London was again attacked by Zeppelins, which, fearful of searchlight and gunfire, flew very high with a corresponding effect on the accuracy of their bomb dropping. The roll of casualties included 46 killed and 114 wounded. For a few months now there was a lull in the aërial attacks on Great Britain, but the most serious raid came on the night of Jan. 31, 1916, when six or seven Zeppelins passed over the midland counties, dropping over 300 bombs and generally

terrorizing the inhabitants, the aim being to strike a blow at the industrial centres. Here 61 were killed and 101 injured, and the total number of the killed for 29 raids since the beginning of the war was 266. Beginning March 31, 1916, air raids were made over Great Britain for five successive nights and not only the eastern counties but even Scotland and the northeast coast were visited and bombs dropped. In one of these raids the Zeppelin *L–15* suffering severely from gunfire was forced to descend and was captured by the British.

The aërial defense of Great Britain came in for considerable criticism both within and without Parliament and unfavorable comparison with that maintained in France was made, but there were fundamental differences in the nature of the problem. Paris was behind a carefully guarded military frontier and all approaches were by land, while Great Britain, surrounded by water and often enveloped in fog, presented a much better opportunity for attack given an aëroplane or airship that could maintain itself in air long enough for a sustained flight. Many Englishmen urged that too much had been done for defense and not enough in the way of offensive movements against the Zeppelins in their home ports and stations.

Such raids as those described stand out apart from their actual military significance, but they must not be allowed to eclipse the daily routine and the ever-increasing number of frequent combats on all the battle fronts of this great war. What was remarkable at the beginning of the war, such as visits of the German Taubes to Paris in August, 1914, or the bomb dropping by a Zeppelin on Antwerp on September 1, of the same year, soon became commonplace as did the bombing of the German hangars at Düsseldorf and Cologne by the Allies later in the month. Attacks on Friedrichshafen by the British and on Freiberg by the French followed, while a British raid on Cuxhaven on Dec. 25, 1914, was an early example of a number of aëroplanes working together. Aërial attacks and reconnoissances in force became more frequent, ever on a larger scale and with greater elaboration of organization as well as with more powerful and more heavily armed machines. To deprive the enemy of the services of aviators and machines and to prevent their use for purposes of advantage now became a prime military necessity with a direct bearing on operations. Patrols were maintained more effectively, the service of security and information carried on daily in spite of hostile interference, while for the gunners in and behind the trenches ranges and directions were observed in the unprecedented bombardments that took place from time to time. Bombing raids by aëroplanes were organized on a large scale by the French especially with their heavier machines and many of these were very successful. While both sides continually lost many aëroplanes in actual fighting, the Germans suffered severely with respect to their Zeppelins by accident as well as by gun fire. The first Zeppelin to succumb as the result of aëroplane attack was on June 7, 1915, when a Canadian aviator, Sublieut. R. A. J. Warneford, R.N., in a Morane monoplane encountered the German airship *LZ–38* flying at a height of about 6000 feet between Ghent and Brussels. Getting directly above the Zeppelin he was able to land a bomb squarely on the envelope so that the resulting explosion entirely destroyed the dirigible. There were further accidents to the German Zeppelins during the autumn and early winter of 1915, the Russians destroying an airship by artillery fire near Kalkun on the Libau-Benin Railway on December 5. Another notable achievement was the bringing down of the German naval Zeppelin *LZ–77* by an incendiary shell from a 77-mm. anti-aircraft gun of a French motor section at Brabant-le-Roi on Feb. 21, 1916. The shell ignited the gas bag. On May 3 the naval Zeppelin *L–20* was forced to descend on the Norwegian coast where it was blown up to preserve neutrality, while on May 5 one Zeppelin was destroyed by gunfire from French warships over Saloniki and another by the British off the coast of Schleswig-Holstein.

Along with the brilliant feats of individual aviators there was developed a tendency towards tactical formations and the use of many machines. In August, 1915, at one occasion 84 French aëroplanes were assembled for flight over the German lines, difference in speed and armament making possible tactical dispositions of the greatest advantage. The Germans for a time had some machines of superior armament and from August, 1915, heavier guns and armored aëroplanes figured and operations by flotillas became more general, these including the use of powerful bombing machines accompanied by armored scouts for their protection and swift flying machines for advanced reconnoitring. Air craft were also used at sea against warships and transports and in August, 1915, the Russians employed seaplanes against a German gunboat near Windau accompanied also by a Zeppelin and two seaplanes. Aëroplanes were also in evidence in the south and east, for the Russians attacked Constantinople in August dropping bombs on the harbor forts and from this time both sides were in active aërial warfare until the close of the Dardanelles campaign. On August 10 the Russians brought seaplanes to bear in repelling the landing of German troops off the Gulf of Riga.

Everywhere there was aërial activity and damage wrought by air craft, yet unavoidably this was accompanied by wholesale destruction of machines and losses of aviators. As samples of aërial attacks, and in fact but little more here can be attempted, mention may be made of the bombing of a poison gas plant at Dornach on Aug. 26, 1915, by a French aviator and a bomb attack on the royal palace at Stuttgart, a step it was announced taken in retaliation for German bomb dropping on unfortified towns and civilians. In every kind of operations air craft aided as at the battle in the attack on Artois Sept. 25, 1915, when the British airmen were prominent, and later at Verdun in the spring of 1916. On the western front in April, 1916, French airmen brought down 31 hostile aëroplanes. On October 3, a group of 19 French aëroplanes essayed an attack on Luxemburg, where the Kaiser had established headquarters.

In the south, Austrians were active against Italy, and bombing raids were made against Brescia, Verona, Venice, Udine, and other points, while the Italians in turn made attacks on Austrian territory. On Nov. 28, 1915, occurred the first battle between British and German seaplanes near Dunkirk with damages to both sides, while on November 29 a British seaplane destroyed a German submarine off the Belgian coast.

Typical of a day's work for the airmen may

be mentioned the British War Office report of Dec. 19, 1915, which announced 44 combats in the air on the western front. In April, 1916, French airmen on the western front brought down 31 hostile aëroplanes, while in the struggle around Verdun aëroplanes of both sides were in constant service. In the great drive of June and July, 1916, the Allies' aëroplanes participated actively, and reports made mention of extraordinary effects attending the dropping of powerful explosives on the trenches. The aëroplanes also made many raids in the rear. Airmen mostly French were active with the eastern army in the Balkans where the intense cold put many difficulties in their way. Around the Suez Canal the aëroplanes were invaluable in supplying information of threatened movements.

In 1916 everywhere there was increased aërial activity, a more active patrol service was maintained, and actions were frequent and serious. At sea aëroplanes were searching out for submarines and scouting, and employment of airship and aëroplane before and in a large naval battle for scouting and reconnoissance in a manner and on a scale somewhat corresponding to their use on land found a notable opportunity in the great fight off Jutland on May 31, 1916.

The verdict of two years' use of aëroplanes and airships confirmed in the main previous theory and prediction. The aëroplane demonstrated itself an important and essential element of modern warfare both on land and sea. The airship, which in the hands of the Germans increased vastly in efficiency as the war progressed and was found valuable for oversea scouting and reconnoissance and bomb dropping, may cause damage, serious and costly; but that it contributed anything worth while to the settlement of the war or greatly affected its progress or outcome was not proven by two years of use in 1914–16. As regards relative technical or military advantage by June, 1916, it was more difficult to say. The aërial services of the Allies in organization and extent had developed to a greater degree than those of the Teutonic Powers and had become more efficient with ever-improved machines and heavier armament, but throughout the war German and Austrian aviators fought most valiantly, and the limited success achieved by the Zeppelins was due to their inherent nature rather than to unskillful operation. See AËRONAUTICS; HANGAR; MILITARY AËRONAUTICS; NAVAL AËRONAUTICS.

VI. ALLEGED ATROCITIES

Belgium. Shortly after the occupation of Belgium by the Germans, reports reached the outside world of shocking atrocities alleged to have been committed by the German army during the invasion. To ascertain, if possible, the truth of these reports, the government of Great Britain appointed a commission of prominent English statesmen and jurists headed by Viscount Bryce to investigate the matter. Depositions of more than 1200 persons were considered by the commission. From the evidence accumulated the commission reached the following conclusions:

1. That there were in many parts of Belgium deliberate and systematically organized massacres of the civil population, accompanied by many isolated murders and other outrages.

2. That innocent men, women, and children in large numbers were murdered and women violated.

3. That looting, house burning, and wanton destruction of property were ordered and countenanced by the officers of the German army.

4. That women and children were used as a shield for advancing military forces.

In answer to these charges the German government issued a memorandum specifying the acts of civilians in Belgium, in violation of the rules of war, such as shooting at German soldiers from private houses, and mutilating wounded Germans, which, they claimed, justified the German military authorities in their acts of reprisal.

Great resentment was aroused in England by the action of the German military authorities in executing Miss Edith Cavell,* an English nurse who was accused of utilizing her position to assist in the escape of Belgian, French, and British soldiers from Belgium.

Another incident which caused considerable adverse criticism of the German government was the case of Cardinal Mercier (q.v.), Archbishop of Malines and Roman Catholic Primate of Belgium. After a trip through the devastated parts of Belgium he wrote a pastoral letter describing the conditions which he had found. In passionate words he set forth the evidence of ruined villages, churches, schools, and monasteries destroyed. Efforts were made by the German authorities to suppress the letter, and the Cardinal was put under restraint, although not actually imprisoned by the German Governor of Belgium, Von Bissing.† In answer to a protest made by the Pope the German authorities stated that all restraints upon the Cardinal's freedom of communication with the clergy had been removed.

Armenia. The governments of France, Russia, and Great Britain issued the following joint note on May 23, 1915. "For the past months Kurds and the Turkish population of Armenia have been engaged in massacring Armenians with the help of the Ottoman authorities. Such massacres took place about the middle of April at Erzerum, Dertshau, Moush, Zeitun, and in all Cilicia. The inhabitants of about 100 villages near Van were all assassinated. In the town itself the Armenian quarter is besieged by Kurds." The preaching of a holy war soon after this increased the massacres to such an extent that the Armenian paper *Mshak* estimated that only 200,000 of the race still remained in the country, out of a total of 1,200,000 at the beginning of the war, and that 850,000 had been killed or enslaved by the Turks and 200,000 had migrated to Russia. The United States placed an informal request before the German Ambassador, asking that the German government attempt to alleviate the conditions of the Armenians. An informal reply said that the Armenian reports were greatly exaggerated. Charges of barbarous cruelty were laid before the Sublime Porte by the American Ambassador, Morgenthau. Turkey filed counter charges at Washington, stating that Russian troops, aided by Greeks and Armenians, had committed acts

* Edith Cavell was head of a nurses' training school in Brussels; as a nurse did much for German as well as Allied soldiers in European War. The American Minister, Brand Whitlock, made every effort to have her life spared. The execution roused England and France and was commented on throughout the United States. A notable memorial service was held at St. Paul's, London, and a statue of Miss Cavell by Sir George Frampton was to be erected adjoining Trafalgar Square.

† Moritz Ferdinand, Baron von Bissing, born (1844) at Bellmansdorf; rose to be lieutenant general (1897) and general of cavalry, commanding the Seventh Army Corps; after invasion of Belgium by the Germans was appointed Military Governor of the country.

of cruelty against Moslems in the Caucasus region, and that continual revolutions incited by the Allies were occurring in Armenia.

Poland. At the outbreak of the war Germany, Austria, and Russia attempted to gain the loyal support of the entire Polish nation by promises of the reëstablishment of the old Polish Kingdom. Poles fought against each other in the hopes that a united Poland would result. In the great German drive into eastern Russia Poland was crushed and the inhabitants suffered untold hardships. As the Russians retreated they compelled the Poles to abandon their homes for military reasons. Any villages that escaped the Russians were almost invariably destroyed by the Germans. It is estimated that at least 20,000 villages were wiped out and that over 200 towns were completely destroyed. In the Gorlice district the Polish Relief Victims' Fund estimate that during the 18 months' campaign 1,500,000 noncombatants, caught between the contending armies, perished from hunger and disease. The Rockefeller Foundation reported that the entire civilian population faced a famine. The poorer classes were found to be existing in many cases on meatless soup and a crust of bread. There was no fuel to be had and many were frozen to death during the winter of 1915–16. Attempts were made to feed the Polish sufferers through an American committee, but Germany and Great Britain could not agree as to method.

Serbia. The conditions in Serbia were practically similar to those in Poland. Villages and towns were wiped out in the face of the German drive through the Balkans. After the first drive of the Austrians into Serbia fever epidemics broke out all over the country. It is presumed to have been caused by the congestion of all the rural population in the urban districts as a result of the war. Hundreds died daily, and in many places it was impossible to bury all the victims. Physicians were sent to Serbia by the Allies and hospital units were made up in the United States and sent over. Cholera also broke out among the noncombatants after the German drive. It was caused by the shortage of food and the bad sanitary conditions, the people being forced to herd together and to live in the open. It is estimated that over 600,000 noncombatants died as a result of the plague and from hunger.

VII. DESTRUCTION OF ART AND ARCHITECTURE

The great war saw the destruction or mutilation of many of the landmarks of Europe in the field of art and architecture. Charges and countercharges were made by the belligerents of deliberate attempts to destroy these. The destruction of a large part of the city of Louvain, including its church of St. Pierre, the University of Louvain (q.v.), and its library of rare books and manuscripts aroused much feeling in all civilized countries. In defense of its action the German general staff issued an official communication in which it was stated that the civilian population, after the surrender of the city to the Germans, had fired upon German soldiers from private houses, as a result of which five officers were wounded. It was also claimed that the Belgian authorities had encouraged a general uprising of the civilian population against the Germans. The case of Louvain figured largely in the American press, but it was only one of numerous similar instances where towns and villages containing gems of art and architecture had been burned and many of their inhabitants shot because they had resisted invaders.

The beautiful cathedral of Rheims (q.v.), dating from the thirteenth century, suffered irreparable damage from repeated German bombardments. The Germans, in explanation of the first bombardment, maintained that the French had established an observation post in its tower. It is doubtful if the exquisite carvings, statuary, and stained glass windows can ever be replaced. Another city to suffer was Ypres (q.v.). Its famous Cloth Hall was seriously damaged during the heavy bombardments of the Flanders campaign.

There was constant danger to architecture of historical interest from the frequent aërial attacks on cities. For example, during an Austrian raid on Venice bombs fell on the Scalzi Church. The ceiling, which was ornamented with beautiful sculpture of Tiepolo, was crushed. Historic landmarks of London and Paris narrowly escaped damage from Zeppelin raids.

VIII. NEUTRAL NATIONS

A war involving all of the great industrial nations of Europe was certain to have far-reaching effects upon all neutral nations. The complete dislocation of international trade and the closing of all the great stock markets of the world gave rise to financial and economic problems which were absolutely unprecedented. After the first shock the business interests gradually adjusted themselves to the new conditions. But soon it became apparent that problems far more serious than those produced by the temporary disturbance caused by the outbreak of the war, confronted the neutral nations. To the questions of neutral trade, contraband and blockade, which had arisen in previous wars, there were added new and more vexing problems due to the introduction of new methods of warfare, especially the operation of the submarines.

United States. As the largest and most important of the neutral Powers, the United States was sure to be vitally affected. This country was looked to by the smaller neutral nations to champion the interests of all neutrals. Moreover, it was certain that the United States would be called upon to furnish large quantities of supplies to the belligerent Powers. Each of the belligerents would be anxious to avail themselves of this source of supply, and each in turn would strive to prevent their opponents taking advantage of it. Under these conditions the situation which confronted the United States authorities in attempting to maintain strict neutrality was a trying one, and the problem was made more difficult by the attitude of groups of persons in this country whose sympathies were with one or the other of the belligerents in Europe. The following are the most important questions which arose involving the United States and the various European Powers.

Blockade and Neutral Trade.—During the early months of the war Great Britain established her complete control of the seas, except in so far as it was interrupted by the operations of the German submarines. That Great Britain would take full advantage of her sea power was to be expected, and that in so doing serious difficulties would arise in regard to the rights of neutral nations was also clear. In the first place

there was the always vexed question of contraband. There was no Hague Convention which dealt with the question of conditional and absolute contraband. As the Declaration of London (see LONDON, DECLARATION OF) was declared by Great Britain not to be in force, the question had to be determined by the general rules of international law. But upon this question there was no general agreement among the nations. Belligerent Powers naturally wished to extend the list of contraband, while neutral Powers quite as naturally wished to restrict it.

A more serious and difficult question affecting neutrals arose, due to the peculiar geographical position of Germany. On two sides the country was bounded by neutral Powers which touched the sea. Through Holland and the Scandinavian countries contraband might be shipped from the United States or other neutral countries to Germany and thus nullify England's sea power. The problem which confronted Great Britain was to prevent contraband articles from reaching Germany, while at the same time not to interfere with legitimate trade between neutral countries. Shortly after the outbreak of hostilities Great Britain began detaining American ships bound for neutral ports on the ground that their cargoes were destined for the enemy. For some months the United States government did not protest, hoping that Great Britain would modify her policy. Finally on Dec. 26, 1914, the United States addressed a communication to Great Britain, calling attention to the interference by the latter with American commerce with neutral nations, on the ground that goods so consigned might reach the enemies of Great Britain. The United States authorities contended that "mere suspicion was not evidence and doubts should be resolved in favor of neutral commerce, not against it." To this note Great Britain replied on Jan. 7, 1915, that that country had not aimed to interfere with the bona-fide trade of the United States with neutral countries, but figures were given showing the marked increase in exports of such articles as rubber and copper from the United States to neutral countries contiguous to Germany. It was stated that with such figures the presumption was very strong that such goods were ultimately destined for a belligerent country. The note further stated that Great Britain was prepared to admit that foodstuffs should not be seized without the presumption that they were intended for the armed forces of the enemy. In regard to the placing of cotton on the list of contraband it was stated that the British government had not contemplated any such action. In conclusion the British government agreed to make reparation for any injury improperly done to neutral shipping.

A novel question arose from the action of the German government in placing under government control all of the food supply of the Empire. The British government declared that it would be impossible under these conditions to distinguish between food intended for the civilian population of Germany and food to be used by the German military forces. In view of this situation the British government stated that foodstuffs intended for consumption in Germany would be considered contraband.

For some months after the outbreak of the war Great Britain hesitated to declare a blockade of German ports. This attitude was due, in part at least, to the recognized difficulty of rendering such a blockade effective, in view of the geographical position of Germany, and of the activities of submarines. But events forced Great Britain to abandon her somewhat anomalous position. On March 1, 1915, Mr. Asquith announced in the House of Commons that Great Britain and France, in retaliation upon Germany for her declaration of the "War Zone" around the British Isles (see below), would confiscate all goods of "presumed enemy destination, ownership, or origin." Such action, of course, could only be justified under the existing rules of international law on the presumption that a lawful blockade of German ports had been declared. In answer to an inquiry from the American government as to whether such a blockade was contemplated the British government stated that as an effective "cordon controlling intercourse with Germany had been established and proclaimed, the importation and exportation of all goods to or from Germany was, under the accepted rules of blockade, prohibited." The British government further defined the radius of activity of the French and British fleets in enforcing the blockade as European waters including the Mediterranean. It was further stated that they would refrain from exercising the right to confiscate ships and cargoes for breaches of the blockade, and restrict their claim to stopping cargoes destined to or coming from the enemy's territory.

In an extended communication addressed to the British government by Secretary Bryan (q.v.) on March 30, 1915, attention was called to the unusual character of the proposed blockade and the interference with legitimate neutral commerce which might readily result. The United States government was willing to concede that the changed conditions of naval warfare, especially the operations of submarines, might justify some modification of the old form of close blockade, but it was unwilling to concede the right of belligerents to blockade neutral ports. It was further pointed out that alleged illegal acts of Germany could not be offered as an excuse for unlawful acts on the part of Great Britain. In conclusion it was stated that the German Baltic ports were open to the trade of the Scandinavian countries, although it is an essential element of blockade that it bear with equal severity upon all neutrals.

For some months the question was allowed to remain in abeyance, because more serious questions had arisen in connection with Germany's submarine warfare. (See below.) It was clear, however, that irritation at the continued interference by Great Britain with American commerce was constantly increasing. On Aug. 3, 1915, the State Department at Washington published five diplomatic communications which had been exchanged between the two governments relating to the detention of American ships and cargoes. In response to the American note of March 30, 1915, on the subject of the restrictions imposed on American commerce by the British Orders in Council, Sir Edward Grey defended the Orders on the ground that it was necessary for Great Britain and her Allies to take every step in their power to overcome their common enemy in view of the shocking violation of the recognized rules and principles of civilized warfare of which she had been guilty during the present struggle. He further denied that the Orders in Council violated any fundamental principle of international law by applying a blockade in such a way as to cut off

the enemy's commerce through neutral ports, "if the circumstances render such an application of the principles of blockade the only means of making it effective." It was contended that the only question that could arise in regard to the new character of blockade was whether the measures taken conform to "the spirit and principles of the essence of the rules of war" as stated in the American note of March 30, 1915. Sir Edward Grey contended that there was precedent for the British policy in the position taken by the United States during the Civil War. In order to prevent contraband being shipped from neighboring neutral territory to the Confederacy the Federal government enforced the doctrine of the continuous voyage and goods destined for enemy territory were intercepted before they reached the neutral ports from which they were to be reëxported. Such action, moreover, was upheld by the Supreme Court of the United States in the case of the *Springbok*. The main argument of the British government was that when the underlying principles governing blockade and contraband are not violated it is permissible to adopt new measures of enforcement.

To this contention the United States replied with a vigorous note on Oct. 21, 1915. It was stated that the so-called blockade instituted by the Allies was "ineffective, illegal and indefensible," that the "American government cannot submit to a curtailment of its neutral rights and that the United States must insist that the relations between it and His Majesty's government be governed, not by a policy of expediency, but by those established rules of internationl conduct to which Great Britain in the past has held the United States to account."

This note did not have the effect of forcing Great Britain to modify her blockade policy. On the contrary Great Britain served notice, on March 30, 1916, that thereafter the doctrine of continuous voyage would be applied to vessels carrying conditional contraband as well as to those carrying absolute contraband. See NEUTRALITY: INTERNATIONAL LAW.

On April 25, 1916, the British government made an extended reply to the protest of the United States. It was contended that the practices complained of were "judicially sound and valid" and that the relief neutrals sought was to be obtained by mitigation of necessary hardships rather than "by abrupt change either in theory or application of a policy based upon admitted principles of international law carefully adjusted to the altered conditions of modern warfare." The note further stated that "an impartial and influential commission" had been appointed to find ways to minimize delays and pledged the Allies to make their restraints as little burdensome as possible. In regard to the complaint that the methods adopted by the Allies in intercepting neutral trade had not hitherto been employed by belligerents, it was answered that "new devices for dispatching goods to the enemy must be met by methods of intercepting such trade." In particular it was pointed out that modern conditions, such as the size of the steamships, and the methods of concealing contraband, made it no longer feasible to search ships at sea and justified sending vessels into port for search.

At great length the note discussed the question of proofs of the destination of contraband. As in a previous note it was contended that figures issued by the United States Department of Commerce showed that exports from the United States to the Scandinavian countries had increased threefold since the outbreak of the war, and there was strong reason to believe that much of this increase was not bona-fide neutral trade. It was pointed out that large consignments of meat had been made to such persons as dock laborers, lightermen, bakers, etc., and it was obvious that such consignments were subterfuges. In view of these facts it was contended that "no belligerent could in modern times be bound by a rule that no goods could be seized unless they were accompanied by papers which established their destination to an enemy country. To press such a theory is tantamount to asking that all trade between neutral ports shall be free, and would thus render nugatory the exercise of sea power and destroy the pressure which the command of the sea enables the Allies to impose upon their enemies."

The foregoing statement contained the real crux of the whole matter. It was the contention of the United States that the exercise of the right of blockade did not justify any interference with neutral trade between neutral ports while Great Britain once more referred to the action taken by the United States during the Civil War in enforcing the doctrine of the continuous voyage as justifying their interception of trade which, it was contended, was destined for the enemy although immediately consigned to neutral countries.

The note finally denied the statement made by the United States government that the blockade was ineffective. It was stated that it is doubtful if there had ever been a blockade where the ships which slipped through bore such a small proportion to those which were intercepted.

This note did not bring the questions at issue, between the United States and Great Britain, any nearer to a settlement. It was evident that while Great Britain was anxious to adopt a conciliatory policy in dealing with neutral commerce, she was unwilling to concede the principle for which the United States contended, viz., that trade between the United States and neutral countries should not be interfered with.

Use of Neutral Flags.—Early in the year 1915, the German government made representations to the government of the United States that British ships were making use of neutral flags in order to escape capture. Particular attention was called to the action of the captain of the British steamer *Lusitania* in raising the United States flag when approaching British waters, and it was stated that orders had been issued by the British government to all commanders to make use of neutral flags when necessary. On Feb. 10, 1915, the United States government addressed a note to the British government calling attention to this matter. Without disputing that in exceptional cases there was precedent for the use of neutral flags by merchant vessels to escape capture, it was pointed out that any general use of the American flag for such purposes would endanger American ships, by raising the presumption that they are of belligerent nationality. In answer to this the British government stated, on Feb. 19, 1915, that English law allowed the use of the British flag by foreign merchant vessels in order to escape capture, that instances were on record of United States vessels making such use of the English flag dur-

ing the American Civil War, and that it would be unreasonable to deny to British vessels at the present time a similar privilege. It was stated, however, that the British government had no intention of advising their merchant shipping to use foreign flags as a general practice.

Interference with Mail.—A determined protest was also made by the United States government against the interference by Great Britain with neutral mail in transit between neutral ports. It was contended that under The Hague Convention postal correspondence on the high seas is inviolable. To this protest the British government replied that this provision was not intended to cover the shipment of contraband by parcel post, and in order to prevent such shipment Great Britain would insist upon the right to examine mail packages on the high seas.

Submarine Warfare and the War Zone.—The European War witnessed for the first time the use of the submarine on a large scale in naval warfare. It was evident that the introduction of this new weapon would give rise to a number of novel questions. The frail construction of these boats makes them an easy prey, if seen, for warships or even for unarmed merchantmen which might sink the submarines by ramming them. These conditions, it was contended, make it necessary for the submarines to attack quickly and without warning. Furthermore the old method of capture by which a prize crew was placed on the captured vessel could hardly be followed by the submarines as the size of the crew was small and could not be spared for this purpose. The only feasible method of disposing of vessels captured by submarines was to sink them. But this raised the question of the safety of passengers and crew. The established rules of international law required that merchant vessels could not be sunk, unless they attempted to escape, until provision was made for the safety of passengers and crew. The United States first became involved in the issue when on Feb. 4, 1915, Germany declared the waters around the British Isles a war zone after Feb. 18, 1915. It declared its intention of sinking every enemy merchant ship found in the zone even if it was impossible to save the crew and passengers. It also stated that neutral ships entering the war zone were in danger.

The United States government promptly took notice of this proclamation, and on Feb. 10, 1915, sent a communication to the German government calling attention to the serious difficulties that might arise if the policy contemplated were carried out, and declaring that it would hold the German government to a strict accountability if any merchant vessel of the United States was destroyed or citizens of the United States lost their lives. In reply to this note the German government stated on Feb. 18, 1915, that, in view of the illegal methods used by Great Britain in preventing commerce between Germany and neutral countries, even in articles which are not contraband of war, the German government felt justified in using all means within its power to retaliate on England. Complaint was made of the large quantities of munitions of war which were being sent to Great Britain, and it was stated that Germany intended to suppress such traffic with all means at its disposal. Finally, it was suggested that, in order to avoid mistakes, all American vessels carrying noncontraband through the war zone should travel under convoy.

In order to avoid, if possible, the very serious consequences of the proposed German naval policy, the government of the United States addressed an identical note to Great Britain and Germany suggesting an agreement between these two powers respecting the conduct of naval warfare. The memorandum contained the following suggestions: (1) That neither power should sow floating mines on the high seas or in territorial waters, and that anchored mines should be placed only in cannon range of harbors for defensive purposes, and that all mines should bear the stamp of the government planting them, and be so constructed as to become harmless when separated from their anchors. (2) That neither should use submarines to attack the merchant vessels of any nationality, except to enforce the right of visit and search. (3) That each should require their merchant vessels not to use neutral flags for purposes of disguise.

The note further suggested that the United States government designate certain agencies in Germany to which foodstuffs from the United States should be sent, and that the German government guarantee that such foodstuffs be used for noncombatants only. Great Britain was requested to agree not to put foodstuffs on the list of absolute contraband, and that ships of foodstuffs sent to the designated consignees in Germany should not be interfered with.

Nothing of practical importance came from these suggestions. Germany replied, accepting some and rejecting others, while Great Britain reviewed the alleged violations of international law and defended the stoppage of foodstuffs destined for Germany as a legitimate incident of the blockade.

Thus matters rested pending the first case in which an American vessel should be sunk or American lives lost. On March 28, 1915, news was received that the British steamship *Falaba* had been sunk and that among those lost was an American citizen, Leon C. Thrasher. Accounts differed as to the actions of the steamship when called upon by the commander of the submarine to stop. The German government defended the action on the ground that the *Falaba* had attempted to escape after being warned, and that, upon being overhauled, ten minutes had been allowed for the crew and the passengers to take to the lifeboats before the vessel was torpedoed. While this case was still under consideration by the United States government, it was reported that the American vessel *Cushing* had been attacked by a German aëroplane in the English Channel on April 29, 1915, one bomb being dropped on the ship which caused some damage but no loss of life. Within two days word was received that the American steamer *Gulflight* had been attacked by a German submarine off the Scilly Islands on May 1. Two members of the crew were drowned and the captain died of heart failure the following morning.

Sinking of the Lusitania.—Before the government of the United States had formulated any action in connection with these cases the civilized world was shocked at the terrible news that the Cunard Line steamship *Lusitania* (q.v.) had been sunk on May 7, 1915, by a German submarine off Old Head of Kinsale at the southeastern point of Ireland resulting in the loss of 1150 lives, of whom 114 were known to be American citizens. Prior to sailing of the *Lusitania* from New York on her fatal voyage, an advertisement signed by the German Embassy ap-

peared in many American newspapers warning Americans of the danger of traveling on British vessels through the war zone.

The first feeling of horror at the terrible catastrophe was succeeded by a feeling of bitter resentment in America at what appeared to be a ruthless sacrifice of innocent lives. It appeared, at first, as if a break between the United States and Germany were inevitable. President Wilson (see WILSON, WOODROW) waited six days before taking definite action, stating that it was important to act with deliberation as well as with firmness. In the meantime the German government, on May 10, 1915, sent a communication to the United States government expressing its sympathy for the loss of American lives, but at the same time maintaining that the responsibility rested with the British government, which through its plan of starving the civilian population of Germany by prohibiting the importation of foodstuffs, had forced Germany to resort to retaliatory measures. It was further claimed that British merchant vessels were generally armed, and repeated attempts had been made by such vessels to ram submarines. Finally it was stated that the *Lusitania* carried a large quantity of ammunition in her cargo and warning had been given by Germany that such vessels were liable to destruction.

On May 13, 1915, the eagerly awaited statement of the United States was sent to Germany. With a dignity and an earnestness which the gravity of the situation called for, President Wilson reviewed the series of acts of German submarine commanders culminating in the sinking of the *Lusitania*, which he said "the government of the United States has observed with growing concern, distress, and amazement."

Referring to the claim that the alleged illegal acts of her adversaries justified Germany in adopting retaliatory measures the American note stated that the government of the United States could not admit that any such measures were legal which infringed the clearly established rights of neutrals under international law. These rights include the protection of the lives of noncombatants traveling on unarmed merchant vessels and the right of neutrals to travel on the high seas wherever their legitimate business calls them. In view of these clearly established principles the note stated that "it confidently expects the Imperial German government will disavow the acts of which the government of the United States complains; that they will make reparation as far as reparation is possible for injuries which are without measure, and that they will take immediate steps to prevent the recurrence of anything so obviously subversive of the principles of warfare, for which the Imperial German government have in the past so wisely and so firmly contended." In conclusion it was stated that "the Imperial German government will not expect the government of the United States to omit any word or any act necessary to the performance of its sacred duty of maintaining the rights of the United States and its citizens and of safeguarding their free exercise and enjoyment."

Some hope was felt that the German government would disavow the act when on May 11, 1915, a note was issued explaining its attitude with respect to American and other neutral ships in the war zone. It stated that the German government had no intention of attacking such neutral ships if they were guilty of no hostile act. Even if such ships carried contraband they were to be dealt with according to the rules of international law applying to prize warfare. It further stated that if a neutral ship should be destroyed by mistake the German government would "unreservedly recognize its responsibility therefor." While this did not cover the question involved in the *Lusitania* case, viz., the right of neutrals to travel in safety on merchant vessels under a belligerent flag, nevertheless it was a distinct modification of the policy announced in the proclamation establishing the war zone.

On May 28, 1915, the German government submitted a note defining its position in regard to the various questions raised in the American note. With regard to the cases of the *Cushing* and the *Gulflight* it was stated that an investigation was in progress and the results of this investigation would be communicated to the United States government shortly. (A note was sent by the German government on June 4, 1915, expressing regrets for the sinking of the *Gulflight*, explaining that no distinctive marks were seen on the vessel by which she could be identified. Germany further agreed to furnish full recompense for the damage done. In regard to the *Cushing* the German government asked for additional information in the possession of the American government in order that a conclusion might be reached in the matter.) In regard to the *Falaba*, it was again stated that the commander had disregarded the order to lay to and had sent up rocket signals for help.

Concerning the *Lusitania*, the German government took the position that the government of the United States had not considered all of the material facts in the case. It then repeated the charge that the *Lusitania* had guns on board mounted under decks, that the British government had issued orders to merchantmen to ram submarines, and that in view of these alleged facts the German commanders "were no longer in a position to observe the rules of capture otherwise usual." It was further contended that the *Lusitania* carried large quantities of ammunition and a number of Canadian troops, and that the German government was justified in destroying war munitions destined for the enemy. Finally it was asserted that the rapid sinking of the *Lusitania* was due to an explosion of the cargo of ammunition. (It was categorically denied both by the British authorities and the American port officials at New York that the *Lusitania* carried guns and war munitions.) The German government requested the American government to carefully consider the above statements and express its view in regard to them when the German government agreed to make a final statement as to its position.

It was at this juncture in the negotiations that Mr. Bryan resigned as Secretary of State on the ground that he was unable to agree with the President as to the proper policy to pursue in dealing with the difficulties with Germany. The two points upon which Mr. Bryan in his letter of explanation stated that he was not in agreement with the President were (1) as to submitting the *Lusitania* case to the investigation of an international commission and (2) as to warning Americans against traveling on belligerent vessels or vessels carrying cargoes of ammunition. Mr. Bryan held that the questions in dispute should be considered by an international commission, and secondly, that American travelers should be warned as above indicated.

The next diplomatic move was made on June 9, 1915, when the American government replied to the German government that it noted with satisfaction the position taken by the latter in the cases of the *Cushing* and *Gulflight*. In regard to the *Falaba* the United States was unwilling to admit that the attempt on the part of the merchantman to escape capture altered the obligation of the commander of the attacking vessel to provide for the safety of the lives of those on board the merchantman. In regard to the statements made by Germany that the *Lusitania* was armed, the American government stated that it had official information that such was not the case. With regard to the carrying of contraband by the *Lusitania*, it was held that this was entirely irrelevant to the question of the legality of the methods used in sinking the vessel. Brushing aside these extraneous issues, the American government took its stand firmly on the ground that it was "contending for nothing less high and sacred than the rights of humanity," and it stated that it "very earnestly and very solemnly" renewed its representations made in the previous note.

A reply to this note came from the German government on July 8, 1915. There was in this communication little evidence of a desire to meet the issue. There were the usual assertions in regard to England's inhuman methods of warfare and a suggestion for guarding the safety of American vessels in the war zone. The rejoinder to this note sent by the government of the United States on July 21, 1915, indicated very clearly that it considered the German communication evasive and unsatisfactory. It stated once more in the clearest manner possible the real question at issue, namely, that acts of reprisal against an enemy are indefensible when they deprive neutrals of their acknowledged rights. The note further gave pointed evidence that the United States government felt that the discussion had gone far enough and that "it cannot believe that the Imperial government will longer refrain from disavowing the wanton act of its naval commander." Despite this urgent suggestion from the United States that the matter should be speedily settled the negotiations dragged on. There was evidence, however, that the German government was attempting to find some solution which would concede most that the United States was contending for while at the same time avoid the appearance of being humiliated. For example, on Sept. 1, 1915, Ambassador von Bernstorff (q.v.), in a letter to the new Secretary of State Lansing (q.v.), gave assurance that German submarines would not sink any more liners without warning. It is to be noted that this included ships belonging to belligerents as well as neutrals. Finally, in November, the German government authorized its Ambassador at Washington to begin negotiations looking to a settlement of all outstanding issues between the two nations.

While the negotiations in regard to the *Lusitania* were being conducted, further complications arose from the continued action of German submarines and commerce destroyers. The sinking of the American schooner *Wm. P. Frye* by the German auxiliary cruiser *Prinz Eitel Friedrich* led to an exchange of notes in which Germany finally agreed to pay an indemnity for the loss of the vessel and cargo, and also made the important stipulation that thereafter no merchant vessel would be sunk until the safety of the crew and passengers was made absolutely certain.

In the case of the British steamship *Arabic*, sunk by a German submarine on Aug. 19, 1915, the German government at first refused to acknowledge any obligation in the matter, as it was contended that the *Arabic* had attempted to ram the submarine. Later, however, the German government agreed to pay an indemnity for the loss of American lives on the *Arabic* and further stated that the instructions to the commanders of submarines had been made so stringent that a repetition of incidents similar to the *Arabic* was considered out of the question. Just when it appeared that the issues between Germany and the United States which had arisen in connection with the operations of the submarines were about to be settled, a new issue appeared which seriously complicated the whole situation.

Question of Armed Merchantmen.—It had long been a recognized right under international law for merchant vessels to carry armament for defensive purposes. This practice dates back to the days of piracy and privateers, and the armament of a merchantman was intended for purposes of defense against these irregular enemies. It was never contemplated that such armament would be available against a regular man-of-war. The appearance of the submarine, however, changed the aspect of an armed merchantman. Even small-calibre guns would be effective for sinking these frail craft.

The German government contended that Great Britain had mounted guns on a large number of merchant vessels and had issued instructions to the masters of such vessels to attack submarines which approached their ships. Under these circumstances the German government contended that such vessels were in fact men-of-war and might be sunk without warning. There was much force in this argument, and the United States government in a communication to the belligerent Powers stated that, in view of the changed conditions of warfare and the disappearance of pirates and privateers, it was seriously considering regarding all armed merchantmen as vessels of war. It was suggested that the belligerents agree that submarines observe the rules of international law and at the same time that all armament should be removed from merchant vessels.

While this note was being considered by the belligerent Powers, matters were brought to a head when on Feb. 10, 1916, the governments of Germany and Austria-Hungary notified the United States that after March 1, 1916, armed belligerent merchant vessels would be sunk without warning by the Teutonic Powers. At about the same time it became known that the Entente Allies would not accept the compromise suggestions proposed by the United States.

This new development in the submarine issue aroused serious concern in the United States. There was a strong sentiment in Congress that the government should carry out its announced position of considering all armed merchantmen as vessels of war. The administration felt, however, that as the belligerent Powers had declined to accept its suggestion for disarming merchant vessels it was not within its right to insist upon this modification of international law. For a time it appeared as if a serious breach would occur between Congress and the Administration. Resolutions were introduced in both Houses of

Congress, calling upon the President to warn Americans not to travel on armed merchantmen. The President did not welcome this intervention of Congress in the conduct of negotiations with foreign Powers, and in order to place Congress on record, he asked for and received what in effect was a vote of confidence from Congress.

This new issue once more delayed the final settlement of the issues between Germany and the United States. The President refused to continue further the negotiations relative to the *Lusitania* case until Germany gave assurances that the submarine warfare would be conducted in such a way as not to imperil Americans traveling on the high seas. In a note presented to the State Department, Feb. 16, 1916, Germany recognized her liability in the *Lusitania* affair. She promised reparation and said that submarine operations (as reprisals) must only be directed against enemy subjects.

The sinking of the French cross-channel steamer *Sussex* aroused serious concern in the United States in view of the promises which had been made by Germany. In a communication sent to the American government on April 10, 1916, the German authorities offered an explanation of the sinking of several vessels, and denied responsibility for the sinking of the *Sussex*. President Wilson, in order to bring the whole issue to a final settlement, if possible, sent on April 19, 1916, a communication to Germany which was clearly in the nature of an ultimatum. It stated that an impartial investigation conclusively established the fact that the steamer *Sussex* was sunk without warning by a torpedo of German manufacture. It then reviewed the submarine activities for the preceding year and pointed out how submarine commanders had continued to sink merchant vessels, both belligerent and neutral, without warning, despite the explicit promises of the German government. In conclusion it was stated that unless the German government "immediately declare and effect an abandonment of its present methods of submarine warfare against passenger and freight-carrying vessels, the government of the United States can have no other choice but to sever diplomatic relations with the German Empire altogether."

On the same day that this note was sent, President Wilson, before the two Houses of Congress, read a message in which he reviewed the course of negotiations in connection with submarine warfare and informed Congress of the nature of the message which he had sent to Germany.

In reply to this note the German government stated that it was possible that the *Sussex* was sunk by a German submarine, and if further investigation should establish this to be the case "the German government will not fail to draw the consequence resulting therefrom." On the other hand the German authorities denied the assertion made in the American note that there had been an indiscriminate destruction of vessels by German submarines. They defended the activity of the submarines as a legitimate retaliation for the alleged violations of international law by Great Britain. However, it was stated that submarine commanders had received further instructions to the following effect. "In accordance with the general principles of visit and search and the destruction of merchant vessels recognized by international law, such vessels, both within and without the area declared a naval war zone, shall not be sunk without warning and without saving human lives, unless the ship attempt to escape or offer resistance."

While this was a substantial agreement to the demand of the United States, the note went on to say that Germany would expect the United States government to "demand and insist that the British government shall forthwith observe the rules of international law universally recognized before the war," and in case the British government failed to do so "the German government would then be facing a new situation, in which it must reserve to itself the complete liberty of decision." This concluding statement held out the possibility of a renewal of submarine warfare without restrictions in case Great Britain did not modify her policy of blockade.

To this communication the United States government returned an immediate reply, stating that it would rely upon a "scrupulous execution" of the new policy by the German government. At the same time the note stated that the United States government could not agree that the continuance of this new policy of submarine warfare by Germany was "contingent upon the conduct of any other government affecting the rights of neutrals and noncombatants."

Shipment of War Munitions.—Shortly after the outbreak of the war large orders for war munitions were placed by the Entente Allies with American firms. The complete control of the seas by the British and French fleets made it impossible for the Teutonic Powers to obtain similar supplies. Comment in the German press indicated that the feeling in Germany was very strong that the United States was not observing a strict neutrality by allowing such shipments. On April 4, 1915, Ambassador Bernstorff called the matter to the attention of the United States government officially. He maintained that while the United States had taken no action in regard to alleged violations of international law by Great Britain in interfering with neutral trade, it had allowed American firms to supply large quantities of war munitions to Germany's enemies. He maintained that conditions in the present war were unique, that while theoretically arms might be shipped from the United States to Germany, practically they could be sent only to her enemies. A real spirit of neutrality called for the stoppage of a trade which was aiding only one side.

In a vigorous reply to this note President Wilson set forth clearly the position of the United States. He first called attention to the fact that her relations with England could not be made a subject of discussion with a third government. With regard to the shipment of arms and ammunition, the President pointed out that any change in the laws of neutrality during the progress of a war would be a departure from the principle of strict neutrality and the placing of an embargo on the trade in arms would constitute such a change.

In reply to a similar protest by the Austro-Hungarian government on Aug. 1, 1915, the government of the United States on Aug. 12, 1915, made an exhaustive statement of its position. It reiterated the statement made in the reply to Germany that any change in the rules of neutrality made during a war would violate the spirit of neutrality. In addition it pointed out that it had never been the policy of the United States to maintain a large military establishment or great stores of ammunition and had

depended upon the right to purchase arms and ammunition from neutral Powers in time of war. To prohibit such trade would compel every nation to have on hand sufficient munitions of war to meet any emergency, and would practically make every nation an armed camp.

Apart, then, from any question of the legality of an embargo on arms, the United States government felt that it would be a mistaken policy as it would deliberately encourage the spirit of militarism.

Relations with Austria-Hungary.—During the year 1915 two serious disputes arose involving the United States and Austria-Hungary. The first of these concerned the activities of the Austro-Hungarian Ambassador to the United States, Dr. Theodor Dumba.*

On Sept. 1, 1915, James F. J. Archibald, an American newspaper correspondent, was arrested by the British authorities, when the steamer *Rotterdam* put into Falmouth, for carrying dispatches from the German and Austrian embassies at Washington to Berlin and Vienna. Among the papers was a letter from Dr. Dumba, suggesting a plan for crippling the munition factories in America by fomenting strikes among the Austro-Hungarian laborers in these factories. Dr. Dumba admitted the authenticity of the documents and defended his action on the ground that it was his duty to bring to the attention of his fellow countrymen employed by the manufacturers of munitions that they were engaged in enterprises unfriendly to the fatherland, and that the Imperial government would regard them as guilty of a serious crime, punishable by penal servitude should they return to their own country.

This explanation proved unsatisfactory to the American government and Secretary Lansing notified the Austrian government that as Dr. Dumba had "conspired to cripple legitimate industries of the people of the United States and had flagrantly violated diplomatic propriety by employing an American citizen protected by an American passport as a secret bearer of official dispatches through the lines of the enemy of Austria-Hungary," he was no longer acceptable to the United States as the Ambassador from Austria-Hungary. In answer to this demand the Austro-Hungarian government agreed, on Sept. 27, 1915, to recall Dr. Dumba.

The second incident involving the two countries was the sinking of the Italian steamer *Ancona* on Nov. 7, 1915, by an Austrian submarine. The *Ancona* had attempted to escape but was overhauled. It was charged by the survivors that the submarine continued to fire after the *Ancona* had stopped. In all more than 200 lives were lost, among them nine American citizens. In a vigorous note the government of the United States, on Dec. 6, 1915, demanded that the Austro-Hungarian government should disavow the act, that the commander of the submarine should be punished, and that an indemnity should be paid for the loss of the lives of American citizens.

To this the Austro-Hungarian government replied on Dec. 15, 1915, asking for more specific information upon which the government of the United States based its charges. On Dec. 19, 1915, the American government replied, stating that it based its charges on the official report of the Austro-Hungarian Admiralty, and declined further to specify the additional testimony tending to corroborate the Admiralty's report. The incident was closed by the Austro-Hungarian government granting practically all of the American demands. In a note sent Dec. 29, 1915, it was stated that the submarine commander had been punished for not taking into consideration the panic aboard the *Ancona* which rendered disembarkment difficult. It agreed that Austria-Hungary should indemnify American citizens affected. While disclaiming responsibility for lives lost by the shots which were fired while the *Ancona* was attempting to escape, or for those lost by the faulty lowering of lifeboats, Austria agreed not to press for proof that the American lives were lost through the fault of the submarine commander, and agreed "to extend indemnities to those whose cause cannot be established." In conclusion the note stated that the Austro-Hungarian government "reserved to itself the right to bring up for discussion at a later time the difficult questions of international law connected with submarine warfare."

Public Opinion in the United States.—Public opinion in the United States was sharply divided as to the lessons to be drawn from the war, and as to the policy which that country should adopt. On the one hand a vigorous campaign was inaugurated to strengthen the military and naval defenses of the United States. It was urged with great earnestness that the war had demonstrated the futility of military unpreparedness and that the United States was in particular danger because of her great wealth which other nations would covet.

On the other hand it was urged with equal fervor that the cause of the war was primarily the great military armaments in Europe, and that the United States would make a great mistake by joining in the competition for military preparedness. It was pointed out by the advocates of peace that the energies of the country should be devoted to finding some means, if possible, to end the war, and to further the plans for preventing future struggles. Perhaps the most noteworthy, and certainly the most picturesque, of the efforts of the pacifists in the United States was the expedition organized by Henry Ford (q.v.), a millionaire automobile manufacturer, to go to Europe to discover some means of ending the war. A liner was chartered for the purpose. Included in the party of about 150 were a number of prominent American men and women, together with a considerable number of newspaper and magazine writers and moving-picture men. The United States authorities let it be known that the mission was in no sense officially sanctioned, while the European countries at war clearly indicated that the expedition was not welcome. Despite these discouragements the party sailed on Dec. 4, 1915. During the voyage serious discord developed among the members of the party. The expedition reached Christiansand, Norway, on Dec. 18, 1915. A few days later it was announced that Mr. Ford would have to leave the party and return to America because of illness. The remainder of the party went on to Copenhagen, and later to The Hague, where a number of meetings were held with delegates from other neutral countries. The expedition accomplished nothing of importance towards ending the war.

* Constantin Theodor Dumba, born (1856) in Vienna; graduated in law at the University of Vienna (1878) and then studied in Paris; entered Austrian Foreign Office (1879); Privy Councilor (1908); Ambassador from Austria to the United States from 1913 till his recall on demand of the United States government in 1915.

President Wilson, in order to get first-hand information concerning the condition of affairs in the belligerent countries, sent Edward M. House* abroad as his personal confidential agent. It is thought that the President was seeking to discover whether the time was opportune to offer mediation.

Scandinavian Countries. Immediately after the outbreak of the European War the three Scandinavian countries declared their neutrality and the governments of Norway and Sweden published identically worded explanatory communications which stated that the two governments had agreed to maintain their neutrality and had exchanged binding assurances with a view to preventing any situation arising which would precipitate hostilities between them.

In Sweden there was a strong Germanophile sentiment among the military class, which is in reality more a dislike of Russia than a love of Germany. This anti-Russian feeling is due mainly to the fear that Russia contemplates aggression against the Scandinavian peninsula. In Denmark and Norway the popular sentiment appeared to be favorable to Great Britain. The geographical position of these countries, especially of Denmark and Sweden, made it peculiarly difficult for them to maintain their announced position of neutrality. They controlled the entrance to the Baltic Sea and were so situated as to provide easy transit to both Russia and Germany.

On the initiative of the Swedish government a conference of the three Scandinavian monarchs was held at Malmö, Sweden, in December, 1914. It was called for the purpose of taking counsel together regarding means for limiting and counteracting the economic difficulties imposed on the three countries by the war. This conference was followed by the issuance of an identically worded protest to the nations at war against their measures which threatened neutral commerce.

The interference with Swedish trade, especially by Great Britain, led to the adoption of retaliatory measures on the part of Sweden. Embargoes were laid on wood pulp and other commodities needed by the Entente Allies. In order to reach a solution of the question of neutral trade Great Britain, in July, 1915, sent a commission to Sweden. Some months later it was stated that a satisfactory arrangement had been made.

A second conference of the premiers and foreign ministers of the three countries was held in March, 1916, at Copenhagen with the purpose of strengthening the understanding between them. It was reported that an agreement had been reached that if any one of the three nations should become involved in the war, the other two would not align themselves with the opposing belligerents. It was further decided that at the proper time steps should be taken by the three Powers in conjunction with other neutrals to protect the interests of neutrals generally.

Netherlands. The geographical situation of the Netherlands made its relations to the belligerents even more difficult to adjust than was the case in the Scandinavian countries. At the outbreak of the war there was considerable apprehension in Holland that their country might suffer a fate similar to that of Belgium. The authorities, however, determined to defend the neutrality of Holland to the best of their ability, and with this end in view the Dutch army was mobilized and sent to the frontiers. These military measures, together with the expenditures made in caring for a large number of Belgian refugees who fled to Holland, entailed a considerable financial burden upon the country. In common with other neutral countries, Holland was seriously affected by the restrictions placed upon neutral commerce, especially by Great Britain. As Holland offered an easy means of communication with Germany, Great Britain deemed it necessary, in order to make her blockade of Germany effective, to adopt some measure to prevent neutral goods passing through Holland to Germany. With this end in view there was organized a company known as the Netherlands Overseas Trust, to which was to be consigned all imports which might be of use to Germany. This company agreed to dispose of these imports so that none should reach Germany.

Switzerland. The situation of Switzerland was unique. The little country was completely surrounded by the nations at war. The sympathies of the people were determined by their racial affiliations. There are three distinct racial groups in Switzerland, namely, German, French, and Italian, of which the German group is the largest. Despite these conflicting sympathies, the Swiss authorities were determined to maintain the neutrality of the country, and the army was mobilized in order to prevent any violation of this neutrality by the belligerent Powers. In dealing with the problem of imports into Switzerland, the Entente Allies followed much the same policy as had been adopted in Holland. There was organized a company called the *Société Suisse de Surveillance Economique*, through whose hands imports which might be of service to Germany were to pass.

South American Countries. All of the South American countries were seriously affected by the outbreak of the European War. A large amount of the business in these countries was carried on by European credit and the dislocation of the European financial markets seriously crippled the business interests in South America. Moreover, a large part of the export trade of these countries was cut off and emergency measures had to be adopted to relieve the situation. In Chile a moratorium was declared, and the President was empowered to extend government aid to the nitrate industry, the most important in the country. Argentina floated two loans, one of $15,000,000 and the other of $25,000,000, in the United States. This was the first time a South American country had negotiated a loan directly in the United States.

Chile became involved in a dispute with the belligerents when, on April 2, 1915, the German cruiser *Dresden*, which had entered Chilean waters and had been ordered interned, was sunk by a British squadron. Chile demanded an apology from Great Britain for this violation of her sovereignty and this demand was conceded. Germany sent a sharply worded note protesting against the acceptance of this apology, and Chile replied by demanding an apology from Germany for overstepping the bounds of international law in intervening in a question which involved Chile's relations with another Power. After some discussion the matter was adjusted peaceably.

* Edward Mandell House, born (1858) at Houston, Tex.; educated at Cornell University; active in Democratic politics in Texas and director of the campaigns of many successful Democratic nominees for Governor from 1892; himself never a candidate for office; confidential adviser of President Wilson from the time that Wilson was Governor of New Jersey.

IX. RELIEF MEASURES

The outbreak of the European War very soon made it evident that millions of innocent victims in the fighting areas would be without independent means of support on account of wholesale destruction of property, the confiscation of food supplies, and the paralysis of industry. This was first illustrated in Belgium, where it was estimated that by November, 1914, over 6,000,000 people had been rendered homeless and 1,500,000 destitute. The prosecution of the war, however, resulted in the creation of a similar situation in Russian Poland, Galicia, and in Serbia. The situation in Poland was even worse than that in Belgium. Finally the unprecedented butchery of the Armenians by the Turks rendered relief for the remnant of the Armenian population an absolute necessity.

As early as September, 1914, relief organizations began to be formed in the United States. After considerable duplication at first, relief committees gradually were systematized under central committees. All sorts of devices were resorted to, including appeals through newspapers, endless-chain whist parties, fairs and bazars, theatrical and musical performances, "tag" days, balls and fêtes of various kinds, and appeals through churches and other organizations.

Commission for Relief in Belgium. This was the most extensive relief organization, embracing all neutral countries. It was brought into existence through the activities of the American and Spanish ambassadors at London and ministers at Brussels, the American Ambassador at Berlin and the American Minister at The Hague. There were national organizations in America, Spain, Italy, and England, besides a most extensive distributory organization in Belgium and northern France. It carried out the distribution of its aid in Belgium through the Comité National de Secours et d'Alimentation. Similarly on account of the devastation in the occupied French territory the Comité d'Alimentation du Nord de France was organized. The commission had assembling depots in every State in the United States, and representative executives in all but about 12 States.

The committee secured pledges from England, Holland, and Germany, permitting the transportation of food products to the occupied territory and the pledge of Germany that such food would not be confiscated for war purposes. The general policy of the commission was to coöperate with organizations of every sort in Belgium and northern France; local committees were brought into existence in almost every commune of the occupied territory, and over these were district and provincial committees, all under the Comité National. The work was carried out under three main divisions: the Provisioning Department; the Financial Relief and Exchange Department; and the Benevolent Department. The Provisioning Department provided food for about 7,000,000 people in Belgium and 2,300,000 in northern France. Foodstuffs were sold to the population and the profits thus secured were used by the Benevolent Department for the care of the destitute. Food was given out through a system of canteens covering all Belgium, meals being supplied at a per capita cost of only eight cents a day. There were also baby canteens, cheap restaurants, meals for school children, and in some cases provision of shelter. Aid was also given to or through the following: a committee to aid doctors and pharmacists by supplying medicines, serums and other necessities; child institutions working for the better feeding of infants, the aid of private and public orphanages, and assistance to war orphans and other homeless children; the treatment of indigent consumptives; an agricultural committee to control the supply of seeds and fodder; a committee for the aid and protection of artists, some 50,000 lace workers (mostly Belgian women), destitute foreigners, and refugees from other localities; a committee for the rehabilitation of churches; local workrooms for the repair of clothing for the destitute; and miscellaneous grants for Cardinal Mercier for trade training for maimed soldiers, and for maternity hospitals.

Up to June 30, 1915, gifts of money from all parts of the British Empire reached a total of $4,850,582; cash gifts from the United States totaled $311,939; the Belgium Relief Fund (see below) had sent $502,025; from commissions in China, Italy, and Spain had been received $85,716; and Belgium institutions and Belgians abroad had supplied $16,222,701. Gifts of foods and clothing are not included in these figures.

Belgium Relief Fund. This fund "for women, children and other noncombatants" had its headquarters in New York City. It embraced numerous local committees, including one in every State. Most of the cash received was spent for food, but small sums were sent to refugees in Holland and to war victims in the unoccupied parts of Belgium.

Jewish Relief. On account of the great number of Jews in Poland and other parts of Europe who suffered extreme privation as a result of the war, the American Jewish Relief Committee for Sufferers from the War was organized in New York City. Towards the close of the year 1915, a most active campaign for funds was undertaken. Local committees were formed in cities throughout the country. In 1916 a great bazar was held in New York City which realized about $1,000,000.

In Great Britain was formed the Russian Jews' Relief Fund for the aid of Jews in Russia and Poland. It had branches in all the principal cities. By means of it over 120 relief centres were feeding every day more than 200,000 homeless and destitute Jews.

In Russia a central relief committee at Petrograd sent out word that military authorities had forcibly removed 250,000 Jews from their homes in the occupied territory and that 200,000 more had left voluntarily. The committee had opened employment agencies in 31 cities and equipped 10 workshops. Hospitals, asylums, infirmaries, and schools were opened.

Other Funds. There were a considerable number of other agencies in America collecting money and supplies for the relief of special classes of victims. Among these were the American Ambulance Fund, the Duryea War Relief Fund, the American Girls' Aid, the Fund for the Relief of Women and Children in France, the Vacation War Relief Committee, the Cardinal Mercier Fund, the National Allied Relief Committee, the Servian Relief Fund, the National Committee for Syrian and Armenian Relief, the Polish Victims' Relief Fund, the American Polish Relief Commission, and the British-American War Relief Fund.

Red Cross. This society was put to the se-

verest test it ever had to undergo. In all the belligerent countries, the work of the relief committees was supplemented by the efficient service rendered by the Red Cross Society. The American National Red Cross Society rendered greater continuous service than was ever given by any Red Cross of a neutral country during a foreign war. At the outbreak of the war this society had an enrollment of about 6000 nurses and surgeons. It sent over a number of surgical and sanitary units (a unit is a working force of 3 surgeons and 12 nurses sent to a hospital, together with the necessary supplies) for hospital work and the relief of noncombatants. An enormous quantity of purchased and donated medical, surgical, and hospital supplies, bed linen, garments, etc., were shipped from the United States to practically all the battle fronts by the American Red Cross. In Serbia and Montenegro the American Red Cross, in conjunction with the Rockefeller Foundation, suppressed the epidemic of typhus fever which destroyed 150,000 lives.

X. FINANCIAL AND ECONOMIC ASPECTS

In ancient times wars involved the entire male population and frequently the women as well in the actual fighting and campaigning, but modern wars affect the vast majority of the population, even of belligerent nations, only through their economic relations. The development of the vast mechanism called into operation by war to-day has however required such immense financial transactions and such gigantic demands upon industrial resources that these indirect effects in the European War were felt not merely by every family in the fighting areas but indeed by every family in the civilized world. The first immediate financial effect of the outbreak of war is a disturbance of the machinery of international credit. Foreign investments frequently aid during peace in restoring the balance of trade, but in this war investment movements were exactly reversed. Thus normally the great excess of United States exports of merchandise over imports is offset in large part by foreign investments in American securities. But the war brought a sharp reversal of this process, the New York Stock Exchange being deluged with orders from abroad to sell at any price. The outbreak of hostilities creates a desire to delay payment of obligations owed but to insist on immediate payment of those due. Trade temporarily comes to a standstill and gold shipments become dangerous and are impeded by great advances in insurance rates and by the reluctance of its holders to part with it. Moreover so paralyzing was the effect of the war at the moment it began that a temporary cessation of international exchange must have been inevitable. The greatest force of these conditions was naturally felt at London, the world centre. Consequently we find there the government taking most extraordinary measures to restore the movement of exchange. In war as in times of financial crisis each nation seeks to increase its gold holdings. This can be done only by increasing exports, decreasing imports, selling foreign investments, or contracting obligations abroad. Now it is not possible for belligerent nations to increase their exports because of the disturbance of their own production, the drafting of workers into the armies, the increased demand for goods due to the war, and, in the case of nations hostile to England, the control of the high seas by the British fleet. On the other hand all fighting nations experience a greatly increased demand for goods, especially for food and all kinds of military supplies. This may be in part offset, and vigorous efforts were made in all countries and notably in England, France, and Germany to offset this in part, by cutting down the consumption of articles classed as luxuries. The great reduction of trade to and from the Central Powers made their foreign exchange problem relatively simple, though the rates of exchange ran heavily against them. The Allies on the other hand began the war with rates of exchange in their favor, mainly owing to the enormous obligations of the United States. This situation, however, was within a few months exactly reversed owing to the extensive purchases of the Allies and the great volume of American securities sold by them. So unfavorable became the rate and so necessary were American goods that international loans of unprecedented size were effected to enable the Allied Powers to continue their purchases in the American market.

Closely involved with the problem of international exchange are the banking institutions and their rates of interest. In addition, however, the banks must meet great internal problems connected with currency, the flotation of government loans, and the special problems arising from the unique conditions in internal trade. Currency systems are deeply affected though less markedly than formerly when their basis was less firmly established. Nevertheless the shock of war was everywhere so pronounced in its effect upon instruments of credit that every belligerent nation and the United States were compelled to issue additions to their outstanding currency. The interruption of foreign trade and the consequent dislocation of business are reflected in the movement of the stock markets. Almost upon the instant that hostilities began the world's stock exchanges were paralyzed. The Bourses at Toronto and Madrid closed July 28; those at Vienna, Budapest, Brussels, Antwerp, Berlin, and Rome on July 29; and those at Paris, St. Petersburg (Petrograd), Montreal, and all South American centres on July 30. This threw the burden of the world's stock market operations on the London and New York exchanges. The former of these closed on July 31 for the first time in its history. The governors of the New York Exchange thus faced a crucial situation. A panicky state of mind prevailed; brokers were deluged with orders, especially from abroad, to "sell at the market"; it was evident that to remain open meant complete demoralization. Consequently this exchange also was closed on July 31, shortly after that at London.

The gradual readjustment of industries to the new war basis is another fundamental aspect of its effects. Never before was concerted action in industrial life so supremely important for the outcome of a trial at arms. The war brought about an actual mobilization of industries for war purposes in every belligerent country. Moreover the productive efforts of neutrals, not merely in munitions manufacture, but in many lines, were tremendously stimulated. The productive power of the entire world was raised almost to its highest pitch in the vast attempt at mutual destruction by the belligerents. Never were goods produced so abundantly and

never was capital destroyed so rapidly or the world hastened towards pauperization at such a pace. The nearly complete cessation of exports from the Central Powers involved a violent readjustment in many industries previously engaged in producing for foreign markets. Among the Allies such industries were less disturbed, while in the United States and other neutral countries there were numerous transformations due not merely to the development of munitions factories, but to the manufacture of all kinds of military supplies, and the development of industries for supplying articles previously imported from Germany and Austria as well as supplying the similar needs of other neutrals. Finally the outbreak of the war was speedily followed in every nation by the adoption of special financial measures for supplying the needed public funds and the longer the war continued the more vital became the extent, variety, and basis of the various war loans. The foregoing—exchange, banking, currency, stock market, war loans, and the readjustments of industry—constitute the principal features of the effects of war on finance and trade.

International Exchange and Banking Problems. The financial problems confronting the bankers and traders of Great Britain were of the most momentous importance for the trade and commerce of the world. The priority of England in the development of international trade had long since made London both the financial and commercial centre of the world. In consequence an important part of London financial institutions had been devoted to settling accounts between debtors and creditors in all parts of the world. Here are included the accepting houses, bill brokers and discounters, and the banks. The immense volume of this business is realized when it is known that at any one time there were before the war about $1,600,000,000 of trade and finance bills for which the accepting houses and banks were liable, many millions falling due daily. The entire system of handling international exchanges collapsed early in August and it was not until about mid-September that regular quotations of rates of exchange again appeared in London. Accepting houses and joint-stock banks faced ruin because clients for whom acceptances had been made failed to remit; but these clients themselves were confronted with canceled orders, cessation of trade, stoppage of the supply of goods, impossibility of remitting, and similar contingencies. The discounters and bill brokers found themselves with large quantities of discounted bills on hand for which they could not be reimbursed and at the same time their banks were calling for a return of loans. Even the banks themselves were directly involved through the possession of bills which they had discounted. Moreover their loans to bill brokers were counted as quick assets and the embarrassment of the brokers necessarily weakened the banks. To check demands upon its resources the Bank of England raised its rate to 10 per cent. See PANIC, FINANCIAL.

Before this situation became unmanageable the government on August 2, two days before its own declaration of war, declared a moratorium on bills of exchange to last one month. This checked the tendency to panic by giving a breathing spell during which methods and means of handling the problem were formulated.

Nine days later a Treasury statement announced that the Bank of England would rediscount on certain terms any "approved bill" before it became due; and that acceptors of bills would be given time in which to make payment but would be required to pay 2 per cent above bank rate for the privilege of extension. The government suggested that the bank be prepared to approve all bills customarily discounted, "and also good trade bills, and the acceptances of such foreign and colonial firms and bank agencies as are established in Great Britain," with the understanding that the government would guarantee the bank against loss. On September 5 another Treasury statement announced that, owing to the choking of the exchange mechanism by premoratorium bills, acceptors would be lent funds for paying such bills as they came due, and that any unpaid balance of such loans would not be pressed "for a period of one year after the close of the war." Thus both old and new acceptances seemed amply protected. A further difficulty was met in foreign indebtedness. On November 3 was promulgated a plan to investigate solvent traders and advance them funds up to 50 per cent of the foreign debts due them. Thus every obstacle to the resumption of exchange business was removed. On the Continent similar, but less stupendous, problems were to be met. Moratoria were declared in every belligerent country except Germany, and in some neutral countries for reasons similar to the foregoing. Germany avoided a moratorium mainly because of her isolation and partly by the stoppage of collections on bills owed abroad. In both France and Germany, as in England, the central banks were permitted to greatly enlarge their note circulations and thus expanded to unprecedented figures their rediscounts for other banks. See MORATORIUM; PANIC, FINANCIAL; REDISCOUNTING.

The most serious aspect of the American financial situation and the fundamental cause of most difficulties was the stupendous debt owing to Europe upon the outbreak of war. Although this country had normally a trade balance of about one-half billion dollars annually, nevertheless its indebtedness for interest and dividends, for tourists' expenditures, for freight, and other items, changed the great trade surplus into a net debt. Sir George Paish, an international authority who was sent to the United States in October, 1914, by English bankers to expedite the payment of these obligations, estimated their total at $600,000,000. This included more than $100,000,000 of short-term loans which ordinarily could have been easily renewed or met by fall exports. Abroad refuge had been taken behind moratoria; and the great central banks of Europe served to pool resources and control operations, while in the United States the new Federal Reserve System was not yet in working order. Although $45,000,000 in gold was sent to Europe during the last few days of July and the first week of August, sight exchange on London at New York, normally $4.86 per pound sterling, rose to $5, then to $6, and finally to $7, a height never before approached, and regular exchange was not quoted until September 11. A special factor in aggravating the banking difficulties at New York was the maturing early in the fall of about $82,000,000 of New York City warrants held in London and Paris. To meet these and to strengthen the city's credit there was provided a loan of $100,000,000 in gold to

which every bank and trust company in the city but one contributed. At the same time bankers of the country created a "Gold Pool" of over $100,000,000 to meet urgent mercantile obligations abroad, and to provide gold needed for export. It was composed of contributions from banks in reserve cities in proportion to their gold holdings. It served as a guarantee against the complete collapse of American credit abroad and removed from the banks the necessity of seeking refuge behind an unofficial moratorium. Portions of this fund were shipped to the branch of the Bank of England established at Ottawa, Canada, to serve as a basis for exchange on London. The sharp rebound of trade towards the close of the year, the entrance of the world into the American market for goods and loans made possible the dissolution of the "Gold Pool" in January, 1915.

The exchange situation was made particularly difficult by the great reduction of the export trade, especially the exportation of cotton. Moreover the prosperity of the South was seriously threatened unless some means could be devised whereby cotton could serve as a basis for additional credit. Congress and Secretary McAdoo authorized banks to issue emergency currency on the basis of cotton warehouse certificates. About the same time a plan for a Cotton Loan Pool was devised whereby pledges to supply funds to be loaned through Southern banks to cotton growers were deposited with members of the Federal Reserve Board as individuals. By the middle of November more than $100,000,000 was thus subscribed. However the considerable revival of the export trade in cotton towards the close of 1914 together with the great improvement of internal trade, and the bracing effect of the establishment of the Federal Reserve System made the cotton pool wellnigh unnecessary. It became inoperative in January, 1915, only $28,000 having been applied for.

The rates of international exchange reflect the conditions both of trade and of credit. At New York the rate on London was not regularly quoted until September 11, when the cable transfer rate stood at $4.95, par of exchange being $4.86. It became still more unfavorable, reaching $4.975 in the weeks of October 8 and 15. It thereafter fell steadily, reaching par on December 22. It continued to fall until early September, 1915, when it reached $4.63. It was partially restored by the Anglo-French loan, but only for a brief period. In December the British government began to borrow or purchase American and Canadian securities owned by English citizens with a view to their use as security for loans to be advanced by American bankers as a means of preventing further declines in the rate of exchange. About the same time the importation of certain luxuries was prohibited for a like reason.

At Paris the rate of exchange was slightly unfavorable to London during the first half of October, no rates being quoted during August and September; it gradually declined until November 26 and thereafter rose continuously, reaching par again Feb. 19, 1915. It thereafter continued to become slightly more unfavorable to Paris with every passing week. In May, 1916, Finance Minister Ribot began the collection of American, Swiss, Dutch, Scandinavian, and South American securities to be used as a basis for credits for equalizing exchange with the United States. At the same time the government announced a long list of articles the importation of which was prohibited partly to affect exchange rates.

Almost from the beginning of the war rates of exchange were unfavorable to Berlin. The slight volume of foreign trade and the adjustment of outstanding accounts early brought the rates to considerable stability. Nevertheless the continued purchases in neighboring neutral countries and the steady inflation of German currency brought about a decline of German credit in the later months of 1915. Thus the exchange rate at New York had been only 14 per cent unfavorable until November, 1915, when it dropped rapidly to 26 per cent unfavorable. Similar rapid declines brought about rates unfavorable by 38 per cent at Amsterdam, and by 28 per cent at Zurich.

As stated above the New York Stock Exchange was forced to close very quickly after the closing of the London Exchange. This naturally disturbed the banking situation since considerable loans were based on stock as collateral. Such collateral is generally most fluid of all, but with its market closed it became quite solidified. The banks, however, gradually readjusted affairs without forcing repayment of loans or otherwise unduly disturbing a delicate situation. The reopening of the Exchange was delayed in part to prevent the resumption of the pressure of European sellers and the consequent increase of foreign obligations. The Exchange declared the level of prices on July 30 the official minimum, and on this basis some transactions were carried through under the direction of a Committee of Five. In this manner more than $100,000,000 of bonds and 250,000 shares of stock were transferred by the end of November. In Philadelphia public auction sales of stocks and bonds were held at various times, prices ranging not far below those of July 30. Gradually at New York the scope of exchange business was enlarged; transactions in a restricted list of bonds were begun on November 28; and two weeks later trading in 181 specified stocks with definitely established minimum prices was begun. The total dealings, however, on the New York Exchange aggregated only 47,899,000 shares for the year 1914, slightly more than one-third those of 1912.

With the opening of 1915, however, pessimism gradually disappeared under the revival of business and was replaced by waves of speculative fever in the stock market. This was notably true in April when 21,000,000 shares were transferred, and in August, September, and October, 26,000,000 shares being transferred in the latter month. The shares of the munitions companies were popularly known as "war brides." Many of these stocks made most phenomenal advances in price during the year. Less speculative interest was shown in the stocks of numerous companies manufacturing supplies the demand for which had been greatly stimulated by the conditions of war. Moreover the great increase in the volume of railway traffic, which towards the close of 1915 amounted to an unprecedented congestion of freight and the refusal of numerous roads with terminals on the Atlantic seaboard to receive additional goods for export during certain periods, resulted in advances in railway stocks. This revival of business did not occur soon enough to prevent a very large amount of railway mileage from

going into the hands of receivers, but railway stocks in general showed advances of 10 to 20, points. In the year 1915 fewer miles of new railways were built than in any year since 1864; in October, 1915, more miles were in receiverships than ever before; and yet in the early months of 1916 earnings were never larger.

The bond market likewise reflected the great abundance of capital seeking investment. While advances in bond prices were not remarkable, there was a general upward movement ranging from 1 to 6 per cent during 1915. Moreover the easy money market resulted in the ready flotation of an unusual amount of public and corporation bonds. In consequence of these conditions the total number of stock shares exchanged in 1915 was greater than in any preceding year since 1909.

In addition to the foregoing the American market absorbed an astonishing volume of securities previously held by foreign investors. At the opening of the war the par value of American corporation securities owned abroad was variously estimated at from $4,000,000,000 to $6,000,000,000. The most authoritative estimate showed that $620,000,000 of these securities were repurchased during the first five months of 1915; the estimate for the entire year was that not less than $1,000,000,000 of such stocks and bonds were transferred to American investors.

Currency. Every country in war time experiences an irresistible demand for increases in credit instruments. Not only do governments issue treasury notes but banks are certain, as in times of panic, to increase their note issues. In England there was much discussion of a proposed "suspension of the Bank Act," meaning a proposal to permit the Bank of England to expand its note circulation without increasing its reserves. The steps devised for reëstablishing foreign exchange obviated this measure, though Bank of England circulation was expanded and a large volume of £1 and 5s treasury notes were issued. A law of August 7 made not merely these treasury notes legal tender but also postal money orders. Provision was also made for the issue of certificates, like clearing-house certificates, for the settlement of bank balances. Finally the currency and Bank Notes Act authorized the Bank of England to issue to depositary banks notes up to 20 per cent of their deposits and current balances. (See PANIC, FINANCIAL.) In May, 1916, the bank held $140,000,000 in gold against over $500,000,000 of paper. The bank, however, owing to its command of the entire gold production of South Africa amounting to about $200,000,000 per year, was enabled to make extensive gold shipments to the United States and at the same time maintain its credit unimpaired. In France the government authorized practically unlimited issues by the Bank of France and various promises of the government were issued. (See below, *Cost of the War.*) It was estimated that whereas the actual inflation in England amounted to about 144 per cent by December, 1915, it was 157 per cent in France. In Germany, as explained below, the *Darlehnskassen* and the *Kriegskreditbanken* notes were based on property of various kinds. These tended to drive gold and silver out of circulation so that the government authorized the Reichsbank to issue its own notes in exchange for them. At the same time, however, the bank was instructed to refuse to pay out gold for its own notes, but a vigorous effort was made to increase the bank's gold reserves. This reserve was thus increased from about $300,000,000 in July, 1914, to $610,000,000 in January, 1916. But the notes for which the bank was responsible had increased from $475,000,000 to $1,560,000,000. Austria and Hungary likewise went speedily to a paper basis.

The breaking down of the mechanism of international credit seemed certain to produce a panic in American banking circles. The American banking system was individualistic and proverbially weak under strained credit. It failed to supply additions to the currency at times when most needed. The Federal Reserve System was particularly designed to remedy this weakness, but in August, 1914, this system had not been finally established. After a conference of bankers and the Secretary of the Treasury at New York on August 2 it was decided to issue emergency currency under the Aldrich-Vreeland Act as modified by the Federal Reserve Act of 1913, and to issue in addition clearing-house certificates. Congress responded to the situation by hurriedly enacting a law reducing the tax on emergency notes for the first three months to 3 per cent and increasing their limit to 125 per cent of capital and surplus. Moreover State banks affiliated with the reserve system were authorized to take out notes; and cotton and tobacco warehouse receipts were made a legal basis for note issues. In consequence more than $250,000,000 of emergency currency had been issued by September 1; a total of $384,500,000 of such notes was issued by December 1. Very little publicity was given to the issue of clearing-house certificates in principal banking centres of the country, but $250,000,000 of them were issued. Practically all of the emergency currency and the clearing-house certificates were retired by the end of January, 1915. Meanwhile the banking and credit situation had been materially strengthened indirectly by the revival of trade and directly by the final establishment of the Federal Reserve System, which was in full working order by Nov. 20, 1914.

Employment and Wages. In every nation the opening of hostilities brought on a temporary paralysis of trade, making the problem of unemployment acute in every belligerent country. Special committees, national and local, and special relief funds were created to meet the situation. The gradual readjustment of industry to a war basis and the recruiting of vast armies, however, very soon solved the problem. In Great Britain the labor problem was greatly complicated by the requirements of international trade. There were not merely the demands of the army and navy for equipment and munitions, but the immense difficulty of paying for greatly increased imports from countries to which exports were reduced. This difficulty was greatly increased by the requirement that Great Britain aid in financing her allies and colonies. Consequently the raising of an army at home was directly counter to her financial and commercial demands. The general effect of war on labor was stated by Gladstone to be an immense stimulus during war with enlarged employment and rise in wages, but excessive labor competition, severe unemployment, and reductions in wages when war is over. The truth of the first part of this statement

was made manifest in 1914. Very shortly in every country there was less unemployment than in times of peace, labor shortage actually became acute, wages advanced, and great numbers of women were drawn into unwonted industrial pursuits.

At the outset Great Britain was more unfavorably situated with regard to the manufacture of munitions of war than France, Germany, or Austria. Except for a few scattered private firms, a few small governmental establishments working for both army and navy, and the Woolwich Arsenal employing about 10,000 men, she had no munitions factories operating in July, 1914. Nethertheless 18 months later the entire country was dotted with such factories, their creation being one of the striking phenomena of the war. The astounding demands early aroused the existing arm makers to the highest pitch of activity, but it early became evident that the output of existing plants would be inadequate. By February, 1915, it became manifest that heroic measures must be adopted to secure an adequate output. Out of the delays and confusion resulted a ministerial crisis in May, 1915, which led to the formation of the Ministry of Munitions with Mr. Lloyd-George as its head. This sought to develop the latent capacities of manufactures in engineering and mechanical trades. The entire country was divided into eight munitions districts, besides two in Scotland and two in Ireland, with committees in principal towns. In March the Defense of the Realm Act had authorized the government to commandeer any factory for war purposes. Under this Act many old plants had already been transformed and new ones built, equipped, and manned. The Ministry of Munitions was needed, however, to bring order out of existing chaos by centralizing responsibility and control. It systematically investigated and listed every available factory and private resource. By the close of 1915 there were in addition 33 national shell factories employing from 300 to 1000 persons each, which had been created at government expense by adapting existing establishments. At the same time a number of national projectile factories were being completed to manufacture ammunition for a new type of heavy gun. Gradually the staff of the munitions office, including over 3000 persons divided among numerous departments, was brought to a high state of efficiency. From the first a source of great embarrassment was the inadequacy of skilled labor and its attitude towards the training and employment of unskilled workers. This problem was intensified by the enormous enlargement of the munitions industry, and was not alleviated by extensive advertisement for machinists in the United States. It was estimated that early in 1916 this business alone employed not less than 1,000,000 workers. Among these were included about 300,000 women who were found in England, as in France and Germany, to be capable of performing practically every kind of labor required in munitions making. The organized skilled workers objected to the "dilution" of the shops by unskilled and semiskilled workers, and resorted to strikes and other interruptions. Acts of Parliament very considerably reduced the privileges of labor to leave work and to transfer at will, but special boards for adjusting demands were created and elaborate rules were established to protect the health of the workers, especially of women and children.

Statistical measures of the amount of unemployment were not wanting. The *Labor Gazette* gave the percentage of trade-union members unemployed in June, 1914, as 2.4; it rose to 7.3 in August, and declined steadily thereafter to 2.5 in December, 1914, and to 0.5 in February, 1916. Wages showed little advance before January, 1915, but in February moved sharply upward in engineering, shipbuilding, railway service, docking, and carting, and thereafter the advance spread to all lines. The dearth of skilled labor resulted in many labor tangles, but the government and trade-union officials succeeded in maintaining an unusual degree of industrial peace. The number of trade disputes in 1914 was 999, involving 448,529 workers and a loss of 10,111,337 days of work; while in 1915 they numbered only 674, involving 445,936 workers and a loss of only 2,929,700 days of work.

The French Ministry of Labor reported that in August, 1914, only 48 per cent of establishments and 58 per cent of workers were employed. There was, however, a continuous improvement. By October, 1915, 81 per cent of establishments and 98 per cent of workers were employed. In metal manufactures and transportation new workers had been employed in numbers nearly sufficient to offset those with the colors; and this was partially true of food and chemical industries. But in printing, woodworking, building, glass and pottery making, and precious metals the numbers employed at the later date were less than half the peace normal. As in England women were drawn in great numbers, not only into munitions manufacture, but into many lines of industry, agriculture, and transportation.

In Germany the general course of events was very similar to that in England and France. The general dislocation of industry at the outbreak of the war brought into operation concerted action not merely to relieve unemployment but to shift industry to a war basis. The amount of unemployment among trade unions was 22.4 per cent at the end of August, 1914. It dropped to 15.7 per cent by the end of September, and continued steadily downward to 7.2 per cent at the end of December. This, however, was sufficiently above normal to require a special appropriation of $125,000 per month by the city of Berlin to relieve unemployment during the winter of 1914–15. By May, 1915, trade-union members unemployed numbered only 2.9 per cent; by September, only 2.5 per cent, at which percentage it remained until February, 1916. As in other countries all trades engaged directly or indirectly in the production of military supplies were unusually prosperous, were employing unusual numbers of workers, and paying higher wages than before the war. But among hat makers, printers, lithographers, bookbinders, wood workers, and porcelain workers the percentage of unemployment was considerably higher than normal. The employment of women was very extensive; their number in unaccustomed pursuits reached 500,000 by July, 1915; they were found in nearly every branch of industry.

The effect of the war upon American industrial conditions was most remarkable. The impetus of the new demands set up by the war began to be felt before the close of 1914. Early in 1915 feverish activity began in various branches of the iron and steel industry, in the

production of copper, lead, spelter, and other metals, and in all branches of munitions manufacture. From these industries the impetus gradually spread to all allied industries and to those engaged in manufacturing such articles as automobiles, railway supplies, boots and shoes, blankets and woolen goods, and food products. While in the fall of 1914 unemployment had been extensive, this problem gradually disappeared, with the result that by the middle of 1915 there was an actual scarcity of labor in many lines, especially skilled labor, and wages had begun to advance. Consequently by the fall of 1915 the tremendous stimulus to American industry had reached all branches of the retail trade. Estimates of war orders placed in the United States during 1915 varied widely, ranging all the way from $1,000,000,000 to $2,000,000,000. During the early months of 1915 the Allies were victimized extensively by smooth, self-constituted, and often irresponsible agents of manufacturers, and by other speculating intermediaries seeking fortunes in commissions on war orders. Occasionally the Allies were defrauded by the manufacturers themselves. In all of this immense war business there was a feverish haste and a recklessness in expenditure that involved much waste. This was reduced, however, by the development by the Allies of regular channels for placing orders and by an elaborate and extremely thorough system of inspection of products.

American Foreign Trade. Not only did the Allies resort to the United States for unprecedented quantities of goods of numerous kinds, but Secretary of Commerce Redfield pointed out in his annual report for 1915 that the demands of Canada, Central and South America, India, the Near East, South Africa, and indeed every part of the world for American goods had increased. The impetus of this world-wide demand was scarcely felt during 1914. Consequently the exports in that year differed very little from those of the preceding years, being slightly less than in 1912 or 1913. For the calendar year 1915, however, the exports reached the remarkable figure of $3,547,480,372. This was an excess over imports of $1,768,883,677, an excess more than two and one-half times that of the previous maximum in 1913. Net importations of gold aggregated $420,000,000, as compared with net exports during the two preceding years of $193,000,000. For the first nine months of the fiscal year 1916 the imports aggregated $1,505,000,000 and the exports, $2,997,000,000.

The immense volume of American export trade created an unprecedented situation in the shipping world. By the fall of 1915 the quantity of goods for export actually exceeded the carrying capacity of merchant vessels available, in spite of great advances in freight rates and the utilization of every type of craft however old. British experts pointed out that their government had requisitioned for war purposes not less than 50 per cent of the entire British merchant fleet. German submarine activities had destroyed about 6 per cent. Moreover the large German merchant marine was practically nonexistent. Consequently freight rates first doubled, then trebled and quadrupled, and in special cases advanced as much as 900 per cent by the spring of 1916. In some instances a vessel would earn its entire cost on a single round trip. Antiquated steam vessels were selling at prices from two to five times their value before the war; consequently there developed unprecedented activity in American shipbuilding yards. By April 1, 1916, orders had been given for 360 vessels with a total tonnage of more than 1,000,000.

World Trade. The war seemed destined to have permanent and far-reaching effects upon the world's commerce. In America active measures were begun before the close of 1915 to strengthen the American hold upon new markets and to increase coöperation in foreign trade after the war. On Dec. 1, 1915, e.g., was organized the American International Corporation, with $50,000,000 capital. Its purpose was to develop trade connections in foreign countries and promote the investment of American capital abroad. Its organization was led by the National City Bank, which was then engaged in establishing branches in principal South American countries. This bank also had acquired control of the International Banking Corporation with 16 banks in China, Japan, India, the Philippines, and Panama. The Bureau of Foreign and Domestic Commerce and the Federal Trade Commission and numerous business organizations devoted much attention to the furtherance of all efforts to secure a firm grasp of markets previously held by English and German traders. Similarly plans were formulated early in 1916 for systematic study of the demands of Europe during the period of reconstruction following the war. Among the Allies every effort was made to stamp out every trace of German economic penetration, and plans were formulated for reducing German competition upon the restoration of peace. On April 23, 1916, there opened in Paris the International Parliamentary Economic Conference of the Entente Allies for the discussion of trade agreements and legislative measures designed to reduce German competition and facilitate trade among the Allies and their colonies. From Germany it was reported that systematic measures were being taken to prosecute most vigorously efforts to regain lost trade.

Foreign Credits. The commanding importance of the United States as the greatest neutral market of the world made it for the first time in its history a lender on a large scale. During 1915 loans aggregating $1,000,000,000 were contracted in America by foreign governments, more than four-fifths of the proceeds being expended there for war supplies. Loans to the Canadian Dominion government, eight provinces, and 10 cities aggregated $147,000,000. Argentina borrowed $64,000,000; Switzerland, $15,000,000; Sweden, $5,000,000; Norway, $8,000,000; Greece, $7,000,000; notes of the German Treasury to the amount of $10,000,000 were sold to American investors. Russia secured loans for $92,000,000; Italy borrowed $25,000,000; but the great loans were those contracted by France and Great Britain. In addition to the Anglo-French loan of $500,000,000, France secured $75,000,000 on notes, bonds, and collateral; and London banks borrowed $50,000,000. The purpose of these loans was to equalize rates of exchange, but in spite of them and extensive gold shipments sterling exchange declined to $4.63 by September, 1915. It was therefore necessary for British financiers to restore a more normal rate. In that month a commission of British and French financiers came to the United States to establish a credit for $750,000,000 or even $1,000,000,000. The sum, how-

ever, was reduced to $500,000,000 after various conferences. A syndicate was formed led by J. P. Morgan and Company which took the loan at 96 or on a basis to yield an average of 5.75 per cent. Early in 1916 Argentina secured an additional $15,000,000; and Canada, $75,000,000.

Prices and Food Supplies. Inevitably the war had a far-reaching effect upon the movements of prices throughout the world. War not only destroys existing property, but it requires the creation and consumption of goods in amounts immensely greater than the demands of peace. All sorts of raw materials are required in unprecedented amounts and their prices together with those of products made from them rise correspondingly. The most striking advances were those of copper, nickel, lead, zinc, and all kinds of steel products, together with the various constituents used in the manufacture of explosives; but even more important in their effect upon the general welfare of the inhabitants not only of belligerent but of all other nations was the rise in the prices of food products. Thus, e.g., the price of copper rose from about 12 cents to nearly 30 cents per pound; cotton doubled in value: and food prices rose so extensively that administrative measures to regulate them were undertaken by Austria, Bulgaria, Denmark, Egypt, France, Germany, Great Britain, Greece, Holland, Italy, Norway, Russia, Serbia, Spain, Sweden, Switzerland, and Turkey. Most of these countries prohibited the exportation of foodstuffs. In most of them municipal authorities either alone or in conjunction with national or military authorities fixed maximum prices.

The actual extent of the rise in prices is best indicated by index numbers. For the United States *Bradstreet's Index* rose from $8.7087 on August 1 to $9.8495 on August 15, 1914. It dropped during the next 10 weeks and thereafter rose steadily to $11.7598 on April 1, 1916. In Great Britain an astonishing rise in the price of coal resulted in the appointment of a commission of investigation in March, 1915. This body found that the increase of 100 per cent or more was a natural consequence of the recruiting of nearly 250,000 miners and increases in cost of transportation. According to the *Board of Trade Labour Gazette* retail food prices advanced from July, 1914, to March, 1916, by 45 per cent in small towns and 51 per cent in large towns, an average of 48 per cent for the United Kingdom.

The greatest interest attached to the question whether Germany could be starved into submission. Normally the annual excess of German food imports over exports is considerable. In 1912 and 1913 this excess amounted to 2,000,000 tons of wheat, 3,000,000 tons of barley, 1,000,000 tons of corn, and 500,000 tons of rice and potatoes. There are normally also large imports of meat and animal products, oil cake, and fodder. Imports amounted to about 40 per cent of the annual consumption of meat products, and 20 to 30 per cent of grains and vegetable products. The war cut off most of the imports; the campaigns in East Prussia and Alsace destroyed crops; agricultural labor was reduced; North Sea fisheries were closed; and Chile fertilizer no longer available. Nevertheless considerable supplies were still derived from Holland, Scandinavia, and Switzerland, and through military and diplomatic operations large supplies of grain and fodder were procured from Bulgaria and Rumania. Moreover the entire economic resources of the Empire were mobilized by the early creation of an economic general staff, "The Division of Raw Materials of War," which reorganized industry, reduced consumption, reclaimed old materials, utilized by-products, created new materials and new chemical and industrial methods, erected factories, controlled goods seized by the armies and had great powers of appraisal and price fixing.

By January, 1915, the extravagance of many consumers, the speculation in food prices, and the manipulation of food supplies and markets induced the government to extend its control. On January 25 it was decreed that all supplies of wheat and rye should come under control of the War Grain Association; and local supplies were placed in charge of Communal Associations. The consumption of cereals was brought under the supervision of an Imperial Distributing Bureau. In February a system of regulating the bread supply by bread cards, which limited the weekly consumption of each individual or family, was instituted. With the passage of time similar regulations were extended to meat and vegetables, and finally in May, 1916, the control of all food supplies was placed in charge of a "food dictator" or government bureau. While the best statistical evidence seemed to indicate that food supplies were sufficient to meet minimum requirements there was some evidence that high prices led to serious food riots and much popular discontent late in 1915 and in 1916. According to the Prussian official *Statistische Korrespondenz* the prices of 20 important food products rose 88.5 per cent from July, 1914, to Feb. 1, 1916.

In Vienna official reports showed an advance of 112.9 per cent in 17 important foods from July, 1914, to December, 1915. In Italy the general level of food prices was 31.2 per cent higher in December, 1915, than in July, 1914. The official index of retail food prices in Australia advanced 31 per cent from July, 1914, to July, 1915; 39 per cent to August, 1915; and then fell, being 31 per cent higher in November, 1915, than in July, 1914. In New Zealand general prices rose 30 per cent from August, 1914, to December, 1915, inclusive. Official publications showed that in Copenhagen the cost of living rose 24.2 per cent from July, 1914, to February, 1916; for food prices alone the advance was 33.4 per cent.

Cost of the War. The real cost of war should be measured in terms of the sacrifices of the people engaged in it and of the rest of the world. Such sacrifices would include not merely the loss of lives of those killed in combat, the sufferings of the wounded, and the increased death rate both during and after the war consequent upon injuries and deprivations, but also the labors, hardships, and sufferings imposed upon the soldiers and the non-fighting population both during actual hostilities and during the long years of recuperation thereafter. It is evident that such a cost cannot be computed. Even when measured in financial terms the cost should include not merely the huge public expenditures but also the dislocation, misdirection, and destruction of productive power, both of labor and of capital, and the destruction of private and public property, works of art, and great historical landmarks. It is evident that these latter items can be only

roughly approximated. Consequently the cost of war is usually stated in terms of governmental expenditures.

The following tables from *The Wall Street Journal* give a statement of the war loans of both belligerents and nonbelligerents up to March 1, 1916. The first table states in thousands of dollars (i.e., 000 omitted) the debts of belligerents before the war and on March 1, 1916. In the case of Germany the debts of both the Empire and the states are included; and the war loans of France include advances from the Bank of France.

COUNTRY	Pre-war debt	War loans	Present debt
Great Britain	$3,485,000	$7,670,000	$11,155,000
France	6,607,000	6,590,000	13,197,000
Russia	4,537,000	4,117,500	8,654,500
Italy	2,836,000	1,465,000	4,301,000
Total for Allies.	$17,465,000	$19,842,500	$37,307,500
Germany	5,198,000	6,415,000	11,613,000
Austria-Hungary	3,970,000	2,547,500	6,517,500
Turkey	640,000	214,000	854,000
Central Powers.	$9,808,000	$9,176,500	$18,984,500
Grand total	$27,273,000	$29,019,000	$56,292,000

The approximate per capita indebtedness on March 1 was: Great Britain, $242; France, $330; Germany, $177; Austria-Hungary, $159; Italy, $87; and Russia (in Europe), $57.

The daily cost of war gradually increased from less than $40,000,000 per day at the beginning to fully $100,000,000 per day to April, 1916. The following table estimates total and daily costs.

COUNTRY	Cost to March 1, 1916	Daily cost
Great Britain	$7,440,000,000	$25,000,000
France	5,400,000,000	15,500,000
Russia	5,500,000,000	16,000,000
Italy	1,200,000,000	8,000,000
Other Allies	980,000,000	3,000,000
Total for Allies	$20,520,000,000	$67,500,000
Germany	6,260,000,000	22,000,000
Austria-Hungary	3,560,000,000	12,000,000
Turkey and Bulgaria	580,000,000	1,500,000
Central Powers	$10,400,000,000	$35,500,000
Grand total	$30,920,000,000	$103,000,000

The loans of the various belligerents from the beginning of the war to March 1, 1916, aggregated over $29,000,000,000. Of this enormous sum the Allied Powers had contracted 68 per cent and Great Britain alone 26 per cent or more than one-fourth. British loans included the first war loan of $1,750,000,000 of 3½ per cent bonds on a basis of 3.97 per cent; the second war loan of $2,925,000,000 of 4½ per cent bonds on a basis of 4.58 per cent; and treasury bills of over $2,000,000,000. There were also included loans for Canada, India, and Australia aggregating over $260,000,000, one-half of the Anglo-French loan in the United States, and advances to Allies and colonies exceeding $2,000,000,000. In addition to the above the English Chancellor of the Exchequer had announced in February, 1916, that an additional war credit of $2,500,000,000 was immediately needed, bringing the English total of loans to over $10,000,000,000. The principal item for France was the Loan of Victory of 5 per cents at 87 to yield 5.75 per cent aggregating $3,100,000,000. There were advances from the Bank of France to Feb. 17, 1916, of $1,120,000,000; bonds and notes in London of $506,000,000; and one-half of the Anglo-French loan, besides notes and banking credits in New York amounting to $80,000,000. France had also issued national-defense bonds to the amount of $1,392,584,000. Russia had issued four internal loans aggregating $1,545,000,000; 4 per cent bonds to the amount of $309,000,000; treasury bills at 5 per cent aggregating $1,364,750,000; and had contracted loans in England, France, Japan, and the United States to complete her total. In Italy there had been three issues of 25-year bonds bearing 4½ or 5 per cent in the aggregate amount of $1,190,000,000. In addition she had contracted obligations in England for $250,000,000 and in the United States for $25,000,000. France and England had advanced to Belgium $218,000,000. Japan issued a loan for $26,000,000 in 1914. Serbia had secured $33,000,000 from France.

The German loans began with a 5 per cent issue at 97.5 in September, 1914, to the amount of $2,125,000,000. A second issue of 5 per cents at 98 in May, 1915, totaled $2,250,000,000. A third in September, 1915, at 99 aggregated $3,000,000,000. The fourth loan bearing 5 per cent interest, the books for which were closed in April, 1916, reached $2,500,000,000. Special banks (*Darlehnskassen*) were established by the government for the purpose of advancing money on securities of various kinds, such money to be invested in the loans. Similar advances of paper money (*Darlehnskassenscheine*) were made on goods for export but unable to leave Germany during the war. In some cases even pledged property, household goods, and instruments of trade could be mortgaged to these banks in order to secure funds for investment in the war loans. In the second loan the bonds of the first loan were accepted in part payment; but the amount of such transactions was not published. In the third loan the government exchanged its obligations for contracts of manufacturers and traders to deliver to the government goods of a specified value. It was believed by many that the slight resort to taxation, the great expansion of paper currency, and excessive use of credit were unsound methods of war finance.

The Austro-Hungarian loans included a first, second, and third Austrian loan aggregating $1,782,000,000 and a first and second Hungarian loan aggregating $471,000,000 besides loans contracted in Germany to the amount of $298,500,000. The actual expenditures, however, of the Dual Monarchy were somewhat shrouded in mystery. In floating their loans special banks and methods similar to those adopted in Germany were used. Turkey contracted two loans in Germany amounting to $214,000,000; and Bulgaria obligated herself to German bankers to the extent of $30,000,000.

In addition to the foregoing various neutral countries had been forced to contract loans by the added expenditures made necessary by the war. These amounted to $143,000,000 in Holland; $40,000,000 for Rumania; $25,000,000 for Egypt; $51,000,000 for Switzerland; $28,000,000 for Denmark; $24,800,000 for Spain; $16,000,000 for Norway; $14,380,000 for Sweden; and $8,000,000 for Greece.

Helfferich, *How Germany Raises Billions* (Eng. trans., 2d ed., New York, 1915).

WAR'MAN, CY (1855–1914). An American journalist and author, born near Greenup, Ill. In 1888 he established the *Western Railway*, a semimonthly magazine, at Denver, and in 1892 the short-lived *Daily Chronicle* at Creede, Colo. General attention was first called to him by the New York *Sun* in 1892, in an article which characterized him as the "Poet of the Rockies"; and subsequently his verse and his railroad stories became widely popular. His publications include: *Tales of an Engineer* (1895); *The Express Messenger* (1897); *Frontier Stories* (1898); *The Story of the Railroad* (1898); *The White Mail* (1899); *Snow on the Headlight* (1899); *Short Rails* (1900); *Weiga of Temagami* (1908). A collection of his verse entitled *Songs of Cy Warman* appeared in 1911.

WARM-BLOODED ANIMALS. The birds and mammals. See ANIMAL HEAT.

WAR MESS. See CHEVES, LANGDON.

WARMING. See HEATING AND VENTILATION.

WARMING, värʹming, JOHANNES EUGENIUS BÜLOW (1841–). A Danish scientist, distinguished for his knowledge of Arctic botany and geology. He was born on the island of Manö (North Sea) and lived in Brazil during 1863–66. He studied at Bonn with Hanstein and at Copenhagen (Ph.D., 1871), where he became professor of pharmaceutical botany in 1876. In 1882 he was appointed professor at Stockholm, and from 1885 to 1911 was again at Copenhagen as professor and director of the Botanical Garden. He established plant ecology as a primary division of botany and made researches in morphology and taxonomy. His most important works are: *Haandbog i den systematiske Botanik* (1878; Eng. trans., *A Handbook of Systematic Botany*, 3d ed., 1911); *Oversight over Grönlands, Islands, og Faeröernes Flora* (1887); *Plantesamfund* (1895; Eng. trans., *Ecology of Plants*, new ed., 1909); *Dansk Plantevaekstt* (1906 et seq.).

WAR'MOUTH, or GOGGLE EYE. A small fresh-water bass (*Chænobryttus gulosus*), closely related to the rock bass (see BASS) of the Eastern and Central United States, which is more elongate than the sunfish, very variable in color and markings, and noted for its large mouth and great voracity. See Plate of PERCH.

WARMSPRING. A collective designation for several remnant tribes of Shahaptian stock (q.v.) now residing with the Wasco (q.v.) upon the Warmspring Reservation in northern Oregon, upon which they were collected under the terms of a treaty made in 1855. The present divisions are the John Day, Tenino, Tyigh, and Des Chutes. They were originally salmon fishers, root diggers, and berry gatherers. It was chiefly by their aid that the Modocs (q.v.) were finally conquered in the war of 1872–73, the Warmsprings pursuing them into their retreat in the rocks of the Lava Beds, where the soldiers were afraid to venture. They number now 550.

Some of the Apache of Arizona are also designated as the Warmspring band, from their former habitat in the vicinity of Aguas Calientes.

WARMTH. See CUTANEOUS SENSATIONS.

WARNECK, värʹnĕk, GUSTAV ADOLF (1834–1910). A German historian of missions. He was born at Naumburg, studied at Halle, and served for many years as pastor and (1885–1901) as secretary of the committee of German missions. In 1897 he became honorary professor in Halle. His writings include: *Missionsstunden* (1878–84; 5th ed., 1907); *Die gegenseitigen Beziehungen zwischen der modernen Mission und Kultur* (1879; Eng. trans., 1883; new ed., 1888); *Abriss einer Geschichte der protestantischen Missionen von der Reformation bis auf die Gegenwart* (1882; 10th ed., 1913; Eng. trans., 1884, new ed., 1901); *Die Mission in der Schule* (1887; 10th ed., 1905); *Evangelische Missionslehre* (3 vols., 1892–97; 2d ed., 1897–1905). In 1874 he founded the *Allgemeine Missionszeitschrift.*

WARNER, ANNA BARTLETT (1820–1915). An American novelist, who wrote under the pseudonym "Amy Lothrop." She collaborated much with her more famous sister, Susan Warner (q.v.). For many years Miss Warner and her sister lived on Constitution Island in the Hudson near West Point, and for well-nigh two generations they conducted a Bible Class for the cadets of the United States Military Academy, thus coming to be regarded as almost part of the teaching force of that institution. In 1908, with Mrs. Russell Sage, she gave Constitution Island to the government. Her funeral services were conducted with military honors. Among her many books may be mentioned: *Dollars and Cents* (1852); *Stories of Vinegar Hill* (1872); *Blue Flag and Cloth of Gold* (1880); *Cross Corner* (1887); *Patience* (1891); *Up and Down the House* (1892); *West Point Colors* (1903); and a biography, *Susan Warner ("Elizabeth Wetherell")* (1909).

WARNER, ANNE (MRS. FRENCH) (1869–1913). An American author. She was born at St. Paul, Minn., where she was married to Charles Ellis French in 1888. Her writings include: *A Woman's Will* (1904); a series of books dealing with the adventures of a maiden lady, Susan Clegg; *The Rejuvenation of Aunt Mary* (1905), which was also dramatized; *Seeing France with Uncle John* (1906) and *Seeing England with Uncle John* (1908); *The Panther* (1908); *Your Child and Mine* (1909); *Just between Themselves* (1910); *When Woman Pro-*

poses (1911); *The Gay and Festive Claverhouse* (1914); *The Taming of Amorette* (1915).

WARNER, CHARLES DUDLEY (1829–1900). An American author, born in Plainfield, Mass. He graduated at Hamilton College, N. Y., in 1851. After spending a short time in surveying on the Missouri frontier (1853), he returned to the East (1854) to take up the study of law. He graduated at the Law School of the University of Pennsylvania in 1856, and practiced his profession in Chicago until 1860, when he removed to Hartford. Here he became assistant editor and later editor-in-chief of the Hartford *Press*, and in 1867 coeditor of the Hartford *Courant*, with which he was connected till his death. In 1884 he took charge of the department of *Harper's Magazine* called "The Editor's Drawer," and in 1892 succeeded W. D. Howells in "The Editor's Study" of the same periodical. He made several visits to Europe and the East as correspondent of American newspapers and traveled extensively in the United States and Mexico, contributing papers of descriptive and social life to *Harper's Magazine*. Among his best-known books are: *My Summer in a Garden* (1870); *Saunterings* (1872); *Backlog Studies* (1872); *Baddeck, and That Sort of Thing* (1874); *Mummies and Moslems* (1876); *In the Levant* (1877); *Being a Boy* (1877); *Washington Irving* (1881); *Captain John Smith* (1881); *A Roundabout Journey* (1883); *Their Pilgrimage* (1886); *On Horseback* (1888); *Studies in the South and West, with Comments on Canada* (1889); *A Little Journey in the World* (1889), a novel; *Our Italy* (1891); *The Golden House* (1895), a novel; and *That Fortune* (1899), a novel. He was also editor of the *American Men of Letters* (1881), a series of biographies, and of the *Library of the World's Best Literature* (1896–97). In conjunction with Mark Twain, one of whose closest friends he was, he wrote (1873) *The Gilded Age* (see CLEMENS, SAMUEL LANGHORNE). Prof. T. R. Lounsbury edited a complete edition of his works in 15 volumes (Hartford, n. d.). Warner was greatly interested in prison reform and other philanthropic work, and by his travels and genial personality did much to bring North and South to understand each other. He was sympathetic with young authors and was a kindly critic, a refined humorist, and a helpful force in American letters. Consult Annie A. Fields, *Charles Dudley Warner* (Garden City, N. Y., 1904); *passim*, A. B. Paine, *Mark Twain* (3 vols., New York, 1912); Brander Matthews, *Aspects of Fiction* (new ed., New York, 1902).

WARNER, EVERETT LONGLEY (1877–). An American landscape painter and etcher. He was born in Vinton, Iowa, and studied at the Art Students' Leagues in Washington and New York, and in Paris, finally settling in New York. Good examples of his work are to be found in most American public collections, including: "Broadway on a Rainy Evening" (Corcoran Art Gallery, Washington); "A February Day" and "Quebec" (Pennsylvania Academy of Fine Arts, Philadelphia); "A Mountain Village, Tyrol" (St. Louis Museum); "Along the River Front, New York," and six etchings, in the Toledo Art Museum; "December Hillside" (Syracuse Museum). He was elected an associate of the National Academy of Design in 1913, and was awarded medals in Philadelphia (1908), Buenos Aires (1910), and San Francisco (1915).

WARNER, OLIN LEVI (1844–96). An American sculptor. He was born at West Suffield, Conn., and at first worked as a telegrapher. In 1869 he went to Paris, and studied at the Beaux-Arts under Jouffroy, Falguière, and Mercier, and afterward was assistant to Carpeaux. In 1870, on the proclamation of the French Republic, he entered the foreign legion and did good service during the siege of Paris. On his return to New York in 1877 he was unsuccessful in winning public recognition and returned to his father's farm. But through the efforts of his friend Daniel Cottier, the merit of his work was finally recognized, and his success became established. His modeling is severe and simple in style, displaying fine feeling for the yielding elasticity of the flesh, and beauty and suavity of line. In relief he was especially successful. His important works include: two caryatides for a fountain at Portland, Oreg. (1888); the graceful "Diana" in the Metropolitan Museum, New York, which also possesses the portrait busts of J. I. Blair, the artist's wife and daughter, and J. Alden Weir; portrait statues of Governor Buckingham (Hartford, Conn.), William Lloyd Garrison and General Devens (both in Boston), and one of the bronze doors for the library of Congress, Washington. Later portrait busts include those of Wyatt Eaton and W. C. Brownell. Warner was one of the five original members of the Society of American Artists and became a member of the National Academy in 1889. He died in New York from a fall from a horse. About a score of his works, including "Dancing Nymph," were exhibited at the Panama-Pacific Exposition, San Francisco, in 1915. Consult Lorado Taft, *History of American Sculpture* (New York, 1905).

WARNER, SETH (1743–84). An American soldier, born at Roxbury, Conn. Removing with his father to Bennington, Vt., in 1763, he there became prominent as a leader of the Green Mountain Boys, opposing New York's claim to the New Hampshire Grants (later Vermont), and being outlawed in consequence by the New York government, in 1771. In 1775 he led the detachment which on May 12 captured Crown Point, and on July 27 became by election lieutenant colonel of the Green Mountain Boys, participating as such in General Montgomery's expedition to Canada. On July 5, 1776, he was appointed colonel in one of the Continental regiments, and on July 7, 1777, was in command at the disastrous battle of Hubbardton (q.v.), subsequently rendering efficient service at the battle of Bennington (q.v.), Aug. 16, 1777. Early in 1782 he was forced by ill health to retire from the army, and returned to Roxbury, where he died. Consult Chipman, *Life of Colonel Seth Warner* (Middlebury, Vt., 1848).

WARNER, SUSAN (1819–85). An American novelist, born in New York, known also under the pen name of Elizabeth Wetherell. Her first novel, *The Wide, Wide World* (1851), won much popularity, and was translated into French, Italian, Russian, Swedish, and Spanish. *Queechy* (1852) was also popular, though not a close second to its immediate predecessor. She next published *The Law and the Testimony* (1853), in which under appropriate headings are grouped the biblical texts establishing the cardinal doctrines of Christianity. This was followed by a story full of scenic description, *The Hills of the Shatemuc* (1856). Of several subsequent

stories the more noteworthy are *The Old Helmet* (1863), *Melbourne House* (1864), and *Daisy* (1868). Miss Warner also collaborated with her sister Anna (Amy Lothrop) in *Say and Seal* (1860) and several other juvenile books, which, most of them, appeared in the series entitled *Mr. Rutherford's Children* or in that called *Karl Krinken and his Christmas Stocking*. (See WARNER, ANNA B.). Several of her works found acceptance in French, German, and Swedish translations, but none approached in merit or popularity *The Wide, Wide World*, which, next to *Uncle Tom's Cabin*, was perhaps the most widely circulated story of American authorship. Consult Anna B. Warner, *Susan Warner* (New York, 1909).

WARNER, WILLIAM (?1558–1609). An English poet, born in London. He studied at Magdalen College, Oxford, but left without a degree, and settled in London as an attorney. He died March 9, 1609, at Amwell, in Hertfordshire, and was buried there. Warner is chiefly known for *Albion's England* (1586), a long poem in fourteen-syllable lines treating of history and legend from Noah to William the Conqueror. Originally in four books, the poem was enlarged in subsequent editions to 16 books, and the history was brought down into the reign of James I (1612; reprinted in Chalmer's *English Poets*, vol. iv, London, 1810). Warner also published a translation of the *Menæchmi* of Plautus (1595) and a collection of tales under the title *Pan His Syrinx* (1585).

WARNING COLORATION. Conspicuous markings upon certain animals to protect them from the attacks of other animals. Most species so marked secrete a repugnant fluid which is either ejected from special glands or which, in the case of insects, gives them a bad taste, so that they are repulsive to monkeys, birds, lizards, or insects. Such inedible species are often marked with bright colors, spots, or bands, and such colors are said to warn off intruders, which after their first experience recognize them as unfit to eat. A familiar example is the skunk, whose conspicuous black and white markings render it visible even in a rather dark night. Warning coloration is especially common in insects, especially gaily colored caterpillars and butterflies, like the milkweed butterfly (*Anosia archippus*). The brightly colored caterpillars, like the currant worm and a number of others, when fed to birds are rejected with disgust. Hence they enjoy immunity from attacks by birds. Wallace, who first suggested the theory of warning colors, called attention to the fact that while most caterpillars are edible and also protectively marked (see PROTECTIVE COLORATION AND RESEMBLANCE), the gaily colored ones are distasteful to birds. This has since been experimentally proved. Whether, however, the colors have been actually acquired, as Wallace supposes, as a warning of inedibility, still remains to be proved. It should be remembered that the bright red and blue colors of caterpillars and of butterflies are deep-seated and formed from the waste products of the blood, and that their deposition is a chemico-physical or physiological process quite independent of attacks of birds, etc.

WARNSDORF, värns'dôrf. A town in Bohemia, Austria, 59 miles north by east of Prague (Map: Austria-Hungary, D 1). It is especially known for its large cotton manufactures. Woolen and linen goods, velvet, cement, and machinery are also produced. Pop., 1900, 21,150; 1910, 22,970.

WAR OF 1812, GENERAL SOCIETY OF THE. An hereditary patriotic society organized in Philadelphia, Pa., Jan. 8, 1891, by representatives of the Association of the Defenders of Baltimore in 1814 (organized in 1842), which became the State Society of Maryland, and by representatives of the Pennsylvania Association of the Defenders of the Country in the War of 1812 (organized in 1852). It has for its object the preservation of the memories and victories of the War of 1812. It admits to membership any lineal descendant of one who served in the War of 1812, in the army, navy, revenue marine, or privateer service of the United States. Since the formation of the national society, State organizations have been established in Massachusetts, Connecticut, Ohio, District of Columbia, New York, New Jersey, and Delaware, distributed among which is a total membership of about 1000.

WAR OF 1812, MILITARY SOCIETY OF THE. A patriotic society instituted in New York City on Jan. 3, 1826, by officers of the War of 1812, and consolidated with the Veteran Corps of Artillery (organized in New York City as an independent military organization on Nov. 25, 1790, by officers and soldiers of the War of the Revolution), on Jan. 8, 1848. This society was incorporated as a military society on Jan. 8, 1892. Its insignia consists of a Maltese cross of gold and blue enamel, superimposed by an eagle in gold, on the breast of which is an anchor in black and the legend 1812, pendant from a ribbon of red and blue. The society admits to membership acceptable male descendants of any commissioned officer of honorable record in the War of 1812. The membership is about 100, and the annual meeting is held on January 8, the anniversary of the battle of New Orleans.

WAR OF 1812, THE. See UNITED STATES.

WAR OF JENKINS EAR. See JENKINS EAR, WAR OF.

WARPING (from *warp*, AS. *weorpan*, Goth. *wairpan*, OHG. *werfan*, Ger. *werfen*, to throw; connected with OChurch Slav. *vrĕšti*, Skt. *varj*, to throw, and possibly with Gk. *ῥίπτειν, rhiptein*, to throw). A mode of improving land by flooding, practiced where rivers bring down large quantities of mud, or where mud is brought up from estuaries by the tide. It has long been practiced in Italy and some of the valleys of the Alps, the rich soil brought down by the mountain streams being arrested and made to increase the fertility of fields. A similar process, known as colmatage, is used in France. Warping has also been practiced in England, especially on lands adjacent to the Humber estuary, but is perhaps less common now than formerly. The process is considered most beneficial on sandy and peaty soils. Consult especially F. H. Storer, *Agriculture*, vol. iii, p. 258 (New York, 1897), and James Stephenson, *Warping* (Jour. Roy. Agr. Soc. England, 73 (1912), p. 104).

WAR PLANE. See MILITARY AËRONAUTICS and Plate.

WARRANT (OF. *warant, guarant, garant*, warrant, protector, from OHG. *giwerēn*, Ger. *gewähren*, to grant). A writ issued by a judicial officer, directed to a sheriff, a constable, or other executive officer, requiring him to arrest a person named therein and bring him before the official who issued it. A warrant is usually

issued only upon the oath of a complaining witness as to the probable or actual guilt of the person to be apprehended. The matter of the arrest of a person suspected of crime is regulated by statute in each State; but, in general, where a crime does not come to the actual notice of a peace officer a warrant should be issued for the arrest of a suspected person. Furthermore, only the person whose name appears on the warrant can be apprehended thereunder, and the old English practice of issuing blank warrants has never been adopted in the United States. In some States a person who is thus arrested may demand to see the warrant. See SEARCH WARRANT; ARREST; HABEAS CORPUS; ETC.; also consult the authorities referred to under CRIMINAL LAW.

WARRANT OF ATTORNEY. In law an instrument by the terms of which one person is empowered or authorized to do some act for another, such as to transact his business, execute a deed, or to collect rents or debts. The expression is practically synonymous with power of attorney. A warrant of attorney to sue or defend was in English law a special warrant from the crown authorizing a person to name an attorney to bring suit or defend for him. See ATTORNEY.

WARRANT OFFICER. A noncommissioned officer in the United States army or navy. In the army the company noncommissioned officers, corporals and sergeants, are appointed by the regimental or battalion commander on the recommendation of the company commander. The regimental noncommissioned staff is appointed by the regimental commander on the recommendation of the battalion commander. Each noncommissioned officer receives a certificate or warrant of rank signed by the appointing officer and countersigned by the adjutant. In the navy a warrant officer holds his position by virtue of a warrant issued by the Secretary of the Navy. Warrant officers rank next below midshipmen and consist of boatswains, gunners, carpenters, sailmakers, machinists, and pharmacists. After six years service, warrant officers are, after passing an examination, commissioned as chief boatswains, chief gunners, etc., with the rank of ensign. For the pay and allowances of warrant officers, see PAY AND ALLOWANCES. See CORPORAL; SERGEANT; BOATSWAIN; GUNNER; ETC.

WARRANTY (OF. *warrantie*, guarantee; Fr. *garantir*, to warrant). At law, an assurance of a fact together with an agreement to indemnify. Although used commonly as interchangeable with guaranty, and derived from the same word, the latter means properly the binding promise of a third person. With reference to the sale of chattels the term is used in regard to title or quality (see SALE; CONTRACT). At common law title in the seller was not presumed, but if the sale was made in the open market the purchaser was protected. To-day possession of the vendor implies a warranty of title. For example, there is an implied warranty by the innocent vendor of stolen goods on which recovery may be had against him by the purchaser. As to quality the general rule of *caveat emptor* (let the buyer beware) applies. Hence the law is that a purchaser has only a reasonable time for inspection of the goods and rejection. If he retain them he is presumed to accept them. Thus if he delays examining the goods he loses his right of returning them. It is otherwise with regard to hidden defects, but the circumstances of each case govern and the general rule of reasonableness applies. Statutes and decisions in various States have to a certain extent modified the general law that there is no implied warranty of quality. Thus there is an implied warranty that food sold by a retailer to his customers is wholesome and sound, while in sales between dealers there is none. Where goods are to be manufactured for a distinctly stated purpose the law will imply a warranty that they are fit for that purpose. A warranty being an agreement to indemnify an assurance of fact and collateral to the contract of sale, the purchaser has two remedies, either to reject the goods and treat them as not sold or to retain them and claim on the agreement to indemnify. In the first case the question is the performance or compliance with the terms of the contract. Such would be questions as to fraudulent representations and sales by sample, and the warranty may be treated as a condition precedent. In the second he affirms the contract and rests on the collateral agreement of warranty. Like other contracts in law there must be a consideration and a meeting of the minds usually expressed. The breach of the warranty and the actual damages suffered constitute the basis of a claim, the general law of contracts applying. A warranty must be clear and distinct. General praise of the goods by the vendor is not binding. It should be distinguished from an inducement. In insurance law a warranty has a special significance and is a statement or promise which must be strictly true or complied with, while a representation need be only substantially correct. There has always been considerable confusion in law as to the principle of warranty and decisions have been anomalous. This is because the same assurance of fact may be treated either as a representation or inducement for making the sale, as a condition precedent of the sale or as a warranty. With reference to real estate the term warranty is used in connection with the deeds and relates to covenants of title. In these the warranty must be express and is strictly construed. The distinction is usually made between Full Covenant of Warranty Deeds and Quit Claim Deeds (q.v.), the latter being the release of any possible interest with no warranty and the former containing a binding agreement to defend or indemnify the vendor as to superior claims of title.

WARREN, wŏr'ĕn. A town in Worcester Co., Mass., about 22 miles (direct) east of Springfield, on the Boston and Albany Railroad (Map: Massachusetts, C 4). There are manufactories of steam pumps, woolen goods, power presses, and machine-shop products. Pop., 1900, 4417; 1910, 4188.

WAR'REN. A city and the county seat of Trumbull Co., Ohio, 52 miles by rail southeast of Cleveland, on the Mahoning River, and on the Pennsylvania, the Erie, and the Baltimore and Ohio railroads (Map: Ohio, J 3). Warren has steel plants, electric apparatus and supply works, shovel works, electric lamp factories, and manufactories of fire extinguishers, bath tubs, automobiles, boilers, storage tanks, steel ranges, etc. There is a public library here. Pop., 1900, 8529; 1910, 11,081; 1915 (U. S. est.), 12,810.

WARREN. A borough and the county seat of Warren Co., Pennsylvania, 66 miles east-southeast of Erie, at the confluence of the Al-

legheny River and the Conewango Creek, and on the Pennsylvania and the New York Central railroads (Map: Pennsylvania, C 2). It is the seat of the State Hospital for the Insane, and has the Jefferson Memorial and Struthers libraries. The borough is engaged in oil refining, and the manufacture of furniture, iron and steel, chemicals, boilers, gas engines, etc. Pop., 1900, 8043; 1910, 11,080; 1915 (U. S. est.), 14,391.

WARREN. A town in Bristol Co., R. I., 8 miles by rail northwest of Fall River, Mass., on Narragansett Bay, and on the New York, New Haven, and Hartford Railroad (Map: Rhode Island, C 3). It has the George Hail Free Library. Manufacturing is the leading industry, the most important products been cotton goods, twine, and braid. Oyster fishing is also carried on. Warren occupies the site of the Indian village Sowams, the home of Massasoit (q.v.), and was settled by the whites, at least temporarily, as early as 1635. Until 1746, when it was incorporated by Rhode Island and named in honor of Admiral Sir Peter Warren, it was a part of Swansea, Mass. From it, in 1770, Barrington was taken. Pop., 1900, 5108; 1910, 6565; 1915 (State census), 7241. Consult: Tusten, *A Discourse, May 8, 1845* (Providence, 1845); Baker, *The History of Warren, 1776–83* (Warren, 1901).

WARREN, Francis Emroy (1844–). An American legislator, born at Hinsdale, Mass. He served in the Forty-ninth Massachusetts Volunteers in 1862–63, moved to Wyoming in 1868, and there became active in Republican politics. He was president of the council (1873–75) and a member of the council (1884–86) of the Wyoming Territorial Legislature, treasurer of Wyoming Territory (1876–77, and 1879–85), mayor of Cheyenne (1885), and Territorial Governor (1885–86, and 1889–90). In 1890 he was elected the first Governor of the State of Wyoming, but resigned that office before the end of the year in order to become United States Senator. He was reëlected to the latter office for the fourth time in 1913.

WARREN, Frederick Morris (1859–). An American French scholar, born at Durham, Maine. After graduating from Amherst in 1880, he studied at the Sorbonne, Paris (1884–86) and took his Ph.D. in 1887 at Johns Hopkins. Here he taught till 1891, then for 10 years was a professor at Adelbert College, and from 1900 occupied a chair at Yale. He was president of the Modern Language Association of America in 1908 and became an editor of *Modern Philology*. His writings, which show sound scholarship and are characterized by a vigorous and incisive style, include *A History of the French Novel Previous to the Seventeenth Century* (1895) and *Ten Frenchmen of the Nineteenth Century* (1904), besides numerous contributions on French literature, published in leading literary and linguistic journals.

WARREN, Gouverneur Kemble (1830–82). An American soldier, born at Cold Spring, N. Y. He graduated at West Point in 1850, and took part as chief topographical engineer in the Sioux Expedition of 1855 and participated in the action of Blue Water. From 1859 to 1861 he was assistant professor of mathematics at West Point, but in May of the latter year he accepted a lieutenant colonelcy in the Fifth New York Volunteers. He took part in the battle of Big Bethel on June 10, and in August he was commissioned colonel of his regiment. He took part in the Peninsular campaign, and later commanded a brigade of the Army of the Potomac during the Maryland campaign. A few days after the battle of Antietam he was commissioned brigadier general of volunteers, but in February, 1863, he was relieved of his brigade, and was appointed chief topographical engineer of the Army of the Potomac, a position which he filled at the time of the battle of Fredericksburg. In May, 1863, he was promoted to be a major general of volunteers, and soon afterward was appointed chief engineer of the Army of the Potomac. At the battle of Gettysburg he was the first to recognize the importance of Little Round Top, and for his promptness and gallantry in securing possession of it he was brevetted colonel in the regular army. From March, 1864, to April, 1865, he commanded the Fifth Corps and participated in the important battles of the Richmond campaign. After the battle of Five Forks he was relieved of his command by General Sheridan. A court of inquiry relieved his reputation of any stain. In May, 1865, he resigned his commission in the volunteer service, and during the following years he was employed on surveys and harbor improvements. He published several books, including *Explorations in the Dacota Country* (1855–56); *Preliminary Report of Explorations in Nebraska and Dacota in the Years 1855–57* (1858); and *An Account of the Fifth Army Corps at the Battle of Five Forks* (1866). Consult the *Biographical Memoirs of the National Academy of Sciences*, vol. ii (Washington, 1886).

WARREN, Henry (1794–1879). An English water-color painter. He was born in London, first studied sculpture with Nollekens, and afterward painting in the schools of the Royal Academy. In 1835 he joined the new Society of Painters in Water Colors, of which he was president from 1838 to 1873. He was a member of the Royal Commission for the Paris Exhibition in 1855. He illustrated Wordsworth's *Pastoral Poems*, Moore's *Paradise and the Peri*, Lockhart's *Spanish Ballads*, and "The Happy Valley" from *Rasselas*.

WARREN, Henry White (1831–1912). An American Methodist Episcopal bishop and author, brother of William Fairfield Warren. He was born at Williamsburg, Mass., and graduated in 1853 at Wesleyan University, Middletown, Conn. He taught ancient languages at Wesleyan Academy, Wilbraham, Mass. (1853–55), and then entered the New England Conference (1855). After serving churches about Boston he was transferred to the Philadelphia Conference (1871), and was elected Bishop (1880). In 1863 he was a member of the Massachusetts Legislature. He published: *Sights and Insights* (1874); *The Lesser Hymnal* (1877); *Studies of the Stars* (1878); *Recreations in Astronomy* (1879); *The Bible in the World's Education* (1892); *Among the Forces* (1898); *Fifty-two Memory Hymns* (1908). He was editor of *The Study* (1896–1900).

WARREN, Sir (Thomas) Herbert (1853–). An English educator, scholar, and author. He was born at Bristol, and was educated at Clifton College and at Balliol College, Oxford. From 1877 to 1885 he was fellow and tutor of Magdalen College, of which thenceforth he was president. Subsequently he served also as vice chancellor of Oxford University (1906–10) and then was professor of poetry. Warren identified himself prominently with British edu-

cational progress. In 1914 he received the K.C.V.O. His publications are, notably: *Plato's Republic* (i–iv, 1888, and several times reprinted), with introduction and notes; *Education and Equality* (1895); *By Severn Sea and Other Poems* (1897); *Poems of G. J. Romanes* (ed. with introd., 1896); *Life of Prince Christian Victor of Schleswig-Holstein* (1903); *Magdalen College, an Historical Sketch* (1907); *Essays of Poetry and the Poets* (1909); *Tennyson's Poems* (1910); *Oxford and Poetry* (1911); *Robert Bridges, Poet Laureate* (1913); *R. D. Blackmore's Lorna Doone* (1914); *War and Poetry* (1915).

WARREN, JOHN (1753–1815). An American surgeon, brother of Joseph Warren, and father of John Collins Warren (1778–1856) (qq. v.). He was born at Roxbury, Mass., graduated at Harvard in 1771, attended the wounded at the battle of Bunker Hill, and afterward accompanied the American army to New York and New Jersey as hospital surgeon. From 1777 to the close of the war he superintended the military hospitals in Boston. In 1783 he was one of the founders and the first professor of anatomy and surgery in the newly established medical school at Harvard. He was the first president of the Massachusetts Medical Society (1804–15). Consult his life by James Jackson (Boston, 1915).

WARREN, JOHN BYRNE LEICESTER, third and last Baron de Tabley (early pseudonym, WILLIAM LANCASTER) (1835–95). An English poet, born at Tabley House, in Cheshire, England. He was educated at Eton, and at Christ Church, Oxford, graduating in 1859. In 1860 he was called to the bar at Lincoln's Inn, but never followed the law. In 1887 he came to his title. Being of sensitive temperament, he passed most of his life in seclusion, enjoying, however, the intimate friendship of several distinguished contemporaries, among whom were Gladstone and Browning. His volumes of verse comprise notably: *Præterita* (1863); *Eclogues and Monodramas* (1864); *Studies in Verse* (1865); two dramas, *Philoctetes* (1866) and *Orestes* (1868), his strongest works; *Rehearsals* (1870); *Searching the Net* (1873); and a long tragedy, *The Soldier's Fortune* (1876). Though admired by the few, his poetry won no recognition with the public. In 1893 Warren issued *Poems Dramatic and Lyrical* (followed by a second series in 1895), comprising old and new pieces, and at once met his full meed of praise. He also wrote on numismatics, botany, and book plates. Consult A. H. Miles, *Poets and Poetry of the Nineteenth Century*, vol. iv (London, 1891), and the appreciative essay by Edmond Gosse in *Critical Kit-Kats* (New York, 1896).

WARREN, JOHN COLLINS (1778–1856). An American surgeon, son of John Warren (q.v.), born in Boston. He graduated at Harvard in 1797, studied medicine with his father and in London and Paris, began practice in Boston in 1802, and at Harvard was assistant professor of anatomy and surgery (1806–15), and professor of surgery, succeeding his father (1815–47). He was one of the founders and long an editor of the *Boston Medical and Surgical Journal* (1828). He was also one of the founders of the McLean Asylum for the Insane, and of the Massachusetts General Hospital of which he was long chief surgeon. In 1846 he performed the first public operation on a patient anæsthetized by ether, in the Massachusetts General Hospital, Dr. W. T. G. Morton (q.v.) being the anæsthetist. He was a pioneer in the excision of bones and joints, and introduced an operation for fissure of the soft palate. Warren made a fine collection of specimens in anatomy, osteology, and paleontology, now known as the Warren Museum, to which he bequeathed his own skeleton. In 1849 he served as president of the American Medical Association. Among his works are: *Diseases of the Heart* (1809); *Comparative View of the Sensorial System* (1820); *Surgical Observations on Tumors* (1837); *Etherization* (1848); and *Mastodon Giganteus* (1855). Consult his *Life, Compiled Chiefly from His Autobiography and Journals* (Boston, 1860), by Edward Warren. See also WARREN, JOHN COLLINS (b. 1842).

WARREN, JOHN COLLINS (1842–). An American surgeon, son of John Collins Warren (1778–1856) (q.v.), born in Boston. He graduated from Harvard (1863) and from Harvard Medical School (1866), where he taught after 1871 (as professor of surgery from 1893 till his retirement in 1907). In 1908 he became an overseer of Harvard. He was honored abroad as well as at home. From 1873 to 1881 he was editor of the *Boston Medical and Surgical Journal* and in 1896 served as president of the American Surgical Association. He published *Surgical Pathology and Therapeutics* (1895) and edited *International Textbook of Surgery* (1900).

WARREN, JOSEPH (1741–75). An American patriot, born at Roxbury, Mass., June 11, 1741. He graduated at Harvard in 1759, and became a physician in Boston in 1764. In the early disputes between the colonists and the British government he associated himself with Samuel Adams and other ardent Whigs, and was the orator at the second anniversary of the Boston Massacre, March 5, 1772. In 1772 he became a member of the Committee of Correspondence, and throughout the years immediately preceding the Revolution he was a frequent contributor to the patriot press. He drafted the extreme but influential Suffolk Resolves, adopted in September, 1774, by a convention of Suffolk County, and forming the most radical statement of the American position which had up to that time been made. He was a member of the Provincial Congress of Massachusetts, and in April, 1775, was elected president pro tem of that body. In March of that year he was again the orator at the anniversary of the Boston Massacre, refusing to be intimidated by the threats of British officers. He had much to do with the success at Lexington on April 19, and in June was commissioned major general. He opposed the occupation of Charlestown Heights, advocated by Putnam and Prescott, thinking the American supply of ammunition too small. Overruled by a majority of the council, which resolved to fortify Bunker Hill, he went there as a volunteer, refusing to take the chief command, offered him by both Prescott and Putnam. During the battle of June 17 he was instantly killed. A monument to his memory by Paul W. Bartlett was erected in Boston in 1904. Consult Richard Frothingham, *Life and Times of Joseph Warren* (Boston, 1865). For his brother, see WARREN, JOHN.

WARREN, JOSIAH (1799–1874). An American philosophical anarchist, born near Boston. He participated in Robert Owen's communistic

experiment at New Harmony, Ind. (q.v.), in 1825–26. In the following year he opened at Cincinnati, Ohio, a time store, in which goods were sold at cost with 7 per cent added for rent, fuel, etc., and every customer was timed and charged so much an hour for the time of the salesman. In connection with this business Warren issued labor notes, which were used as money. Having demonstrated the feasibility of the experiment, he closed the store. Subsequently he established a community in Ohio, and later founded Modern Times, a community on Long Island. Warren is considered by the philosophical anarchists to be, with Proudhon (q.v.), the founder of their system of thought. He published *True Civilization* (1846; 5th ed., 1875), and *Equitable Commerce* (1852).

WARREN, LAVINIA (1841–). An American dwarf, exhibited by the showman, P. T. Barnum, born at Middleboro, Mass. She was descended from a French family named Bonpasse. Under Barnum's management her name was changed from Mercy Lavinia Bumpus. On Feb. 10, 1863, she was married in Grace Church, New York City, to Charles S. Stratton (q.v.), or Tom Thumb, her sister Minnie Warren, and Commodore Nutt, two other dwarfs, acting as bridesmaid and groomsman. Her height was considerably less than 2 feet. She traveled and was exhibited in Europe with her husband, and they accumulated a considerable fortune. One child sprang from their union, but died in early infancy. Two years after her husband's death, which occurred in 1883, Lavinia Warren married Count Primo Magri, an Italian dwarf.

WARREN, LEO. See MEDING, OSKAR.

WARREN, MERCY (1728–1814). An American dramatist, poet, satirist, and historian, born at Barnstable, Mass. She was a sister of the patriot orator James Otis, and wife of the Revolutionary leader James Warren. She was one of the most brilliant women of her time, and her intellectual versatility was prized alike by Thomas Jefferson and John Adams. Abigail, wife of John Adams, was her intimate friend through life. Her first dramas, *The Adulator* (1773) and *The Group* (1775), satirized the Massachusetts Tories. *The Squabble of the Sea Nymphs* (1775) was a comic epic on the Boston Tea Party. More conventional are the tragedies *Sack of Rome* and *The Ladies of Castile*, which may be found in her *Poems, Dramatic and Miscellaneous* (1790), a volume of extremely slight merit. She wrote also an elaborate and stilted *History of the American Revolution* (3 vols., 1805), which is important because of her close personal association with many persons prominent at that period. Consult E. F. Ellet, *Women of the Revolution* (New York, 1856; reprinted, 2 vols., Philadelphia, 1900).

WARREN, MINTON (1850–1907). An American Latin scholar, born in Providence, R. I. He graduated from Tufts College in 1870, and took his Ph.D. at Strassburg in 1879. He was professor of Latin at Johns Hopkins University until 1899, and thereafter until his death professor at Harvard. He was director of the American School for Classical Studies at Rome, Italy, in 1896–97. In the latter year he held the presidency of the American Philological Association. His writings, which appeared in the learned periodicals, dealt chiefly with epigraphy and Latin comedy. Especially noteworthy is his paper "The Stele Inscription in the Roman Forum," in *American Journal of Philology*, xxviii (Baltimore, 1907).

WARREN, SIR PETER (1703–52). A British naval officer, born at Warrenstown, Meath, Ireland. He entered the navy as a volunteer in 1717, and after seeing service in European and African waters was in 1727 appointed captain of the 70-gun ship *Grafton*. The following years he spent mostly in the West Indies and along the coast of North America, and in 1744 he was promoted to the rank of commodore. In 1745, as commander of the fleet which cooperated with the colonial troops, he had an important part in the capture of Louisburg (q.v.), and in addition acquired considerable wealth, his squadron having captured many valuable prizes. Two months later he was promoted to be rear admiral of the blue, and in 1747, as second in command under Anson, helped to defeat the French near Cape Finisterre.

WARREN, SAMUEL (1781–1862). An English clergyman. He entered the ministry of the Wesleyan Methodist Church in 1802, but in 1834 was suspended for opposing the formation of a theological institution at Manchester. His appeal to the Lord High Chancellor was denied in 1835, and in the same year he was expelled from the denomination. Many of his sympathizers, first known as Warrenites, united with the Leeds seceders of 1828 (Protestant Methodists; from 1835 Wesleyan Association Methodists). In 1857 they united with other seceders to form the United Methodist Free church. Eventually Warren grew tired of continuous controversy and joined the Church of England, spending the last years of his life as the incumbent of All Souls' Church, Ancoats, Manchester. He was the author of: *A Digest of the Laws and Regulations of the Wesleyan Methodists* (1827); *Sermons on Various Subjects* (1833); *Remarks on the Wesleyan Theological Situation* (1834).

WARREN, SAMUEL (1807–77). A British legal scholar and novelist. He was born in Denbighshire, Wales, the son of Samuel Warren (1781–1862) (q.v.). He studied medicine at Edinburgh and law at the Inner Temple, London; was called to the bar in 1837; and in 1851 was appointed Queen's counsel. He served as Recorder of Hull (1854–74); as member of Parliament for Midhurst (1856–59); and then as master in lunacy. A Conservative in politics and a strong supporter of Lord Derby, it was in the interests of his party that he wrote *Ten Thousand a Year* (1839), a novel which made him famous. It first appeared in *Blackwood's Magazine*, and has retained its popularity in numerous editions and translations. His first work, *Passages from the Diary of a Late Physician* (1830–31), also had a new edition as late as 1905. Warren also wrote several valuable legal treatises. A collection of all his writings was issued in five volumes (1854–55).

WARREN, WHITNEY (185?–). An American architect, born in New York. He studied architecture privately in New York and under Daumet and Girault in Paris. After his return to New York in 1894 he engaged in the independent practice of architecture, and designed the New York Yacht Club building (1899). Later as a member of the firm of Warren and Wetmore he collaborated in the design of the monumental New York Central terminal (Grand Central station) in New York, completed in 1913; of the Belmont and Ritz-

Carlton and other hotels, of the Automobile Club, and of the Chelsea Docks, all in New York; of important residences in New York and Toronto; of the Grand Trunk station in Winnipeg, Canada, the Paul Jones crypt at the Naval Academy, Annapolis, and bronze gates in the Cathedral of St. John the Divine, New York, besides many other important works. Warren was awarded a silver medal at the Paris Exposition in 1900, was made a member of the Académie des Beaux-Arts of the French Institute in 1905, received the honorary degree of A.M. from Harvard University in 1913, and was elected to the National Institute of Arts and Letters.

WARREN, WILLIAM (1812–88). An American actor, for many years connected with the old Boston Museum. He was born in Philadelphia, and there after his father's death in 1832 he made his début in the part of Young Norval, the character in which his father, also an actor, had begun his career upon the stage. He first appeared in New York in 1841, in London in 1845, and in Boston in 1846. The next year he became a member of the company at the Boston Museum, where he remained, with a brief exception, till he retired in 1883. He died in Boston. His semicentennial in 1882 brought out many deserved tributes to an admirable comedian and representative of the best traditions of the stage. He was at his best in such rôles as Dr. Pangloss, Sir Peter Teazle, and Dr. Primrose. Consult McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896).

WARREN, WILLIAM FAIRFIELD (1833–). An American Methodist Episcopal theologian, brother of Henry White Warren. He was born at Williamsburg, Mass., graduated at Wesleyan University, Middletown, Conn. (1853), and studied at Andover Theological Seminary and at Berlin and Halle. He entered the New England Conference in 1855 and was professor of systematic theology in the Methodist Episcopal Missionary Institute at Bremen, Germany (1860–66). He was acting president of the Boston University School of Theology (1866–73), was president of Boston University (1873–1903), and dean of the School of Theology (1903–11), and after 1873 he was also professor of comparative theology and philosophy of religion. He published *The True Key of Ancient Cosmology* (1882); *Paradise Found—the Cradle of the Human Race at the North Pole* (1885); *The Quest of the Perfect Religion* (1886); *In the Footsteps of Arminius* (1888); *The Story of Gottlieb* (1890); *Religions of the World and the World Religion* (1900); *The Earliest Cosmologies* (1909); *The Universe as Pictured in Milton's Paradise Lost* (1915).

WAR'RENSBURG. A city and the county seat of Johnson Co., Mo., 65 miles southeast of Kansas City, on the Missouri Pacific Railroad (Map: Missouri, C 3). It is near mineral springs, which have given the city some reputation as a summer resort. The city is the seat of a State Normal School. Other prominent features are the courthouse, Masonic Temple, and opera house, and the Pertle Springs Park. Warrensburg is a shipping centre and has grain elevators, flouring mills, a packing house, and manufactories of shirts, overalls, and creamery products. Pop., 1900, 4724; 1910, 4689.

WAR'RINGTON, wŏr'ĭng-tŭn. A county borough and important manufacturing town of Lancashire, England, on the right bank of the Mersey, at the head of navigation, 16 miles equidistant from Liverpool and Manchester (Map: England, D 3). On the east are situated the Latchford locks of the Manchester Ship Canal, which is spanned by five bridges at Warrington. The town is well built. Warrington has owned a municipal free library, museum, and art gallery since 1848. Its chief industrial importance is in iron manufactures of all kinds; it also has breweries, and leather, cotton, glass, chemical, and soap works. The *Walintune* of Domesday, it was a place of military importance in the fifteenth century. Pop., 1901, 64,241; 1911, 72,166.

WARRINGTON, GEORGE. A stanch friend of the hero in Thackeray's *Pendennis.*

WARRISTON, wŏr'ĭs-tŭn, ARCHIBALD JOHNSTON, LORD (1611–63). A Scottish statesman, born at Edinburgh. With Alexander Henderson he framed the Scots national covenant in 1638 to resist the attempt of Charles I to force the English liturgy upon the Scottish church, and he helped to negotiate the treaties of Berwick (1639) and Ripon (1640), and that with the English Parliament. He resisted the famous engagement into which the Scottish Parliament entered with the King in 1648. In 1658 he was called to serve in Oliver Cromwell's House of Peers. After the Restoration he was hanged on the order of Charles II. Consult *Diary of Sir Archibald Johnston of Warriston* (Edinburgh, 1911), edited by G. M. Paul.

WARRNAMBOOL, wąr'nam-bo͞ol. A seaport of Victoria, Australia, 166 miles westsouthwest of Melbourne, on Lady Bay (Map: Victoria, B 6). Among the principal features are the art gallery and museum, a fine race course, Albert Park, and the botanical gardens. Pop., 1901, 6410; 1911, 7403.

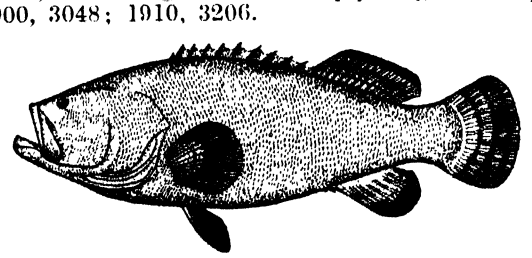
WARSAW, wąr'są (Pol. *Warszava,* vär-shä'vä). A government of Poland (Map: Russia, B 4). Area, 5625 square miles. It is mainly low and flat, but somewhat hilly along the lower course of the Vistula. This river forms the north boundary of the government and is of great importance as a waterway. Warsaw has a poor soil, but agriculture is highly developed owing to the prevalence of large holdings. There is also considerable manufacturing, of which cotton and woolen goods, products of iron and steel, various articles of apparel (especially footwear), and sugar (for the production of which beets are extensively grown) form the bulk. Pop., 1912, 2,639,400, of whom the Roman Catholics formed 80 per cent and the Jews about 12 per cent.

WARSAW. Formerly the capital of the Kingdom of Poland, now the capital of the Government of Warsaw, in Poland (Map: Russia, B 4). It is beautifully situated on a gently undulating, fertile plain, for the most part on the left bank of the navigable Vistula, on a cliffy terrace 100 feet high. It is 404 miles east of Berlin. The suburb of Praga is on the right bank, and is flanked by a modern suburb—New Praga. Although it has lost in political status, it has been increasing its prestige in all other directions. Warsaw is the intellectual centre of Poland, whose literary and artistic activity it inspires.

The main city lies close to the river in a compact form and is well built. The streets are regularly laid out except in the old city, where the ancient houses are quaint and the

thoroughfares crooked and narrow. There are 11 gates, beyond which lie the suburbs. Two bridges cross the Vistula—a railway bridge and the Alexander Bridge, the latter dating from 1865. The former is guarded by a strong fort on each side of the river, the Alexander Citadel being on the left bank. The centre of life in Warsaw is the Palace Square, near the river, and the terminal of the Alexander Bridge. The Theatre Square lies a short distance southwest and is flanked by the town hall, and by the fine Grand Theatre, where plays and operas are given. Two fine boulevards, in imitation of the Champs-Elysées district of Paris, are found in the southern part of the city—Ujazdowska and Jerusalem streets. Southwest of the Palace Square is the small but attractive Saxon Garden laid out by Augustus II. There are also the Krasinski gardens. Along the river in Praga stretches the Alexander Park.

There are seven Russian and more than 30 Roman Catholic churches. The Roman Catholic Cathedral of St. John is north of the Palace Square, and is connected by corridors with the royal palace, which lies on the right and between the square and the river. The church was founded in 1360. Near the Saxon Garden is the cathedral of St. Alexander Nevsky, built in the Byzantine style in 1894–1912. The church of the Holy Cross lies southwest and dates from 1695. The numerous palaces of the nobility have generally been put to municipal uses by the Russians. The ancient royal palace and the Saxon Palace, in the Saxon Garden, formerly the residence of the Saxon-Polish kings, is used by the public administration. In the Casimir Palace is the university. In the southern end of the city, near the river, is the Belvedere summer palace, with beautiful gardens embellished with ponds, etc. Adjacent is the Lazienki Palace, built by Poniatowski. There is an elaborate memorial, with eight reposing lions, to the Polish generals who fell in 1830 while remaining loyal to the Russians.



Warsaw is the great industrial and commercial centre of Poland. Machinery, carriages, food products, animal products, and woven goods are leading items among the many varied productions. There are more than 50 book-printing establishments. Boot and shoes, millinery, plated ware, etc., are manufactured. In 1912 there were in this city 11,277 industrial establishments, employing 576,233 workmen and turning out goods valued at over $500,000,000. Leather, coal, and corn are leading commodities of trade. Warsaw is the seat of the government and of the high dignitaries of both the leading religious faiths.

Pop., 1901, 756,426; 1913, 872,500, including 15,000 Protestants and 300,000 Jews. Germans form a considerable part of the population. At the head of the educational system stands the university. (See WARSAW, UNIVERSITY OF.) The medical school of Warsaw is famous, as is also the school of art, with a fine museum. The other educational institutions include a conservatory of music, an institute of agriculture, and a technical college. In nearly every educational institution in the city the instruction is given in Russian.

History. Warsaw was the residence of the mediæval dukes of Masovia. In 1526 Warsaw and all Masovia became part of Poland. In 1550 King Sigismund II established his residence here and Sigismund III made it the capital, although the kings continued to be crowned at Cracow. The city was taken by Charles X Gustavus of Sweden in 1655. Here, on July 28–30, 1656, was fought a great battle in which the Poles were defeated by the armies of Sweden and Brandenburg. In 1702 Charles XII of Sweden entered Warsaw. In 1794, after the second partition of Poland, the city rose against the Russians. In the summer of that year it successfully withstood the forces of Frederick William II of Prussia. In the fall a Russian army under Suvarov advanced against it. Praga was stormed on November 4, the Russians perpetrating a fearful massacre, and on the 8th Warsaw surrendered. In the third partition of Poland Warsaw fell to Russia. In 1807 it became the capital of the newly erected Duchy of Warsaw. (See POLAND.) In 1813 it passed to the Russians. The Polish uprising of 1830 began here on November 29, the Grand Duke Constantine being forced to retire. It was also the centre of the uprising of 1863. Occupying as it did a position far to the front, Warsaw was peculiarly exposed in the War of 1914. Its exposure was further accentuated by the fact that from the Russian point of view it was situated on the wrong, i.e., the left, bank of the Vistula. It was strongly protected to the northeast by the line of the Narev with its fortresses, and to the northwest by Novo-Georgievsk on the Vistula, facing, as it were, Thorn. On the south it was not so well off, the nearest position of strength being Ivangorod, a considerable distance up the river. In the campaign of 1915 the fall of Ivangorod brought on the evacuation of Warsaw. But before this it had successfully resisted all German attempts made to capture it. See WAR IN EUROPE.

WARSAW. A city and the county seat of Kosciusko Co., Ind., 122 miles north by east of Indianapolis, on the Pennsylvania and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Indiana, F 2). It is in a picturesque lake region and has considerable reputation as a summer resort. The noteworthy features include Winona Park, the Winona Agricultural and Technical Institute, the public library, and the county courthouse. Warsaw manufactures overalls, cut glass, splints, vacuum cleaners, flour, machinery, etc. Pop., 1900, 3987; 1910, 4430.

WARSAW. A village and the county seat of Wyoming Co., N. Y., 44 miles southwest of Rochester; on the Erie and the Buffalo, Rochester, and Pittsburgh railroads (Map: New York, B 5). It has a Carnegie library and a municipally owned opera house. There are salt works and manufactories of knit goods, brooms, carriages, elevators, ivory buttons, lanterns, paper boxes, steel bridges, flour, and pipe organs. Pop., 1900, 3048; 1910, 3206.

THE WARSAW.

WARSAW (corruption of *guasa*). A large fish (*Promicrops guttatus*), common in the Gulf of Mexico and southward. See JEWFISH.

WARSAW, PRINCE OF. See PASKEVICH, I. F.

WARSAW, UNIVERSITY OF. A university founded in 1816 and opened in 1818. After the Polish Revolution of 1830 the university was suppressed and its library transferred to St. Petersburg. In 1857 a medical school was opened at Warsaw, and in 1861 a higher institution of learning was established, which was organized into a university in 1869. The statutes of 1884 which took away all academic freedom from Russian universities are also in force at the University of Warsaw. Before the great war it consisted of the following faculties: (1) History-philology; (2) physics-mathematics; (3) law; (4) medicine. It had an attendance of 2415 in 1913. The library is particularly rich in Polish literature and history. It contains now over 570,000 volumes and nearly 1400 manuscripts. The ethnographical museum also contains valuable manuscripts. In 1820 the astronomical observatory was erected. During the German occupation the university was reconstituted with a Polish faculty.

WARSHIP. A vessel armed and equipped for purposes of war. All fully efficient fighting ships are designed and built as such, the characteristics of a warship and merchant vessel being so different that it is impossible to transform the latter into an efficient fighting craft. Warships are divided into battleships, battle cruisers, coast-defense ships, light cruisers, gunboats, destroyers, torpedo boats, and submarines. Merchant vessels, when armed for scouting, commerce destroying, or other service, are called auxiliary cruisers. Fleet auxiliaries, such as supply ships, repair ships, hospital ships, etc., are not regarded as warships; if they carry an armament it is only a light one. Battleships are those which are best armed and protected. All of recent design in 1916 were of the "dreadnought" type, i.e., the main battery consisted of a number of heavy guns which are all of one calibre. Smaller pieces were carried, but for defense against torpedo and air craft only. Battle cruisers carry guns of the same calibre as those on contemporary battleships, from which they differ in being very much faster. This excess of speed is obtained by reducing the weight of armor protection and increasing the displacement. The so-called "armored cruisers" are no longer built. They were usually smaller than contemporary battleships, faster, carried lighter guns, and were protected by thinner armor. Protected cruisers were given the name because they were fitted with curved "protective" decks of armor just below the water line. All cruisers have such decks, and nearly all late types below the battle-cruiser class have thin armor belts along the water line as well; the speed is high, reaching 30 knots; but the battery is necessarily light and nearly all such vessels are called "light cruisers." Coast-defense ships are usually armored, and most of them are old vessels no longer fit for fleet uses; but a few small coast-defense battleships have been built for the weaker navies and during the great war Great Britain constructed some monitors of special type for inshore work. Gunboats are of many kinds, the sea-going type being merely small cruisers of 1500 tons or less. Destroyers, torpedo boats, and submarines are very completely described under the head of TORPEDO BOAT. See CRUISER; FRIGATE; MONITOR; NAVAL OPERATIONS; NAVIES; RAM, MARINE; SHIP AND SHIPPING; SHIP, ARMORED; WAR IN EUROPE; also *Navy*, under the head of UNITED STATES, FRANCE, GERMANY, ETC.

WARS OF THE ROSES. See ROSES, WARS OF THE.

WART (AS. *wearte*, OHG. *warza*, Ger. *Warze*, wart; perhaps connected with AS. *wearre*, Lat. *verruca*, wart, or with Goth. *waúrts*, Ger. *Wurz*, AS. *wyrt*, Eng. *wort*, weed, and ultimately with Eng. *root*). An excrescence of the skin due to hypertrophy of the papillæ, varying in shape, size, and position. Warts are generally round or oval, with roughened summits, frequently on the hands, rarely on the face. They appear especially upon children. There are several varieties of wart or verruca. The ordinary form, verruca vulgaris, appears upon children between the ages of 2 and 14, remains a few years, and then disappears; or they may last through life. When a wart has been cut or burned, frequently small warts, called "seed warts," appear near by. Verruca senilis is a wart probably caused by the senile degeneration of the tissues of the skin, favored by irritation and want of cleanliness. These are generally upon the back, arms, face, neck, or trunk. They are rounded and irregular, dark in color, and of a greasy feel. Frequently they are the seat of troublesome itching. Venereal warts, or condylomata, occur as a result of the discharge of gonorrhœa (q.v.) or as an evidence of syphilis (q.v.); they are found upon the genitals or the mouth, between the toes, or beneath the breasts. Warts which are threadlike, usually appearing on the face or neck, are called verrucæ filiformes. Other varieties are of little importance. Treatment of warts consists of cauterization with nitric acid, acetic acid, silver nitrate, or the acid nitrate of mercury. Salicylic acid removes some, as also a strong alkali, frequently applied. Some may be snipped off with scissors close to their bases; but they frequently return. The electrocautery and electrolysis have been used with success.

WARTABIED. See ARMENIAN CHURCH.

WARTBURG, värt'burg. A castle near Eisenach in Saxe-Weimar, Germany, situated on a hill 565 feet above the town. (See EISENACH.) It was begun about 1070 and till the year 1247 it was the residence of the Landgraves of Thuringia, attaining its greatest splendor under Hermann I (1190–1217), who was a noted patron of the arts. The castle is the occasional residence of the Grand-Duke of Saxe-Weimar. The restoration of the castle was begun in 1847 after designs by Ritzen, who reproduced with great faithfulness the original plan of the structure.

The Sängersaal in the Hofburg is noted as the scene of the legendary Wartburg Krieg or Sängerkrieg of 1207, in which the most celebrated of German minstrels competed for supremacy. Walther von der Vogelweide, Wolfram von Eschenbach, and Heinrich von Ofterdingen participated in the musical tourney, and to the first of these fell the prize. This legend, dating from the early part of the thirteenth century, was blended in time with a West German tradition regarding the contest between the pious Wolfram and the magician Klingsor aided by the devil. The story in its modified form became the subject of an early poem which attained wide currency before the end of the thirteenth century. From this source Wagner, among others, drew part of his material for the libretto of *Tannhaüser*. On Oct. 18, 1817, about 500 students

of the various German universities assembled at the Wartburg, at the instance of the Jena Burschenschaft (q.v.) to celebrate the third centennial of the beginning of the Reformation and the anniversary of the battle of Leipzig (1813). In reality the meeting was a protest on the part of the German youth against the policy of reaction which, after the Congress of Vienna, Metternich forced upon Germany. See GERMANY.

WARTEGG, ERNST VON HESSE-. See HESSE-WARTEGG, ERNST VON.

WARTENBURG, HANS YORCK VON. See YORCK VON WARTENBURG.

WARTHE, vär'te (Pol. *Warta*). A river of Germany and Russian Poland, the largest tributary of the Oder. It rises in southwest Russian Poland and flows in a general northwesterly direction, entering Prussia at its junction with the Prosna (Map: Germany, G 2). It traverses the Prussian Province of Posen through the Warthe swamps, of which 140 square miles are protected by dikes, and joins the Oder at Küstrin. Of its total length of over 540 miles, 265 miles are navigable. As the principal river of Posen the Warthe has a considerable traffic and is connected by canal with the Vistula.

WART HOG. A large bush-ranging wild pig of Africa, of which there are two species, *Phacochœrus africanus*, of Eastern Africa, called "halluf" in Abyssinia, and *Phacochœrus œthiopicus* of South Africa. Both have very long and broad heads with enormous tusks, and the face made ugly by pairs of great wartlike protuberances on each side of the nose, and one pair just below the eyes.

WARTON, wąr'ton, JOSEPH (1722–1800). An English literary critic, born at Dunsfold, Surrey. He was educated at Oriel College, Oxford, took orders in 1744, and was curate at Basingstoke (1744–45), and subsequently at Chelsea. In 1744 he published a book of verse with the title *Ode on Reading West's Pindar*, and in 1746 a collection of *Odes on Various Subjects*, in which he declared against the didactic school of poetry represented by Pope. In 1753 he published a four-volume edition of Vergil in Latin and English, himself contributing translations of the *Eclogues and Georgics*, critical essays, annotations, and a *Life* of the poet. He failed of any important preferment in the Church, and in 1755 became second master of Winchester School. From 1766 to 1793 he was headmaster. While at Winchester he published the two volumes (1757–82) of his *Essay on the Genius and Writings of Pope*, his most important work. His edition of Pope's works (1797) remained the best until the appearance of that by Elwin and Courthope. Warton became prebendary of London in 1782, and of Winchester in 1788.

WARTON, THOMAS (1728–90). An English poet and critic, born at Basingstoke. He was the younger brother of Joseph Warton (q.v.). From Trinity College, Oxford, he graduated B.A. in 1747, and M.A. in 1750. He remained at the university all his life, being professor of poetry there in 1757–67. In 1767 he took the degree of B.D. To him fell two Church livings—Kiddington in Oxfordshire (1771) and Hill Farrance in Somersetshire (1782). In 1785 he was appointed Camden professor of history at Oxford, and poet laureate in succession to William Whitehead. Warton began writing verse in boyhood. His poems (sonnets, odes, and lyrics), collected in 1777, reached a fourth edition in 1789. Written in imitation of Spenser and Milton, they are interesting as links between the older English poetry and the remarkable poetic outburst beginning with Wordsworth and Coleridge. Warton gained his reputation as a critic with *Observations on the Faerie Queene* (1754; enlarged to 2 vols., 1762), a pioneer work in the revival of enthusiasm for magic and mystery. In 1774 appeared the first volume of his *History of English Poetry*. Two more were added in 1778 and 1781, bringing the work through the age of Elizabeth. A fourth volume, intended to carry the subject onward to Pope, was never written. In spite of errors in fact and of generalizations proved incorrect by later investigations, the *History of English Poetry* still possesses very great value. Judged historically, it marks an epoch in English literary history. Warton's last important undertaking was an edition of *Poems upon Several Occasions by John Milton* (1785), which in the judgment of David Masson is the best critical edition of Milton's early poems ever published. Warton's *History of English Poetry* was reëdited with suppressions and additions by W. C. Hazlitt (London, 1874). The standard memoir is prefixed to the *Poems*, ed. by R. Mant (2 vols., Oxford, 1802). Consult also W. P. Kerr, *Thomas Warton* (Oxford, 1911), and C. Rinaker, *Thomas Warton: A Biographical and Critical Study* (Urbana, Ill., 1916).

WARWICK, wŏr'ĭk. The county town of Warwickshire, England, on the Avon, 21 miles southeast of Birmingham (Map: England, E 4). The most notable edifice is Warwick Castle, the principal residence of the earls of Warwick, beautifully situated on a rocky elevation 40 feet high, on the banks of the Avon. Of this edifice, Guy's Tower, 128 feet high, was built in 1394; and Cæsar's Tower, 147 feet high, is still more ancient. Warwick Castle possesses a valuable collection of paintings, armor, and other relics. The Leicester Hospital and the Beauchamp Chapel in the parish church are fine examples of mediæval architecture. There are ironworks and manufactures of gelatin. Originally a British settlement, Warwick was occupied by the Romans. It was destroyed by the Danes. William the Conqueror's presence is recorded in Warwick, where he erected strong fortifications, and the earls of Warwick are famous in British history. Pop., 1901, 11,889; 1911, 11,858. Consult Cooke, *Historical Guide to Warwick Castle* (Warwick, 1859).

WARWICK, wąr'wĭck. A town including several villages, in Kent Co., R. I., 5 miles south of Providence, on Narragansett and Cowesett bays, the Pawtuxet and Providence rivers, and on the New York, New Haven, and Hartford Railroad (Map: Rhode Island, C 3). In 1912 the town was divided, about 8 square miles being set apart and called West Warwick, leaving the original town with about 36 square miles. While Warwick has foundries and machine shops, a thread mill and a bleachery, it is essentially residential, the industrial quarter now being included almost wholly in West Warwick, where there are extensive manufactories of cotton goods. Pop., 1900, 21,316; 1910, 26,629; 1915 (State census), Warwick, 13,302; West Warwick, 15,782.

Warwick, founded in 1642 by a small company headed by Samuel Gorton (q.v.), was called Shawomet until 1648, when its present name

was adopted in honor of the Earl of Warwick. Massachusetts at first claimed jurisdiction, and in 1643 almost completely destroyed the settlement. In 1676 Warwick suffered severely from an Indian attack. It was the birthplace and early home of Gen. Nathanael Greene. Consult Fuller, *The History of Warwick* (Providence, 1875).

WARWICK, FRANCES EVELYN (*née* MAYNARD), COUNTESS OF (1861–). A British humanitarian. After her marriage to the fifth Earl of Warwick she became a leader of society, but was more generally known for her interest in public movements. She founded a complete organization, both at Warwick Castle and at Easton Lodge, for the welfare of the poor and nursing of the sick; the Lady Warwick College (housed in Studley Castle, Warwickshire) for training young women in horticulture, dairy, bee, and poultry keeping; a science and technical school on her Essex estate; and a home for crippled children at Warwick. Lady Warwick became an active Socialist, and lectured on Socialism in the United States. She published *Warwick Castle and its Earls* (2 vols., 1903), and *William Morris, his Home and Haunts* (1912).

WARWICK, GUY OF. See GUY OF WARWICK.

WARWICK, JOHN DUDLEY, EARL OF. An English statesman. See DUDLEY, JOHN.

WARWICK, RICHARD BEAUCHAMP, EARL OF (1382–1439). An English soldier. He succeeded to the title in 1401, and participated in the war with Owen Glendower and the Percys, and was at the battle of Shrewsbury (1403). In 1408 he set out on a pilgrimage to the Holy Land, and, after traveling widely, returned to England in 1410. In 1413 he went to France as a commissioner to treat for peace, and the next year attended the Council of Constance. In 1414 he was put in command of Calais. After the death of Henry V Warwick was in charge of the education of Henry VI (q.v.). He was employed in many difficult matters, and finally in 1437 he was appointed lieutenant to rule Normandy; this office he held until his death, April 30, 1439. Consult: Sir J. H. Ramsay, *Lancaster and York* (Oxford, 1892); C. L. Kingsford, *The First English Life of King Henry the Fifth, etc.* (ib., 1911); J. H. Wylie, *The Reign of Henry the Fifth*, vol. i (Cambridge, 1914).

WARWICK, RICHARD NEVILLE, EARL OF, popularly named THE KING-MAKER (1428–71). A celebrated English warrior and statesman. He was born on Nov. 22, 1428, the eldest son of Richard, Earl of Salisbury, and Alice, daughter and heiress of Thomas Montacute. He became the most powerful nobleman in the kingdom, by his marriage with Anne, daughter and heiress of Richard Beauchamp, Earl of Warwick, and not only acquired by this alliance the lands of the Warwick family, but was created Earl of Warwick, with succession to the heirs of his wife. He is the most prominent figure in the Wars of the Roses (q.v.). Until 1453 Warwick remained neutral, but after that he was associated with Richard, Duke of York. The first battle, at St. Albans, between Yorkists and Lancastrians in 1455, was won mainly by his impetuous onset. He was rewarded with the governorship of Calais. In 1457 he obtained command of the fleet for three years. In 1458, with five large and seven small vessels, he attacked 28 ships, 16 of which belonged to the King of Castile. After a battle of six hours he withdrew, having captured six vessels. A little later, in spite of the truce with Lübeck, he seized a fleet bound thither. Upon the renewal of civil strife in 1460 Warwick landed in Kent at the head of his Calais troops, and entered London amid acclamations. He defeated Queen Margaret's army, near Northampton (1460), with great slaughter, and took the King prisoner. The Duke of York now advanced his claim to the throne. Queen Margaret raised an army to rescue the King; and the Duke committed the monarch to the custody of Warwick, while he marched against the Lancastrians. At Wakefield, on Dec. 31, 1460, the Yorkists were overthrown by the army of Queen Margaret. The Duke was taken prisoner and put to death, and Warwick's father, the Earl of Salisbury, with 12 other Yorkist chiefs, was beheaded at Pontefract. The second battle of St. Albans was won by the Lancastrians (1461), but Edward, Earl of March, now Duke of York, accompanied by Warwick, marched boldly upon London, which was thoroughly Yorkist, and Edward was proclaimed King (Edward IV). The Lancastrians suffered defeat at Towton, and Edward, returning to London in triumph, was crowned June 22, 1461. Warwick now had his first misunderstanding with King Edward. He had been authorized to negotiate with Louis XI of France for the marriage of his sister-in-law, Princess Bona of Savoy, to King Edward, and was indignant at the King's sudden marriage with Elizabeth Woodville. He was now high in power. To the earldoms of Warwick and Salisbury, with the estates of the Despensers, he added the offices of high admiral and great chamberlain, besides the lord lieutenancy of Ireland and the government of Calais. But he was losing in the King's council and the relatives of the Queen were becoming more prominent. After having been sent into honorable banishment by means of embassies to France, Burgundy, and Brittany, Warwick in 1469 gave his daughter in marriage to George, Duke of Clarence, the King's brother, without asking Edward's permission. He finally broke out into open revolt against Edward, and concluded a treaty with Queen Margaret, by which it was agreed that her son, Prince Edward, should espouse Anne Neville, Warwick's daughter, and that in failure of issue the crown should devolve on Clarence. King Edward escaped to Holland, and Henry VI, who had been confined in the Tower, resumed the sovereignty. Edward, however, raised a body of Flemings and Dutchmen, and, landing near Hull, advanced towards London. He gave battle to King Henry's army, commanded by Warwick, at Barnet, April 14, 1471. Warwick and his brother Montagu, betrayed by Clarence, were left dead on the field, and with them fell the greatness of the house of Neville. Warwick is the hero of Lord Lytton's *The Last of the Barons*. Consult: C. W. C. Oman, *Warwick the Kingmaker* (London, 1891); Sir J. H. Ramsay, *Lancaster and York*, vol. ii (Oxford, 1892); Sir William Stubbs, *Constitutional History of England*, vol. iii (6th ed., ib., 1897).

WARWICK, ROBERT RICH, second EARL OF (1587–1658). An English Puritan nobleman and naval commander. He was the eldest son of Lord Robert Rich, who was created Earl of Warwick in 1618; in the following year the son succeeded to the title. He was educated at Emmanuel College, Cambridge, studied law, and

was admitted to the bar in 1604, and became member of Parliament for Maldon in 1610. He joined the Puritan movement; played an important part in the colonization of Rhode Island and Connecticut; was a councilor of the New England Company, and a friend of Thomas Hooker, the founder of Hartford. In the Civil War he was a supporter of the Parliamentarian cause; in 1642 he served as lieutenant of the fleet under Northumberland, whom he succeeded as admiral in 1643; and during the protectorship of Cromwell was chosen to bear the sword of state in the latter's presence.

WARWICKSHIRE, wŏr'ik-shĕr. A midland county of England (Map: England, E 4). Area, 902 square miles. The surface is generally level or gently undulating. The county is traversed by the river Avon; it was formerly covered with forest and there is still much woodland. Five-sixths of its area is under cultivation, including pastures; wheat is the chief crop, while dairying receives much attention. The north portion is industrial and its mechanical industries are very important, especially founding and the manufacture of machinery, cycles, automobiles, jewelry, and instruments. Nearly 3,000,000 tons of coal are mined annually, and the production of iron ore is increasing. Pop. (administrative county), 1901, 940,879; 1911, 1,040,409. The county town is Warwick, and the largest cities are Birmingham and Coventry.

WAR ZONE. In warfare, especially in naval warfare, the ever-present problem is to reconcile the military necessity of the belligerents with the personal and commercial rights of neutrals. The belligerent state must be free to put effective pressure upon its antagonist, but the rights of a neutral state, being inherent in sovereignty, may not be abridged by belligerent action. These principles, if rigidly insisted on, would produce inevitable clash; hence experience has suggested compromise, and international law has accorded to the belligerent the right of visit and search with a view to prevent carriage of contraband or unneutral service, as well as the more extreme right of blockade. See BLOCKADE; CONTRABAND OF WAR; INTERNATIONAL LAW; LONDON, DECLARATION OF; NEUTRALITY.

The actual zone of battle, on sea as on land, has always been considered as interdicted to neutrals, and if damage is sustained through necessary acts of war no claims for indemnity arise. But it is unsafe to press the analogy further, for while on land the theatre of operations is always under the jurisdiction either of the local sovereign or the military occupant, naval warfare is conducted in large part upon the high seas which lie outside the jurisdiction of any state and upon which all, neutrals and belligerents alike, have an equal right to be.

The restriction implied in the war zone, however, is primarily a result of new methods of warfare, such as the mine, the submarine, and the use of radiotelegraph. It was employed for the first time in the Russo-Japanese War both by way of the laying of mines on the high seas and the designation of strategical areas through which the passage of all vessels was regulated and in certain cases prohibited. Japan established 12 or more such areas, but in all cases the essential purpose was defense, though "in several areas the boundaries seem to have run outside the 3-mile limit and even 10 miles from land seems to have been included in some instances." The conclusion drawn from a discussion of the subject was that a "belligerent may be obliged to assume in time of war for his own protection a measure of control over the waters which in time of peace would be outside of his jurisdiction." (*International Law Situations,* United States Naval War College, 1912, pp. 114–129.)

The policy of the belligerents in the great war went far beyond this limited idea of defense sea areas. Charging each other with violation of international law, they proceeded, on the basis of reprisals, to preëmpt for hostile uses large areas of the high seas. These areas were mined in many cases and became the scene of an unregulated submarine warfare. Early in October, 1914, the British government advised mariners that it had authorized a mine-laying policy in the southern part of the North Sea, in retaliation for a similar policy pursued by Germany. On November 3 notice was given that the whole of the North Sea was to be considered a military area, and all vessels were warned against entering it except under Admiralty directions. This step was taken, it was stated, because of indiscriminate German mine-laying on the high seas on the trade route between Liverpool and America, the Admiralty feeling it necessary "to adopt exceptional measures appropriate to the novel conditions under which the war is being waged." On Feb. 4, 1915, the German government announced a further extension of this policy by proclaiming as a war zone the waters surrounding Great Britain and Ireland, the English Channel included. "On and after Feb. 18, 1915," according to this proclamation, "every enemy merchant ship found in the said war zone will be destroyed without its being always possible to avert the danger threatening the crews and passengers on that account. Even neutral ships are exposed to danger in the war zone, as in view of the misuse of neutral flags ordered on January 31 by the British government and of the accidents of naval war, it cannot always be avoided to strike even neutral ships in attacks that are directed at enemy ships."

The United States was prompt to protest against the proposed policy in so far as it might affect American life and property. Such a course of action, it pointed out, could not be viewed "in any other light than as an indefensible violation of neutral rights," and all steps would be taken to secure to American citizens the full enjoyment of their acknowledged rights on the high seas.

This policy of the war zone, rigorously pursued, led to a prolonged diplomatic controversy. Meanwhile a principle just beginning to get a locus standi in international law was extended, through reprisals, far beyond its original purpose, in defiance alike of the recognized laws of warfare and the long-established rights of neutrals.

Bibliography. United States Naval War College, *International Law Situations* (1912); World Peace Foundation, *War Zones* (Pamphlet Series, Boston, 1915), being the official documents as published by the United States government.

WASATCH (wą'săch *or* wą'săch') **MOUNTAINS.** A mountain range belonging to the Rocky Mountain system (Map: Utah, C 3). It begins in southeast Idaho, and runs southward, east of the Great Salt Lake and through

the centre of Utah, gradually turning to the southwest, and ending at the southwest corner of the State. It forms the eastern boundary of the Great Basin, from which it rises abruptly in great and very conspicuous rugged masses broken by deep cañons, and bearing large pine forests on its middle slopes. Its average height is about 10,000 feet, and several of its peaks are over 12,000 feet high. The range is a recent uplift, and of a composition similar to that of the minor Basin Ranges. It consists in the north of a ridge of Carboniferous rocks flanked by Tertiary and Cretaceous strata, and in the south of great masses of igneous rocks. Coal, iron, and silver constitute its chief mineral wealth.

WAS'CO (Tenino, grass people). The easternmost tribe of Chinookan stock (q.v.) formerly claiming the country on the south side of the Columbia River, about the Dalles, Oregon, and now gathered with other tribes upon the Warmspring Reservation in the same vicinity. They were essentially a fishing people. They number 242.

WASE'CA. A city and the county seat of Waseca Co., Minn., 76 miles south of St. Paul; on the Chicago and Northwestern and the Minneapolis and St. Louis railroads (Map: Minnesota, D 6). It has several grain elevators, and manufactories of flour, cereals, foundry and machine-shop products, etc. Notable buildings are the county courthouse, the First National Bank, and the People's State Bank. Adjoining the city on the east is Clear Lake. Pop., 1900, 2774; 1910, 3054.

WASH. See LOTION.

WASH, THE. A drowned plain on the east coast of England, between the counties of Lincoln and Norfolk (Map: England, G 4). It is about 22 miles in length, 15 miles in average breadth, and receives the rivers Witham, Welland, Ouse, and Nen. The shores are low and marshy, and the Wash is occupied by sandbanks, dry at low water. Two wide spaces or pools of water, called Lynn and Boston Deeps, afford anchorage for vessels.

WASHASHE, or WASASH. See OSAGE.

WASH'BURN. A city and the county seat of Bayfield Co., Wis., 60 miles east by south of Duluth, Minn.; on Chaquamegon Bay, an arm of Lake Superior, and on the Chicago and Northwestern and the Northern Pacific railroads (Map: Wisconsin, B 2). It has a handsome high school, courthouse, and city hall, and a public library. The harbor is well adapted to shipping, and considerable trade is carried on in the products of the vicinity—principally grain, lumber, and brownstone. There are saw and lumber mills, a creamery, and a large crate factory. There is a large dynamite plant four miles from the town. The Jesuits founded a mission near here in 1665. Pop., 1900, 6814; 1910, 3830.

WASHBURN, CADWALLADER COLDEN (1818–82). An American soldier, political leader, and capitalist, born at Livermore, Me. In 1839 he removed to Iowa and later to Illinois, where he studied law. In 1842 he began practice at Mineral Point, Wis. He entered into partnership with Cyrus Woodman in 1844, the firm devoting much of its attention to real estate and banking. Woodman retired in 1855 and subsequently Washburn made fortunate investments in timber lands and became one of the pioneers in the flour-milling industry. In 1854 he was elected to Congress by the Antislavery element, and was twice reëlected, serving until 1861. There he joined his brothers, Israel Washburn and Elihu B. Washburne (q.v.). Soon after the outbreak of the Civil War he raised the Second Regiment of Wisconsin Cavalry and was mustered into the Federal service in February, 1862. He served under General Curtis in Arkansas from March to July of that year and was then promoted to be brigadier general of volunteers. In November, 1862, he was promoted to be major general and was given a division in the Army of the Tennessee. In 1864 he was given command of the District of West Tennessee, which, with the exception of some months when he commanded the District of Vicksburg, he continued to administer until he resigned from the service on May 25, 1865. He was again a member of Congress from 1867 to 1871, and in 1872–74 was Governor of Wisconsin. He gave largely to education, built an observatory at the University of Wisconsin, and founded an orphan asylum at Minneapolis.

WASHBURN, EMORY (1800–77). An American jurist. He was born in Leicester, Mass.; studied at Dartmouth, but finished his education at Williams in 1817; was admitted to the bar (1821); practiced at Leicester until 1828, then at Worcester for 30 years. He served in both branches of the State Legislature, was a justice of the Common Pleas Court (1844–47), and Governor of Massachusetts (1854–55). In 1856 he was appointed Bussey professor of law in the Harvard Law School and served until 1876. He died in 1877. He published a number of pamphlets and lectures and the following legal treatises: *American Law of Real Property* (Boston, 1860); *American Law of Easements and Servitudes* (Boston, 1863).

WASHBURN, GEORGE (1833–1915). An American Congregational missionary and educator, born at Middleboro, Mass., and educated at Amherst College (A.B., 1855), and at Andover Theological Seminary. In 1858, as a missionary of the American Board (Congregational), he went to Turkey, where he labored until 1868. After seven years as professor of philosophy in and acting president of Robert College, Constantinople, he served as its president from 1877 to 1903, succeeding his father-in-law, Cyrus Hamlin (q.v.). In this office he accomplished an important work in piloting the institution successfully through a critical period. Because of his deep interest in Bulgarian independence he received the Order of St. Alexander from the Prince of Bulgaria. In 1908 he returned to the United States. He published *Fifty Years in Constantinople and Recollections of Robert College* (1909; 2d ed., 1911). Consult also W. S. Monroe, *Bulgaria and her People* (Boston, 1914).

WASHBURN, MARGARET FLOY (1871–). An American psychologist. She was born in New York City, and was educated at Vassar (A.B., 1891), and at Cornell (Ph.D., 1894). Miss Washburn served as professor of psychology and ethics at Wells College from 1894 to 1900, at Cornell was warden of Sage College and lecturer in psychology in 1900–02, and at the University of Cincinnati was assistant professor of psychology in 1902–03. Afterward she was associate professor, and from 1908 professor, at Vassar. Her contributions to periodicals deal largely with problems of sensation

and perception. She translated *Principles of Morality* (1901), which is vol. iii of Wundt's *Ethics*, and wrote *Animal Mind: Textbook of Comparative Psychology* (1908).

WASHBURN COLLEGE. An institution for higher education, founded at Topeka, Kans., in 1865 by the General Association of Congregational Ministers and Churches of Kansas. The campus contains 160 acres on which are 13 buildings. The college gives instruction through the College of Liberal Arts, the course in Engineering, Law School, School of Fine Arts, and an Academy. The value of the college buildings in 1915 was $274,708, the endowment amounted to about $260,000, and the total annual income was about $60,000. In 1916 a campaign was carried on to raise $400,000, to which the General Education Board offered to add $100,000. The total enrollment in the college in 1915–16 was 831, of whom 479 were in the College of Liberal Arts. The faculty numbered about 80. The president was Parley P. Womer, D.D.

WASH'BURNE, ELIHU BENJAMIN (1816–87). An American political leader and diplomat, born at Livermore, Me. He studied law in the Harvard Law School and was admitted to practice in 1840. He was a delegate to the Whig National Convention of 1844, and from 1853 until 1869 was a member of Congress. From 1855 until 1865 he was chairman of the Committee on Commerce, and he was also a member of the Joint Committee on Reconstruction. By his insistence on economy in the national service he gained the name of the "Watch Dog of the Treasury." Among the many bills he introduced was one for the establishment of national cemeteries. When Grant became President, he made Washburne his Secretary of State, but Washburne soon resigned to become Minister to France. During the Franco-Prussian War he represented the German interests, and during the bloody days of the Commune was the only foreign representative who remained at his post. In 1877 he returned to the United States and settled at Chicago. He published *Recollections of a Minister to France, 1869-77* (2 vols., 1887), and edited *History of the English Settlement in Edwards County, Illinois* (1882), and *The Edwards Papers* (1884).

WASH HOUSES, PUBLIC. In Great Britain and on the Continent, where public bath houses, owned and operated by the municipality, have long been in existence, it is quite common to operate public laundries in connection with the bath houses. (See BATH HOUSES, MUNICIPAL.) Within recent years, however, there has been a tendency to separate these institutions and locate them in different buildings. The first public wash house in England was built in 1842 at Liverpool, in connection with a public bath house. The first public wash house erected in Germany, having a public laundry, was built at Hamburg in 1855. Unlike the British wash houses, it is said that most of the German wash houses have proved self-supporting and sometimes yield a profit. In America there are no municipally owned public laundries. In a few of the public bath houses the bathers are supplied with conveniences for the cleansing of their wearing apparel. In Philadelphia the Public Baths Association operates a public wash house in connection with the bath house. The laundry, which at first was reserved for men on certain days, was subsequently open to women only.

WASHING MACHINES. See LAUNDRY MACHINERY.

WASHINGTON. A western State of the United States, popularly called the Evergreen State. It occupies the northwestern corner of the United States proper, lies between lat. 45° 32′ and 49° N., long. 116° 57′ and 124° 48′ W. In the northwest a deep inlet formed by the straits of Juan de Fuca, Haro, and Georgia separates the State from Vancouver Island. The greater part of the southern boundary is formed by the Columbia River. The State is roughly of rectangular shape, with an extreme length from east to west of 360 miles and an extreme breadth of 240 miles. The area is 69,127 square miles, including 2291 square miles of water. Washington ranks nineteenth in size among the States.

Topography. Washington closely resembles Oregon in its main topographical features, and, as in Oregon, the Cascade Mountains divide the State into a smaller western and a larger eastern section, which are strongly contrasting in their climatic and other characteristics. The Cascade Mountains (q.v.) vary in width from 50 miles at the southern margin of the State to over 100 miles at the international boundary. The main crest has an average altitude of about 5000 feet, but above this rise a large number of individual peaks and ridges. The highest mountains are five snow peaks of volcanic origin, as follows: Adams (12,307), St. Helens (10,000), and Rainier or Tacoma (14,408) in the southern part of the range, and Glacier Peak (10,436) and Baker (10,837) in the northern Cascades. From the eastern base of the Cascades and south of the Great Bend of the Columbia stretches the vast basaltic plateau, an undulating treeless plain lying between 500 and 2000 feet above the sea. Almost the only irregularities in its surface are the deep valleys of the Columbia and its branches, the coulees, which are more or less dry cañons, and the rolling hills of æolian origin which comprise the chief wheat lands of the State. West of the Columbia, however, the lava field has been upturned in a series of anticlinal and monoclinal ridges running east and west as spurs of the Cascades. South of the Snake River, in the southeastern corner of the State, there is another uplift, known as the Blue Mountains, exceeding 5000 feet in altitude. The northeastern quarter of the State, north of the Great Bend and the Spokane River, is rugged and mountainous, forming a connecting link between the Rocky Mountain system and the Cascades and rising in some of its peaks to an altitude of over 6000 feet. The central feature of western Washington is the Puget Sound basin, a longitudinal depression between the Cascade and Coast ranges corresponding to the Willamette valley of Oregon. Its highest parts are scarcely over 500 feet above the sea, and it is penetrated through more than half its length by the numerous branching arms of Puget Sound, forming one of the most magnificent systems of harbors in the world. The Coast Range is not very pronounced in the south, consisting of broad irregular masses having a maximum elevation of 3000 feet. In the north, however, it rises into a well-defined group called the Olympic Mountains, whose highest point is Mount Olympus, with a height of 8150 feet. The Pacific coast itself south of the Straits is but little

indented, practically the sole reëntrant being Gray's and Willapa harbors.

Hydrography. The only large independent river in Washington is the Columbia (q.v.), which drains the entire eastern section of the State. Its principal tributaries within the limits of Washington are the Pend Oreille and the Spokane rivers in the northeast and the Snake River in the southeast. Its chief affluent from the east slope of the Cascades is the Yakima. Western Washington is drained by a large number of comparatively small streams flowing into Puget Sound and the ocean. The largest of those entering the sound are the Skagit in the north and the Nisqually in the south. Of the streams rising on the western slope of the Cascades only one, the Chehalis, breaks through the Coast Range and enters the ocean directly. There are a number of lakes in eastern Washington, but most of them are either expanded rivers, such as the long and narrow Lake Chelan, the largest in the State, or remnants of old river courses. There are glaciers on several of the highest mountains.

Climate. There is a great contrast between the climates of western and eastern Washington, owing to the fact that the Cascade Range condenses the greater part of the moisture in the west winds and shuts out the tempering influence of the sea. In western Washington the climate is equable, with a mean temperature for January of 39° and for July of 62°, while the minimum is generally between 10° and 20° and the maximum about 95°. In eastern Washington the mean for January is 30° and for July 74°, while the extremes range between 112° and 30° below zero. Western Washington has a humid atmosphere, with an annual rainfall ranging from less than 25 inches at Port Townsend to 132 inches at Clearwater, on the Pacific coast. About 70 per cent of the rain falls at night. The heaviest belts of rainfall are on the western slopes of the Olympics and towards the western summit line of the Cascades. The average normal rainfall for the whole of eastern Washington is 16 inches, and except on the higher slopes in the northeast and southeast it is insufficient to support agriculture without irrigation. In the south-central part the average is less than 10 inches. Throughout the State by far the greater amount of precipitation occurs during the winter months; thus at Clearwater the normal precipitation for January is 20 inches, while in July it is only one inch. The snowfall is heavy on the western mountains, but in eastern Washington it is light, and the warm chinooks often evaporate it completely without wetting the ground. The higher peaks are capped with perpetual snow. Blizzards and tornadoes are unknown. Thunderstorms occur quite frequently in eastern Washington during the late spring and early summer months.

Soil and Vegetation. The soils are fertile in most parts of the State. The Puget Sound basin is covered with a rich alluvium over the bottom lands and a deep mantle of glacial drift over the uplands. Over the great plains of eastern Washington the soil is composed mainly of decayed volcanic material, which possesses the elements of fertility in the highest degree, and, where it has accumulated to a sufficient depth, can be rendered highly productive by irrigation. Where not irrigated, however, the eastern lava plains are treeless and consist mainly of sagebrush desert. The higher slopes of the north and east are covered with rich grasses, and on the eastern spurs and slopes of the Cascades there are open, park-like forests of pine. Western Washington, on the other hand, is covered with some of the most magnificent forests in the world. They consist mainly of gigantic coniferous trees, such as the Douglas fir, spruce, giant cedar, and Western hemlock. The forests are rendered almost impenetrable by a profusion of undergrowth thriving in the rankest luxuriance in the moist atmosphere.

Geology. In Washington the igneous and metamorphic rocks predominate, the sedimentary formations underlying only a minor portion of the State. The northern Cascades are composed mainly of metamorphic rocks with igneous intrusions; the southern Cascades have a smaller proportion of metamorphic rocks and a larger amount of igneous rocks, both in the form of dikes and lava flows. East of the Cascades and south of the Great Bend of the Columbia and the Spokane River the bed rock is almost wholly basalt. The basalt is of Middle Tertiary age and occurs as a great series of horizontal sheets or layers representing flows or outpourings of molten lava that came up from beneath through longitudinal fissures and which flowed far over the plains before cooling. The individual layers or strata of basalt vary in thickness from a few feet to several hundred, and they are well exposed for observation or study along the cañons of the Snake and the Columbia. North of the lava plains the formations are mainly metamorphic rocks, such as gneiss, schist, slate, quartzite, and marble, in age varying from Paleozoic to Tertiary. There are numerous areas of igneous rocks, represented mainly by granites, diorites, rhyolites, and basalts. The centre of the Olympics is composed of folded strata of quartzites and slates of pre-Tertiary age, surrounded on nearly all sides by conglomerates, sandstones, and shales, with some intrusive rocks, practically all of Tertiary age. About the Puget Sound basin and throughout southwestern Washington the bed rock is of Tertiary age and is made up of alternating layers of shale, sandstone, and conglomerate, with frequent outcrops of basalt. The northern part of the State and all of the higher Cascades were covered by the Pleistocene ice sheet, which made at least two well-defined advances.

Mineral Products. Washington ranked twenty-ninth among the States in the total value of minerals produced. It is the only State on the Pacific coast in which coal mining is of any importance. Coal represents over half the total value of the mineral products of the State. The product in 1914 amounted to 3,064,820 short tons, valued at $6,751,511. The principal producing area is the Rosslyn field in Kittitas County and in the counties close to Puget Sound. Cement ranks second in importance among the mineral products, and in 1914 there were produced 2,045,465 barrels, valued at $2,303,433. The principal products of the clay-working industry are vitrified brick, common brick, sewer pipes, etc. The value of the products in 1914 was $1,809,491. Basalt and sandstone are the principal quarry products. In 1914 the total value of stone produced was $1,600,615. The gold produced in the year amounted to 26,953 fine ounces, valued at $557,173. Other minerals produced are copper, lead, and silver. The total value of the mineral produced in 1914 was $13,830,739.

Agriculture. Of the total land area of approximately 42,775,040 acres, 11,712,235 were included in farms, 54.4 per cent of which was improved land. There were in that year 56,192 farms, the average number of acres per farm being 208.4. There are in the eastern section of the State large tracts of semiarid land used as ranches. The total value of all farm property including land, buildings, implements and machinery, domestic animals, poultry, and bees was $637,543,411. The average value of farm land per acre was $44.18. Of the total number of farms, 48,466 were operated by owners and managers, and 7726 by tenants. There were in that year 37,770 native white farmers, 17,297 foreign-born white farmers, and 1125 negro and other nonwhite farmers. Of the foreign-born farmers most came from Germany, Sweden, Canada, Norway, and England in order named. Of the 1125 nonwhite farmers 673 were Indians, 316 Japanese, 77 negroes, and 59 Chinese. The total acreage of all crops for which acreage was reported in 1909 was 3,431,273, and combined value of all crops $78,927,053.

The following table shows the acreage, production, and value of the principal crops as estimated for 1915 by the United States Department of Agriculture.

CROPS	Acreage	Prod. in bu.	Value
Corn	39,000	1,053,000	$811,000
Wheat	2,000,000	50,394,000	41,324,000
Oats	275,000	13,750,000	5,088,000
Rye	8,000	146,000	110,000
Potatoes	61,000	8,235,000	4,365,000
Hay	812,000	*1,868,000	20,174,000
Barley	175,000	7,263,000	4,067,000

* Tons.

The leading crops in order of importance in 1909 were wheat, hay and forage, oats, barley, and potatoes. The thirteenth census shows that there was in wheat an acreage of 2,118,015, a production of 40,920,390 bushels, valued at $35,102,370; in hay and forage an acreage of 742,137, a yield of 1,391,664 tons, valued at $17,147,648; in oats an acreage of 269,742, a production of 13,228,003 bushels, valued at $5,870,857; in barley an acreage of 171,888, a yield of 5,834,615 bushels, valued at $3,331,930. There was devoted in the same year to potatoes 57,897 acres, from which 7,667,171 bushels were harvested, the value of the crop being $2,993,737. The acreage devoted to vegetables (other than potatoes) was 24,410 and their value $2,989,000. Orchard fruits to the value of $4,274,124 were grown in the same year. Most important among such products was the apple, followed by plums and prunes. By far the most important of the small fruits is the strawberry, the total quantity raised that year being 7,683,774 quarts and their value $529,535. The total production of small fruits produced in that year was 13,480,930 quarts, valued at $941,415. The grape production in that year was 1,704,005 pounds, valued at $51,412. There were devoted to the growth of flowers and plants and nursery products 1682 acres, the output being valued at $1,044,907. There were also raised 13,794 tons of sugar beets, valued at $85,954.

Live Stock and Dairy Products.—The value of live stock on farms in 1909 was $47,370,775. According to the estimates of the United States Department of Agriculture there were on the farms of the State on Jan. 1, 1916, 308,000 horses, valued at $28,952,000; 15,000 mules, valued at $1,590,000; 263,000 milch cows, valued at $15,912,000; 221,000 cattle other than milch cows, valued at $6,696,000; 568,000 sheep, valued at $3,010,000; 314,000 swine, valued at $2,669,000. The total value of milk, cream, and butter fat sold, and butter and cheese made in 1909 was $8,746,041. There were sold 25,524,209 gallons of milk, valued at $3,889,006, and 6,751,575 pounds of butter were made, which had a value of $1,992,249. The total number of fowls of all kinds on the farms in that year was 2,272,775, valued at $1,367,440.

Irrigation.—Irrigation is carried on to a greater or less extent throughout the State. West of the Cascades the rainfall as a rule is ample for the cultivation of all crops, while the region east of the mountains is arid or semiarid. It is here that irrigation is more generally practiced, and in Yakima County from 75 to 90 per cent of the farms are so treated. The number of farms on which irrigation was carried on in 1910 was 7664, the acreage so treated being 334,378. There were in that year 1934 independent enterprises capable of irrigating 470,514 acres. The total length of ditches was 3892 miles, of which 1600 were main, while 1180 were laterals.

Forest Products. Washington held first place among the States in 1909 in the production of rough lumber, the output being 3,862,916 M feet B. M. valued at $51,083,399. Nearly 80 per cent of this was Douglas fir. The State also produced nearly three-fifths of all of the shingles manufactured in the United States and stood second in the production of laths, the output being 8,879,467 thousand and 451,384 thousand respectively. The chief species cut were Douglas fir, yellow pine, cedar, spruce, hemlock, larch, and white pine. The production of Douglas fir amounted to 3,060,983 M feet B. M., and the output of cedar was 183,952 M feet B. M. The State held second place in the production of western yellow pine with a cut of 266,357 M feet B. M., and third place in the production of larch with output of 39,795 M feet B. M. In addition to figures given above there were produced on the farms forest products valued at $3,754,293.

Fisheries. In point of value of fish products Washington ranked fourth in 1908. More than three-fourths of the value of these products was contributed by salmon and halibut. The catch of the former was valued at $1,571,000, while the output of the latter was put at $1,236,000. The oysters taken were valued at $352,500. The fishing industry gave employment to 4954 persons, and its equipment and other capital were valued at $3,441,000. The value of the apparatus employed in boat and shore fisheries greatly exceeded that reported for vessel fisheries, while the value of catch of the two classes of fisheries was about equal. The total value of the fishery products in 1908 was $3,513,000.

Manufactures. Washington ranked twenty-first among the States in total value of manufactured products, the per capita value of such products being $193. The manufacturing industry has depended very largely for its crude materials upon the natural resources of the State. The principal figures for 1909 and 1904 regarding the manufactures of the State and five leading industries are shown in the following table.

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — FIVE LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)	Expressed in thousands			
All industries	1909	3,674	80,118	69,120	$222,261	$49,766	$220,746	$102,858
	1904	2,751	51,459	45,199	96,953	30,087	128,822	62,656
Lumber and timber products	1909	1,263	47,447	43,749	97,224	31,327	89,155	52,276
	1904	1,099	32,579	30,137	44,799	19,820	54,999	35,581
Flour-mill and gristmill products	1909	96	973	644	11,077	464	17,853	2,379
	1904	76	840	613	6,490	410	14,664	1,894
Slaughtering and meat packing	1909	14	971	828	5,103	575	15,654	1,894
	1904	13	402	335	2,284	287	6,252	829
Canning and preserving	1909	80	2,284	2,029	7,355	1,272	9,585	4,549
	1904	61	834	689	2,261	380	3,617	1,266
Printing and publishing	1909	506	4,583	2,624	5,867	2,140	9,286	7,062
	1904	383	2,834	1,797	2,850	1,354	4,765	3,709

In point of total rough lumber sawed Washington ranked first in 1909. (See *Forest Products.*) By far the most important product of flour and grist mills was white flour, the production of which in 1909 was valued at $12,287,736. The most important of the slaughtering and meat-packing products is fresh beef, which in 1909 was valued at $6,035,883. The canning industry is largely confined to canning and curing of fish and the canning of oysters and clams.

The average number of wage earners was 69,120, of whom but 266 were under 16 years of age. The female wage earners numbered 2859. For a majority of the wage earners the prevailing hours of labor were 60 per week.

The 10 cities which in 1909 had a population of 10,000 or more gave employment to 39.8 per cent of the average number of wage earners and turned out 50.7 per cent of the total value of products. Seattle, the largest of the group, gave employment in 1909 to 11,331 wage earners and put out products to the value of $50,569,198. Tacoma gave employment to 5765 wage earners and manufactured products valued at $22,449,979. Spokane, with 3989 wage earners, had an output valued at $18,879,591. Everett, Bellingham, Aberdeen, Walla Walla, and North Yakima rank after these in the order named. See articles on these cities.

Transportation. Washington's water communications comprise an extensive system of waterways, consisting of the Columbia (q.v.) and Snake rivers and their branches and Puget Sound with its numerous bays and inlets, which afford excellent shipping facilities on some of the best harbors on the Pacific coast. The railroads are quite adequate and are fairly distributed over the State, and in 1914 the total mileage was 8833. The most important roads and their mileage in that year were the Northern Pacific, 2788; the Oregon and Washington, 2557; the Great Northern, 1414; the Chicago, Milwaukee, and St. Paul, 926; and the Spokane, Portland, and Seattle, 548.

Banks. As Washington was admitted to statehood long after the national banking system was introduced, the national banks are the older and the stronger institutions. The banks are sound and there were no failures even during the panic of 1893.

The following table shows the condition of the various banks in 1915:

	National banks	State banks
Number	78	244
Capital	$11,435,000	$7,882,700
Surplus	4,464,000	2,063,659
Cash	7,165,000	3,828,911
Deposits	84,876,000	56,278,759
Loans	65,316,000	44,121,441

Government. The present constitution of the State was adopted in 1889, but has since been amended in important details. Amendments may be proposed in either branch of the Legislature, but in order to become a part of the constitution must be favored by a two-thirds majority of each House and approved by the voters at large.

Legislative.—The legislative authority is vested in the Legislature, consisting of Senate and House of Representatives, both of which meet biennially. The initiative and referendum have been adopted and are in full force. The House of Representatives consists of not less than 63 nor more than 99 members. The Senators must number not more than one-half or less than one-third of the number of members of the House of Representatives. Members of the Legislature are elected biennially.

Executive.—The executive department consists of a Governor, Lieutenant Governor, Secretary of State, Treasurer, Auditor, Attorney-General, Superintendent of Public Instruction, and Commissioner of Public Lands. They are chosen at the same time and place of voting as members of the Legislature. The Governor holds office for four years, as do the other executive officers. The State Treasurer is not eligible for immediate reëlection.

Judiciary.—The judicial power is vested in a supreme court, superior court, justices of the peace, and such inferior courts as may be established by the Legislature. The supreme court consists of nine judges, the majority of whom form a quorum and may pronounce a decision. Judges of the supreme court are elected for a term of six years. In each of the organized counties is a superior court, for which at least

one judge is chosen at the general State election, to serve a term of four years.

Suffrage and Elections.—All persons, male or female, of the age of 21 years or over, who are citizens of the United States and have lived in the State one year, in the county 90 days, and in the city, ward, town, or precinct 30 days, and who are able to read and speak the English language, are allowed to vote. Indians not taxed are not allowed to vote. Elections for State officers are held on the Tuesday following the first Monday in November, every four years, in even years. All nominations to office are by primary elections. By a constitutional amendment adopted in 1914 all elected public officers, except judges of courts of record, are subject to recall.

Local and Municipal Government.—The county is the unit of local government. County officers are elected for a term of two years and may not hold office more than two terms in succession. Any city containing a population of 20,000 inhabitants or more may frame a charter for its own government.

Miscellaneous Constitutional and Statutory Provisions.—There are laws forbidding the employment of children under 14 years; providing system for the registration of births and deaths; prevention of race-track gambling; establishing pensions for mothers and a juvenile court law. State-wide prohibition went into effect on Jan. 1, 1916.

Finances. At the time of its admission to statehood Washington assumed the Territorial debt, consisting of $153,669, which existed in the form of unpaid and interest-bearing warrants. This debt was bonded in 1900. The constitution prohibits the creation of a funded debt over $400,000, but the insufficiency of taxable property made payments of money expenses impossible, and both the bonded and floating debt gradually grew. In 1900 the bonded debt amounted to $820,000, and there were outstanding debts to the amount of $721,000. Since then most of the latter has been converted into bonds. In 1914 the bonded indebtedness was $331,024. The total receipts for the fiscal year ending Dec. 30, 1915, amounted to $11,927,794, the disbursements to $10,945,613, leaving a balance in the treasury of $4,842,465.

Militia. The males of militia age in 1910 numbered 340,872. The organized militia on Jan. 1, 1915, was composed of 1244 enlisted men and 82 officers. It included a regiment of infantry, a troop of cavalry, a company of signal-corps troops, four companies of coast artillery, and three detachments of sanitary troops.

Population. The population of the State at each Federal census since its designation as a Territory was: 1860, 11,594; 1870, 23,955; 1880, 75,116; 1890, 357,232; 1900, 518,103; 1910, 1,141,990; 1915 (est.), 1,471,043. The density per square mile in 1910 was 17.1. The urban population, i.e., in places of 2500 or more, was 605,530 in 1910. The native whites of native parentage numbered 585,386, the native whites of foreign or mixed parentage 282,528, and the foreign-born whites 241,197. Japanese and Chinese constitute 1.3 per cent of the population, the Indians 1 per cent, and negroes 0.5 per cent. Of those born in foreign countries 16.2 per cent came from Canada, 13.3 from Germany, and 11.8 from Norway. Of the native-born population only 29.7 per cent was born in the State. Those from other States come largely from the northern half of the United States, Minnesota, Illinois, Iowa, and Wisconsin contributing the largest shares. By sex the population was divided into 658,663 males and 483,327 females. In 1910 there were 10 cities with a population of 8000 or over. These, with their population for 1910 and 1915 (est.), follow: Seattle, 237,194 and 330,834; Spokane, 104,402 and 142,990; Tacoma, 83,743 and 108,094; Everett, 24,814 and 33,767; Bellingham, 24,298 and 31,609; Walla Walla, 19,364 and 24,205; North Yakima, 14,082 and 19,844; Aberdeen, 13,660 and 19,277; Vancouver, 9300 and 13,555; Hoquiam, 8171 and 11,103.

Education. Washington has been one of the foremost States in the development of its educational system. The percentage of illiteracy (among those of 10 years of age and over) in 1910 was 2. In the native white population the percentage was 0.3 and in the foreign-born white population 4.8. The school population (ages 6–20 years) according to the thirteenth census was 293,478, of whom 195,259 attended school. According to the report of the State Superintendent of Education the total number of children of school age in the State on May 1, 1915, was 303,614. The average daily attendance was 190,129, out of a total enrollment of 240,521. The total number of teachers was 9068, of whom 7276 were women and 1792 were men. The average salary paid men teachers per month was $113.09 and women $85.04. There were 153 high schools fully accredited and 358 not fully credited.

Washington was one of the first States in which women were placed in charge of educational affairs. Special effort has been made to create a more general interest in practical agricultural and industrial study among the boys and girls. To further this there has been organized the Washington Boys' and Girls' Agricultural and Industrial Contest Association, which carries on a series of community, county, and State contests, in which farmers, bankers, and business men and women coöperate with school superintendents and teachers. High schools are inspected by a regular high-school inspector. The growth of high schools in numbers and efficiency in recent years has been remarkable. In 1914 there were 484 schools, in which were enrolled 31,321 students. The Legislature of 1915 passed several measures relating to education. Among these was an act establishing and providing for the maintenance of night schools. Another important measure provided for the consolidation of two or more adjoining districts in the same county, in case the majority of the electors of each district vote for such consolidation. The current school fund in 1915 amounted to $3,036,140. The total disbursement for educational purposes for the year ending June 30, 1914, was $10,850,603.

There are State normal schools at Bellingham, Cheney, and Ellensburg. The University of Washington at Seattle and the State Agricultural College at Pullman are part of the educational system of the State. Other institutions of collegiate rank are Spokane College at Spokane, the University of Puget Sound at Tacoma, Whitworth College at Tacoma, and Whitman College at Walla Walla. These are all coeducational. Conzaga College at Spokane is a Roman Catholic institution for men only.

Charities and Corrections. The charitable and correctional institutions are under the super-

vision of a State Board of Control. These institutions include Western Hospital for the Insane at Fort Steilacoom, Eastern Hospital for the Insane at Medical Lake, Northern State Hospital for the Insane at Sedro Woolley, State Institution for the Feeble-Minded at Medical Lake, State Soldiers' Home at Orting, Washington Veterinary Home at Port Orchard, State School for the Deaf and State School for the Blind at Vancouver, State Penitentiary at Walla Walla, State Training School of Chehalis, and State reformatories at Seattle, Tacoma, Olympia, Everett, and Monroe.

Religion. The Roman Catholics constitute over one-third the reported number of communicants. The Methodists, about one-third of the Catholics, rank next, followed by the Presbyterians, Lutherans, Baptists, Disciples, and Congregationalists.

History. The Territory of Washington was set off from Oregon, March 2, 1853. The southern boundary was the Columbia River to the forty-sixth parallel near Walla Walla, and thence east to the Rocky Mountains, thus including Idaho and a part of Montana. (For early history, see OREGON.) At its organization the population was only 3965, of whom 1682 were voters. With the discovery of gold in eastern Washington a great influx of population followed and the alarmed Indians determined to exterminate the whites. This led to the Washington-Oregon Indian War of 1855–56. Again, in 1857, there were serious Indian troubles concurrent with the rush of population to the gold fields of British Columbia, but the greatest rush was after the discovery of gold at Salmon River in 1860. At the time of the boundary treaty between Great Britain and the United States in 1846 (see OREGON), the forty-ninth degree was accepted as the boundary to the channel between Vancouver Island and the mainland, thence down that channel to the sea. In 1859 a dispute arose as to which channel was meant, as on this hinged the possession of the Haro Archipelago, of which San Juan is the largest island. A collision between British and American soldiers was narrowly averted. (See PICKETT, GEORGE E.) The question was finally settled in favor of the United States by the decision of the German Emperor, Oct. 21, 1872. In 1885–86 a violent agitation arose against the Chinese. Mobs burned their houses, forced them to leave towns, and in some cases resorted to murder. Martial law was declared in Seattle in 1886, and the Governor called for the aid of Federal troops. An attempt was made to secure statehood in 1876, and in 1878 a constitution was adopted, but to no purpose. In 1881–83 another bill was introduced into Congress, but again failed. In 1889 (February 22) the Omnibus Statehood Bill, admitting the two Dakotas, Montana, and Washington, was signed by the President. A constitutional convention met July 4, the constitution formed was ratified October 1, and State officers were elected at the same time. The State was admitted November 11, and its progress since has been exceedingly rapid. The Federal government has spent large sums for a navy yard and other governmental works at Port Orchard, near Seattle. In national politics the State voted for Republican electors in 1892 and for a fusion ticket of Democrats and Populists in 1896, but returned to the Republican column in 1900 and 1904. In the presidential election held in 1908 Taft received 106,062 votes, and Bryan 58,691. Samuel C. Cosgrove, Republican, was elected Governor, but died on March 28, 1909. He was succeeded by Lieutenant Governor M. E. Hay. In the election of Nov. 8, 1910, a constitutional amendment giving suffrage to women was adopted by a large majority. In 1911 the cities of Seattle and Tacoma recalled their mayors from office. In the presidential election of 1912 Roosevelt received 111,179 votes, Wilson 87,674, and Taft 71,252. The Democrats elected their candidate for Governor, Ernest Lister. A measure providing for State-wide prohibition to go into effect on Jan. 1, 1916, was carried at this election.

GOVERNORS OF WASHINGTON

TERRITORIAL

Isaac I. Stevens		1853–57
C. H. Mason	Acting	1857
Fayette McMullen		1857–58
C. H. Mason	Acting	1858–59

Bibliography. Bancroft, *History of Washington, Idaho, and Montana* (San Francisco, 1890); Evans, *History of the Pacific Northwest* (Portland, 1889); Hawthorne, *History of Washington* (New York, 1893); *Illustrated History of Klickitat, Yakima and Kittitas Counties; with Early History of the State* (Spokane, 1905); Bagley, *In the Beginning: Sketch of Early Events of Washington* (Seattle, 1906).

WASHINGTON. The capital city of the United States, conterminous with the District of Columbia (q.v.), a territory of 69¼ square miles (excluding 9¼ square miles of water), under the exclusive jurisdiction of Congress. It is situated on the Potomac River, about 100 miles from its mouth, and 40 miles by rail southwest of Baltimore, 228 miles from New York, 3118 from San Francisco, and 1110 from New Orleans; lat. (Capitol) 38° 53′ N., long. 77° W.

Description. The situation of the city is one of picturesque beauty. The Potomac stretches out nearly a mile in width along its border, the city touching tidewater and the head of navigation. Rock Creek and the Anacostia or Eastern Branch here enter the river, which is spanned by three bridges. Along the Potomac the land is low, but it gradually rises, reaching an elevation of 100 feet, and much more in the suburban portion of the city. A circle of hills forms the edge of a plateau which has in some parts an elevation of 300 to 420 feet. Formerly the section of the District bounded approxi-

mately by Rock Creek, the Potomac River, the Eastern Branch, and Florida Avenue was the city of Washington, but now there are no civil distinctions throughout the entire District. Georgetown, built partly on the heights of the Potomac River, west of Rock Creek, was a municipality before the site of the Federal city was selected. Anacostia, Brightwood, and other names given to the settlements in the District away from the main centre of population are still in use, but have no civil significance. The steam railroads enter the city from three different points and centre in the beautiful Union Station.

The plan of the city, which was made in 1791 by Pierre Charles L'Enfant, a French engineer who served in the Revolutionary War, under the direction and executing the general idea of General Washington, is generally conceded to be the most complete as well as the most artistic city system ever carried out. So far as the topography of the country outside of the former urban limits made it possible, this plan has been applied to the entire District. Out of the celebration, Dec. 12, 1900, of the Centenary of the National Capital came as its permanent memorial the plan (1902) of the Senate Park Commission (D. H. Burnham, Frederick Law Olmsted, Augustus Saint-Gaudens, C. F. McKim), extending, in principle, the plan of the park system of the city of Washington to the entire District and also suggesting sites for future public buildings and monuments. Never adopted by either House of Congress it is nevertheless being followed generally because of the authority of its reasoning. Within the old city limits the alphabetical streets run east and west and the numbered streets north and south, the whole being intersected by twenty-one avenues named from different States in the Union. The avenues converge at centres such as the Capitol and the President's house, so that these broad thoroughfares aid materially in giving that variety which is the unique feature of the city's plan, and in providing direct communication between the different centres.

The streets on the whole are among the widest in the country, ranging, as they do, from 80 to 160 feet. They are paved with asphalt very generally and the sidewalks are commonly of cement. More than 100,000 trees line the streets. Massachusetts Avenue is adorned with a quadruple row its entire length of four miles and a half. The broad diagonal avenues form at the intersections with the rectangular streets 302 squares and circles and reservations. The most important of these streets are K Street Northwest, Sixteenth Street Northwest (Avenue of the Presidents), Massachusetts Avenue, and Connecticut Avenue. The tendency in the growth of the city is towards the northwest.

Buildings. The architectural character of the city is dominated by the neoclassic spirit of the principal government buildings. At the founding of the city the Roman revival was beginning to modify the simpler Colonial taste; later the Greek revival brought in a further modifying influence. All the earlier and some of the later official buildings have been erected in one or the other of these styles or in a blending of the two. These give to the whole city an air of dignified splendor which the carrying out of the "Commission" improvements will greatly enhance. The earliest building to be completed was the "White House" (q.v.) or Executive Mansion, designed by Thomas Hoban from Ireland, in 1795, burned in 1814, and rebuilt subsequently. But the most conspicuous monument is the Capitol, at the other (east) end of Pennsylvania Avenue; whose white dome, 288 feet high, dominates the view in every direction. Begun in 1793 on plans by Wm. Thornton (q.v.) and continued under Latrobe and Bulfinch (q.v.), it was built of sandstone and substantially completed in 1811. It was burned in 1814 by the British and rebuilt by Bulfinch (1815–27). It then comprised only the central part of the present edifice. The House and Senate wings of marble and the iron dome were added by T. U. Walter (q.v.) between 1851 and 1863. The completed edifice measures 751 by 350 feet, and is decorated with pilasters and columns of the Corinthian order. The central rotunda, 97 feet in diameter and 180 feet high, has many historical paintings chiefly by John Trumbull. Statuary Hall was formerly the Hall of Representatives, and the original Senate Chamber is now occupied by the Supreme Court. The Capitol as a whole, despite faults of detail, is probably the most stately of all legislative palaces, and worthy of the dignity of the United States government. Nearly opposite it, to the east, is the Library of Congress, a fine building completed in 1897 at a cost of over $6,000,000. It is in Renaissance style, and is remarkable for the elaborate richness of its interior decorations by noted American artists. (See LIBRARY OF CONGRESS, with Plate.) The administrative offices of the Senate and House occupy two buildings of marble adjoining the Capitol grounds, with imposing Corinthian colonnades. They are respectively by Carrère and Hastings and McKim, Mead, and White.

The view from the Capitol down the broad expanse of Pennsylvania Avenue to the White House is interrupted by the unfortunate location of the great Treasury Building. This is a magnificent structure of granite, designed by Robert Mills (1845); it is of the Greek Ionic order and measures 450 by 250 feet. Near by is the huge building of the War, State, and Navy departments, by Mullet, in an uninspired and mechanical version of the French Renaissance style, picturesque in mass, but defective in detail. The Patent Office at F Street, by Mills (extended by Walter), is a massive and dignified Greek Doric building. It is the official home of the Department of the Interior, which also occupies a building across the street, formerly the Post Office Department building, with its Indian and Land offices. The old City Hall, now occupied as a courthouse, northwest of the Capitol, is an interesting building of the early nineteenth century. In quite different style from all the foregoing buildings are those devoted to the Pension Bureau and the Government Printing Office, both on G Street and built of brick. The first named is noted for its great glass-roofed court, and its exterior frieze in terra cotta depicting scenes from the Civil War. West of the Capitol, in the Mall, stand two important institutions: the Smithsonian, with its group of picturesque "Norman" buildings; and the new National Museum, a noble structure of white marble, recently completed at a cost of $4,000,000, in a dignified neoclassic style, harmonizing with the Capitol and other public buildings. In a somewhat freer Renaissance style are the charming Carnegie Library on Mt. Vernon Square, by A. R. Ross; the Corcoran

Art Gallery on New York Avenue, adjoining the White House grounds, by Ernest Flagg; the Continental Hall of the D. A. R., by E. P. Casey, and the Pan-American building of the Bureau of American Republics, by Cret and Seeler. These last two are comparatively recent buildings, as are also the magnificent Union Station by D. H. Burnham, completed in 1911 at a cost of several million dollars, and the new Post Office Department near by, by Burnham and Graham, completed in 1916, a white marble structure of the Corinthian order. The Municipal Building of the District of Columbia on the south side of Pennsylvania Avenue was completed in 1908 from plans of Cope and Stewardson. It is a handsome building in Renaissance style. Near by is the Post Office, a lofty building with a tower, in the Romanesque style (1895). The Carnegie Institution on Sixteenth Street, by Carrère and Hastings, and the magnificent new Temple of the Scottish Rite on Fifteenth Street, by J. R. Pope, are among the conspicuous buildings of the northwest section.

Important new buildings for the government are about to be along the Mall: they are those for the Agricultural Department, the Department of Justice, the Supreme Court, and the Records Office. They are all in Renaissance or neoclassic style, and will add materially to the architectural dignity of the capital. Deserving of mention apart from any architectural merit or demerit are the ordnance buildings in the old Navy Yard, where gun forgings are finished; the Bureau of Engraving and Printing in the southwest section; the National Observatory beyond Rock Creek; and the Army Medical Museum and the Fish Commission buildings in the Mall.

Owing to the District regulations limiting the height of buildings in proportion to the width of the streets, there are no "sky-scrapers" in Washington. The nearest approach to the type is seen in the Post Office, the *Star* newspaper office, the government Printing Office, the new Ebbitt Hotel, and a few hotels and apartment houses on the wider avenues. Nevertheless, the tallest masonry building in the world is in Washington—the Washington Monument (q.v.) in Monument Park, a mile and a half west of the Capitol. It is of obelisk form, 555 feet high. It closes the vista through the Mall from the Capitol. South of this is the Lincoln Monument, now in process of erection from plans by Henry Bacon—a noble Greek Doric hall, with reliefs and a colossal statue of the martyred President.

The ecclesiastical architecture of Washington calls for no special mention, but the city abounds in handsome residences, some of them of remarkable beauty.

Parks. With the exception of the Mall, the plan of the city made no provision for extensive park space. There are, however, many open places scattered throughout the city, some of which are of sufficient size to warrant their being placed in the category of small parks. Their combined area is 617 acres. While this system of little parks is to remain a feature of the urban plan as applied to the territory beyond the original city limits, yet large areas have been and are to be reserved. The latest addition is Potomac Park, a domain of 739 acres, which has been reclaimed from the Potomac River. It is practically a continuation of the Mall and will afford water drives and other attractive features. The water attractions are increased by a large tidal reservoir basin connected with the main channel of the Potomac. Another fine public reservation is the stretch of territory comprising the Zoölogical and Rock Creek parks and containing 1775 acres. The land lies on either side of Rock Creek ravine from Connecticut Avenue north to the District bounds and is broken and picturesque. A monumental bridge of concrete crosses Rock Creek at Connecticut Avenue; another at Q Street. When the reclamation of the Anacostia flats is completed, another large addition will be made to the park area.

The statues throughout the city are numerous and, on the whole, meritorious. Many are effigies in bronze of distinguished soldiers and sailors. Among them is the statue of Rochambeau in Lafayette Park, which flanks the one erected on the east side of the same park in memory of Lafayette and his compatriots in the Revolutionary War. Another is that of Frederick the Great, near the War College. Abraham Lincoln is commemorated by a bronze group erected in Lincoln Park by the colored people and elsewhere by other statues. There are also memorials to those who have won distinction along paths other than military; as, e.g., Joseph Henry, Daniel Webster, Benjamin Franklin, Samuel D. Gross, Martin Luther, Samuel Hahnemann, John Marshall, John Witherspoon, Henry W. Longfellow, and James A. Garfield.

Educational Institutions. The public-school system has the patronage of all classes of the community, and a smaller percentage of children attend private institutions than in the average city. The system includes all the approved modern features, from the technical high school to kindergarten, night school, and vacation schools. In 1915 there were 57,533 pupils enrolled and the number of teachers was 1766. There were 153 permanent school buildings. The higher educational institutions are the George Washington University (q.v.), the Catholic University of America (q.v.), Georgetown University (q.v.), Howard University (q.v.), the Carnegie Institution (q.v.), and the Columbian Institution for the Deaf and Dumb. Law, medical, and dental schools are maintained in connection with the George Washington, Georgetown, and Howard universities. There are also a law school under the auspices of the Catholic University, and the Washington College of Law, primarily for women. In addition to the National College of Pharmacy there is a pharmaceutical school in George Washington University and also one in connection with Howard University. There is in George Washington University a college of veterinary surgery. The American University, established by the Methodists, has extensive grounds near the city, and two buildings have been erected, but the university has not yet been opened. Near the Catholic University are several affiliated colleges established by various orders for the education of their members. These include St. Thomas College (Congregation of St. Paul), the Marist College, Holy Cross College, College of the Holy Land (Franciscans), St. Austin's College (Society of St. Sulpice), Trinity College for girls, and colleges conducted by the Dominicans and the Paulists. Housed in a splendid building on Seventeenth Street are the treasures of the Corcoran Art Gallery. An art school carried on in connection with the gallery has large classes.

WASHINGTON
THE CAPITOL

Libraries. Washington contains a greater number of collections of books than any other city of its size in the world. There are no less than 34 libraries owned by the government, besides the Public Library and those in educational institutions and in private hands. The aggregate number of books and pamphlets in these libraries is estimated to be more than 2,000,000. The Library of Congress, with 1,500,000 books and pamphlets, is one of the great general collections of the world. The various scientific bureaus of the government have valuable special collections. Among these may be mentioned the great medical library of the Surgeon-General's Office, and the collections belonging to the Geological Survey, the Patent Office, the Smithsonian Institution, the Agricultural Department, the Bureau of Labor, the Weather Bureau, the Bureau of Education, the Naval Observatory, and the War, State, and Navy departments. The Public Library is a free circulating library. It occupies a spacious marble structure on Mt. Vernon Square, given by Andrew Carnegie. The library is controlled by a board of trustees, appointed by the District Commissioners. The Bar Association has a valuable library in the Court House, and there are also collections of books in the various educational institutions.

Charitable Institutions. The city is well supplied with hospitals, some of the leading ones being Garfield, Providence, Freedmen's, Homœopathic, Emergency, Columbia Hospital for Women, Government Hospital for the Insane, District of Columbia Tuberculosis and Municipal Children's Hospital, Georgetown University Hospital, and George Washington University Hospital. There are many dispensaries, asylums, homes, reformation and relief societies. Social-settlement methods are not lacking. Organized charitable work on an extensive scale is carried on by the Associated Charities, which is supplied in large part with funds raised by the Citizens' Relief Committee. An incorporated company has erected sanitary homes for the poor.

Theatres, Clubs, and Hotels. Some of the leading theatres are the Columbia, the National, and the Belasco. The principal clubs are the Metropolitan, Cosmos, University, Chevy Chase, and Army and Navy, which are all in commodious homes. There is perhaps no city in the world where the flood of visitors is so continuous as at the national capital. It is probably true that more conventions and annual gatherings are held in Washington than in any other place. The facilities for the comfort and care of the stranger are extensive and thoroughly modern. Among the prominent hotels are the New Willard, Shoreham, Raleigh, Ebbitt, Gordon, Cochran, Hamilton, and Grafton.

Communications. Railroads entering the city are the Baltimore and Ohio, the Chesapeake and Ohio, the Pennsylvania, the Southern, and the Washington South at the Union Station, and the Washington and Old Dominion, the Washington Baltimore and Annapolis Electric, and the Washington and Virginia Electric at various points through the city. The city is well equipped with electric lines, underground trolleys being used exclusively within the boundaries, while the overhead are outside the city limits. Many of these lines afford cheap transportation to the outlying territory, some of them extending as far as 20 miles out into the country.

Manufactures. Washington is not a manufacturing city, but still a large sum of money is invested in manufacturing enterprises, and the value of the yearly output is considerable. The product is made up principally of articles for home consumption. According to the census reports in 1914 the District had 513 private manufacturing establishments, with a total capital of $40,799,000. They employed 8884 hands and paid in wages $6,076,000. The materials used were valued at $12,074,000. The product was valued at $28,904,000. Besides, the government employed in its manufactures 11,639 employees, receiving $16,820,000 in annual wages.

Government. Since 1874 the government has been under the control of three Commissioners, appointed by the President and approved by the Senate. The citizens have no direct voice in the appointments to office within the District, having no vote in District or national affairs.

Estimates of the money needed for municipal purposes are sent to Congress by the District Commissioners, and an appropriation bill is framed, based on these estimates. In the year 1915 the total District expenditures were $14,845,469.45, of which $1,376,359.46 was from water taxes and other trust and special funds. The principal items were as follows: education, $3,164,308.17; interest on debt and sinking fund provision, $975,408; improvements and repairs of streets, $1,671,897.19; health, including sewerage system, $1,174,622.79; protection, including police and fire departments, $1,920,589.07. Half of the amount appropriated is paid by the United States, and the other half is raised by taxation from the citizens of the District. This division of the municipal burden is based partly upon the large ownership by the United States of property in the District, which of course is untaxed and which is estimated to be one-half of the entire area of the old city and over one-third of the entire District, and also on the exclusive control of the government and its policy to keep it simply a national capital. The expenditures of money made under the direction of the Commissioners must pass the scrutiny of the auditing officers of the Treasury Department, just as in the case of all Federal expenditures. With these safeguards about municipal disbursements and the practical elimination of local politics, the affairs of the District are managed with a degree of economy and efficiency that is believed to be without a parallel in the history of municipal government. The tax rate on both real and personal property is $1.50 per hundred. In the case of real estate it is upon the assessed valuation, which is not less than two-thirds the actual value. The total debt of the District on June 30, 1915, was $6,223,000. The assessed value of real estate in 1915 was $390,098,849 and of personal property $51,341,826.

The water supply is brought from the Great Falls of the Potomac by means of an aqueduct 12 miles long. The water works are owned by the government. The fund from the water tax is kept separate from the general fund and used for the water system. A sand-filtration plant is part of the system.

Population. In 1915 the population of the District was 357,749, of whom 258,940 were white and 98,809 were colored.

History. For a number of years after the Revolutionary War the country had no permanent capital, and there was great rivalry among the principal cities to secure the seat of govern-

ment. At last, in 1790, partly as the result of a compromise and partly in deference to Washington's judgment, the Potomac country was chosen and Virginia and Maryland each offered to cede a tract to the general government. By Act of March 30, 1791, Washington, who desired a great national capital, was authorized to select the site and mark the boundaries, and this he did early in the year, the corner stone of the Federal territory being laid on April 15. On the spot chosen an Englishman named Francis Pope had settled in 1663 and had called his place Rome. Major Pierre Charles L'Enfant, a French engineer who had served in the Continental army, was chosen to lay out the town, and, though dismissed in March, 1792, he drew up a plan which was adopted by the commissioners in charge and in general accordance with which Andrew Ellicott laid out the city. In September, 1791, the name Columbia was adopted for the District and the name Washington for the city. The District was originally 10 miles square, but in 1846 the Virginia portion was retroceded, leaving a total area of 70 square miles. The land within the area of Washington laid out in lots was divided by agreement equally between the United States and the proprietors, and certain other portions were purchased by the government at a nominal price. The land for streets and avenues was given to the United States by the proprietors; it constituted 54 per cent of the area. By the sale of the lots thus obtained a part of the money used in the erection of the public buildings was secured. In order to facilitate this division the land owners deeded their entire holdings to the government, receiving from the latter title deeds. For this reason the land records within the original urban limits start from the government's title to the whole acquired in 1791. During the first few years the large scale on which the plans were drawn was in such striking contrast to the actual size of the place that by travelers and others Washington was derisively called the City of Magnificent Distances, the City of Streets without Houses, the Wilderness City, and the Capital of Miserable Huts. In 1800 the north section of the Capitol, the corner stone of which had been laid in 1793, was finished, and Congress held its first session there in November, the archives having been transferred from Philadelphia somewhat earlier. A letter writer in this year said: "The Capitol is on an eminence near the centre of the immense country called here the city. There is one good tavern and several other houses are finished or being built." The city is now regarded as coextensive with the District, though there are some differences in taxation between the urban and the rural parts.

On Aug. 24, 1814, an English force of about 5000 men under General Ross and Admiral Cockburn defeated an American militia force of about 7000 at Bladensburg (q.v.), and, advancing to Washington, set fire to the Capitol, the President's house, and other public buildings, all of which, however, were replaced within the next few years.

During the Civil War Washington was repeatedly threatened by Confederate armies, notably in July, 1864, when General Early, after defeating Gen. Lew Wallace at Monocacy, only 30 miles away, advanced to within a few miles of the city. Early in 1861 work was begun on a system of fortifications which when finished consisted of "68 inclosed forts and batteries, having an aggregate perimeter of about 14 miles and emplacements of about 1120 guns; of 93 unarmed batteries, having 401 emplacements; and of 20 miles of infantry trenches." These works have been since unoccupied with the exception of Fort Myer (q.v.) on Arlington Heights. Throughout the war Washington was a vast depot of military supplies; long trains of army wagons were almost constantly passing through its streets; immense hospitals for the sick and wounded were erected, and many churches, public institutions, and the Capitol itself were at times given up to this service. On May 23 and 24, 1865, Washington was the scene of the greatest military display ever witnessed in America, when the Federal veterans of the war were reviewed by President Andrew Johnson.

With the year 1871 began what has been called the Renaissance of Washington. Under the lead of Alexander R. Shepherd, Governor of the District, vast improvements were effected throughout the city; pavements were constructed, a sewage system devised, shade trees set out, grades equalized, parks beautified, and a new system of water supply provided. In consequence of the expense entailed by this reconstruction of the city, which was carried on with great waste, arising in a great measure from extravagance, the Territorial debt increased from $5,000,000 in 1871 to $22,000,000 in 1875, and largely on this account Congress (1874) changed the government. Georgetown, which had been settled as early as 1695, had been laid out as a town in 1751 and had been incorporated in 1789, was annexed to Washington in 1878, its charter having been withdrawn in 1871.

WASHINGTON. A city and the county seat of Wilkes Co., Ga., 75 miles by rail northwest

of Augusta, on the Georgia Railroad (Map: Georgia, D 2). It has St. Joseph's Academy and the Mary Willis Library. The village has carriage factories, foundries, and machine shops, and manufactories of fertilizers, cottonseed oil, engines, furniture, etc. Pop., 1900, 3300; 1910, 3065.

WASHINGTON. A city and the county seat of Daviess Co., Ind., 111 miles southwest of Indianapolis, on the Evansville and Indianapolis and the Baltimore and Ohio Southwestern railroads (Map: Indiana, C 7). It manufactures lumber, flour, tiling, clothes hangers, plows, and veneering. The Baltimore and Ohio Southwestern Railroad maintains repair and construction shops here. There is a public library. Pop., 1900, 8551; 1910, 7854.

WASHINGTON. A town and the county seat of Washington Co., Iowa, 66 miles southwest of Davenport, on the Chicago, Rock Island, and Pacific, the Chicago, Burlington, and Quincy, and the Chicago, Milwaukee, and St. Paul railroads (Map: Iowa, F 3). It has important horse-breeding and stock-raising interests and manufactures flour, buttons, and hog-oilers. There is a public library. Pop., 1900, 4255; 1910, 4380; 1915 (State census), 4685.

WASHINGTON. A city in Franklin Co., Mo., 54 miles west of St. Louis, on the Missouri River, and on the Missouri Pacific Railroad (Map: Missouri, E 3). There are manufactories of pipes, boxes, shoes, zithers, etc. Pop., 1900, 3015; 1910, 3670.

WASHINGTON. A borough in Warren Co., N. J., 65 miles west of Jersey City, on the Morris Canal, and on the Delaware, Lackawanna, and Western Railroad (Map: New Jersey, B 2). Washington is important industrially, having, among its manufactories, sanitary-supply works, woodworking establishments, piano and organ factories, silk mills, brass foundries, etc. Pop., 1900, 3580; 1910, 3567.

WASHINGTON. A city and the county seat of Beaufort Co., N. C., 127 miles by rail east by south of Raleigh, on the Pamlico River, and on the Atlantic Coast Line, the Washington and Vandemere, and the Norfolk and Southern railroads (Map: North Carolina, E 2). It carries on a considerable trade in cotton, corn, rice, farm produce, lumber, and naval stores. Oyster fishing and shipbuilding are important industries; and there are also steam gins, lumber and planing mills, cooperages, and manufactories of fertilizers, buggies, shirts, etc. The city contains two hospitals and the Washington Collegiate Institute. Pop., 1900, 4842; 1910, 6211.

WASHINGTON. A borough and the county seat of Washington Co., Pa., 32 miles by rail southwest of Pittsburgh, on the Pittsburgh, Cincinnati, Chicago, and St. Louis, the Baltimore and Ohio, and the Waynesburg and Washington railroads (Map: Pennsylvania, A 7). It is the seat of Washington and Jefferson College (q.v.), and of Washington Female Seminary. There are also the Citizens' and the Washington County Law libraries, and that of the Young Men's Christian Association. The leading manufactures are glass, flour, paint, carriages, tin, steel, foundry and machine shop products, baby carriages, automobile tires, electric furnaces, pottery, and brick. Originally called Bassettown, Washington received its present name in 1784. It was incorporated as a township in 1810, and was chartered as a borough in 1852. Pop., 1900, 7670; 1910, 18,778; 1915 (U. S. est.), 21,160.

WASHINGTON, Fort. See Fort Washington.

WASHINGTON, Mount. The highest peak of the White Mountains in New Hampshire, and, with the exception of a number of peaks in North Carolina and Tennessee, the highest point in the United States east of the Rocky Mountains (Map: New Hampshire, G 4). It rises from the Presidential Range near the centre of the White Mountain group, east of the Crawford Notch, and has an altitude of 6290 feet. It is composed chiefly of granite; its west slope is steep, and on the north and east it is broken by deep gorges. The lower slopes are covered with forest, but the summit is bare and rocky.

WASHINGTON, State College of. A coeducational State institution founded at Pullman, Washington, in 1890 under the National Land Grant Act. It offers partially elective courses in the departments of mathematics and civil engineering, chemistry, botany and zoölogy, agriculture, horticulture, forestry, English, economic science and history, mechanical engineering, modern languages, mining engineering, and military science and tactics with supplementary courses in physics, geology and mineralogy, Latin, and education. Special instruction is provided in the schools of agriculture, dairying, pharmacy, veterinary science, and business, the school of artisans, and the preparatory school. Provision is also made for graduate instruction. The endowment includes 190,000 acres of land, the larger part of which has not yet been converted into funds, $50,000 annually from the Morrill Fund, $15,000 from the Hatch Fund, $15,000 from the Adams Fund, $10,000 from the Smith-Lever Fund, and State appropriations amounting to about $800,000 biennially. The total attendance in 1915 was 1647, and the faculty numbered 150. The building and grounds are valued at about $1,315,000, and the college property at $293,000. The gross income amounts to about $570,000 annually. The library contains about 20,000 books and 8000 documents. The institution was formerly known as Washington Agricultural College and School of Science. The president in 1916 was Enoch A. Bryan, LL.D.

WASHINGTON, Treaty of. A treaty concluded in 1871 between the United States and Great Britain for settling various differences between the two governments, but chiefly those with regard to the Alabama claims (q.v.). In the beginning of 1871 the British government sent Sir John Rose to the United States to ascertain whether negotiations looking towards the settlement of the question in dispute would be acceptable to the President. The United States government received his advances with cordiality and on the 26th of January Sir Edward Thornton, the British Minister at Washington, formally proposed the appointment of a joint high commission to meet at Washington for the purpose of devising means for settling the matters at issue. The United States readily consented to the proposal, provided the differences growing out of the Civil War should be included among the subjects to be considered. The British government promptly accepted the American proviso and the President appointed as Commissioners Hamilton Fish, E. R. Hoar, Justice Samuel Nelson, Robert C. Schenck, and George H. Williams. The British government

selected as its Commissioners Earl de Grey (Marquis of Ripon), Sir John Macdonald, Sir Stafford Northcote, Sir Edward Thornton, and Montague Bernard. The joint commission entered at once upon its task and on the 8th of May concluded a treaty which received the prompt approval of the two governments, and which is known as the Treaty of Washington. Aside from the settlement of the dispute growing out of the so-called *Alabama* claims (q.v.), provision was made for the adjustment of the differences with regard to the Northeastern fisheries by the appointment of a mixed commission to meet at Halifax and pass upon the relative value of certain reciprocal privileges granted each of the contracting parties. Finally provision was made for submitting to the arbitration of the Emperor of Germany the dispute concerning the Northwest boundary. See SAN JUAN BOUNDARY DISPUTE.

The so-called rules of Washington agreed upon by the contracting parties for the guidance of the tribunal in the interpretation of certain terms used in the treaty, and of certain principles of international law governing the obligations of neutrals, are: (1) That due diligence "ought to be exercised by neutral governments in exact proportion to the risks to which either of the belligerents may be exposed, from a failure to fulfill the obligations of neutrality on their part." (2) "The effects of a violation of neutrality committed by means of the construction, equipment, and armament of a vessel are not done away with by any commission which the government of the belligerent power benefited by the violation of neutrality may afterward have granted to that vessel; and the ultimate step by which the offense is completed cannot be admissible as a ground for the absolution of the offender, nor can the consummation of his fraud become the means of establishing his innocence." (3) "The principle of exterritoriality has been admitted into the laws of nations, not as an absolute right, but solely as a proceeding founded on the principle of courtesy and mutual deference between different nations, and therefore can never be appealed to for the protection of acts done in violation of neutrality." The agreement on the part of Great Britain to these rules was qualified by the declaration that "her Majesty's government cannot assent to the foregoing rules as a statement of principles of international law which were in force at the time when the claims mentioned arose, but, in order to evince its desire of strengthening the friendly relations between the two countries and of making satisfactory provision for the future, agrees that the arbitrators should assume that the British government had undertaken to act on the principles set forth in the rules."

Adams, *Before and After the Treaty of Washington* (ib., 1902); J. F. Rhodes, *History of the United States*, vol. vi (ib., 1906); Fish, *American Diplomacy*, (ib., 1915). See ALABAMA CLAIMS.

WASHINGTON, BOOKER TALIAFERRO (c.1858–1915). An American educator of the negro, born near Hale's Ford, Franklin Co., Va. He was a plantation slave, the son of a mulatto slave and of a white man. After the Civil War he removed to Malden, W. Va., where he was employed in a salt furnace and later in a coal mine and where he obtained his first instruction in a night school. After much difficulty and hardship he made his way to the Hampton (Va.) Normal and Agricultural Institute, where he defrayed the cost of his board by acting as janitor, and studied for three years (1872–75). He then taught school for two years at Malden, studied further for eight months (1878–79) in the Wayland Seminary of Washington, D. C., and in 1879 was appointed an instructor at Hampton Institute. There he was successful in directing the work of about 75 Indians of whose education General Armstrong was then making trial, and introduced and took charge of the night school, which soon became an important feature. In 1881 he was appointed to establish a colored normal school at Tuskegee, Ala., the State Legislature having granted an annual appropriation of $2000 to be used for the salaries of instructors. He opened the school in a dilapidated shanty and a church, with 30 scholars, and himself as the only teacher, but he left it with many buildings, hundreds of acres of land, 1500 students and 185 teachers, and a remarkable spirit of devotion and aspiration. His efforts to better the condition of this institution led to his appearance at many important public assemblages, religious and secular, both North and South, and his addresses on these occasions soon made him known as a remarkably fluent and effective speaker. He became known, moreover, not only as a man who was tremendously in earnest, but as a far-sighted and practical reformer. His most notable address was that given at the opening of the Atlanta (Ga.) Cotton States and International Exposition in 1895, on the subject "The New Negro." In 1900 he organized the National Negro Business League at Boston, Mass. He received an honorary M. A. from Harvard in 1896 and an LL.D. from Dartmouth in 1901. When abroad he was received by the King of Denmark and addressed the National Liberal Club of London. He died at Tuskegee, Nov. 14, 1915. His publications include: *The Future of the American Negro* (1899); *Sowing and Reaping* (1900); *The Story of My Life and Work* (1900; new ed., 1915); a remarkable autobiography, *Up from Slavery* (1901); *Character-Building* (1902); *Working with the Hands* (1904), a sequel to *Up from Slavery; Tuskegee and Its People* (1905); *Putting the Most Into Life* (1906); *Frederick Douglass* (1907); *The Negro in Business* (1907); *The Story of the Negro* (1909); *My Larger Education* (1911); *The Man Farthest Down* (1912). Consult also: Thrasher, *Tuskegee: Its Story and Its Work* (Boston, 1900); W. H. Holtzclaw, *The Black Man's Burden* (New York, 1915); Stowe and Scott, *Booker T. Washington: Builder of a Civilization* (Garden City, N. Y., 1916), with introduction by Washington. See TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE.

WASHINGTON, BUSHROD (1762–1829). An American jurist, born in Westmoreland Co., Va. He was the son of John Augustine Washington, younger brother of General Washington. He graduated at William and Mary College in 1778; studied law in Philadelphia; practiced for a time in his native county; and from 1780 until the surrender of Cornwallis at Yorktown served as a volunteer in Col. J. F. Mercer's troop of horse. In 1787 he became a member of the Virginia House of Delegates, and in the fol-

lowing year was a member of the Virginia convention that ratified the Federal constitution. In 1798 he became an associate justice of the United States Supreme Court. Four years later, upon the death of Martha Washington, he inherited the mansion of Mount Vernon and part of the estate. Among his published works are: *Reports of Cases Argued and Determined in the Court of Appeals of Virginia* (1798–99); and *Reports of Cases Determined in the Circuit Court of the United States, for the Third Circuit, from 1803 till 1827*, edited by Richard Peters (1826–29). His *Life* was written by Horace Binney (privately printed, Philadelphia, 1858).

WASHINGTON, GEORGE (1732–99). Commander in chief of the Continental forces in the War of the American Revolution, and first President of the United States. He was born at Bridges Creek, Westmoreland Co., Va., Feb. 22, 1732, and was the oldest son of Augustine Washington by his second wife, Mary Ball. His great grandfather was John Washington, who emigrated from England about 1657 with his brother Lawrence. John became a landed proprietor and planter in Virginia, in the Northern Neck, a district between the Potomac and the Rappahannock rivers, and left two sons, Lawrence and John, the former being the father of Augustine. The little recorded concerning Augustine Washington represents him as a man of high character. By his first wife he had three sons and a daughter; by Mary Ball, who was endowed with great intelligence and beauty, four sons and two daughters. Soon after George's birth his father removed to a farm on the Rappahannock River, opposite Fredericksburg, where he died in 1743. His estate was bequeathed to George; the other children were handsomely provided for, Lawrence receiving the estate afterward called Mount Vernon. But while the family had a competency and were large landed proprietors, the facilities for education in the Colonies—particularly in the South—were at this time so meagre that the younger children were forced to depend on the poor common schools of the neighborhood, where they acquired only the rudimentary branches. Yet, though naturally diffident, George saw something of planter society, and at the age of 13 he wrote out for his own use 110 maxims of civility and good behavior.

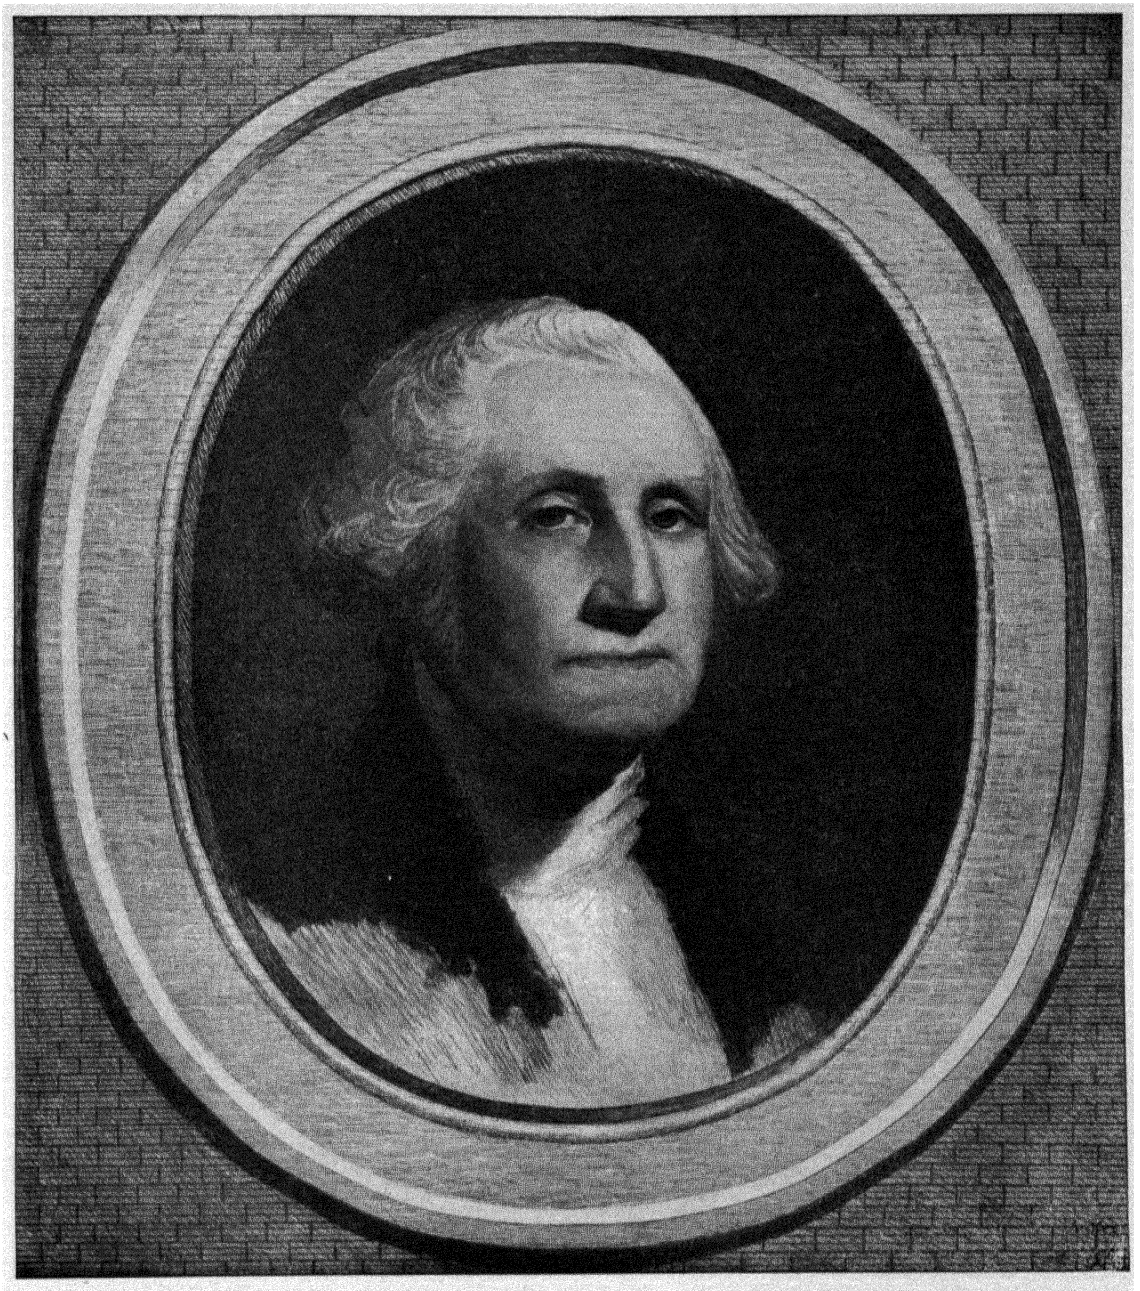
He was athletic in form, much given to exercising, a graceful and expert rider, and fond of the wild life of the woods and encampments. He had the customary boyish proclivity towards imitation of military service, possibly in a marked degree, and appears to have been generally chosen as a leader by the companions of his youth, and to have been deferred to by them in the settlement of disputes which arose. As a growing lad, he was not remarkable as a scholar; was rather reserved and sedate in his demeanor; and was of a more serious turn of mind than is usual among boys. Such education as he received was completed by the time he was 16 years of age, his last two years of schooling having been devoted mainly to the study of engineering, geometry, trigonometry, and surveying, probably from his having a mathematical turn of mind, and also because the profession promised advantages, in view of the wild state of the country and the increasing demand for accurate surveys.

In 1748 Washington received a commission as public surveyor, and the summer months of the next three years were occupied by him in the duties of his profession, more particularly in the region of the Alleghanies, and especially on the immense tracts of land owned by Thomas, Lord Fairfax, the first surveys of which he made in March and April, 1748. Surveyors were scarce, and the remuneration was ample, and as the young Virginian was economical, he saved money, and acquired property by purchase long before he reached his majority. This fact and the qualities of character which he displayed gained him a solid reputation; and he was thus early regarded with esteem and confidence by the leading men in the Colony.

The year 1751 found the frontiers of Virginia threatened by the French and Indians, and frequent attacks and depredations occurred, necessitating some provision for the public safety. The Colony was accordingly divided into military districts, to each of which an adjutant general was appointed, with the rank of major, and a salary of £150 per annum. George Washington received one of these appointments, and entered with zeal on the study of military tactics and strategy, chiefly under Adjutant Muse, a Virginian, and Jacob Van Braem, a Dutch soldier of fortune. These studies were interrupted in 1751–52 by an excursion to Barbados with Lawrence, who was sent thither by his physicians. On his death, in July, 1752, Lawrence bequeathed to George the estate of Mount Vernon, which had been left to him by his father. The care of this property and his military duties occupied George until 1753, when he was sent as a commissioner by Governor Dinwiddie to gain information concerning the intentions of the French, who had sent an expedition to the headwaters of the Ohio, and to warn them against trespassing upon territory claimed by Virginia. Washington acquitted himself of this mission very creditably, displaying great judgment, coolness, and address. He set out from Williamsburg in October, 1753, with no escort, and performed his journey through nearly 600 miles of wilderness in a most intrepid manner in spite of treachery and accidents. In the spring of 1754 he was made second in command of the regiment which formed the military establishment of the Colony, and, with half the regiment, was sent forward to occupy the outposts on the Ohio. His superior officer, Col. Joshua Fry, suddenly died, and he was soon left in sole command. This was his first campaign, and he at once distinguished himself by defeating a detachment of the French under Jumonville. The skirmish of Great Meadows (July 3, 1754), which followed, resulted in the capitulation of the provincial forces on terms honorable to Washington. On a reorganization of the Virginia troops, which meant an inferior military grade for him, he resigned his commission and retired to Mount Vernon, refusing in a dignified way offers from Governor Sharpe of Maryland of a renewal of his commission under conditions he deemed incompatible with self-respect.

In 1755, however, he accepted a position as aide on General Braddock's staff and passed through the ill-fated campaign of that year. His personal bravery under fire was conspicuously shown in the disastrous battle of the Monongahela, July 9, in which he displayed the greatest gallantry, and it was recognized that Braddock's defeat was largely due to neglect of

Washington's wise counsel. The duty now fell to Washington of reorganizing the provincial troops, and he retained the command of them until the close of the campaign of 1758, when he resigned his commission and retired to private life.



On Jan. 6, 1759, Washington married Mrs. Martha Custis, a young widow with two children, John and Martha Parke Custis, and wealthy in her own right. The management of her large estate, combined with that of his own, now occupied most of his time, at least until about 1763. Having been elected to the House of Burgesses of Virginia shortly before his marriage, he now began to appear prominently in public affairs, attending regularly every meeting of the Assembly, and, though seldom speaking, taking care to be thoroughly informed upon every prominent public question. He moved much in society; was also an enthusiastic hunter; practiced a generous hospitality at Mount Vernon; associated constantly with the leading men of the Colony; and soon, and imperceptibly, gained a recognized position as a man of great ability and marked personal influence. At this time he was frequently made the depositary of important trusts, and was very often chosen to act as arbitrator in disputes arising among the colonists. His devotion to business and affairs was untiring, his industry extraordinary. He personally took charge of all his numerous accounts and business records, conducted his large and increasing correspondence, and drafted all his own contracts and deeds. At the outbreak of the Revolution he was recognized as the leading man in the Colony of Virginia, and was certainly one of the wealthiest in the Colonies.

When the disputes between the Colonies and England began, Washington held that arms should be the last resort. His respect for lawful authority made him dread any rupture; nevertheless, he drew up in 1769 a nonimportation agreement, which was signed by the House of Burgesses, and at the provincial convention at Williamsburg, Aug. 1, 1774, he was among the foremost in asserting the right of the Colonies to self-government. It was at this time that he made one of the few impulsive speeches recorded of him. Touched by the sufferings of Boston, resulting from the enforcement of the Boston Port Bill (q.v.), he exclaimed: "I will raise 1000 men, subsist them at my own expense, and march with them, at their head, for the relief of Boston." He was one of the six Virginia delegates appointed to the first Continental Congress, which met in September, 1774; and on June 15, 1775, was chosen by that body commander in chief of the Continental army, his nomination having been formally made by Thomas Johnson of Maryland and warmly seconded by John Adams. He accepted with great modesty, refused any pay for his services, and asked only that his expenses be refunded to him after the war. For this important position his previous education had singularly adapted him. Not only was he competent in military affairs and skilled by precept and experience in the art of war, but his extensive knowledge of the geographical character of the country, and his familiarity with the characteristics and qualifications of the royal army, made him certainly the most dangerous antagonist, as a commanding officer, with whom that army could have to cope in the Colonies.

Washington left Philadelphia on June 21, joined the army at Cambridge, and assumed command on July 3, 1775. This army numbered about 16,000 men, all told. It was in want of everything that could make it an effective fighting force—arms, ammunition, accoutrements, and, worse than all, esprit de corps. He proceeded at once to complete an effective organization of his army, by forming it into six brigades of six regiments each, keeping together the troops from each Colony, as far as practicable, and placing them under a commander from their Colony. He maintained a constant correspondence with Congress, pressing his views earnestly upon that body, and, though slowly, with marked success. All the officers were commissioned anew by Congress, and gradually a Continental army was formed. Washington corresponded with the heads of the different Colonial governments, and afterward with the Governors of the several States, and succeeded at length, not only in creating the American army, but in becoming the sole channel of communication between it and the numerous and complicated depositories of authority in the United States. But all this was accomplished amid embarrassments innumerable. The army itself became diminished by the expiration of terms of enlistment; there were cabals among the officers, and disagreements with the civil authorities. For the events of the Revolutionary War, see UNITED STATES, *History*. After the war Washington exerted himself in endeavoring to obtain from Congress a settlement of the claims of his officers. It is probable that, had Washington so desired, he could at this time have founded a monarchy, sustained by his army. He took the course, on the contrary, of quelling this disposition on the part of his soldiers whenever it showed itself. On June 8, 1783, he issued his splendid letter to the Governors of the States with regard to the necessity of establishing a firm and dignified Federal government. On Nov. 25, 1783, the British evacuated New York; on December 4 Washington delivered his farewell address to the army; and on December 23, at Annapolis, he resigned his commission to Congress and retired to private life.

During the five years following the close of Washington's military career, he found sufficient occupation in attending to the affairs of his homestead and property, and in fostering the progress of his native State. Mount Vernon was now constantly the scene of a profuse hospitality over which Washington presided with the courtly dignity natural to him. He maintained his keen interest in public affairs, greatly regretting the general chaos and such disgraceful outbreaks as Shays's Rebellion, and helped by his correspondence to bring the leading men of the country to a determination to form a more perfect Union. He was president of the Philadelphia convention of 1787, which framed the Constitution of the United States. Washington was unanimously chosen the first President of the United States, and on April 30, 1789, took the oath of office in New York, where Congress was then sitting.

Washington's administration of the civil government was marked by the methodical precision which had characterized his conduct through life. His conscientious habit of undertaking no duty until he comprehended its entire scope and bearing was also especially apparent in his new position. He thoroughly informed himself

GEORGE WASHINGTON
FROM AN ETCHING BY T. JOHNSON

concerning all affairs of state, and every political act of importance which had been performed by the government and its agents since his retirement. He personally directed the organization of the different departments of the government under the new system, and in accordance with the Constitution, and no act of his was more significant than his appointment as heads of departments of such distinguished and able men as Jefferson, Hamilton, Knox, and Edmund Randolph. Meanwhile, before the work of Congress began, Washington found time to make a tour through the Eastern States, better to acquaint himself with the views of the men who were presently to lay the foundations of the commercial and industrial greatness of the United States. Before Congress, in his first message, he laid an eminently judicious series of suggestions of laws and provisions, which were at once made the basis of legislation. He refrained sedulously from allying himself with either of the two parties, Federalist and Democratic Republican, forming under Hamilton and Jefferson; and, on the contrary, strove to reconcile the differences between the leaders which he foresaw must inevitably in the future bring about wider differences among the people. The success of his first administration, and the universal sense of a security under his leadership, produced a general anxiety, as his term of office drew to a close, that Washington should accept the presidency for a second term. Jefferson and Hamilton—wide apart as the poles in their political opinions, and personally at enmity with each other—agreed in this; and each wrote a letter to Washington urging his compliance with what was now a great popular demand. To their solicitation and that of others he acceded; he was reëlected unanimously, and on March 4, 1793, took the oath of office for the second time as President of the United States.

The very beginning of Washington's second administration saw the United States drawn into the vortex of European politics. The French Revolution was culminating in a Reign of Terror. Great Britain and France were at war, and gratitude seemed to demand that the western Republic should sustain her sister state and former ally in the existing struggle. But Washington was especially opposed to foreign complications, and while he recognized the French Republic, and received its representative, he steadfastly adhered to his resolution to avoid interference in European turmoils, and issued a proclamation of neutrality on April 22, 1793. Factions now arose in the United States, the one side seeking to enforce practical adherence to the cause of France and the other sustaining Washington in the face of bitter accusations of bias in favor of the recent enemy of America, Great Britain. Between Republicans and Federalists the line was now drawn strictly on this basis. Dissensions and resignations occurred in the cabinet. Among the people Jacobin clubs were formed, which were as virulent in the expression of their animosities as were their prototypes in France. In the midst of all the excitement consequent upon such a state of affairs, which was greatly increased by the injudicious, not to say insulting, defiance of the proclamation of neutrality by Genet, the French representative to the United States, Washington sent John Jay as envoy extraordinary to England. Jay negotiated a commercial treaty which, though by no means satisfactory, was better than nothing, and this was signed by Washington on Aug. 18, 1795. (See JAY TREATY.) Thus, by his wisdom and determination, did Washington prevent his country—just emerging from the trials and vicissitudes of the War of Independence—from engaging in entangling alliances which would certainly have precipitated renewed warfare and perhaps have rendered impossible the growth of the Republic.

Among the important events of Washington's administration were the admission of Vermont, Kentucky, and Tennessee into the Union, the assumption of the war debts of the States by the Federal government, the chartering of the Bank of the United States, the establishment of the national mint, the Whisky Insurrection (q.v.) of 1794 in western Pennsylvania, the unsuccessful expedition of General Harmar against the northwestern Indians in 1790, the disastrous defeat of General St. Clair by them in 1791, and the victory gained by General Wayne over them at Fallen Timbers, Aug. 20, 1794. The retirement of Jefferson from the cabinet, and the more decided ascendency of Hamilton in the councils of the Administration, also should be mentioned, as well as the scurrilous attacks upon Washington by the radical adherents of the former. While Washington leaned to the Federalist side, he was far from being the mere instrument of the brilliant Hamilton.

On Sept. 19, 1796, Washington, declining to serve again, issued his Farewell Address to the country he had been so largely instrumental in forming almost out of chaos. He delivered his last presidential message, turned over his office to his successor, John Adams, and retired to his home at Mount Vernon, followed by the love and veneration of his people. For further details concerning his two administrations as President, see the article UNITED STATES.

At Mount Vernon he devoted himself to agriculture. In 1798 the prospect of a war with France led to his appointment as commander in chief of the National army. On Dec. 12, 1799, he was exposed in the saddle, for several hours, to cold and snow, and attacked with acute largyngitis, for which he was repeatedly and largely bled. He sank rapidly, and died on December 14. His last words were characteristic. He said: "I die hard; but I am not afraid to go. I believed from my first attack that I should not survive it. My breath cannot last long." A little later he said: "I feel myself going. I thank you for your attentions; but I pray you to take no more trouble about me. Let me go off quietly. I cannot last long." After some instructions to his secretary about his burial he became easier, felt his own pulse, and died without a struggle.

When news of his death reached Europe, the mourning became almost as widespread as it had been in America. The armies of Bonaparte and the Channel fleet of Great Britain did homage to his memory. It was admitted on all hands that a cosmopolitan statesman of the highest rank, and a noble friend of mankind, was lost to the world. The eulogy of "Light-Horse Harry" Lee that he was "First in war, first in peace, and first in the hearts of his countrymen," thus had a wider meaning than its author intended perhaps to give it—a meaning which the lapse of years has extended rather than diminished.

Washington was 6 feet 2 inches in height, with brown hair, blue eyes, large head and

hands, and strong arms. The portraits painted in his early life are perhaps the most truthful, as the artificial teeth worn in his later years altered decidedly the expression of his face. The statue by Houdon, at Richmond, has been accepted as the typical likeness, but the forehead is probably too retreating. The earliest known portrait, by Charles Wilson Peale, was painted in 1772. That by Joseph Wright, painted in 1782, was highly approved by Washington himself. Those by Trumbull and Sharpless are considered faithful in most respects. Those by Stuart are somewhat idealized. No one picture can be accepted as entirely satisfactory. Washington was a forcible, but not a fluent, speaker. He was attentive to his personal appearance and somewhat fond of display. To a natural diffidence was doubtless due the cold and reserved manner that distinguished him when in public life. Towards young people, and especially towards his nieces and nephews—his adopted children, for he had none of his own—he was gracious and gentle. He was fond of fox hunting, visited the theatre occasionally, and was a moderate wine drinker, but was opposed to the use of tobacco, although he raised it on his plantations. He was, like nearly all Americans of property at that period, a slaveholder, but he was a considerate master. He possessed at his death 124 slaves, whom he directed, in his will, to be emancipated at the death of his wife, so that the negroes of the two estates who had intermarried might not be separated. As early as 1786 he expressed himself in favor of abolition by legislative authority. He was not a scholar, and the 1200 or more volumes that composed his library were chiefly on agricultural and military topics. He was a member of the Protestant Episcopal church, but the exact nature of his religious opinions is a subject of controversy.

The early biographers of Washington erred in representing him as an ideal being of almost superhuman excellence. The criticism of later times deems it but honest to portray the man as he was. There are writers who, forgetting that balance of genius is rarer and more commendable often than brilliance, are inclined to rate him below Hamilton or Jefferson in political wisdom; but even these echo the tributes paid by the world to his unselfish devotion to duty, especially to the cause of independence, to his courage, his sublime hopefulness under defeat, his strong will, his marvelous insight into character, his abiding faith in God, and his absolute integrity and purity of motives. When these virtues are considered, few, if any, heroes of history can be placed beside him. The site for a fitting memorial to Washington was appropriated by Congress and plans were accepted for its construction in 1915. They called for a fine Colonial building to be used as a headquarters for patriotic, educational, literary, scientific, medical, and similar organizations in the United States.

Washington's wife, who was of nearly the same age with him, is described as having been amiable in character and lovely in person. She was the daughter of Col. John Dandridge, of New Kent County, and was born in May, 1732. Her first husband, to whom she was married in June, 1749, was Daniel Parke Custis, a wealthy planter. By the courtesy of the period she was called Lady Washington, and whether in her own home or at the "Federal court," she presided with dignity and grace. She died at Mount Vernon, May 22, 1802.

Bibliography. *The Life and Writings of George Washington* by Jared Sparks (12 vols., Boston, 1834–37) has been for the most part superseded by *The Writings of George Washington* edited by W. C. Ford (14 vols., New York, 1889–93); *Letters to Washington*, edited by S. M. Hamilton (5 vols., Boston, 1898–1902), are of interest. Consult also: *The Diary of George Washington, from 1789 to 1791*, edited by B. J. Lossing (New York, 1860); *Washington and the West: Diary of September, 1784* (1905); Chief Justice Marshall, *The Life of George Washington* (5 vols., Philadelphia, 1804); Washington Irving, *Life of George Washington* (5 vols., New York, 1855–59); Richard Rush, *Washington in Domestic Life* (Philadelphia, 1857); H. C. Lodge, *George Washington*, in the "American Statesmen" series, (2 vols., Boston, 1898); H. B. Carrington, *Washington the Soldier* (Boston, 1898); R. H. Schauffler, *Washington's Birthday* (New York, 1910); G. O. Trevelyan, *The American Revolution* (4 vols., ib., 1905–12); P. L. Haworth, *George Washington: Farmer* (Indianapolis, 1915). For the history of Washington's administrations, see Schouler's and McMaster's histories of the United States.

WASHINGTON, Henry Stephens (1867–). An American mining geologist, born at Newark, N. J. He was educated at Yale (A.B., 1886), where he was an assistant in physics (1886–88) and in mineralogy (1895–96), at Leipzig (Ph.D., 1893), and at the American School for Classical Studies, Athens, Greece. After 1892 he engaged in geological investigations (mainly in the branch of petrology), visiting, in pursuit of his studies, Greece, Asia Minor, Italy, Spain, Brazil, and various parts of the United States. After 1906 he was also a consulting mining geologist. His publications include: *Chemical Analyses of Igneous Rocks* (1903); *Manual of the Chemical Analysis of Rocks* (1904; 2d ed., 1910); *The Roman Comagmatic Region* (1907).

WASHINGTON, University of. A coeducational and State institution for higher education founded at Seattle, Wash., in 1861. For several years the work of the University did not rank greatly above that of an academy, but in recent years it has assumed a high place among American State universities. The first class was graduated in 1876. The university includes 10 schools and colleges, the graduate school, college of liberal arts, college of science, college of education, college of engineering, college of fine arts, college of forestry, school of law, college of mines, and college of pharmacy. The total registration in all departments in 1915–16 was 3225. There is held annually a summer session in which over 1000 students are in attendence. An extension division gives instruction through extension classes by correspondence to 1000 additional students. The faculty in 1915–16 numbered 219. The university was a pioneer in giving instruction in journalism, such a course being established as early as 1868. The property of the university is valued at about $5,000,000, the grounds, buildings, and equipment at $2,536,662, and the annual income to about $555,000. The grounds cover 355 acres, within the limits of the city of Seattle. The president in 1916 was Henry Suzzallo, Ph. D.

WASHINGTON, WILLIAM (1752–1810). An American soldier, a kinsman of George Washington, born in Stafford Co., Va. He was educated for the ministry, but on the outbreak of the Revolutionary War entered the patriot army as a captain under Col. Hugh Mercer. He was wounded in the battles of Long Island and Trenton; fought at Princeton; and later became a major in Colonel Baylor's corps of cavalry. In 1779 he joined General Lincoln's army in the South and became a lieutenant colonel in March, 1780. At the battle of Cowpens he made a charge upon Tarleton's troops that decided the day, and in the pursuit he had a personal encounter with the British leader. He assisted in covering the rear of Greene's army in the famous retreat before Cornwallis, and fought with great distinction at Guilford Court House and Hobkirk's Hill. At Eutaw Springs he was taken prisoner, and was not released until the close of the war. He later settled in Charleston, and became a member of the South Carolina Legislature. When war with France became imminent in 1798, he was, upon the recommendation of General Washington, made a brigadier general.

WASHINGTON AND JEFFERSON COLLEGE. An institution for higher education founded at Washington, Pennsylvania, in 1802. The students in 1915–16 numbered 326, and the instructors 21. The productive funds of the college amount to about $900,000, and the annual income to about $70,000. The library contains about 26,500 volumes. The president in 1916 was Frederick W. Hinitt, Ph.D., D.D.

WASHINGTON AND LEE UNIVERSITY. An undenominational institution of learning at Lexington, Va., established as the Augusta Academy in 1749 and chartered in 1782. The first considerable amount of money received by the school was that given by George Washington, which still yields an annual income of $3000 to the university. The name was in consequence changed in 1798 to Washington Academy. In 1802 the Cincinnati Society, on dissolving the organization, appropriated the residue of their funds to the institution. In 1813 its name was changed to Washington College. Gen. Robert E. Lee was made president of the college in 1865, and during an administration of five years wielded great power for good with the students. After his death the corporate name of the institution was changed in 1871 to its present title, and in the same year Gen. G. W. Custis Lee succeeded his father as president, resigning in 1897. His successor was William Lyne Wilson, former Postmaster-General of the United States, who died in 1900. The following year George Hutcheson Denny, LL.D., was elected to the vacant position. He was succeeded in 1912 by Henry Louis Smith, Ph.D., LL.D. The university is divided into four schools, the college, the school of commerce, the school of applied science, and the school of law, with courses leading to the degrees of B.A., B.S., and LL.B. It accepts the certificates of accredited schools in lieu of the entrance examination and offers a number of free scholarships and a university fellowship. In 1916 it had a faculty of 33; 513 students; an endowment of $950,000, with an income of $100,000, and property valued at $660,000, including buildings and grounds worth $450,000. The library numbered 50,000 volumes.

WASHINGTON BARRACKS. A United States Military Post, established in 1797 as Washington Arsenal. The reservation, which includes 69 acres, is situated on Greenleaf's Point in the city of Washington, D. C., which is the post office and telegraph station. It was changed from an arsenal to an artillery post in 1881, and quarters for 25 officers and 400 men and stables for 150 horses were provided. It is the headquarters of the War College, and of the Engineer School. Washington Barracks has been occupied by engineering troops since 1901 and is the repository for part of the military bridge equipage of the United States army, as well as for miscellaneous engineering tools and scientific instruments. The garrison, under normal conditions, is a battalion of engineers.

WASHINGTON COURT HOUSE. A city and the county seat of Fayette Co., Ohio, 40 miles southwest of Columbus, on the Cincinnati, Hamilton, and Dayton, the Baltimore and Ohio Southwestern, the Detroit, Toledo, and Ironton, and the Pennsylvania railroads (Map: Ohio, C 6). It is one of the largest live-stock markets of the country, has two canning plants, and manufactures boots and shoes, flour, furniture, stoves, lumber, etc. Poultry packing is also an important industry. Pop., 1900, 5751; 1910, 7277.

WASHINGTON ELM. A venerable elm northwest of the common in Cambridge, Mass., under which Washington is said to have assumed command of the American army on July 3, 1775. The tree, though carefully protected, is decaying and only about one half remains.

WASHINGTON MONUMENT. A huge shaft in the form of an obelisk, erected in Washington, D. C., to the memory of the first President of the United States. It is the highest masonry structure in the world, having an altitude of over 555 feet, and was designed by Robert Mills (q.v.). The corner stone was laid in 1848 and work on the monument continued slowly until 1877, when it ceased, but was resumed in 1878, and finished in 1884. The Washington National Monument Society originated the plan and controlled the work of construction until 1877, when its property was conveyed to the United States. Maryland marble is the material out of which the monument was constructed. The foundation covers an area of 16,000 feet, and weighs 36,912 gross tons. The shaft is 55 feet 1.5 inches square at the bottom, 34 feet 5.5 inches square at the top, weighs 43,633 gross tons, and is 500 feet 5⅛ inches high; the apex, weighing 300 tons, is 55 feet high, its summit being nearly 600 feet above the tide water of the Potomac. The apex is capped by an aluminium point. Towards the cost of erection the Monument Society had expended $300,000; the total cost has been $1,187,710.31. Lieutenant Colonel T. L. Casey, of the United States Engineers, had charge of the work of construction after it passed under the control of the United States. An elevator and an iron stairway of 900 steps within the monument afford access to the base of the apex. The interior of the shaft contains 179 memorial stones donated by various countries, states, and societies.

WASHINGTON UNIVERSITY. A nonsectarian institution, chartered at St. Louis, in 1853, as Eliot Seminary, in honor of Rev. William G. Eliot. In deference to his wishes the name was changed to Washington Institute. Its first educational work under the charter was

the opening of an evening school for boys, the O'Fallon Polytechnic Institute. In 1857 the institution assumed the title of Washington University. The first college degrees were granted in 1862. A law school was organized in 1867, the Polytechnic School now known as the schools of Engineering and Architecture in 1870, the School of Fine Arts in 1879, and the School of Botany in 1885. The St. Louis Medical College founded in 1842, became a department of the university in 1891, the Missouri Dental College in 1892, and the Missouri Medical College in 1899. Students are admitted to the undergraduate department on examination, or by certificate from an accredited school. The college confers the degree of Bachelor of Arts, and the schools of Engineering and Architecture that of Bachelor of Science. The professional degrees of mechanical, chemical, civil, and electrical engineering are given only after three years or more of successful practice. The master's degree in art and science and the degree of Ph.D. are also conferred. In 1894 a tract of land of which the university now owns about 155 acres just outside the city limits northwest of Forest Park was purchased as a new site for the university, and gifts made by citizens of St. Louis made it possible to begin building at once. The 10 new buildings and new grounds were occupied by the Louisiana Purchase Exposition Company, until January, 1905, at which time the university took possession of the new site and buildings now numbering 13. The Barnes Hospital and the St. Louis Children's Hospital have entered into an affiliation with the Medical School, the school constituting the medical staff and opening their laboratories to the hospitals, the hospital permitting the medical school to use their wards for teaching and investigation. In 1915–16 the faculty numbered 220, and the students enrolled were 1871, without duplicates. Of the students, 1362 were in arts and science, including 627 enrolled in Saturday and evening courses, 379 in the professional schools, and 188 in the art schools. The value of the grounds and buildings in 1915 was estimated at $3,990,000, the equipment at $1,060,000, the total value of the university property at $14,173,000, the endowment $7,065,000, other invested funds about $2,000,000. The library contains about 155,000 volumes and about 60,000 pamphlets. In 1916 the chancellor was David F. Houston.

WASHITA (wŏsh'ī-tà) **RIVER.** See OUACHITA.

WASH'O. A small tribe constituting a distinct linguistic stock, occupying the eastern slopes and valleys of the Sierra Nevada, west of Reno and Carson City, Nev. They appear to be entirely distinct from any other tribe, and are probably the remnant of a more numerous people destroyed by disease or exterminating wars. Nothing is known of their tribal traditions or customs beyond the fact that their women are noted for their beautiful basketry. They get their subsistence from seeds, piñons, small game, and by labor for the whites. They numbered 819 in 1910. Consult A. L. Kroeber, "Washo Language of East Central California and Nevada," in *University of California Publications in American Archæology and Ethnology*, vol. iv (Berkeley, 1907).

WASH SALES. See STOCK EXCHANGE, *Stock Exchange Terms.*

WASIELEWSKI, vä'syĕ-lĕf'skĕ, JOSEPH WILHELM VON (1822–96). A German violinist and writer on music, born at Gross-Leesen, near Danzig. He studied at Leipzig under David, Hauptmann, and Mendelssohn, became a member of the Gewandhaus Orchestra, and was concertmeister at Düsseldorf under Schumann from 1850 to 1852. Later he conducted the new Choral Society at Bonn. In 1855 he settled at Dresden and devoted himself to literary work. From 1869 to 1884 he was city music director at Bonn, and in 1884 he retired to Sondershausen. Among his works are: *Robert Schumann. Eine Biographie* (1858; 4th ed., 1906); with important supplementary matter in *Schumanniana* (1884); *Die Violine und ihre Meister* (1869; 5th ed., 1911); *Geschichte der Instrumentalmusik im 16. Jahrhundert* (1878); *Beethoven* (1888); *Das Violoncell und seine Geschichte* (1889; 2d ed., 1911); *Carl Reinecke, sein Leben, Wirken und Schaffen* (1892).

WASMES, väm. The capital of an arrondissement in the Province of Hainault, Belgium, 6 miles southwest of Mons (Map: Belgium, B 4). It is in the Borinage, a region noted for its extensive coal-mining interests. Pop., 1900, 14,660; 1910, 16,743.

WASP (AS. *wæsp*, MHG. *wefse, wespe*, Ger. *Wespe*, wasp; connected with Lat. *vespa*, wasp, Lith. *vapsà*, gadfly). Any insect of the hymenopterous superfamilies Vespoidea and Sphecoidea, most of the former being known as social wasps, and of the latter as solitary wasps. All of the social wasps belong to the Vespoidea, and according to present classification there have been added to the group, from structural peculiarities, the wasps of the families Pompilidæ, Eumenidæ, Sapygidæ, Scoliidæ, Myzinidæ, Tiphiidæ, and Thynnidæ, all of which lead solitary lives. The superfamilies also contain the so-called solitary velvet ants (q.v.) and the cuckoo flies, gold wasps (family Chrysididæ), as well as two families of parasitic wasps, the Bethylidæ, formerly placed in the Proctotrypoidea, and the Trigonalidæ, formerly placed with the ichneumon flies. All wasps belong to the old group Aculeata, which includes the so-called stinging Hymenoptera. The social wasps have the sting always issuing from the tip of the abdomen, the pronotum not extending back to the tegulæ, the tarsi slender and not dilated or thickened as with the bees. The solitary wasps (superfamily Sphecoidea) are separated from the social wasps by the pronotum, which extends back to the tegulæ when these are present; the trochanters are one-jointed. These wasps are distinguished from the ants by the fact that the first segment of the abdomen is simple and does not contain swellings.

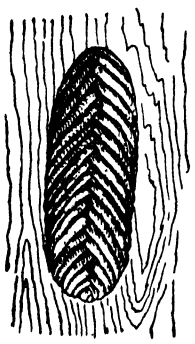
With the exception of the mainly tropical honey wasps (genus *Nectarina*), all the young wasps are usually fed upon other insects or insect remains. The true social wasps of the United States (see INSECT, *Social Insects*) belong to the genera *Vespa* and *Polistes*, the former including the species which make the paper nests with an outer covering, and usually composed of several layers of combs; the latter containing the common, long-bodied black wasps with folded wings which build nests of a single comb without any papery envelope. (See Figure 5, Colored Plate of INSECTS.) These wasps often build nests in barns, etc., but sometimes also in bushes or upon lower surfaces of stones slightly raised from the ground. The cells of one of these wasps' nests are hexagonal, in a

single layer instead of two, as with the higher bees, and usually vertical instead of horizontal. With some species the nest consists of but a single comb, as with *Polistes*, and with others of a series of combs in tiers, the whole inclosed in a spherical case made of many thicknesses of paper, as with many of the Vespas. The nests are enlarged by adding cells to the edges of the comb, space being gained by removing the inner layers of the envelope. These removed portions are masticated and added to the outside. An egg is laid in each cell, and the young larva when hatching hangs with its head downward, suspended by a gummy excretion from the anus. They are constantly fed by the workers and females with the juices of fruits, flowers, and the masticated remains of insects. When full grown they spin silken cocoons, the lower end of which serves as a cap to the cell. After the adult wasp has emerged the cell is cleaned out and a new egg laid in it. With the larger nest builders, a month or less elapses from the laying of the egg to the emergence of the adult. Several generations may be reared in the same cell.

The largest of the American social wasps is the so-called white-faced hornet (*Vespa maculata*). The European hornet (*Vespa crabro*) has been accidentally introduced in the United States and has established itself near New York City. (See HORNET.) The smaller species of *Vespa*, which are generally marked with yellow and are often known as yellowjackets, frequently nest beneath stumps or stones, although nests are often found hanging from rafters and the branches of trees. The nests of *Vespa germanica*, a small yellowjacket, are commonly near the ground, and often exceed a foot in diameter. Access to the nest is gained by one or two circular or oval openings about three-quarters of an inch in diameter, which lead to the centre of the nest. The loose outer papery covering is by no means as tough and firm as with hornets. The combs are built in eight or more horizontal layers attached to each other by strong supports. As a rule the males and queens of true social wasps are not developed until towards autumn, at which time larger cells, always to be found in the lower combs of a nest, are made for their reception.

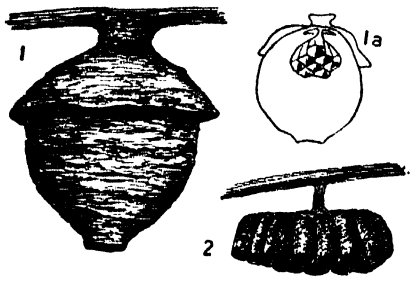
The tropical social wasps of the genus *Polybia* and its allies build enormous nests. A species which occurs in Ceylon has nests which frequently reach a length of 6 feet. The nest of the Brazilian *Polybia scutelaris* is a solid closed structure covered externally with rough knobs or angular projects. The nests of another South American species are so regularly shaped and so compact and solid as to look like a stone. *Vespa orientalis* mixes a considerable quantity of earth with the paper used in its nest, and there is a nest in the British museum from Bahia supposed to be that of a social wasp, the outer wall of which is apparently formed entirely of earth and is one-quarter or one-half of an inch thick. The comb inside appears also to be formed of clay.

The sting of most of the social wasps is severe, but the wasps themselves are not dangerous except when disturbed. When they are flying about they are harmless unless irritated. A person may stand close to a wasp nest without risk if he stands motionless. In fact, a wasp may settle upon a person with no danger of stinging unless some movement is made.



The solitary wasps belonging to the Vespoidea resemble greatly in habits the solitary wasps of the superfamily Sphecoidea, although they differ in important structural characters. The family Pompilidæ is an extensive one, more than 100 species being found in the United States. They may well be known as the spider wasps, since all, so far as known, store spiders in their burrows. As a rule they dig burrows in the ground or utilize excavations of other insects. The tarantula killer (q.v.) of the southern United States is a member of this family. The so-called potter wasps of the family Eumenidæ belong to this group, and construct globular cells of clay or sand attached to a twig by a narrow petiole. These little wasps store up caterpillars, sawfly larvæ, and beetle grubs for their young. Each cell is completely filled and contains a single egg of the wasp. The wasps of the parasitic families Sapygidæ, Scoliidæ, Myzinidæ, and Tiphiidæ, as a rule, lay their eggs upon the bodies of the larvæ of other insects, especially beetle larvæ.

The true solitary wasps of the superfamily Sphecoidea have been divided into 12 families, and comprise many of the most interesting of insects. They usually construct cells in subterranean burrows, each cell provided with paralyzed insects for their larvæ. In their habits the sand wasps or digger wasps are rather typical of the group, e.g., the great digger wasp *Sphecius speciosus* stores the large cicadas or harvest flies in deep burrows usually in clay soils. A burrow consisting of a sloping entrance 6 inches long, turning at right angles and extending several inches farther and ending in a globular cell an inch and a half in diameter, is previously prepared by the mother wasp. Sometimes the main burrow has several branches, each terminating a similar cell. After a burrow is prepared, a cicada is captured and paralyzed by its captor's sting. The cicada is then carried with great difficulty up a trunk of the tree for some distance in order that the wasp may fly obliquely downward to her nest, the weight of the cicada being so great that she cannot fly with it horizontally or upward. The terminal cell being reached, an egg is laid under the middle of the victim's body, upon which the footless larva of the wasp begins to feed as soon as hatched. In the course of a week the larva spins a white cocoon mixed with earth, and remains through autumn and winter, transforming to pupa in spring. Shortly afterward the adult gnaws through the cocoon and works its way up to the surface of the ground.



The solitary wasps of the family Crabronidæ are small insects which burrow in soil and sometimes in decaying wood. A great variety of insects is stored in these cells, each species, however, seeming to have a distinct preference. The industry of some of this family is extraordinary. The Peckhams have observed *Crabro stirpicola* working night and day for a period of 42 consecutive hours. The mud daubers, or mud wasps, of the genus *Sceliphron* (formerly *Pelopæus*) build cells of mud, frequently in great numbers, in sheltered places, often entering houses and barns. Spiders are stored in these cells, as a rule, and a single egg is laid upon the last spider which has been pushed in, and the larva works rapidly, as do other wasps' larvæ of this group. The female wasp completes and provisions one cell before beginning another.

The sand wasps of the family Oxybelidæ burrow in the sand and provision their nests with flies.

Important contributions to our knowledge of the psychology of insects have been made from observations upon the solitary wasps. For example, in the genus *Ammophila* the wasps carefully cover their burrows when they are completed and stored, taking the greatest care to conceal the entrance, the mother wasp frequently returning from time to time to see that nothing has been disturbed, and adding sand or other disguising substances to the covering of the burrow. The most interesting feature of the habits of these insects, however, is the undoubted use of a tool by the mother insect. In filling in the mouth of the burrow, Williston has seen the mother wasp take a stone in her jaws and use it as a tamping iron to pack the earth down more tightly. Fabre's extended studies led to the conclusion that these solitary wasps are inspired by automatically perfect instincts which can never have varied to any great extent from the beginning of time. In his opinion deviation from regular rule would mean extinction. G. W. and E. G. Peckham, however, after equally close study, found that variability in the habits of different individuals of the same species exists in every particular—shape of nest, manner of digging it, manner of stinging the prey and of crushing it, manner of carrying the victim, way of closing the nest, and even in either closing the nest or leaving it open. In the Ammophilas it was noticed that there is a distinct personality among the females. One seemed in haste and spent no time on smaller details; another worked with attention to detail, arranging the burrow and surface with scrupulous care, and sweeping away every particle of dust.

CELL OF A MUD WASP.

NESTS OF PAPER-MAKING WASPS.
1 and 2, nest of hornets; 1 a, section showing interior.

Among the English-speaking people of German descent the word "wasp" is frequently used for other groups of hymenopterous insects. Thus an ichneumon fly is called a parasite wasp, and a chalcis fly the same.

WASPS, THE (Lat. *Vespæ*, Gk. *Σφῆκες*, *Sphēkes*). A comedy by Aristophanes, produced in 422 B.C. at Athens. Its satire is aimed against the proneness of the citizens to go to law.

WASSERMANN, väs'ĕr-män, AUGUST VON (1866–). A German therapeutist. Born at Bamberg, he studied medicine in Berlin and Strassburg (M.D., 1889), and became assistant for infectious diseases at the Koch Institute of the Charité in Berlin. In 1913 he added to his duties those of director of the newly founded institute for experimental therapeutics. He became assistant professor of therapeutics at Berlin University in 1902 and professor in 1911. Wassermann became known as one of the most distinguished pupils of Koch and Ehrlich (qq.v.). His greatest discovery, the so-called Wassermann reaction in syphilis (q.v.), was made in 1906. Important also, especially in forensic medicine, is his precipitin reaction which distinguishes the blood of men and animals by differentiating albumin bodies contained therein. His selen-eosin treatment to inhibit cancer in rats and mice (1913) was not successful in man to the date of writing.

WASSERMANN TEST, or REACTION. See SYPHILIS; WASSERMANN, AUGUST VON.

WASTE (OF. *wast, guast*, waste, devastation, from Lat. *vastus*, waste, desolate, vast). In the law of real property, any material injury caused or permitted to be done by a tenant of a particular estate to the property, and lessening the value of the estate of the reversioner or remainder man. It is called voluntary where the damage is the result of some positive and willful act on the part of the tenant, such as plowing up a flower garden or cutting down fruit trees, and permissive where the tenant is unreasonably negligent in omitting to take proper measures to prevent the injury. Even though the tenant holds without impeachment of waste, wanton acts of destruction may be restrained by a court of equity. A tenant may cut such timber as may be reasonably necessary for his own use, or to reclaim land suitable for agricultural purposes, but the destruction of timber to the detriment of the estate is waste. The destruction of ornamental trees will be restrained as waste by a court of equity. The removal of deposits of sand, gravel, clay, etc., and the opening of mines and quarries are waste, unless the premises are let for such purposes. If open mines, quarries, etc., exist on leased premises, it will be presumed that it was intended that the tenant should work them. The remedy for waste is an action at law for damages, or an application to a court of equity for an injunction. Consult the authorities referred to under REAL PROPERTY.

WASTE, DISPOSAL OF. See SEWAGE DISPOSAL.

WASTE, IMPEACHMENT OF. See IMPEACHMENT OF WASTE.

WASTE LANDS. A popular term for uncultivated and unprofitable tracts in populous and cultivated countries. They are very va-

riable in character and include marsh or swamp lands (both fresh and salt), moors, peat bogs, steep and rocky lands, sand, arid lands (see IRRIGATION), alkali soils (q.v.), galled and gullied soils, and chalk downs. Their improvement is largely a question of expense. It is often more profitable to improve lands already cultivated, and to bring them into a higher state of cultivation and productiveness, than to reclaim waste lands. The means of reclamation are also very various and include drainage, manuring, mulching, irrigation on arid soils, growth of sand-binding plants on sandy soils, etc. The process of reclamation must as a rule be gradual, especially when the soil is naturally poor, and must include improvement of both the physical and the chemical condition of the soil. The most important waste lands are probably the arid lands reclaimable by irrigation and the marsh, swamp, or peat lands, which need especially drainage, but are usually improved also by liming, manuring, and the application of potash salts and phosphates. Consult A. D. Hall, "Reclamation of Waste Lands," in *Popular Science Monthly*, vol. lxxxv, p. 377 (1914).

WASTING PALSY. See MUSCLE, DISEASES OF.

WATANNA, wȧ-tăn'nȧ, ONOTO (1879–). The pen name of an American author, Mrs. Winnifred Eaton Babcock. She was born at Nagasaki, Japan, and was educated at Montreal and Toronto, Canada, and at Columbia University. In 1901 she was married to B. W. Babcock. Her writings include: *The Old Jinriksha* (1895); *Miss Numè of Japan* (1899); *A Japanese Nightingale* (1901), dramatized and produced in the United States and England; *The Wooing of Wistaria* (1902); *The Heart of Hyacinth* (1903); *Daughters of Nijo* (1904); *The Love of Azalea* (1904); *A Japanese Blossom* (1906); *The Diary of Delia* (1907); *Tama* (1910); *Honorable Miss Moonlight* (1912).

WATAUGA (wą-tą'gȧ) **ASSOCIATION.** In American history, the name given to the first compact of government west of the Alleghanies, signed by the settlers of what is now East Tennessee in 1772 and 1775. (See TENNESSEE.) Though the articles are lost, the general scheme is known. A legislative council of 13 was chosen by the signers. This council elected five of their number to exercise judicial and executive functions, and the five chose a chairman. A sheriff and an attorney were appointed and courts were held regularly. Jurisdiction was assumed, however, over none but the signers, and in consequence outlaws from Virginia and North Carolina flocked in. In 1775 or 1776 the name Washington District was given to the territory, and in 1776, at their request, their representatives were given seats in the North Carolina Assembly. Consult Ramsey, *Annals of Tennessee* (Charleston, 1853), and Caldwell, *Studies of the Constitutional History of Tennessee* (Cincinnati, 1895).

WATCH (AS. *wæcce*, from *wæccan*, *wacian*, *wacan*, to watch, wake). A small, portable machine for measuring time. The parent of the watch, as of the other modern timekeepers, was the ancient tower clock, the earliest example of which, known as De Vick's clock, is described under CLOCK. The invention of the spring to take the place of the weight to drive the wheel train made the construction of a portable timekeeper possible. The first watches were made very early in the sixteenth century, Peter Hele, a clock maker of Nuremberg, being usually credited with the invention. At first a straight spring was used, but this was soon replaced by a coiled spring. The first balance used in watches, termed a foliot, corresponded in its action to the suspended weights on a horizontal lever of an early clock. It consisted of a metallic rod terminating at each end in a heavy mass, the whole formed out of a single piece of metal. This was afterward replaced by a wheel, in which the weight, accumulated mainly on the rim, took the place of the weights suspended on the ends of a bar. The first great improvement made in watch construction was the application of the coiled hair spring to the balance wheel. This invention was probably made by Hooke about 1658.

The earliest watches had little physical resemblance to their modern successors. One of the first was a cylindrical box of metal, chased and gilded, the lid pierced with an opening over each hour mark through which the hand could be seen. Others were made in many grotesque shapes and in all sizes from the diameter of a saucer to that of an ordinary lead pencil. Curious mechanism was as much prized as quaint form in these early timekeepers, and both seem to have been considered of more importance than the accurate measurement of time. Alarm watches, and repeaters, or striking watches, were great favorites. The earliest watches usually had but one hand, the minute mechanism and hand being invented in 1687. Enamel dials were first used in 1650. Jewels were first used as pivot bearings for watches about 1700, and about this time keyless watches appeared. In 1749 the compensation balance was invented, the duplex escapement in 1750, the chronometer escapement in 1765. The first very thin watches were made by Lepine in 1776. In 1780 appeared the helical balance spring and the seconds hand.

The fusee, which was invented early in the sixteenth century, continued to be used in English watches until towards the close of the nineteenth century, although it had been discarded in the American machine-made watch many years before. The fusee is a spirally grooved cone, connected with the barrel which contains the main spring by a chain, one end of which is fixed to the broadest part of the cone and the other end to the barrel. From the fusee the motion was communicated to the train, and the theory of its use was that in its unwinding it corrected the variations in the force of the main spring and so equalized the power exerted upon the train. The equalizing effect is due to the fact that, when the spring is all coiled up and its force upon the barrel is greatest, the chain is acting upon the small end of the fusee and its leverage upon the fusee is least; but as the force of the spring diminishes, the chain having reached a broader part of the fusee, the leverage is increased, and the two are so adjusted to each other that the action of the spring modified by the leverage of the chain produces a uniform stress in the fusee. In most modern watches the great wheel forms part of the barrel and the diminishing power of the main spring, as it uncoils, is neutralized by the escapement, with which the balance wheel is connected.

Almost immediately after the invention of the hair spring attempts began to be made to introduce into watches an escapement which would produce greater accuracy than the vertical escapement at first used. The detached lever escapement described farther on is now commonly

used in watches. Early in the history of both clock and watch construction it was noticed that variations in the rate of going, the increase or diminution of the temperature affecting to some extent the moment of inertia of the balance wheel and to a great extent the elastic force of the balance spring. A rise in the temperature makes the balance expand, and therefore augments its moment of inertia; it adds to the length of the spring, and thereby diminishes its elasticity, the elastic force of a spring varying inversely as its length; and the time of vibration of the balance, which depends upon the moment of inertia directly and upon the elastic force of the spring inversely, is increased—i.e., the watch goes more slowly—in consequence both of the increase of inertia and of the diminution of the elastic force of the spring. A fall in temperature is attended by opposite results, the watch going more rapidly. The importance of discovering some means for correcting these temperature variations was most evident in connection with marine chronometers, upon which navigators depend for reckoning their longitude at sea. Early in the eighteenth century John Harrison, who invented the gridiron pendulum for clocks and several other improvements in their mechanism, made the compensating balance, which was soon applied not only to chronometers, but to all high-grade watches. In the compensating balance, the balance wheel is made of two metals—brass and steel—which are affected at unequal rates by temperature. The outer rim is of brass and the inner rim and cross arms of steel, the two metals being firmly united by fusion. To allow for an expansion, the wheel is made in two equal parts, joined by means of a cross arm as shown in Fig. 1. The increased expansive and contractile power of brass over steel is so utilized by proportioning in this combination of the two metals that the changing size of the balance wheel automatically adjusts itself to the varying conditions of the hair spring. It will be noticed (Fig. 1) that the balance wheel

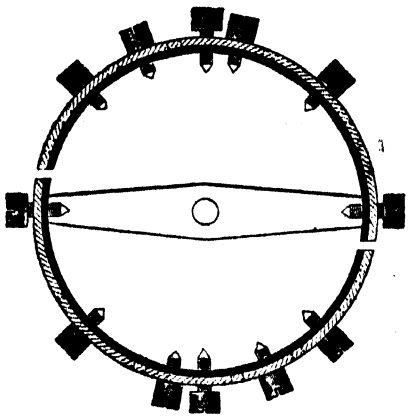

FIG. 1. BALANCE WHEEL.

is ballasted with tiny screws. Their object is twofold, to adjust the balance wheel to the exact weight required to make the desired number of vibrations—18,000 per hour—and, by changing the positions of the screws, to adjust the effective weight of the balance wheel on the diameter to meet changing conditions of temperature. Recent improvements in watch mechanism have resulted in a movement not affected by electrical disturbances. In order to accomplish this, the balance, roller, hair spring, pallet, and fork are made of nonmagnetic materials.

Briefly summarizing the steps by which the mechanism of the modern watch has been developed from De Vick's model, we find: (1) The use of the spring as motive force; (2) substitution of balance wheel, with hair spring, for weights; (3) successive improvements in escapement; (4) introduction of enamel dials; (5) introduction of jewels as pivot bearings; (6) invention of compensating balance; (7) discarding of fusee; (8) introduction of automatic machinery for the construction of the parts.

The mechanism or movement of a modern American watch consists of a series of wheels called the train, the first of which, named the barrel, contains the main spring, in which the power secured when the watch is wound up is stored. The train transmits to the desired points the motion stored up in the spring. At

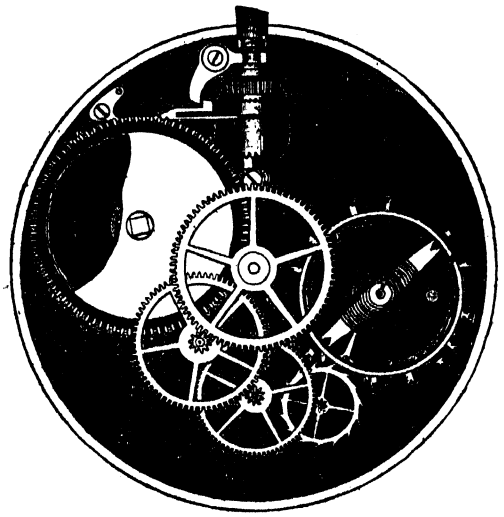

FIG. 2.

the end of the train is the escapement—a delicate and complex mechanism which so regulates the motive force stored up in the main spring that it is expanded with uniformity and at the desired rate. The train of wheels is placed in a circular position as shown in Fig. 2 so as to accommodate the shape of the watch, but the order is best understood by arranging them in a straight line, as in Fig. 3. It has been seen that the first wheel of the train, the barrel, contains the mainspring and is therefore connected with the stem-winding attachment. A little click or pawl, working in the teeth of a ratchet fastened to the mainspring arbor, keeps the lat-

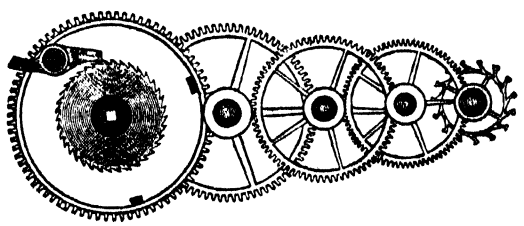

FIG. 3.

ter from running backward. The second wheel of the train, called the centre wheel, is always placed in the centre of the watch, because connected with it on the same staff are the wheels which drive the minute and hour hands. The centre wheel meshes into the third pinion, upon

which the third wheel is firmly fixed. This turns the fourth pinion, which carries a wheel gearing into the escape pinion, upon which the escape wheel is carried. The second or centre pinion is attached to a centre staff, which projects through the main plate of the watch. Upon this projecting portion is mounted another pinion, which from its shape is called the cannon pinion. The minute hand is fitted upon the hub of this pinion and its teeth drive a little wheel which is commonly known as the minute wheel. Attached to this wheel is still another pinion geared to drive the hour wheel, which is mounted on the long hub of the cannon pinion. Upon the hub of the hour wheel the hour hand is placed. The number of teeth on each of these wheels and pinions (which are generally called the dial wheels) is so arranged that while the cannon pinion, carrying the minute hand, makes a complete revolution in one hour, the hour wheel, carrying the hour hand, revolves once in 12 hours. The stem attachment for setting the watch is connected with one or other of these dial wheels.

Returning now to the wheel train, we find that the fourth pinion has a pivot which projects through the frame plate and upon this pivot the second hand is mounted. Hence it is necessary that the fourth pinion and wheel should make a revolution once a minute, or 60 times as fast as the centre staff. This is accomplished by means of the proportioning of the centre wheel, third pinion and wheel, and fourth pinion to each other. Considering, now, the last wheel of the train and its various attachments, which are grouped together under the general name of escapement, we find that the group consists of seven members: The escape wheel, the pallet, the fork, the roller and roller pin, the balance wheel, and the hairspring. The use of each part is explained farther on. The combined object of the whole group is to stop and then set in motion again, at regular intervals, every wheel in the train—an action which causes the familiar tick of the watch. The teeth of the escape wheel, instead of being cut on the epicycloidal curve like the other teeth of the train, so as to convey motion with as little loss of power as possible, are constructed with an entirely different object and in an entirely different form. They form a series of 15 hooks. An anchor-shaped piece, called the pallet, is so hung that first one and then the other of its horns is locked into the tooth of the escape wheel as it revolves. These locking horns are usually made of some precious stone. The unlocking is accomplished by a lever called the fork, which is attached to the pallet. The action of the fork is controlled by the balance wheel by means of a little disk under the balance wheel called the roller. On the outer edge of this disk is the roller pin, which alternately engages and releases the fork. It has already been shown that the action of the hairspring on the balance makes its vibrations isochronous; by means of the fork disengaging at regular intervals the teeth of the escape wheel from the pallet and so freeing the whole train, this isochronous motion is conveyed to the entire watch train. Fig. 4 of the accompanying cuts shows the action of the fork, roller, roller pin, pallet, and escape wheel, while Fig. 5 shows the hairspring connected with the balance, with the roller and roller pin underneath.

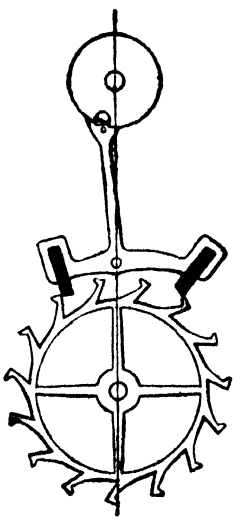

FIG. 4.

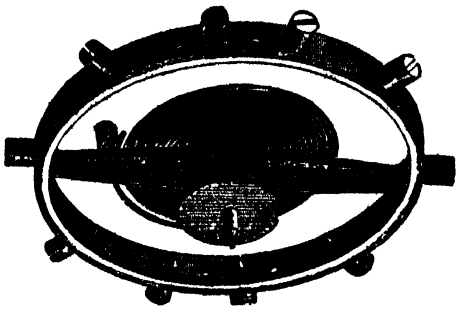

FIG. 5.

Watch Manufacture. In England and Switzerland watchmaking was early developed as a household industry. Among the Swiss, in particular, it gave employment to thousands, the industry being so far subdivided as to consist of over 100 distinct branches; and the Swiss finally became the watchmakers for the world. As early as 1809, when Luther Goddard, of Shrewsbury, Mass., commenced manufacture on a larger scale than had been attempted previously, various attempts were made in the United States to make watches by hand after the Swiss plan; but the price of labor was too high and the laborers too inexperienced, so that each attempt ended in failure. The idea of manufacturing watches by using machinery to make uniform and practically interchangeable pieces was put into successful practice by Aaron L. Dennison, a Boston watchmaker, in 1849, who was familiar with the methods and machinery employed for the manufacture of army muskets, at the United States Armory at Springfield, Mass. His original plan was to gather under one roof several labor-saving machines already in use in Switzerland for some of their watchmaking processes; to supplement these by new contrivances; and to run them all by one power. He formed a small company, which built its first factory at Roxbury, Mass. But the Swiss authorities passed a law prohibiting the exportation of machines, models, or drawings, so that the pioneer company was obliged to construct its own machines. Its first machine-made watch was turned out in 1853. Subsequently the works were removed to Waltham, Mass., where in 1859 the company was reorganized under the name of the American Watch Company, and is still in existence as the Waltham Watch Company. In 1867 the Elgin watches were put upon the market, the National Watch Company of Elgin being organized in 1864. Other important American watchmaking concerns are: the Hamilton, Pennsylvania; Hampden, Ohio; Howard, New York; N. Y. Standard, New Jersey; New England, Connecticut; Rockford and Illinois, Illinois; Seth Thomas, Connecticut; South Bend, Indiana; and Trenton, New Jersey, companies.

It has been claimed for the watchmaking industry that it has caused the invention of a greater number of mechanical appliances than any other, with the possible exception of electricity. Not only ingenuity, but the greatest ac-

curacy and delicacy, is required of the machinery used in watchmaking. For instance, the finest screws used in a small-sized watch have a thread of 260 to the inch and weigh $\frac{1}{80,000}$ of a pound. The wire of a hairspring, though a foot long, weighs $\frac{1}{15,000}$ of a pound. The jewel work is extremely minute. A pallet jewel weighs $\frac{1}{150,000}$ of a pound and a roller jewel much less. The advantages of producing all these minute parts by automatic machinery, besides cheapness and rapidity of production, are the greater accuracy of the parts and the possibility of replacing a broken part with an exact duplicate.

The following is an outline of some of the principal processes: The plates which support the mechanism of the watch are turned on lathes and perforated for screws, arbors, and the like, by drills. The arbors, staffs, and pinions on which the wheels and other moving parts work are also turned on lathes. The teeth in the wheels and pinions are formed by cutters or by saws. The screws, big and little, are made by machines which cut the threads and finish the heads both for appearance and accuracy. The metal of the balances has to be compressed with great care to secure uniform density, by means of hammers or rollers. It must then be faced and recessed by lathes, tapped by drills, finished, and glossed. The springs are drawn, flattened, finished, and coiled by special machinery.

Latterly a branch of the watchmaking industry has been developed devoted exclusively to the production of low-priced watches. The pioneer among the low-priced watches was the Waterbury, which was patented by D. A. Bucke in 1878. Its cheap production was largely due to improvements in the old duplex escapement, which made it possible to stamp out its parts with an ordinary die. Within recent years some of the clock companies have begun making low-priced watches as a by-product connected with clock manufacture, while several large companies specialize in low-priced watches exclusively. These cheap watches are made like small spring clocks. The parts are stamped out, no jewels are used, and very little time is devoted to testing and adjustment. For watches of this type, of which the extreme of cheapness is the famous dollar watch, an enormous demand has arisen, both for domestic consumption and export. This has led to improvements in the manufacture of these cheap watches, so that both in appearance, durability, and time-keeping they are quite satisfactory.

The manufacture of watchcases is now conducted by all better-grade manufacturers as a separate industry. The movements are made to standard sizes and qualities and then sold at wholesale to jobbers, and also to watchcase manufacturers. The watchcase industry had a rapid development towards the close of the nineteenth century and is now one of great importance. Most of the work is performed by automatic machinery. Gold, silver, nickel, and gun metal are used, besides various alloys known under the trade names of silveroid, nickel silver, etc. The popular gold-filled case was patented in 1859 by James Boss, of Philadelphia. Open-face watches have become very popular, thick beveled-edge glass rendering the case as reliable a protection as the extra gold cover of the hunting watch and more nearly dust proof, while watches for the wrist have attained considerable vogue for their convenience both for men and women. Small watches used as pendents are also made for women.

Statistics. The following statistics, of the Thirteenth United States Census, indicate the growth of the industry in the United States. This report shows that, in 1909, 13 establishments in the United States were reported to be engaged in the manufacture of watches and 29 in the manufacture of watchcases, the annual product of watches amounting in value to $11,771,055 and of watchcases to $10,514,854. The tendency of industry to concentrate in large establishments is shown in the growth of this industry: in 1869 there were 37 watch-movement factories in the country, or 24 more than in 1909.

Bibliography. Although there are many European books devoted to the history of watches and to foreign practice, very little has been written regarding American history and methods. For the former phase of the subject, consult bibliography under CLOCKS; Manufactures, vol. x, part iv of the Twelfth United States Census, contains valuable historical and statistical matter, while the volumes on manufactures of the Thirteenth United States Census and the Census of Manufactures, 1914, give later statistics. *The Journal of the Franklin Institute* contains a lecture by E. A. Marsh, Dec. 14, 1894, on "The History of Watch Making." He is also the author of *Evolution of Automatic Machinery in America* (Chicago, 1896), and of a chapter on the "American Watch Company," in the *History of Middlesex County, Mass.* (Philadelphia, 1890), and of various valuable publications of the Waltham Watch Company, which should be consulted, as also printed matter of other large watch manufacturers. *Appleton's Journal* for July 2 and 7, 1870, contains an article on "Watchmaking in America," which includes a good account of the early history of timekeepers. Consult also papers by H. G. Abbott in *American Jeweler*, "The Watch Factories of America," reprinted, Chicago, 1905; David Glasgow, *Watch and Clock Making* (London, 1893); Claudius Saulnier, *The Watchmakers Hand Book*, translated from the French by Tripplin and Rigg (5th ed., ib., 1912); C. E. Fritts, *The Watch Adjuster's Manual* (4th ed., Philadelphia, 1912).

WATCH (AS. *wæcce*, from *wacian*, *wæccan*, Goth. *wakan*, Ger. *wachen*, to wake, watch). A term used to designate the part of a ship's company that is employed in working her at one time. The deck force is divided into starboard and port watches, and the fire-room and engine-room forces usually into three watches. The starboard and port watches are commonly subdivided into first and second parts called quarter watches, though when only a quarter watch is on deck for duty it constitutes the watch for the time being. In cases of emergency, or when the ship is getting under way, coming to anchor, or performing some other evolution requiring all available men, both watches (all hands) are called. In port, all hands are engaged during working hours, but only an anchor watch (q.v.) is on deck at night except in unusual circumstances. In time of war one-half the battery is usually kept manned at night. The term "watch" is also used to designate the period of time during which a watch of men are on deck. This time is two or four hours. The watches are named as follows: midwatch (midnight to 4 A.M.), morning watch (4 to 8 A.M.), forenoon

watch (8 A.M. to noon), afternoon watch (noon to 4 P.M.), first dog watch (4 to 6 P.M.), second dog watch (6 to 8 P.M.), first watch (8 P.M. to midnight). The dog watches are designed to shift the order of the watch so that the same men will not have the same watch every night.

WATCH AND WARD. In the old English law a phrase employed to describe the supervision and care of police officials. Consult Blackstone's *Commentaries*, Book I, p. 356.

WATCHFUL FOX. See KEOKUK.

WATCH HILL. See WESTERLY.

WATCH OFFICER. Officers who have charge of the ship at sea are termed watch officers. The number of such officers depends upon the character of the vessel. In many large transatlantic steamers there are usually two officers on watch at a time. In large naval vessels the younger ensigns act as junior officers of the watch under the regular watch officers, who are lieutenants or ensigns of more experience. The watch officer actually on duty is called the officer of the deck or officer of the watch.

WATER, H_2O. A chemical compound of hydrogen and oxygen, formed by the union of two volumes of the former with one of the latter, or, what is the same, containing 11.136 per cent by weight of hydrogen and 88.864 per cent of oxygen. (See CHEMISTRY, especially historical section.) It is formed by the direct explosive union of its elements at a somewhat elevated temperature. This, however, need not be maintained, during the reaction, by the introduction of heat from outside sources; for the heat developed by the reaction itself (67,500 gram calories for every 18 grams of water formed) is not only sufficient to maintain the temperature necessary for combination, but, in the absence of indifferent gases or of an excess of one of the reacting gases, raises the temperature to 2844° C. (5151° F.). At this temperature about one-third of the reacting gases combine (see REACTION, CHEMICAL), the other two-thirds combining gradually during the subsequent cooling. The reaction may be started by platinum sponge or platinum black (forms of finely divided platinum), or other catalytic agents (see CATALYSIS), such as charcoal, pumice stone, porcelain, rock crystal, glass, etc.; with some of these substances, however, it is necessary besides to apply heat, although the initial temperature need not be quite so high as in their absence.

Liquid Water. Water is well known in the three states of aggregation—liquid, solid, and gaseous. Under normal atmospheric pressure, water is liquid between 0° C. (32° F.), its freezing point, and 100° C. (212° F.), its boiling point. Its greatest density is at about 4° C. (39.2° F.), at which temperature one cubic centimeter weighs, in vacuo, one gram. Its specific heat exceeds that of any other substance except hydrogen, the amount of heat required to raise the temperature of one gram from 18° to 19° C. being the most generally adopted unit of heat—the so-called gram calorie. Water is difficultly compressible, 1,000,000 volumes becoming less by only 50 volumes when the atmospheric pressure is doubled. When viewed through layers of considerable height, pure water is seen to possess a bluish tinge. Soft potable waters have a brownish color. Water containing traces of calcium carbonate in suspension appears opaque if viewed through a sufficiently high column; but the opacity is gradually destroyed if carbonic acid gas is passed into the water, the color of the latter meanwhile changing gradually through brown, yellow, and green, to blue. On the strength of this observation, it has been suggested that the colors of natural waters may be due in part to the varying amounts of carbonic acid contained by them, although the nature of the bottom and the color of the sky largely determine the color of waters, beyond doubt. Liquid water is a poor conductor of heat, and when perfectly pure is one of the poorest known conductors of electricity. The purification of water for scientific purposes is best effected by distillation. An efficient method consists in dissolving a small amount of potassium permanganate in a quantity of ordinary water, allowing it to stand for a day, then adding a further amount of potassium permanganate and some caustic potash and distilling, preferably in an apparatus provided with a platinum condenser (the metal of the apparatus must be free from lead); the first portions of the distillate should be rejected, and the distillation should be interrupted after about four-fifths has passed over; the intermediate portion may be further purified by dissolving in it a small amount of acid potassium sulphate and redistilling. Natural waters may be classified according to their origin. Rain water, which forms by the condensation of the aqueous vapor more or less abundant in the air, is the purest of all natural water, although it takes up foreign substances in its passage from the clouds to the earth, and always contains ammoniacal salts, sodium chloride, and other inorganic salts, as well as traces of organic matter of various kinds. Rain water collected in places where much coal is burned invariably contains traces of sulphuric acid derived from the oxidation of the sulphur from the pyrite present in most coals. Surface water, which includes the water from rivers, is of course less apt to be pure than rain water, its character being determined largely by the nature of the soil over which it passes, and by the vegetation on the surface. The mineral ingredients are usually carbonates, chlorides, and sulphates of the alkalies and alkaline earths, with small quantities of iron and manganese, while the organic matter is of vegetable origin. Well water is that derived from wells or bore holes made in the surface of the earth, and includes the water from shallow wells and that from deep wells. The shallow wells serve chiefly as the source of domestic supply, especially in country districts, and their water is liable to contamination from sewage and other refuse animal matter, owing to the fact that they are invariably sunk in the immediate vicinity of human dwellings. It is to such sources that epidemics of typhoid fever and similar diseases are often traced. Nitrates, nitrites, and ammonia are the constituents commonly found in such waters, and their presence indicates contamination of a dangerous character. Wells more than 100 feet in depth, and especially artesian wells, are used as sources of water, chiefly in cities, for manufacturing plants, which contains only mineral ingredients. Mineral waters (q.v.) possess more or less marked medicinal properties, in consequence of the considerable amounts in them of substances capable of exercising various physiological effects. Sea water is the water which forms the ocean; and as it is constantly receiving the waters more or less impure from rivers, and at the same time losing pure water in the form of vapor by means of evaporation, the impurities

remain behind, and have given to this water its well-known saline character. An analysis of sea water shows traces of nearly every known element; its salinity varies in different parts of the world. When it freezes the resulting ice is practically free from salt. Waters are distinguished as hard and soft according as they contain large or small quantities of calcium or magnesium salts in solution, and this fact may be determined by an examination with a soap solution, the addition of which causes the formation of lather when the quantity added is sufficient to have rendered the water soft.

Ice or Solid Water. The passage of water from the liquid to the solid state is accompanied by an expansion equal to about one-eleventh of its volume; hence water freezing in pipes may easily cause them to burst. The normal freezing point of water varies but slightly with the external pressure; considerable pressures, however, cause a marked depression of the freezing point. (See FREEZING POINT; MELTING POINT.) Besides, if carefully kept out of contact with the air, water may be readily undercooled to temperatures far below its freezing point; it is then, however, in an exceedingly unstable state, and mere contact with a sharp-edged body, or especially exposure to the air, causes the entire mass to freeze very rapidly, the temperature simultaneously rising to the normal freezing point. The heat developed during the freezing of one gram of water is 79.06 calories. Natural ice is transparent and highly coherent. Ice of similar properties is obtained artificially when the cooling medium employed is only about one degree below the freezing point; the ice formed at lower temperatures occludes minute globules of air, and these render it whitish and more or less opaque. Besides ordinary ice, water forms several other forms of ice, discovered by Tammann and by Bridgman (see ICE). Bridgman's "Ice V," which can exist only under high pressures, can be heated to nearly 80° C. (176° F.) without melting.

Water Vapor, or Gaseous Water. This is a normal constituent of the atmosphere (q.v.). The passage of one gram of liquid water into steam at 100° C. (212° F.) involves the absorption of as much as 536 calories of heat. At every temperature water vapor can only exist below a certain maximum of pressure, viz., the vapor pressure of water at that temperature. Under that pressure the vapor is said to be saturated. Stronger pressure causes liquefaction, unless the temperature is above the critical point, which, according to Battelli, is about 364° C. (about 687.7° F.). (See CRITICAL POINT.) Water vapor is colorless and perfectly transparent, unless it is allowed, in the saturated state, to escape into the cold air, when condensation causes the formation of minute bubbles that produce the characteristic appearance of steam.

WATER, HOLY. See HOLY WATER.

WATER, MINERAL. See MINERAL WATER.

WATER AVENS. See GEUM.

WATER BABIES, THE. A fanciful tale by Charles Kingsley (1863).

WATER BEAR, or BEAR ANIMALCULE. See TARDIGRADA.

WATER BED. A rubber bed-tick, designed to be filled with water and to take the place of an ordinary mattress on a sick bed. Its use decreases the probability of the formation of bed sores (q.v.). Objections to it are its great weight when filled, its liability to become cold, thus chilling the patient, and the difficulty of drawing off the contents and replacing them with warmer water. The air mattress, constructed on the same principle, meets all the requirements and is free from the foregoing objections. It is provided with a valve stem through which it may be inflated with an air pump.

WATER BEECH. See HORNBEAM.

WATER BEETLE. Any beetle which lives in or upon the water; more specifically, one of the true water beetles or water tigers of the family Dytiscidæ. They live in the water both as larvæ and as adults, although they are probably modified terrestrial insects resembling the ground beetles of the family Carabidæ. The pupa is terrestrial. They are elliptical convex insects with the hind legs formed for swimming. The wing cases fit perfectly to the body except at the tip, so as to form an air-tight space above the body proper. This space is the air chamber, and the beetle rises to the surface of the water, exposing the tip of its body and drawing in a supply of air which will last it for some time, when it goes below the surface again. The larvæ of the true water beetles are very rapacious, and suck the juices of small, soft aquatic insects. The mandibles are hollow, with a hole near the tip and another at the base, thus being fitted for suction. The water beetles are more numerous in temperate and boreal than in tropical regions. About 2000 species are known, of which nearly 400 inhabit the United States.

Whirligig beetles of the family Gyrinidæ are small oval forms which swim about on the surface of the water, usually darting in curious curves, from which habit the popular name is derived. They can dive, carrying with them a small supply of air, but their proper life is on the surface. The two hind pairs of legs are so modified as to form paddles. The larvæ are aquatic and are elongate with sharp mandibles. They are carnivorous in the larval stage as well as in the adult. About 350 species are known, of which nearly 40 occur in the United States.

The water beetles of the family Hydrophilidæ are sometimes called water scavenger beetles. The larvæ are predaceous and carnivorous, but

WATER BIRDS

COPYRIGHT, 1902, BY DODD, MEAD & COMPANY

1 MUTE SWAN – CYGNUS OLOR 1/10 NATURAL SIZE
2 MALLARD DUCK – ANAS BOSCHAS 1/10 " "
3 GRAY LAG GOOSE – ANSER CINEREUS 1/10 NATURAL SIZE
4 AFRICAN CORMORANT – PHALACROCORAX AFRICANUS 1/10 " "

the adult beetles are, as a rule, vegetable feeders, though they will prey upon small aquatic animals. They are usually dark-colored, of elliptical shape, and do not swim as readily as do the other water beetles, nor is the supply of air which may be carried as extensive as with the others. Many species construct egg cocoons, which are sometimes attached to the body of the beetle and sometimes to aquatic plants, and frequently unattached, floating on the surface of the water. From 20 to 100 eggs are laid in each cocoon. About 1200 species are known, and of these 175 are found in the United States and about 90 in England. Other beetles, such as the Amphizoidæ and Pelobiidæ, live in the water in their early stages. The strangely modified parasitic beetle, *Platypsyllus castoris*, found commonly upon the beaver, might also with justice be called a water beetle. Consult L. C. Miall, *The Natural History of Aquatic Insects* (London, 1895), and V. L. Kellogg, *American Insects* (2d ed., New York, 1908).

WATER BIRDS. A group of birds alike in their adaptations to an aquatic life. Such are the sea birds, or Steganopodes, as the cormorant; the auk tribe, gull tribe, and other marine groups; and the great tribe of fresh-water aquatic birds represented by the swans, geese, and ducks. Water birds are swimmers and divers, and are more or less completely web-footed, thus being furnished with paddles and with broad supports in walking upon muddy shores. All get their food mainly from the water—fish, amphibians, reptiles, shellfish, and small aquatic animals, or else aquatic vegetation. Their plumage is dense, oily, and, except in the ducks, usually of plain black, white, and brown colors; they nest on the ground, as a rule, laying unspotted eggs, except auks, gulls, etc.; the fresh-water section affords many birds esteemed for food and sport, and several domesticated species of great value. Consult S. F. Baird and others, *History of North American Water Birds* (2 vols., Boston, 1884), and H. K. Job, *Among the Water-Fowl* (New York, 1902). See Colored Plate of WATER BIRDS.

WATER BOATMAN. An aquatic bug of the family Corixidæ, in which the head is free, capable of great rotation, and attached to the thorax only by a narrow area. The water boatmen are mottled bugs of oval shape found swimming on the surface of ponds and streams. They are at home beneath the water as well as on the surface, and remain there for a long time, since the fine body hairs retain a film of air. They hibernate in mud at the bottom of ponds or streams. The eggs are laid under water, and are attached to stems of aquatic plants. When their pools dry up they fly to other water, and are sometimes attracted to lights at night. About 40 species occur in the United States, all belonging to the genus Corixa. The eggs of *Corixa mercenaria* and *Corixa femorata* are laid in enormous numbers in the lakes near the city of Mexico, and are made into cakes with meal by natives and half-breeds. The adults also are eaten in Mexico and in Egypt.

WATERBRASH. See PYROSIS.

WATER BUCK, or KOB. One of the large marsh-loving African antelopes of the genus *Cobus* or *Kobus*, several species of which go by other names, as singsing (q.v.). The water buck proper (*Cobus ellipsiprymnus*) is more than four feet tall, and remarkable for its long, shaggy, reddish coat. It is numerous all over southern and eastern Africa, roving in small bands about stony hills near the marshy rivers, to which it runs for refuge when alarmed. Its flesh is very poor eating. See Plate of ANTELOPES.

WATER BUFFALO. See BUFFALO.

WATER BUG. In general terms, any aquatic insect of the order Hemiptera, including all of the members of the six families composing the group Cryptocerata or Hydrocorisæ, as well as the Hebridæ and Hydrobatidæ. (See WATER STRIDER.) The families Corixidæ (see WATER BOATMAN), Nepidæ (see WATER SCORPION), Galgulidæ (see TOAD BUG), and Belostomidæ (see FISHKILLER) belong to this group.

The back swimmers of the family Notonectidæ are predaceous water bugs resembling the water boatmen, but the dorsum is very convex and they always swim with the ventral surface upward, a habit which distinguishes them from all other water bugs. The female pierces holes in the stems of water plants for her eggs. The adults hibernate in mud at the bottom of streams and ponds. About a dozen species are known in the United States. These as well as water boatmen are sometimes known as boat flies, as they occasionally leave the water and fly around lights at night. The creeping water bugs of the family Naucoridæ are small, flat-bodied, oval water bugs found in ponds containing plenty of vegetation, on which the creepers crawl or about which they swim, feeding upon land insects which have accidentally fallen into the water. The marsh treaders of the family Hydrometridæ resemble the water striders, but are more slender and delicate. The adults of the commonest species (*Hydrometra lineata*) hibernate under rubbish along the banks of slow streams and ponds, and lay their eggs singly on the stems of aquatic plants. The larvæ fall into the water and remain near the bank, feeding upon the bodies of insects which fall into the stream. The only other true bugs which are in any way aquatic belong to the family Hebridæ, which contains very small species of semiaquatic habits, found in wet moss and littoral vegetation. The common cosmopolitan German cockroach or croton bug (*Ectobia germanica*) is often called water bug in the United States, since it is found near water pipes in houses. See COCKROACH.

WATERBURY, wą'tĕr-bĕr-ĭ. A city and one of the county seats of New Haven Co., Conn., 33 miles southwest of Hartford, on the Naugatuck River and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 3). It is attractively situated in the heart of the Naugatuck valley. There are four parks—Centre Square, Hamilton, Chase and Union Square, and Riverside Cemetery—of great natural beauty. Among the educational institutions are St. Margaret's Diocesan School for Girls (Episcopal), the Convent of Notre Dame, and the Gerard School. Noteworthy features include: the Silas Bronson Library (97,000 volumes), the Mattatuck Historical Society collection of paintings, historical statuary and medallions, Mulcahy Memorial Hall, the Municipal Building, Union Station, the Federal Building, Elton Hotel, and the county courthouse. The Eagles and Elks orders have homes here. Among the charitable institutions are St. Mary's and Waterbury hospitals, Southmayd Home for Old Ladies, and two day nurseries. Waterbury has large industrial interests. It is the leading centre of the United States for the manufacture

of brassware (including castings and finishings), and is noted for the manufacture of watches and clocks. There are also copper, oroide, silver, and aluminium works, foundries, and machine shops, woolen mills, and manufactories of presses, stamp and steel dies, machinery of many kinds, pressure gauges, brass and steel oilers, rivets, chains, hardware and nails, boilers, cloth, lamps and reflectors, cutlery, bicycle and automobile trimmings, buckles, cartridges, insulated wire, silk thread, etc. Excellent water power has contributed largely to the city's industrial success. The capital invested in manufacturing enterprises, according to the census of 1914, was $48,921,000, while the total value of the products was $50,659,000. The government is vested in a mayor, chosen biennially, and a unicameral council. The water works are owned and operated by the municipality. Municipal expenditures in 1915 were: education, $585,000; streets and bridges, $284,000; fire, $133,000; police, $107,000; charity, $68,000. Pop., 1900, 45,859; 1910, 73,141; 1915 (U. S. est.), 87,745.

Settled in 1674, Waterbury was part of Farmington until 1686, when it was incorporated as a town and its present name adopted in place of the old Indian name, Mattatuck. In 1691 it suffered greatly from a flood, and in 1712 an epidemic, called the "Great Sickness," carried away one-tenth of its inhabitants. It was incorporated as a city in 1853. In 1900 the town and city of Waterbury were united into one municipality. Consult Anderson (editor), *The Town and City of Waterbury* (3 vols., New Haven, 1896).

WATERBURY. A town in Washington Co., Vt., 12 miles by rail northwest of Montpelier, the State capital, on the Central Vermont Railroad (Map: Vermont, C 3). It contains the State Hospital for the Insane and the Henry Janes Library. There are extensive granite-quarrying interests and a shoe-last factory. Pop., 1900, 2810; 1910, 3273.

WATER CALTROPS. Aquatic plants. See TRAPA; WATER CHESTNUT.

WATER CHESTNUT. The edible seeds of the *Trapa natans*, a European and Asiatic species found in a few localities in the United States, called by the French *marron d'eau*. In China the fruit of *Trapa bispinosa*, known as *ling ko*, is common, it having been included among the five food grains of China. The seeds do not keep well, and those offered in bazars are often decayed. The fresh nuts resemble chestnuts in taste. The name "water chestnut" is also given to the edible tubers of the *Eleocharis tuberosus*, a plant of the family Cyperaceæ, which is cultivated by the Chinese in tanks very abundantly supplied with manure. It is destitute of leaves, except a slender short sheath or two at the base of each culm. The tubers are produced on stolons. They are esteemed by the Chinese for food.

WATER CHINQUAPIN. See NELUMBO.

WATER CLOCK. See CLEPSYDRA.

WATER-CLOSET. See PLUMBING.

WATER-COLOR PAINTING (AQUARELLE). The process of painting by means of colors mixed with water and some adhesive, as gum or size, instead of oil. The term is now generally used for such painting upon paper which shows through as a ground. It differs from gouache painting, in which the color is applied in successive layers, as in oil. The processes of painting in vogue before the introduction of oil colors were, for the most part, varieties of water color, as, e.g., fresco painting (q.v.), in which water colors are applied to the wet line of the plaster, and tempera (q.v.). For the technique of painting among the Egyptians, Greeks, and other ancient peoples, whose works, although they made use of water colors, are not aquarelles in the modern sense, see EGYPTIAN ART; GREEK ART; CHINESE ART; ETC.

In early Christian miniatures and book illustrations water color was the medium usually employed. They were designed with the silver point, drawn with the pen, and then colored with light tints. During the Byzantine and Romanesque periods the more elaborate gouache technique was preferred, but the Gothic age saw a revival of the aquarelle. From the treatise of Cennini, a disciple of Giotto, we know that these illuminators had greatly advanced upon their predecessors; they had an elementary knowledge of light and shadow and used about the same variety of colors as contemporary panel painters. In the later fifteenth century water colors were extensively used in the coloring of prints from wood engravings, and to some extent of those from line engravings, a practice which lingered until the seventeenth century. They were also extensively used during this period in drawings and in colored sketches by many of the principal masters.

Such, indeed, was the origin of modern water color. It was the custom of Dürer and certain of the German, Dutch, and Flemish artists to outline drawings with a reed pen and fill in those outlines with an auxiliary flat wash. Gradually the hard lines were replaced by touches with the brush, and the result was a monochrome in browns, and grays, bistre, or India ink. These again came to be tinted, and so suggested the full use of colors. Rembrandt often drew in brown, and added dashes of strong color; and Rubens produced something very like modern water-color drawings. The modern art became emancipated from the old traditions by "gradual disuse of the old shadow tint, and imitation of the local color, not alone of the objects themselves, but of every modification resulting from light, dark, half tint, or distance, a method which at once led to far greater truth and richness than could ever have been attained by merely passing color over the universal shadow tint." The stained drawing gradually gave way to the more perfect tinted drawing. But the tinted style predominated till 1790; and it may be said that the water colors of the eighteenth century were tinted monochromes. Paul Sandby (1725–1809), often called "the father of water-color art," improved upon the tinted drawings by finally working in body color with considerable skill. Whateley, Westall, and Gilpin used water colors as well as oil. Rowlandson, Cristall, Hills, Wright, Mortimer, Gresse, Hearne, and John Robert Cozens (1752–?1799), developed atmospheric effects in a manner before unknown. Thomas Girtin (1775–1802) attained great richness of tone and breadth; his compositions were grand but simple; he massed light and shade in broad and sometimes abrupt forms. J. M. W. Turner (1775–1851) soon distanced all his predecessors and contemporaries, and in his hands water-color painting became a new art. He wholly abandoned preliminary tinting; minute details are imitated in local color; and his work is marked by breadth, fullness, and warmth, as

well as grace. Other important names are those of Varley, Samuel Prout, who excelled in brilliant effects of light and shade, Peter de Wint, Cotman, David Cox, especially noteworthy in excellent atmospheric effects, Copley Fielding, noted for his truthful rendering of rain storm and marine effects, Cattermole, and Birket Foster, who developed mood painting in water color. Millais, Rossetti, Holman Hunt, Ford Maddox Brown, and other members of the Pre-Raphaelite Brotherhood, achieved success in water color, as did also Sir Hubert Herkomer, Walter Crane, Frederick Taylor, H. B. Brabazon, a brilliant colorist, Frederick Walker, and Arthur Melville.

The impetus towards water color in France first came in the early twenties from the Englishman Bonington and from Géricault. It was soon practiced by all important artists, among whom Delacroix, Isabey, and especially Decamps achieved most remarkable results. Among celebrated French aquarellists of a later date were Leloir, Meissonier, Regnault, Detaille, and Vibert, among figure painters; and Jaquemart, scapists. The very popular fan painting upon silk and satin is done with water colors, which have lately been applied, with high success, to paintings upon canvas and other materials as well. In Germany water colors were used by Schwind with great effect in the portrayal of his dreamlike fables, but the first important German aquarellist was Hildebrandt, a pupil of Isabey. Other important representatives are Menzel in Berlin, Karl Werner, and Fielder (Triest). Both in Holland (Israels) and Belgium are flourishing schools, and in Spain and Italy the example of Fortuny gave rise to a particularly brilliant development.

In the exhibitions of water-color paintings yearly held in the United States, particularly in New York and Philadelphia, great variety in technique and subject is seen, but no distinctive American school has as yet been developed. Among the artists prominent in figure painting are Winslow Homer, J. S. Sargent, William M. Chase, C. Y. Turner, Robert Blum, Irving R. Wiles, Frank Benson, and Cecilia Beaux; in landscape may be mentioned Alexander Wyant, J. Francis Murphy, Samuel Coleman, R. Swain Gifford, Henry Farrar, Childe Hassam, C. C. Cooper, Gifford Beal; in marine painting, William T. Richards, Charles Woodbury, and Charles A. Platt; in genre, Walter Gay. Among others, belonging to a younger group, are Hilda Belcher, Helen Turner, Harold Camp, C. K. Chatterton, H. B. Demuth, Arthur Davies, John Sloan, Samuel Halpert, and John Marin.

At present water-color paintings may be devided into three kinds: (1) those in which the coloring is mainly transparent; (2) where it is usually opaque; (3) where transparent, semi-transparent, and opaque colors are freely used in combination. The quick drying of water-color pigments is favorable to rapid execution, and greater clearness of color is attained than is practicable in oils. They are especially adapted to sketches of all kinds, and the rendering of fugitive impressions, and retain color far better than oil paintings. The progress of the art has been greatly promoted by modern chemical developments in the preparation of the colors—great variety of really permanent colors being now procurable. These are pigments ground with gum or other mucilage, and may be kept in cakes, the usual vehicle for moistening and applying them being gum arabic and water. For artists they are now usually prepared so as to be kept moist in earthenware pans or metallic tubes.

The earliest organized society for the promotion of the art was the British Society of Painters in Water Colors, founded in London in 1804, and known since 1882 as the Royal Society, which has held exhibitions since 1805. Societies exist in other countries where the art is practiced. The Société des Aquarellistes Français in Paris was founded in 1879. The American Water-Color Society has held yearly exhibits in New York since 1867, and the New York and Philadelphia Water-Color clubs hold annual exhibitions. The South Kensington Museum possesses what is probably the finest collection of water colors in existence.

Bibliography. For the technical side, consult John MacWhirter, *Landscape Painting in Water Color* (London, 1900); A. L. Baldry, *The Practice of Water-Color Painting* (ib., 1911). For the English school, consult Monkhouse, *The Early English Water-Color Painters* (London, 1889); Redgrave, *Water-Color Painting in England* (ib., 1892); A. L. Baldry, *Royal Institute of Painters in Water Colors* (New York, 1906); H. M. Cundall, *History of British Water-Colour Painting* (London, 1908).

WATER COLORS. Pigments mixed with water, with the addition of some adhesive material such as gum or size. Those prepared for artists' use are made with great care and are generally formed in dry cakes with gum, or mixed with water and glycerin to a pasty consistency, while those that are used for sign painting or coloring walls are simply mixed up with common glue or size. The latter are sometimes called distemper colors, their application being only of a temporary character. See PAINTS.

WATERCOURSE. In law, a living stream of water usually flowing in a well-defined bed or channel into some other body of water. It does not lose its character as a watercourse if it becomes dry in times of unusual drought, but it must have such a permanent and substantial source of supply as not to depend upon mere surface drainage in case of rain. The source may be living springs or from natural percolation, but must be sufficient to supply water during the greater part of the year. For a discussion of the rights of owners of land along watercourses, see RIPARIAN RIGHTS; WATER RIGHTS. Consult Farnham, *Law of Waters and Water-Rights* (Rochester, 1904).

WATER CURE. See HYDROTHERAPY.

WATER DEER. See CHEVROTAIN.

WATER DOG, or WATER SPANIEL. See SPANIEL.

WATER DOG. See HELLBENDER; MUD PUPPY.

WATER DROPWORT (*Œnanthe*). A genus of large perennial plants of the family Umbelliferæ, with compound or decompound disagreeable smelling leaves. The common water dropwort (*Œnanthe crocata*) is common in wet places throughout Europe. The roots of the latter have some resemblance to small parsnips, but are very poisonous. The fine-leaved water dropwort, called water fennel by the Germans

(*Œnanthe phellandrium*), is also common in similar situations in Europe. It is characterized by a jointed rootstalk (rhizome), with tufted whorled rootlets and a strong zigzag stem dilated at the base. Neither of these plants occurs in the United States unless as a rare introduction.

WATEREE (wą'tĕr-ē') **RIVER,** called in its upper course the CATAWBA. A river which rises in the Blue Ridge in North Carolina and flows southeast into South Carolina, where it unites with the Congaree to form the Santee (Map: South Carolina, D 2). Its length is about 300 miles, and it is navigable to the fall line a few miles above Camden, S. C.

WATER ELEVATORS. See PUMPS AND PUMPING MACHINERY.

WATER ENGINE. See HYDRAULIC PRESSURE ENGINE.

WATERFALL. The sudden descent of a stream of water over a declivity. It is the result usually of erosion on rocks of different hardness. A remarkable series of waterfalls exists along the inward edge of the Atlantic coastal plain, in the neighborhood of the cities that lie between Trenton, N. J., and Augusta, Ga. Along this line the more resistant rocks of the older strata come to the surface; the weaker rocks lie to the east of this region, which is often called the fall line. On the other hand, in the case of mountain torrents, where the rocks are very hard, the quantity of water small, and the erosive action quite weak, beautiful and artistic waterfalls and cascades are numerous. The highest waterfalls are mountain cataracts; thus the waters of the Yosemite, California, fall 2660 feet in three leaps. The Oroco Falls of Monte Rosa are 2400 feet high; the Grand Falls of Labrador, 2000 feet; the Gavarnie, in the Pyrenees, 1400 feet; and the Staubbach, Switzerland, 1000 feet. The falls that are famous for the immense quantity of water passing over, rather than the extreme height, are the Falls of Niagara, from 150 to 164 feet, those of Iguassu on the Paraná River, 200 feet, and the Victoria Falls of the Zambezi, 400 feet. The Kaieteur Falls in British Guiana rank among the greatest in combined height and flow with a single leap of 741 feet.

WATER FLEA (so called from its skipping like a flea through the water). A phyllopod crustacean, especially of the genus *Daphne*, whose minute species are common in fresh water. See BRANCHIOPODA; COPEPODA; PHYLLOPODA.

WATERFORD, wą'tĕr-fĕrd. A maritime county of the Province of Munster, Ireland (Map: Ireland, D 7). Area, 717 square miles. The surface is generally mountainous, and there are large marshy districts. About one-half of the area is pasture land, and but a small area is under tillage. Pop., 1901, 87,187; 1911, 83,766. County town, Waterford. Historically Waterford has been one of the chief strongholds of the English in Ireland.

WATERFORD. The capital of Waterford County, Ireland, on the Suir, 12 miles from the sea, and 97 miles south-southwest of Dublin (Map: Ireland, D 7). The city, with the exception of its Ferrybank suburb, with which it is connected by a bridge of 39 arches, 852 feet long, lies on the right bank of the river, along which a handsome and spacious quay extends for nearly a mile, and from which the city ascends gradually in well-built streets. The chief public buildings are the Protestant and Roman Catholic cathedrals, the Protestant Episcopal palace, the Roman Catholic College of St. John, and the national school. Ring or Reginald's Tower, an important archæological monument, erected in 1002, was rebuilt in 1819. In addition to the union workhouse, there are an infirmary, a dispensary, a fever hospital, a district lunatic asylum, and a penitentiary. Vessels of 2000 tons are able to discharge their cargoes at the quay, and there is anchorage for larger ships 6 miles lower down the river, at Passage. The chief trade is with England. The exports comprise butter, pork, bacon, oats, eggs, and live stock. The imports include maize, wheat, flour, petroleum, sugar, and timber. There is a shipbuilding yard, with patent slip, graving bank, and dock, on the Kilkenny bank of the river, and other industrial establishments include distilleries, breweries, foundries, and flour mills. Originally of Danish foundation, Waterford was taken by Strongbow, by whom it was enlarged. It received a charter from John, which was forfeited under James I, but restored by Charles I in 1626. Pop., 1901, 26,743; 1911, 27,430.

WATERFORD. A town in New London Co., Conn., on the Thames River, 3 miles above New London, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, G 4). Granite quarrying and cutting and the manufacture of paper are the chief industries. Waterford was part of the city of New London until 1802 when it was incorporated as a separate town. Pop., 1900, 2904; 1910, 3097.

WATERFORD, wą'tĕr-fĕrd. A village in Saratoga Co., N. Y., on the west bank of the Hudson River, at the junction of the Erie and Champlain divisions of the State Barge Canal, and on the Delaware and Hudson Railroad (Map: New York, G 5). It contains the Breslin Old Ladies' Home and a fine library. There are manufactories of knit goods, gloves, fire hydrants, valves, stocks and dies, brush-making machinery, cooperage products, and lathes. Excellent water power is derived from the Mohawk River which here flows into the Hudson. Havre Island, of Revolutionary interest, lies within the town limits, separated from the village by the Mohawk. Pop., 1900, 3146; 1910, 3245.

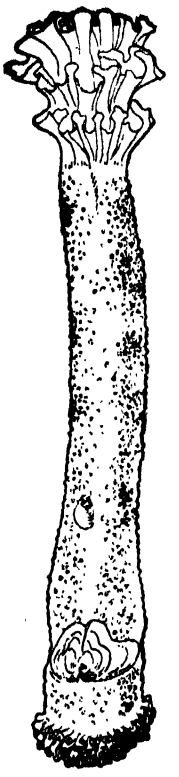
WATER GAS. See GAS, ILLUMINATING.

WATER GLASS, or SOLUBLE GLASS. A term applied to alkaline silicates containing an excess of alkali and soluble in water. Three varieties of water glass are in use, viz.: 1. Potash water glass, or potassium silicate, prepared by fusing together three parts of silica (sand) and two parts of potassium carbonate, with a small quantity of charcoal, in an ordinary reverberatory furnace, the product being soluble in four or five parts of boiling water. 2. Soda water glass, or sodium silicate, prepared by melting together 15 parts of silica (powdered quartz), 8 parts of sodium carbonate, and 1 part of powdered charcoal, heating for five or six hours, then cooling, powdering, and extracting with five or six times its weight of boiling water. Another process consists in boiling silica in a digester with strong caustic soda under heavy pressure. Thus is obtained the original water glass invented by Fuchs of Munich, who first described it in 1825. 3. The so-called double water glass consists of a mixture of both of the foregoing. It may be made by fusing together 100 parts of silica, 28 parts of potassium carbonate, 22 parts of sodium carbonate, and 6 parts of powdered charcoal. These

substances find extensive practical application. When used in the form of varnish or paint they produce a fireproof and waterproof surface. When applied as a coating to a surface containing lime, they combine with the latter, forming an infusible silicate or artificial stone. This process has been taken advantage of for the preservation of frescoes, and is known as stereochromy. It has also been utilized for the manufacture of artificial stone, and of a cement for consolidating siliceous sand into a hard, durable artificial sandstone, capable, before it is fired, of being molded into any desired form. Owing to its water-retaining and hardening qualities water glass is extensively used as an ingredient of yellow laundry soaps. It is also employed in the manufacture of earthenware, and as a substitute for dung in the dyeing and printing of fabrics. Water glass properly diluted is recommended as a preserving liquid for eggs.

WATER GRATES (for furnaces). See SHAKING GRATES.

WATER HEMLOCK. See HEMLOCK and Plate of POISONOUS PLANTS.



WATER HEN. Any one of several rails and gallinules (qq.v.).

WATERHOUSE, wą'tẽr-hous, ALFRED (1830–1905). An English architect, born at Liverpool. He studied with Richard Lane at Manchester, and afterward in France and Italy. His first work of importance was the Court of Assize at Manchester. His next works were the new buildings of Balliol College, Oxford, and of Caius College, Cambridge. Other important buildings are the Manchester City Hall; Pembroke College, Cambridge; Owens College, Manchester; the South Kensington Natural History Museum, London; Eaton Hall, Cheshire; and Iwerne Minster, Dorsetshire. He was one of the most noted and successful of the architects who developed the Victorian Gothic movement to adapt the mediæval styles to modern secular purposes. All his works are in the Gothic style except the Natural History Museum, which is in a free version of the French Romanesque.

WATERHOUSE, JOHN WILLIAM (1849–). An English figure painter. He was born in Rome, Italy, and studied for a short time at the Royal Academy schools in London, but was mostly self-taught. At first he painted in the manner of the classic school of Leighton and Tadema, excelling in the poetic rendering of ideal subjects, remarkably rich in color and highly decorative in design. But his later works suggest Pre-Raphaelite influence. They include "The Oracle" (1884); "St. Eulalia," "The Magic Circle" (1886), "The Lady of Shalott" (1888), all in the Tate Gallery, London; "Hylas and the Nymphs" (1897, Manchester Art Gallery); "Echo and Narcissus" (1903, Liverpool Art Gallery); "The Soul of the Rose" (1908); "Thisbe" (1909). Waterhouse became a Royal Academician in 1895. Consult A. L. Baldry, *J. W. Waterhouse and his Work* (London, 1902).

WATER HYACINTH. See AQUATIC PLANTS.

WATERING-POT SHELL, or ASPERGILLUM. The shell and tube of a strange little bivalve (*Brechites* or *Aspergillum vaginiferum*, of the Red Sea), related to the date shells and shipworm (*Teredo*), which only as an embryo presents the appearance of a normal bivalve. From a floating egg, it ceases very early to live free, and while no more than ⅛ of an inch long sinks into the sand, or adheres to some fixed object, and begins to form a long upward-growing calcareous tube. The little valves appear to be discarded and become soldered into the wall of the sheath, which enlarges upward in pace with the growth of the mantle and siphons, and for their protection; it is usually about the size of a pipe stem. Downward, the animal closes in the sheath by a disk perforated by many tubes, each secreted by a tentacle-like filament of the mantle. A dozen or more species are recognized, all Oriental, and many strangely distorted. The frills around the upper edge of the shell protrude from the sand in which the remainder is buried and exhibit stages of growth. Other species bore in rock, coral, or timber; another genus is *Gastrochæna*, in which the valves are not included in the wall of the sheath.

WATERING-POT SHELL.

WATER JET. See PILE; FOUNDATION.

WATER LEMON. See GRANADILLA.

WATER LILY, POND LILY. Popular names for species of the genera *Nymphæa* and *Castalia*, of the family Nymphæaceæ. The species, of which there are about 30, are natives of temperate and tropical climates and are all perennial, aquatic herbs. They have rootstocks or tubers, which are embedded in the mud at the bottoms of ponds and shallow, sluggish streams; floating, usually round leaves, and usually showy flowers of many tints, ranging from white to red, yellow, and blue. Under the present system of nomenclature the yellow pond lilies, formerly called Nuphar, belong to the genus *Nymphæa*, while the white, pink, blue, etc., flowered ones are Castalias. They have long been favorite plants in water gardens, and a large number of hybrids and varieties have been produced. The starchy seeds and rootstocks are used for food in many parts of Africa, Asia, Australia, and tropical America. The essentials of water-lily culture are rich alluvial mud at the bottom of a shallow pond, plenty of light, and selection of kinds that are hardy in the climate. As a rule the pond should be deep enough to prevent freezing solid, at least where the lily roots are. Tender kinds may be kept in tubs, which can be sunk in the pond for the summer and stored in a greenhouse during winter. Consult H. S. Conard, *Water-lilies*, published by the Carnegie Institution (Washington, 1905), and Conard and Hus, *Water-Lilies and How to Grow them* (New York, 1907). See Colored Plate of AQUATIC PLANTS.

WATER-LILY FAMILY. See NYMPHÆACEÆ.

WATER LOCUST. See HONEY LOCUST.

WATERLOO, wą'tẽr-lo͞o'. A town in Waterloo County, Ontario, Canada, on the Canadian Pacific and Grand Trunk railways (Map: Ontario, E 7). It has a considerable variety of manufactures. Pop., 1901, 3537; 1911, 4359.

WATERLOO, wą'tẽr-lo͞o'. A city and the county seat of Monroe Co., Ill., 23 miles south of

St. Louis, on the Mobile and Ohio, and the East St. Louis, Columbia, and Waterloo railroads (Map: Illinois, D 9). The leading manufactures are flour, condensed milk, cigars, and beer. Noteworthy features are the courthouse and city library. Pop., 1900, 2114; 1910, 2091.

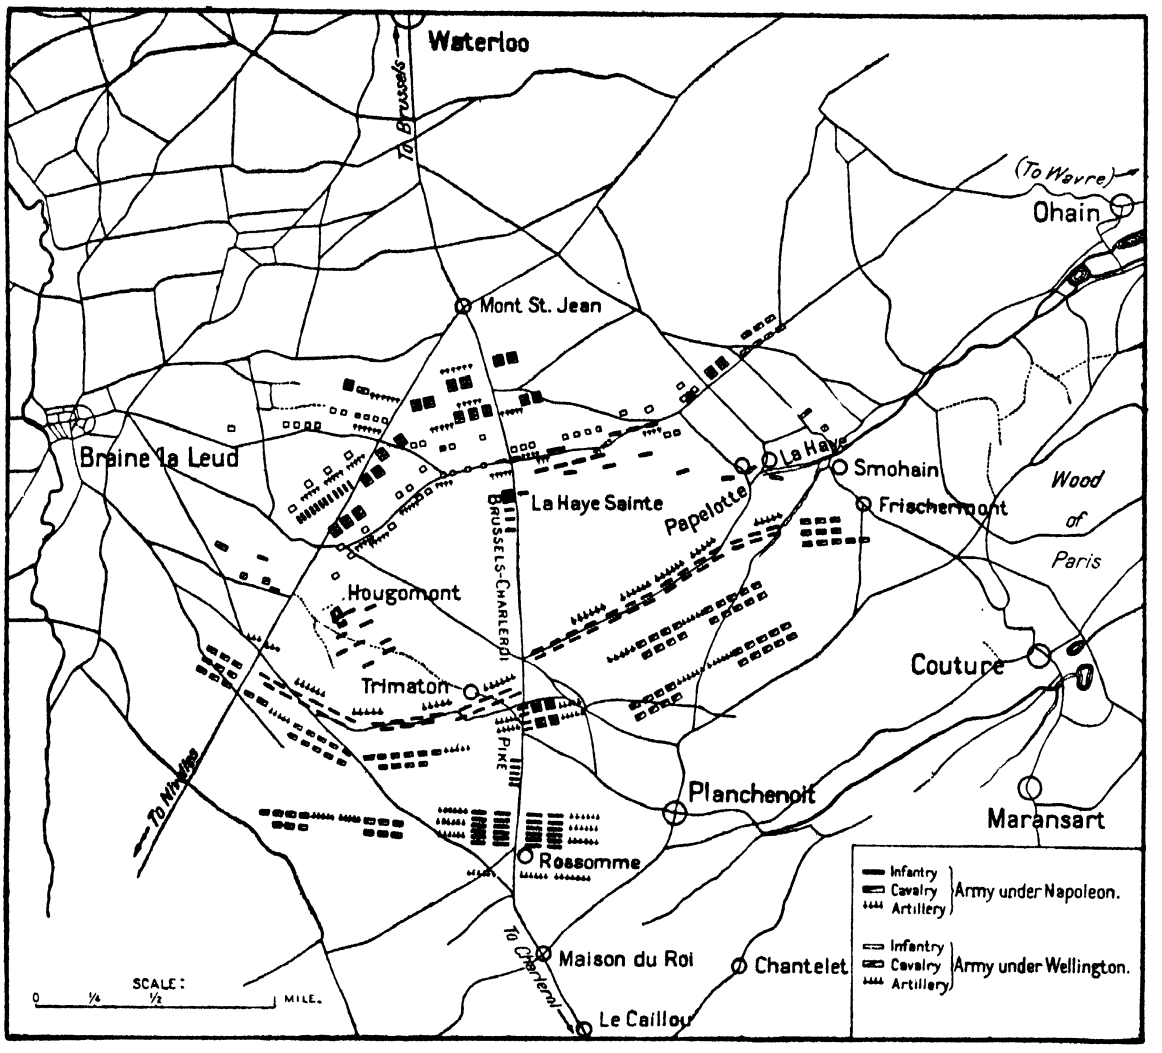
WATERLOO. A city and the county seat of Blackhawk Co., Iowa, 53 miles northwest of Cedar Rapids, on the Red Cedar River, and on the Illinois Central, the Chicago Great Western, the Chicago, Rock Island, and Pacific, and the Waterloo, Cedar Falls, and Northern railroads (Map: Iowa, E 2). It is well laid out and has wide streets. Six parks and a Carnegie library are among the prominent features. Waterloo carries on a large jobbing and wholesale trade and has considerable industrial importance. There are beef and pork packing and corn-canning establishments, brickyards, large cream-separator works, and manufactories of concrete work, gasoline engines, farming implements, well drills, refrigerators, cigars, flour, creamery supplies, and foundry and machine-shop products. The Illinois Central Railroad maintains extensive repair and construction shops here. Waterloo was settled in 1850, and was incorporated in 1868. Pop., 1900, 12,580; 1910, 26,693; 1915 (U. S. est.), 34,131.

WATERLOO. A village and one of the county seats of Seneca Co., N. Y., 45 miles by rail west by south of Syracuse, on the Seneca River and the Cayuga and Seneca Barge Canal, and on the New York Central and the Lehigh Valley railroads (Map: New York, D 5). It manufactures woolen goods, wagons, whisky, flour, etc. The Library and Historical Society has a collection of over 7000 volumes. There are public parks and fine county buildings. Pop., 1900, 4256; 1910, 3931; 1915 (State census), 4343.

WATERLOO, BATTLE OF. The decisive battle, the culmination of a series of engagements constituting a brief campaign, which finally annihilated the power of Napoleon. It was fought June 18, 1815, about 2 miles from the village of Waterloo, in Belgium, and 12 miles south of Brussels. Napoleon escaped from Elba in February and entered Paris March 20. His professed devotion to peace made no impression upon the allies, who suspended negotiations at Vienna (see VIENNA, CONGRESS OF) to prepare for a renewal of the struggle. Napoleon made the best preparation possible to recover his empire, but although able to count on paper an army of over 500,000 men, there were but 198,000 actually ready when the decisive moment arrived. Opposed to him were the English, Dutch, Belgian, and Hanoverian forces, with those of Brunswick and Nassau, all commanded by the Duke of Wellington, and those of Prussia, Saxony, and other smaller German states, under the veteran Blücher. These two armies were distributed in the Belgian Netherlands, Wellington having his headquarters at Brussels and Blücher at Namur. The Austrians gathered an army on the eastern frontier of France, which was to be joined by the Russian contingent, the united force to be commanded by Prince Schwarzenberg. Napoleon intended to follow the tactics of rapid and aggressive action that won his early successes. He planned to destroy his enemies on the north before the Austrian and Russian forces could be made effective, and to dispose of Wellington and Blücher separately. He would concentrate near Charleroi, and expected to meet the Germans first, counting on Blücher's aggressive character to bring him into action earliest. The forces under Wellington were distributed in numerous cantonments, covering a considerable area about Brussels and to the west of the highway leading south from there. They had the seacoast for their base by way of Antwerp and Ostend. The Rhine, by way of Liége and Maestricht, was Blücher's base. Thus if either army was compelled to fall back on its base the allies would be separated, and Napoleon seems to have expected this by attacking Blücher on the right of that general's line.

The French forces on the eve of the campaign, exclusive of noncombatants, consisted of 124,588 men—89,415 infantry, 23,595 cavalry, and 11,578 artillery with 344 guns. They were distributed as follows: First Corps (D'Erlon), 19,939 men; Second Corps (Reille), 24,361; Third Corps (Vandamme), 19,160; Fourth Corps (Gérard), 15,995; Sixth Corps (Lobau), 10,465; Imperial Guard (the commander, Marshal Mortier, being ill, orders were given through the adjutant general, Drouot), 20,884; reserve cavalry (Grouchy, four corps, with horse artillery), 13,784. There seems to have been uncertainty up to the last minute regarding the wing commanders. Marshal Ney was summoned at the last moment and reached his command, the First and Second Corps, on the afternoon of June 15. Grouchy was taken from his command of the reserve cavalry after the campaign had opened and given the right wing, comprising the corps of Vandamme and Gérard. Marshal Soult served as Napoleon's chief of staff, his old chief, Berthier, having adhered to the Bourbons. Soult had held independent commands too long to be well placed in a staff position; but Napoleon's staff was always the weakest part of his army organization, and its errors on many previous occasions had been counterbalanced only by the initiative of some of his brilliant field officers.

The army under Blücher, who had Gneisenau for his chief of staff, numbered 120,954 men—99,715 infantry, 11,879 cavalry, and 9360 artillery, with 312 guns. Of these the First Corps (Ziethen), 32,692 men, was at Charleroi; the Second (Pirch), 32,704, at Namur; the Third (Thielmann), 24,456, at Ciney; and the Fourth (Bülow), 31,102, at Liége. The line was largely veterans, and Blücher was an experienced old campaigner, not brilliant, but brave, hard-headed, and reliable. The army of Wellington numbered 93,717 men—69,829 infantry, 14,482 cavalry, 8166 artillery with 196 guns, and 1240 engineers, etc. Of these the British numbered 31,253 men; the King's German Legion, 6387; the Hanoverians, 15,935; the Dutch and Belgians, with one body of Nassauers, 29,214; the Brunswickers, 6808; another regiment of Nassauers, 2880; and Nassau engineers, etc., 1240. It was a very miscellaneous body of troops, probably the least efficient in its rank and file of all the three armies.



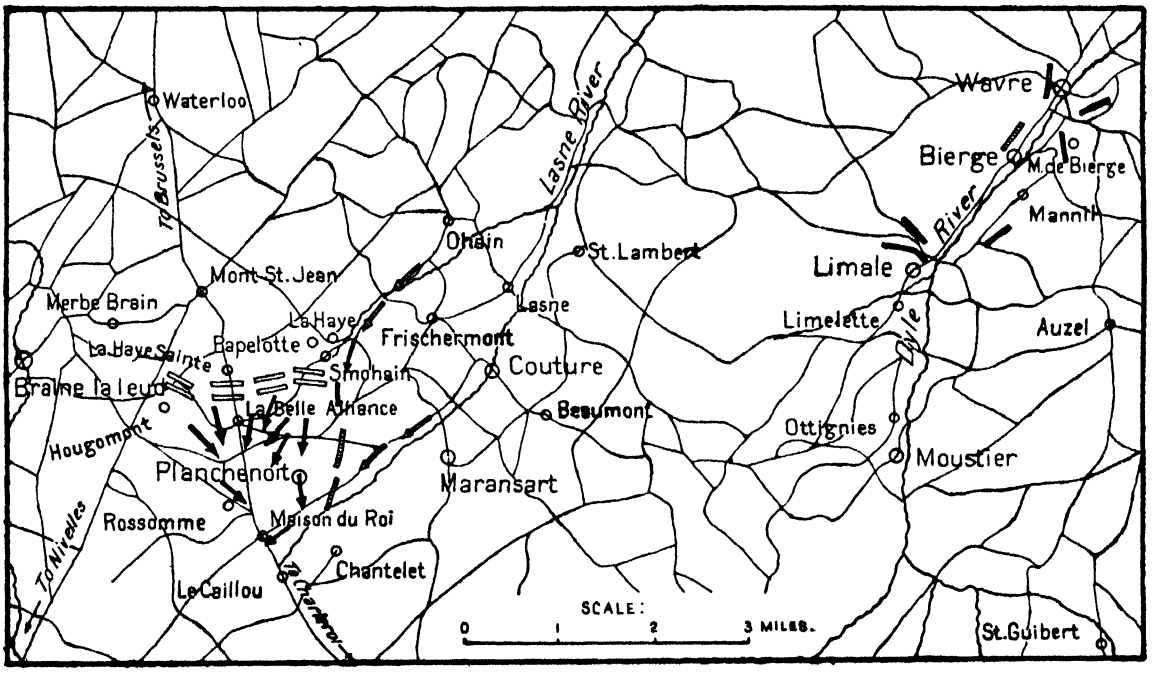
Ligny and Quatre-Bras. The Emperor's advance northward was along the line of the highway through Charleroi to Brussels. The movement began on June 13th, and on the 14th Napoleon's headquarters were at Beaumont. On the afternoon of the 15th the French army began the passage of the Sambre, moved upon Ziethen's position at Charleroi, and slowly forced him back upon Fleurus. Reille advanced on

Gosselies, and had already had an encounter with the Prussian rear guard, when Ney arrived on the field and took command of two corps (the First and Second), with the composition and officers of which he was unacquainted. He continued the advance with Reille's corps through Gosselies to the vicinity of Quatre-Bras, on the main line of communication between Blücher and Wellington. While his German allies were threatened Wellington did not change his position, lest he should uncover Brussels and Ghent. In the afternoon of the 15th learning of the movement towards Quatre-Bras, he began to concentrate his forces, bringing three divisions of about 25,000 men to Nivelles, west of Quatre-Bras. Some of the Netherland troops occupied Quatre-Bras, and they were reënforced on the morning of the 16th by General Sir Thomas Picton with his division. The French were to attack the Prussian position on the 16th in two wings, under Ney and Grouchy, and when Blücher had been disposed of Ney was to move on Brussels. About two o'clock in the afternoon Ney assailed Quatre-Bras, but, owing to reversals of orders, D'Erlon's corps did not join him until he had been forced back upon Frasnes, after hours of desperate fighting. This engagement prevented Wellington from making a flank movement against the French on the Prussian right, which he had promised to make if not himself attacked. At Ligny about 3 o'clock the French divisions of Vandamme and Gérard opened an attack upon Ziethen, who was supported by Pirch and Thielemann. After three hours of hard fighting, the Prussians were thrown into confusion by a charge of the Guard, Blücher himself was disabled, and 21 guns were captured. Napoleon assumed that the Prussians would retreat towards Namur. On the morning of the 17th he wrote to Ney that the Prussians were routed and that Pajol was pursuing them on the roads to Namur and Liége. As a matter of fact, the Prussians under Gneisenau were moving north and converging on Wavre, intending to join Wellington, with whom they were in communication. Wellington had passed the night at Genappe and was preparing to take up a position in force at Quatre-Bras, when he learned of the Prussian manœuvre, which left him in an exposed position. He therefore fell back to Waterloo. At noon of the 17th Napoleon detached Grouchy with 33,000 men to pursue and defeat the Prussians. As the latter had been already eight hours on the march and their real direction was unknown, this was no easy task. Joining Ney with the remainder of his army, Napoleon followed Wellington. Receiving information at Marbais that threw a doubt on his supposition that the Prussians had retreated to Namur, he sent instructions to Grouchy to ascertain whether they were attempting to join the British. When Grouchy received this dispatch, Blücher was nearer to Wellington than Grouchy was to Blücher. When Grouchy reached Gembloux in a heavy rain at ten that night, he knew that the Prussians had marched to Wavre and not to Namur. The main French army arrived at Waterloo late on the 17th and bivouacked opposite the enemy.

Waterloo. Napoleon inspected the position of both armies after midnight, and between 7 and 8 o'clock on the morning of June 18th he saw that his adversary was ordering his army in line of battle. The rain of the night ceased about 8 o'clock, and before nine there was a showy review by the Emperor of his lines. The attack was postponed, however, on Drouot's advice, in order that the ground might be in better condition for artillery. Wellington had the advantage of choice of position and he had taken a strong one. He awaited the attack, relying fully upon the assurance of Blücher that the Prussians would come up in time. About 10 o'clock Napoleon sent to Grouchy to move upon Wavre, but not even then does the Emperor seem to have realized that the whole Prussian force was concentrating there and preparing to aid Wellington.

The main British line stretched across the Brussels-Charleroi road, along the line of the highway from Ohain to Wavre. Outposts held the hamlets of La Haye, Papelotte, and Smohain on the extreme left, and the Château of Hougomont, a strong position, on the right. The farm house of La Haye Sainte in advance of the centre was also occupied. Wellington had on the field 49,608 infantry, 12,408 cavalry, and 5645 artillery, with 156 guns; but of these the British troops numbered only 23,991. The left was held by the Fifth and Sixth British divisions, the Second Netherland, and the cavalry divisions of Vivian and Vandeleur. General Picton of the Fifth probably commanded this wing. The three hamlets were held by one of the Netherland brigades under Prince Bernhard of Saxe-Weimar, and Bylandt's Netherland brigade was advanced in front of the Wavre road. In the rear of the left wing was General Ponsonby's Union cavalry brigade (Royal Dragoons, Scots Greys, and Enniskillen Dragoons). West of the Charleroi road lay Alten's Third British Division. A battalion of the King's German Legion, under Major Baring, garrisoned La Haye Sainte. Farther on the right were Cooke's First Division, a part of Byng's Second Brigade, and some of the German troops. Clinton's Second Division and the Brunswick contingent were in reserve near Merbe Braine; Chasse's Netherlanders were on the extreme right, near Braine-la-Leud; and the heavy cavalry brigade of Lord Somerset was in rear, near the Charleroi turnpike, with the Netherlands cavalry on its right. Napoleon had 48,950 infantry, 15,765 cavalry, and 7232 artillery, with 246 guns. In his first line the First Corps had the right and the Second the left. According to Napoleon's plan of battle, as dictated in the morning, Ney was to open the attack on the right about 1 o'clock, the object being to secure possession of the village of Mont-Saint-Jean, lying on the Charleroi Road in the rear of the British lines. An hour and a half before the time for the main attack a diversion was made in the form of an assault on Hougomont by Prince Jerome's division of Reille's corps. The first assault proving unsuccessful, other divisions were wasted on this unprofitable action, so that the Second Corps took hardly any part in the main attack on the British centre. This was made in echelon about 1.30 o'clock by D'Erlon's First Corps, after a heavy artillery fire had been directed for an hour and a half on Bylandt's exposed position. His brigade was easily routed, but the French pursuing met a terrible fire from Picton's division behind the ridge and were charged by Ponsonby's cavalry and driven back in confusion. The British troops did splendid work in meeting and repulsing this attack. Meanwhile Napoleon had discovered the advance guard of Bülow's Prussian division on the hills of Saint-

Lambert, two or three miles away at his right, and the Sixth Corps was detached to hold this new enemy in check, while a dispatch was sent to Grouchy ordering him to return. This Grouchy, having moved off on his fruitless chase to Wavre, did not receive until evening. A rash and ill-managed assault on La Haye Sainte occupied part of the afternoon, and the house was finally taken at about 4 o'clock, according to Charras, or between 6 and 7, according to Heymès, Ney's chief of staff. Between 4 and 6 o'clock, under Ney's personal direction, the cavalry divisions of Milhaud, Lefebvre-Desnouettes, Kellermann, and Guyot were hurled against



FIELD OF WATERLOO AT 11 A.M., JUNE 18, 1815.

from Maitland's brigade, and were repulsed with terrific loss. The prompt support of General Halkett and Colonel Elphinstone protected Maitland's left and the impetuous charge of Colonel Colborne with the Fifty-second Regiment completed the disorder of the Guard. The Prussians began to arrive about 7:30. Ziethen first came up from Ohain and his troops at once went into action, throwing the French right into confusion. Seeing that victory was in his hands, Wellington threw his whole line forward. The French retreat speedily became a rout. There was no more thought of resistance except by detachments of the Guard and by Lobau with the British right centre, but the British squares, although suffering from the French artillery fire, which supported the cavalry, maintained their formation unbroken. The cavalry were unsupported by infantry, and by 7 o'clock Ney was compelled to withdraw for lack of troops. Lobau failing to check Bülow on the right, the Young Guard was sent in between 5 and 6 o'clock and there was severe fighting around Planchenoit. A little later, believing that his right was secure, Napoleon massed eight available battalions of the Imperial Guard, supported by artillery, for a final attack on Wellington's centre, then almost shattered. General Friant led this assault. As the Guard advanced, D'Erlon made a vigorous and effective assault on the British right. The Guards met a heavy fire the Sixth Corps, who was holding back Bülow and Pirch on the right. Napoleon left the field in the centre of a square of the Guard and reached Paris on June 21st. The exact losses of the two armies are undetermined. Those of the French, in killed, wounded, and missing, probably numbered over 31,000. Official returns for the allies give their losses as 22,428.

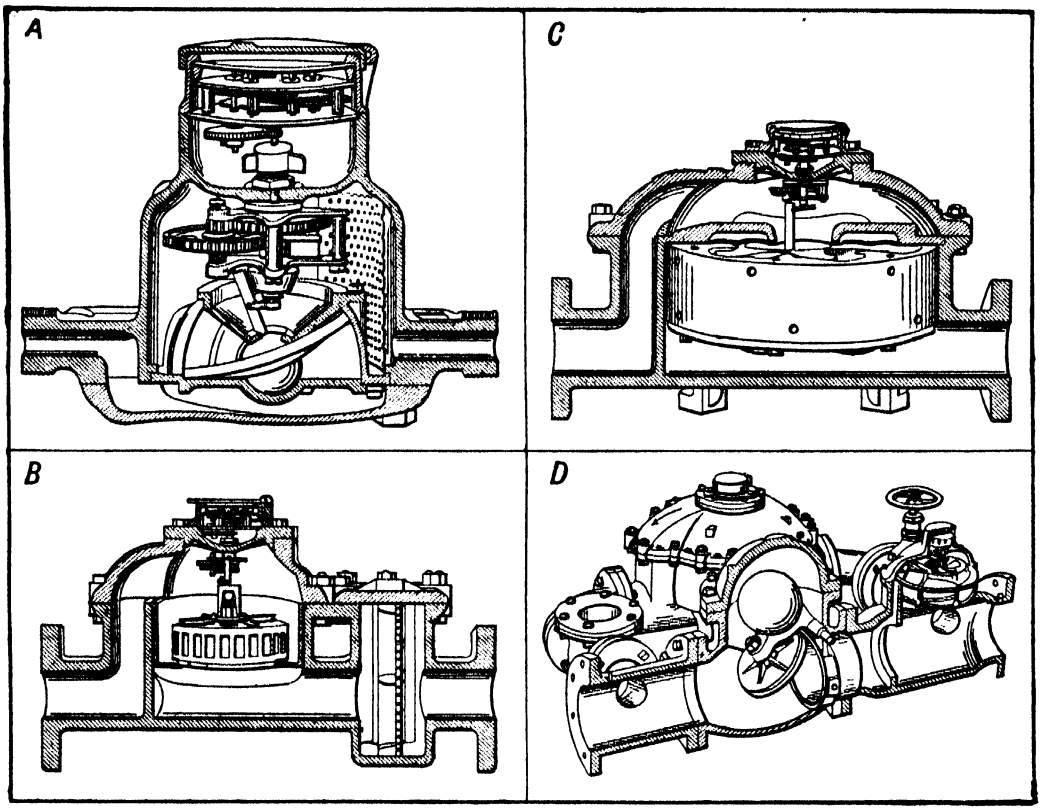
The controverted points relating to the campaign of Waterloo provide abundance of material for the student of military science. Napoleon did not show his usual care and thoroughness in his orders, nor his usual comprehensive judgment in execution. Ney and Grouchy both failed in judgment at critical moments. It was unfortunate for Napoleon that he had as chief of staff a veteran officer who was accustomed to inde-

pendent command instead of a younger man trained in the details of staff work. Wellington, with a less efficient army, showed himself careful, alert, and resourceful, and was well supported by his division commanders at critical moments. Nevertheless, the fact remains that it was the timely coöperation of the Prussians, and especially the arrival in the evening of Ziethen's corps, that turned the scales finally against the French and gave a positive result to the splendid defense of the British position. Wellington counted on this in planning the engagement. That the junction of the allies took place so successfully was due to the masterly strategy of Gneisenau, and to the absence of Grouchy on the chase to Wavre, where it was impossible for him to arrive in time. Had he, instead of following his orders literally, crossed the Dyle at Moustier when he learned at Walhain that the battle was on, he might have headed off the Prussians and delayed their arrival. Whether he could have done this, in the condition of the roads, is doubtful. The wisdom of Napoleon in detaching so large a force for a pursuit that rested upon a mistaken inference, is certainly open to question. When this had been done, Napoleon failed to keep Grouchy sufficiently informed of the exact situation and its needs. See NAPOLEON I.

POSITIONS OF THE THREE ARMIES AT 8 P.M., JUNE 18, 1815.

Bibliography. A good and impartial critical study from all points of view is that by J. C. Ropes, *The Campaign of Waterloo: A Military History* (2d ed., New York, 1893), accompanied by an atlas of 14 maps; also W. Siborne, *History of the War in France and Belgium in 1815* (London, 1848); La Tour d'Auvergne, *Waterloo: Etude de la campagne de 1815* (Paris, 1850); Edgar Quinet, *Histoire de la campagne de 1815* (ib., 1862); Clausewitz, *Der Feldzug von 1815 in Frankreich* (Berlin, 1862); J. S. Kennedy, *Notes on the Battle of Waterloo* (London, 1865); C. C. Watson, *Waterloo* (ib., 1910); MacKenzie MacBride, ed., *With Napoleon at Waterloo, and other Unpublished Documents* (London, 1911); A. F. Becke, *Napoleon and Waterloo* (2 vols., New York, 1915); Lenient, *La Solution des Enigmes de Waterloo* (Paris, 1915).

WATERLOO BRIDGE. A fine stone bridge over the Thames at London, built by private enterprise in 1811–1817 from designs by John Rennie and sold to the Metropolitan Board of Works in 1878. It rests upon nine arches and has a length of 1380 feet and a breadth of 42 feet.



WATERLOO-WITH-SEAFORTH. A town on the southwest coast of Lancashire, England, at the mouth of the Mersey, five miles north-northwest of Liverpool. It is a favorite seaside suburb for Liverpool merchants. Pop., 1901, 23,101; 1911, 26,396.

WATERLOW, wą'tẽr-lō, SIR ERNEST ALBERT (1850–). An English landscape painter. He was born in London and studied at the Carey Academy, Bloomsbury, and at the Royal Academy schools, afterward traveling extensively in Germany and France. In 1890 he was elected a Royal Academician and in 1897 he became the president of the Royal Society of Painters in Water Color. His work shows the influence of Constable, but was more affected by the Barbizon masters, especially Corot. In his canvases nature is interpreted in her gentler moods, in a sympathetic and intimate manner, with a warm and harmonious color scheme and careful draftsman-

ship. Characteristic early works are: "Galway Gossips" (1887, Tate Gallery, London); "Friends or Foes" (1890); "Golden Autumn" (1896, gold medal, Berlin); "A Summer Shower" (Walker Art Gallery, Liverpool). Later works, which show increased breadth of handling, include: "The Thames from Richmond Hill" (1905); "Suffolk Marshes" (1902); "The River Blyth, Suffolk"; "Sketch in Essex" (1905); and "The Banks of the Loing."

WATERMELON. An annual vine, *Citrullus vulgaris*, of the family Cucurbitaceæ, native of tropical Africa, and extensively cultivated in warm climates, particularly in southern Russia and in the United States, where more than 200,000 acres, especially in Texas, Georgia, and Missouri, are annually devoted to it. The refreshing red, greenish, or yellow pulp of its ripe fruit, which weighs from 20 to 50 pounds, and even much more under special management, contains about 93 per cent water and 2 per cent sugar. A number of varieties, especially red-fleshed ones, are in cultivation. The white-fleshed, rather solid form used in preserving is generally known as a citron or preserving melon. The watermelon is sensitive to frost and is easily stunted by cold. It thrives in a rich, warm, sandy loam well supplied with humus. About 15 or 20 seeds are planted two inches deep in well-manured hills spaced 10 to 12 feet apart each way. Later the plants are thinned out to 2 or 3 of the strongest vines in each hill. Many commercial growers plant the seed in rows 18 feet apart and thin the plants to 3 to 4 feet distance in the row. By this method fertilizers used can be easily cultivated into the soil. Thorough cultivation is given until the running vines interfere. (See MELON INSECTS.) The ripe melons are shipped to Northern markets in box cars, the smallest melons being placed on the bottom, since they are less likely to bruise than the larger. The Northern market season is from the middle of May until about Thanksgiving. See Plate of CUCUMBER ALLIES.

WATER METER. An instrument used to measure and automatically record the quantity of water or other liquid flowing through pipes. There are two general classes of meters, known as the positive and the inferential. The positive meter measures the actual volume of water passing through pipes with which it is connected. The inferential meter measures some element or factor of the flow, most generally the velocity. There is what is known as the proportional meter which measures a fractional part of the full flow, thus making it possible to use a relatively small meter, set on a by-pass or pipe branching from and again joining the main pipe. It is used but little. Frequently a small positive and a large velocity meter are combined for use on industrial lines where fire service also is provided. On heavy flows the large meter is automatically switched on.

A, section through a common water meter; *B*, inferential meter; *C*, single piston rotary meter; *D*, combined large (proportional) and small (disk) meters.

Water meters are most extensively used on water-works house service lines to show the amount drawn by each customer, which quantity becomes the basis of his bill. In some places meters are placed on the supply mains and branches so that flows and consumption in various districts can be checked up and large leaks detected.

Positive meters are provided with reciprocating or rotary pistons, or else with an oscillating or gyrating disk piston. In all three classes of positive meters each complete movement corresponds to the filling and emptying of a chamber or series of chambers of known size. There is no escape for the water unless it actuates the piston. The reciprocating pistons

may be single or double. If double, as is generally the case, each piston effects the reciprocal action of the other, much the same as in a duplex pump. (See PUMPS AND PUMPING MACHINERY.) If single, the return stroke is effected by means of a weight or spring. The rotary piston meters may also be double or single. The double type is much like the rotary pump, two pistons with interlocking faces revolving in an air-tight chamber. Some of the single rotary pistons have a series of curved projections and indentations on their outer surfaces. Corresponding to these are similar variations in the cylinder in which the piston revolves. The piston is not fixed rigidly at its centre. The incoming water causes the piston to enter and leave successive indentations in the inclosing cylinder. In other words, a series of chambers are successively filled from the inlet and discharged towards and finally at the outlet of the meter. In place of a piston of this sort a disk or diaphragm is very commonly employed, so constructed as to give an oscillating or wabbling motion. In this way the chambers are alternately filled and emptied. Inferential meters generally have as their primary moving part a series of vanes or buckets, or employ a screw. The velocity of the water is thus indicated.

The Venturi meter generally stands in a class by itself. Although a velocity and not a positive meter it is certain in its action, which depends wholly upon the increase in velocity and consequent reduction in pressure caused by contracting the diameter of a pipe through which water is flowing. It was invented by Herschel, of New York City, about 1886, but the fact that there is a relation between loss of pressure in a contracted tube and the amount of water flowing through it was discovered by Venturi in 1796. By measuring the pressures before and directly at the point of contraction, and taking into account the diameter of the pipe, the flow may be computed. The formula for flow is:

$$\frac{A_t \times A_u}{\sqrt{A_u^2 - A_t^2}} \sqrt{2gh},$$

where A_u = area of upstream cross section in square feet; A_t = area of throat cross section in square feet; h = pressure difference between sections, in feet of water head; and g = gravity acceleration, 32.2 feet per second. The contracted tube is composed of two conical-shaped pipes, generally of cast iron, with their small, truncated ends joined together with a bronze throat piece. The whole tube might be made of masonry, wood, or steel; concrete has been used in a number of instances of late. The total length of the meter is from 8 to 16 times the diameter of the uncontracted portion. The contraction has from one-half to one-fourth the diameter of the full size of the tube. The Venturi meter is available from ½-inch size up, but is most economical above 6 inches. The most notable installations are the huge ones on the Catskill Aqueduct which brings water to New York City. The largest one (and the largest in the world) is 410 feet long, 17½ feet in maximum diameter, 7¾ feet in diameter at the throat, and has a capacity of 700,000,000 gallons per day.

Registering Mechanisms. On all the types of meters described, except the Venturi, which has no working parts, the movements are transmitted through cogwheel mechanisms to a dial or series of dials; or to what is termed a straight reading register, where the actual quantity passed may be read off at a glance. The mechanism is so arranged as to convert the revolutions or other movements of the meter into any desired unit of volume. In the United States the unit employed is generally cubic feet. The registering device of the Venturi meter has two communicating mercury wells connected respectively to the upstream and throat pressure pipe. In each well is a float, and as the flow and pressure difference varies, one float rises or falls more than the other. The motion is transmitted by rack and gear to a hand moving over an indicator dial, and to a cam which governs the movement of a pen arm making its trace proportional to flow instead of pressure difference. A paper chart is moved under this pen by clockwork giving a continuous record. The cam movement is also combined with a second clockwork so that the total flow passed is mechanically counted or integrated.

Waste-Water Meters or District Meters indicate the rate of consumption per unit of time, instead of the aggregate volume. A horizontal disk is so placed in a chamber shaped like the frustum of a cone as to be lifted by the flow of water upward through the chamber. The greater the volume of water passing through the pipe in which the disk is set, the higher the disk will be lifted, in order to increase the annular space through which the water must pass. The disk is connected by means of a wire with a counterweight and pencil. When the disk rises the weight and pencil fall. The pencil makes a mark on a paper placed on a drum revolved by clockwork. The paper is ruled vertically for elements of time and horizontally for units of volume; thus the device registers the rate of flow. Such meters are so located that all the water of a district must pass through them. By comparing day and night rates of consumption of various districts, abnormal conditions may be detected and further steps may be taken to ascertain the cause of the waste. (See WATER WORKS.) The meter just described was invented by George F. Deacon, of Liverpool, England, and has been more widely used abroad than in America. The Venturi meter may be employed for the same general purpose. One of the earliest water meters in the United States was the double piston meter, invented by Henry R. Worthington, who also introduced the direct-acting steam pump.

Since 1900 an instrument called the Pitometer (q.v.) has been used for temporary measurements of the flow of water through the larger sizes of pipes.

The working parts of meters are made as light and durable as is consistent with accuracy and serviceability, and they are generally so designed to be supported by the water, thus reducing wear and tear and loss of head. Vulcanized rubber is the most common material for the disk and some of the rotary piston meters, but where special strength or power to resist the action of hot water or acids is required, brass or some other composition metal is employed. A variety of devices to protect from damage or clogging are used, such as frost cases and strainers to keep out fish and sediment. Extreme accuracy, greater than 2 per cent, is not usually essential in a meter, but it should be sufficiently sensitive to detect small flows or leakage, which, though minute, may amount to large quantities in the course of time. Positive piston meters come to a

standstill whenever anything prevents their registration. The inferential and some of the disk meters cease registering without any effect upon the flow of water.

Current Meters (q.v.) are employed to measure the velocity of water in rivers and large aqueducts and also to determine the flow of sewers. Consult Mansfield Merriman, *Treatise on Hydraulics* (9th ed., New York, 1911). See also the article WATER WORKS.

WATER MOCCASIN. A snake. See MOCCASIN SNAKE.

WATER NET. The common name of the *Hydrodictyon*, a genus of green algæ. See CHLOROPHYCEÆ; CŒNOBIA; HYDRODICTYON.

WATER PHEASANT. See JACANA.

WATER PLANTS. See HYDROPHYTES.

WATER POET, THE. A name of John Taylor (1580–1653) (q.v.).

WATER POLO. A game played by two teams of seven swimmers each. The object of the game is to pass an inflated ball about 27 inches in circumference between the goal posts (set 10 feet apart) and under the cross bar (3 feet above the surface of the water). The players of the sides are divided into three forwards, two backs, one half back, and one goal keeper. The referee starts the game by throwing the ball into the centre of the pool and giving a signal which starts the teams, who had been lined up under their respective goals, swimming towards the ball. One hand only may be used in handling the ball, and it is a foul to interfere with an opponent not in possession of the ball. There are other fouls listed, the usual penalty being a free pass by the opposing side.

WATER POWER. A term used by engineers to define the power obtained or capable of being obtained from water by its fall from a higher to a lower level; also, more specifically, the term applied to a fall in a stream which is used or is capable of being employed to develop power. Water power is perhaps, after wind power, the most natural and at the same time the most truly economic source of energy. The term water power is something of a misnomer. The real agent is gravity, the fluid itself being the medium through which the action of gravity is transmitted to the prime mover. In order that water may be available for the purpose of doing work, it must be in such a position that it can fall from a higher to a lower level (or must be under pressure produced by some external force, such as that of a weight or spring acting on the surface of the fluid through a piston or plunger, which is beyond what is here discussed). Under the former condition its utmost capacity for doing work—potential energy or energy of position—is the product of the height through which it can fall into the weight of the water falling, so that if h denote the available height of the fall and G denote the weight of the water falling per second, then $h \times G$ equals the energy available per second, i.e., the power. The horsepower in a waterfall or rapids is commonly expressed as: $0.1134\ QH$, where Q is the flow in cubic feet per second, and H is the head in feet. If the fluid is allowed to fall without resistance under the action of gravity, either free or confined in pipes, the power available is expended in imparting velocity to the water, and the potential energy of position is converted into kinetic energy or energy of motion, and in this form is available for performing work. It is, however, not necessary that the potential energy of water should first be transformed into kinetic energy in order that it may be employed for motive power. The weight of the fluid can also be allowed to act directly on the prime motor in a manner similar to that in which the weight of a body attached to one end of a rope, passed over a pulley for instance, may be made to raise another body suspended at the opposite end.

A third way of using water power for doing work is by means of its pressure, but the difference between this method and the preceding method is more apparent than real. The so-called pressure of water is the result of weight or its equivalent.

The most usual source of water power in nature is a river or stream, but to make this available for practical purposes some form of works such as dams (q.v.), canals (q.v.), and aqueducts (q.v.) is almost invariably necessary. A river has always a certain fall or gradient, but to be able to take advantage of this fall for doing work, the portion of it utilized must be applied in one or several nearly perpendicular steps. One common way of accomplishing this object is to build a dam across the stream. The effect of this dam is to raise the level of the water above it a height equal to the difference between the original level and the level of the top of the dam, while the level of the stream below the dam remains as it was. To illustrate, let us assume that the stream had originally a fall of 1 foot in 100 feet, and that a dam 6 feet high is built across it. The head which was previously expended almost entirely in overcoming the resistance of the river bed over a distance of 600 feet, while the water gradually descended 6 feet down a gentle incline, will now be available for doing a corresponding amount of useful work by a sudden drop through the same height as before. In other words, the energy originally wasted in useless friction in the gradual descent of the stream is accumulated in the form of head immediately behind the dam before the plunge of the water.

At first rather crude wheels were placed at the dams. But soon, to accommodate all the wheels that there was water for in a given place, high level canals were run out along the banks. Then if the drop was more than the 16 feet, which was then the working limit, the wheel discharges were collected in a second level canal and run through a lower set of turbines. As many as five levels were used. Of this type were most of the historic mill powers of the United States, such as Pawtucket, R. I. (established 1790), Paterson (1791), Fall River (1813), and Lowell (1822).

A large number of low-head American mill powers like those at Rochester, Seneca Falls, and Ticonderoga, N. Y., were developed in cascade—with the rivers dammed in a series of long pools, the tail water of one plant immediately becoming the headwater of the next one below. On many streams in New England there once was a saw or grist mill every few miles, but nearly all of these have been abandoned for at least 50 years, the wood cribwork of the dams having given way and permitted the streams to resume their natural levels.

In the more modern development, where a considerable fall is available, the water is led from the dam in a high level conduit or canal and a pressure pipe, or the latter alone, down nearly to lowest level, where it is run in solid streams through turbines with carefully shaped

vanes (see WATER WHEEL AND TURBINE) or in several jets against tangential impulse wheels (with buckets on the periphery of a runner disk). The earliest water-power plants had a very low efficiency in use of water energy, 25 per cent to 50 per cent at best, and this was reduced to 15 per cent to 30 per cent in old age by leaks, clogging, etc. The most of the hydraulic plants now in good service probably have 60 per cent to 70 per cent efficiency; the modern ones running from 70 per cent to 80 per cent.

It is common to group modern developments into three classes: (*a*) low-head, having up to 100 feet, (*b*) medium-head, having up to 350 feet, and (*c*) high-head, reaching 5000 feet. Low-head plants are necessarily close to or virtually in the dam, since the amount of water required

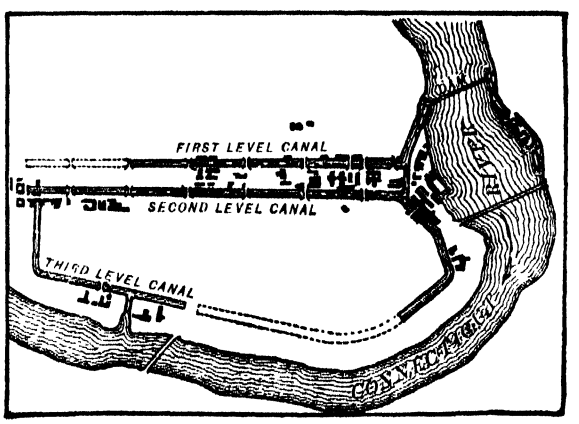
is great and it cannot usually be carried far at the upper level without large investment and disproportionate loss in head. This restriction is reduced in the medium-head plants where canals and penstocks up to a mile in aggregate length are seen. In the high-head developments canals, flumes, and pipes aggregating up to five or ten miles become possible because of the greatly reduced volume for a given power.

The consolidation of the older mill-power rights and their redevelopment in one modern hydroelectric plant has been carried out in very many cases with much profit to all arising out of more efficient use of the water. The redevelopment of most mill powers offers a more attractive field for investment than entirely new schemes in unsettled territory, because of an existing market for power close to the fall so that no long transmission line is needed and no uncertainty of business is met.



The accompanying tables show the water-power resources of the world, and the powers which were notable in the industrial development of the United States, the gap from 1861 to 1866 being due to the stagnation of industrial enter-

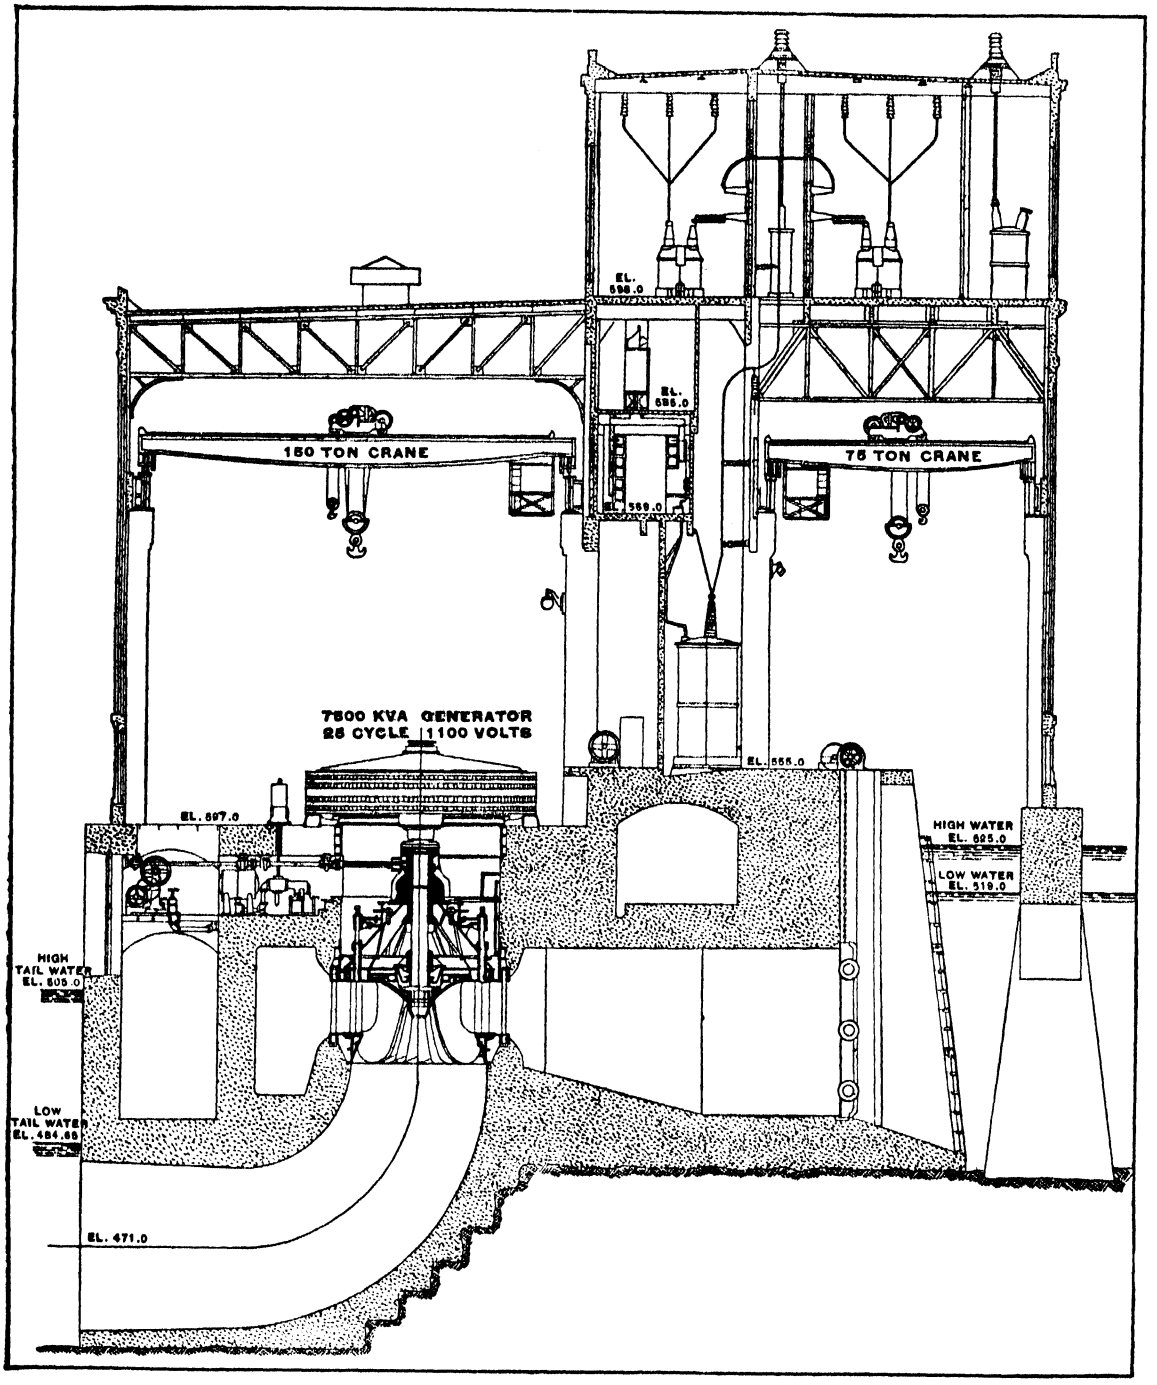
prise during the Civil War. The development of large powers since 1898 is too great to be enumerated, the cause of this development being the use of water power for the generation of electricity which can be transmitted anywhere within 300 miles. At the Great Falls, Sault Ste. Marie, Niagara, Ogden, and Mechanicsville developments this plan is used. Many of these old powers have been redeveloped on modern lines, notably Paterson, Cohoes, Rochester, Niagara (where there is over 300,000 horse power), and Turners Falls.

Typical Power Developments. The mill powers on the Connecticut River of Holyoke, Mass., will show a typical important canal development. Here a total fall of 61 feet is



POWER CANAL SYSTEM AT HOLYOKE, MASS.

seen in some 3200 feet below the dam. The water is used in three levels, though most of the mills are on the upper two. There are some 60 mills requiring about 30,000 horse power day-

times and 15,000 at night; the canals supply 14,000 through 150 odd turbines. Conditions are favorable for a redevelopment, but the complication of various old long-term leases of land and water rights makes the consolidation difficult for years to come.

One of the most celebrated low-head plants in the world is that at Keokuk, Iowa, on the Mississippi River. A dam 4278 feet long has been thrown across the rear at the Des Moines rapids where there is a natural fall of some 23 feet and a flow varying between 20,000 and 372,000 cubic feet per second. First an arch-span viaduct (119 spans 30 feet long on piers 6 feet thick) was built and then the interpier space was closed with a concrete dam of the familiar overfall type. The east end of the dam runs into the bank, but the west end stops at the power house; between this building and the shore is a navigation lock for river boats. The power house is 123 feet wide and 1700 feet long, the length being with the stream. There is space for 30 single-runner 10,000 horse-power Francis turbines running at 57.7 r.p.m. under 32 feet normal head (which varies with the stage of the river from 21 feet to 39 feet). The wheel

SECTIONAL ELEVATION OF POWER HOUSE, KEOKUK, IOWA.

pits, spiral passages, and flaring draft tubes are all molded in the concrete foundations.

A good example of a modern high-head development is the Drum station and canal in connection with the Lake Spaulding dam of the Pacific Gas & Electric Co., Yuba Riva, California. The dam is one of the largest and highest concrete dams in the world, being 305 feet; the lake has a surface area of 805 acres and impounds 4000 million cubic feet of water.

Above the lake there are 22 regulating reservoirs on feeder streams. The water is drawn past the dam and for 4400 feet through 8-foot and 9-foot pressure tunnels, then it flows 8½ miles in canal to a forebay reservoir, where it drops 1375 feet, in elevation to the generating station. The two penstocks are 72 inches in diameter at the top and of ¼-inch steel plate; at the power house the pipe is of 1¼-inch plate and is 52 inches in diameter. Each penstock supplies two overhung impulse wheels each driving a 12,500 kilowatt alternator. A 110-mile transmission line runs to the San Francisco district. There are five other plants lower down on the river using the same water. These develop from 10,000 to 25,000 kilowatts each, a total of 77,500 kilowatts more.

The highest head plant built up to 1916 was that at Lake Fully, Canton Valais, Switzerland. The static head is 5412 feet and the operating head 5248 feet. At Lake Fully a dam was built to create needed pondage; from the dam a penstock descends 2.8 miles to the Rhone valley where the power house is located. The inside diameter of the pipe is 23.6 inches at the top and 19.7 inches at the bottom; the wall thickness varies from ¼ to 1¾ inches. The plant has five 3000 horse-power impulse-wheel units, each with a 10,000 volt 50-cycle generator. The wheel is built up of cast-steel buckets on a cast-steel centre; each wheel has a single nozzle with a deflector-plate and needle-valve governor. The nozzle velocity is about 600 feet per second and the water is discharged from the buckets with some 20 per cent of its velocity, so that a cast-iron and steel casing was needed to prevent erosion of the discharge passages.

Under present industrial conditions hydro-electric power developments tend to become natural monopolies and public utilities, because of the benefits of interconnecting networks of plants and lines, large-scale developments requiring large investments, relationships with consumers like those of steam central-station companies, etc. The proper regulation of power developments in the United States, without hindering the largest use of this natural power, is one of the problems which has been given much attention by State and Federal governments. Up to 1916, in the absence of any adequate Federal law and policy, 50-year revocable permits for development on the public land have been issued by the Secretaries of the Interior and Agriculture. A small land rental was charged, based on natural power capacity of the site and the degree of utilization, and decreased according to the square of the length of transmission line. Although the permits carry prior rights of renewal and are revocable only for cause, yet it is known that the fact that they are departmental permits and not complete franchises causes the risk and interest on funds for investment to rise.

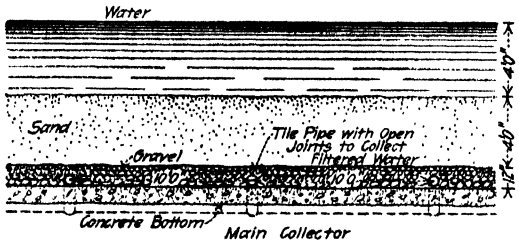
WATERPROOFING. The coating of articles made of textile fabrics, paper, and other substances, so as to render them impervious to water. Besides a solution of rubber for waterproofing, various preparations are used, such as a mixture of beeswax and yellow rosin in boiled oil. Fabrics may also be rendered waterproof by thoroughly impregnating them with a solution of soap and then dipping them into a solution of alum. Paraffin finds extensive use, and articles of various kinds, including leather, and even wood, are made waterproof by keeping them for a time in hot molten paraffin. Several varnishes, too, are used for rendering articles waterproof. Water glass, where applicable, is one of the best waterproofing agents and it likewise acts as a fireproofing medium.

WATER PURIFICATION. The art of removing any objectionable matter from water so as to render it safe for domestic consumption and fit for industrial uses. The objectionable qualities are color, taste, odor, hardness, and turbidity due to pathogenic bacteria, inert organic matter, the presence of iron or other suspended matters. (See WATER WORKS, *Quality.*) The principal means of purification are *sedimentation*, which clarifies water and removes a portion of the bacteria; *coagulation*, an aid to both sedimentation and filtration; *aëration*, which removes odor and may supplement filtration; *filtration*, which removes bacteria and reduces inert organic matter, turbidity, and color; *chlorine disinfection*, also for the removal of bacteria, which has profoundly changed water treatment since its adoption; and various processes for removing or reducing hardness, carbonic acid, iron, and manganese.

Sedimentation is effected by either bringing water to rest or passing it very slowly through shallow reservoirs or basins. The first system is called the intermittent and the second the continuous system. Gravity carries down some of the clay and silt which compose turbidity. The degree of clarification effected depends upon the size and specific gravity of the particles and the length of time afforded. Some waters are improved in a few hours; others are turbid after days. Partly through gravity and partly through entanglement with other suspended matter a considerable percentage of bacterial reduction is effected by sedimentation. Where bacterial purification, rather than clarification, is the object, sedimentation alone is insufficient, but it may be a great aid to filtration. Storage reservoirs afford more or less sedimentation and bacterial reduction, depending upon their size as compared with the daily draft and the character of the water. The design and construction of settling reservoirs do not differ from those of other reservoirs, except in the relative shallowness of the former, the arrangement of inlets and outlets, and the provision made for removing mud deposits from their bottom. In continuous-flow basins having a number of compartments the water generally passes from one



section to another in a thin sheet over a long weir. This insures the drawing of the upper and clearest layer, minimizes the disturbance of water, and may provide aëration of value. If aëration is desired and the levels permit, there may be a series of steps between each weir and the next basin. Two or more compartments are usually necessary, so one may be at rest while the other is being filled; but where the constant-flow system is used for water containing but little sediment one basin may do. Provision must be made for drawing the water as quietly as possible to a level well above the deposit of sediment, to avoid disturbing the latter. The bottoms of settling reservoirs should slope to some common point, where connection should be made with a pipe for flushing when the reservoir is cleaned. The mud is often loosened by means of water under pressure, thrown from a hose, much as in hydraulic mining.

Coagulation is effected by introducing a chemical, generally sulphate of alumina, into water. The substance is broken up into alumina and sulphuric acid. The latter unites with the lime or magnesia in the water and is thereby rendered harmless. The alumina thus set free is transformed into hydrate of alumina, a white, flaky, gelatinous substance, which coagulates organic matter in the water and entangles bacteria. The agent and the impurities are deposited in the settling basin or removed from the water by filtration. It is essential that the water be sufficiently alkaline to decompose the sulphate of alumina, and that plenty of time be allowed for coagulation. If deficiencies in alkalinity are periodic, as in times of heavy floods, they may be made good by adding lime to the water. The time element is secured by providing basins or reservoirs of proper capacity.

Aëration is accomplished by forcing air into water requiring treatment, by discharging water over weirs, or by means of fountains. In a few American cities stored water of surface origin is treated with compressed air delivered into the reservoir through perforated pipes. It is claimed that this practice has been effective in preventing organic growths that give bad tastes and odors. Aëration is also used to precipitate iron before filtration, as mentioned below. As a rule, aëration is merely supplementary to other processes, making good a deficiency of oxygen, and removing odor. In cases where water contains a high percentage of organic matter no amount of aëration economically applicable is sufficient for its removal. The process has little or no effect upon the bacterial contents.

Filtration plants are divided into slow sand and mechanical or rapid, according to the rate of filtration and the methods of cleaning the filters. The filtering material in either case is generally sand. *Slow sand filters* are beds of sand, supported on gravel, and provided with underdrains, the whole being inclosed in a water-tight basin or basins. The water is admitted on the top of the bed, percolates through the pores of the filtering material, is collected by the underdrains, and then passed to a clear water reservoir or to the consumer. Each bed has an area of one acre or less. The rates of filtration range from 2,000,000 to 5,000,000 gallons per acre per day, according to the character of the water and the fineness of the sand. The filtering sand is commonly two to four feet deep and rests on one to two feet of gravel. The latter is placed in layers, increasing in size towards the bottom until stones as large as hens' eggs are found. The underdrains are four inches and upward in diameter, of either tile or vitrified pipe. Automatic devices are employed to regulate the rate of filtration. When the head reaches a maximum fixed by theory and experience to suit local conditions, ranging from three to six feet, one or more beds are thrown out of use for cleaning. The water is drained down to a point somewhat below the level of the top of the bed, and a thin layer of fouled sand is removed by broad shovels. This is washed immediately or else allowed to accumulate for washing at intervals. The washed sand is not replaced until the thickness of the sand bed has been greatly reduced, oftentimes to as little as 12 inches. This is made possible by the fact that the bulk of the work is done in a very thin upper layer of the bed, sometimes not more than one-eighth of an inch deep. The sand is washed (1) by playing hose upon it and allowing the sand and water to flow together through a long flume; (2) by means of running water in a revolving cylinder, provided with arms, or a screw; and (3) the more recent and economical practice, by a series of hoppers and ejectors. In this last process the sand is thrown into a wooden or steel hopper, in the bottom of which is placed an ejector. The jet of water carries the sand up with it to the top of another ejector, where the dirty water is removed. The process is continued until the sand is clean. At a few plants in the United States a traveling washer passes over the bed.

Slow sand filtration removes practically all the bacteria and suspended organic matter, a considerable amount of organic matter in solution, more or less turbidity, and a relatively small amount of color. Where the water has been polluted with sewage the chief object is to reduce the bacteria to a minimum. An average

TYPICAL SECTION OF SLOW SAND FILTER BED.

removal of 98 to 99.5 per cent of the original number is common enough, together with the removal of nearly all of bacillus coli communis, which is taken as an index of possible pollution by sewage.

If the water to be treated is very turbid it will clog slow sand filters so rapidly that keeping them clean becomes an economic and even physical impossibility. In such cases slow sand filtration is supplemented by sedimentation. If the two processes combined are inadequate, without too great an outlay for settling basins and filter beds of large area, then coagulation may be employed. In such cases it is the practice, at least in America, to substitute mechanical filtration, which almost invariably includes both coagulation and filtration, and frequently sedimentation also. In very cold climates it is essential to the best sanitary and economic results that the filter beds be covered as a protection against frost and ice. Masonry vaulting is employed for this purpose.

Mechanical Filtration is, first of all, a straining process, in which the natural capabilities of the filtering medium are aided by coagulation. The gelatinous coagulation material, combined with the sticky organic matters in the water, and with the finely divided clay and silt, form a layer on the surface of the filter and to a greater or less extent on the sides of each sand grain. Thus the effectiveness of the strainer is greatly increased by the reduction in its interstitial passages and by its adhesive qualities. After a comparatively short period, ranging from two days to 12 hours, the filter becomes clogged. The impurities penetrate the whole mass, so all the filtering material must be washed. This is done by the simple mechanical process of reversing the flow of water through the filter, so it passes upward from the bottom. The dirty water is wasted at the top. Prior to or in connection with the reversed flow the sand was formerly, and in some plants still is, loosened by means of power-driven revolving rakes, gradually lowered into the filtering material. In place of the rakes, compressed air, admitted from the bottom, is used in the larger and more recent mechanical filters and in some cases not even air is employed. The filter sand is supported on a false bottom, in which are placed the pipes for collecting the filtered and admitting the wash water. Strainers of perforated metal plates or wire netting give the water access to and permit it to flow from these pipes. The coagulant is admitted to the water before it comes to the filter and is given from a few minutes to several hours' time to act before filtration takes place. If the period is brief a coagulating chamber is placed directly beneath the false bottom of each filter tank; otherwise one or at most two larger coagulating basins, or settling reservoirs in which a coagulant is used, are employed. The coagulant is made of the desired strength by proper dilution. The quantity applied to the water being treated is proportioned by ingenious devices to the changes in rate of pumpage or water consumption. Among these may be mentioned some form of pump, driven or controlled by the flow of water through the supply pipe to the basin or filter. The amount of coagulant used varies from about one-half to three grains per gallon of water, but rarely exceeds one grain except in waters with high turbidity or that have some other unusually troublesome feature. The filtering material used in mechanical filtration is confined in wooden, steel, or concrete tanks. Formerly these tanks were usually round, with diameters of from 10 to 16 feet. Larger tanks, rectangular in plan, have since been common in all except relatively small-size installations from the stock designs of manufacturers. The depth of sand is about the same or a little deeper than in slow sand filters, but the rate of filtration runs from 90,000,000 to 125,000,000 gallons an acre. The tanks and operating mechanism are almost invariably placed in a building, and are therefore quite free from the extremes of heat and from rain or snow. Under proper conditions of design and operation, mechanical filtration will remove almost if not quite as many of the bacteria as the slow sand process, more turbidity and color, but less dissolved organic matter. For many years it was more commonly applied to turbid, highly colored waters than to those which were objectionable on account of sewage pollution, but the practice afterward swung towards mechanical filters, notably after chlorine disinfection became common.

The choice between the two systems depends upon such a variety of local conditions that each case should be most carefully considered on its merits before adopting either system.

History.—The history of filtration, as applied to public water supplies, dates from 1829, when James Simpson built some filter beds for the Chelsea Water Company, of London, England. After that action, slow sand filtration was at first gradually, then rapidly, adopted in England and on the Continent. It was not until about 1887 that the real action of slow sand filters was understood. Prior to that time they were supposed to be strainers only, effecting little or no chemical change upon the water and leaving the bacteria unharmed. In fact, it was not so many years before this that the relation of bacteria to disease (see DISEASE, GERM THEORY OF), and particularly of water-borne germs, was established. The perfection by Koch of methods applicable to the enumeration of water bacteria made possible the announcements by Percy Frankland and others about 1887 that filter beds removed nearly all the bacteria in water. England, Germany, and America have each played important parts in the scientific and practical development of the various aspects of the bacterial purification of water. The early work on slow sand filtration in America was done very largely by the Massachusetts State Board of Health, at its Lawrence Experiment Station (see annual reports, from 1887). Other American investigations, begun a number of years later, are mentioned farther on.

The first American city to be provided with a slow sand filter was Poughkeepsie, N. Y., where in 1870 a plant was built after plans by James Kirkwood. Soon after a similar plant was built a few miles distant, at Hudson, N. Y. No further progress was made in the United States for some 20 years, or until a city plant was constructed at Lawrence, Mass., based on studies at the Lawrence Experiment Station. A number of other small plants soon followed, but the first large plant typical of the more recent American slow sand filtration practice was completed at Albany, N. Y., in 1899, with Allen Hazen as engineer. This plant had a nominal daily capacity, at 3,000,000 gallons per acre per day, of 14,600,000 gallons. Numerous other slow sand filters have since been built, including one of about 125,000,000 daily capacity, built by the United States War Department for purifying the water supply of Washington, D. C., one for the city of Philadelphia, with a capacity of some 300,000,000 gallons a day at Torresdale, on the Delaware River, and a large plant for Pittsburgh, Pa. In the later filters of this type the dirty thin upper layer of sand, after being scraped up, is thrown into portable ejectors and forced by streams of water, under pressure, to ejector washers, where the dirt is removed by strong currents. The cleaned sand is replaced on the top of the filters as needed.

The first mechanical filter connected with a municipal water supply was put in operation at Raritan, N. J., in 1882, by the Somerville Water Company, which supplies Raritan and Somerville. No coagulant was used. In March, 1883, John W. Hyatt patented a filter of the same general type as the one erected at Raritan. In February, 1884, Isaiah S. Hyatt, a brother of John, patented a system of coagulation and fil-

tration combined. These and other patents granted to the Hyatt brothers formed the basis of the Hyatt and later on the New York mechanical filters. Rivals appeared in the market from time to time and much litigation ensued. The litigation was confined chiefly to the use of a coagulant. In 1897 the United States Circuit Court of Appeals, notwithstanding much expert and other testimony designed to show the prior use of coagulating materials coincident with filtration, declared the Hyatt patent valid. The patent expired early in 1901.

For a number of years the use of mechanical filters was confined almost wholly to the production of a bright, clear water. Very little disinterested evidence was available to show their efficiency in this respect and practically none bearing on their bacterial efficiency. In 1893–94 experiments on a small scale were made under the direction of Edmund B. Weston, at Providence, R. I., which indicated that mechanical filters would remove a high percentage of bacteria. In 1895–97 more extensive investigations, on a large scale, were made at Louisville, Ky., with George W. Fuller in charge. Mr. Fuller's report on these investigations (see bibliography) marked an era in water purification. It showed that a water as turbid as the Ohio, and with the large number of bacteria sometimes carried by that stream, could be rendered acceptable by means of sedimentation, coagulation, and mechanical filtration combined. Other notable experiments have since been made at Pittsburgh, Cincinnati, Washington, New Orleans, Columbus, Cleveland, and elsewhere. The new type of mechanical filters dates from September, 1902, when the Little Falls plant of the East Jersey Water Company was put in use.

Iron Removal is accomplished most frequently by simple aëration to precipitate the iron, followed by filtration for its removal. If aëration is not sufficient to effect precipitation a chemical may be employed, like milk of lime where the iron is in the form of a sulphate. Iron removal plants in the United States are nearly all located on or very near the North Atlantic seacoast, but their use is gradually spreading to all points where iron makes trouble when well waters are brought to the surface. In 1915 a plant to remove manganese as well as iron was built at Lowell, Mass.

Algal Growths, with their consequent troublesome tastes and odors, are now prevented by treating water stored in reservoirs with sulphate of copper. The method, although suggested long ago, was brought into practical use by the United States Department of Agriculture, Bureau of Plant Industry, which has published a number of bulletins on the subject, beginning in 1904.

Water Softening has long been widely used in Europe but except for railway and industrial purposes it was not employed in the United States until after 1900. The pioneer water-softening process, and one that is still largely used, was invented and patented by Prof. Thomas Clark, of Aberdeen, Scotland, about 1841. In the simplest form of this process, lime water, or milk of lime, is thoroughly mixed with the water to be treated. After 12 to 24 hours' subsidence the water is so drawn off as to leave the precipitate behind. Modifications of the Clark system include a variety of settling and filtering devices. Permanent hardness, caused by the sulphates of lime and magnesia, may be removed or reduced by using carbonate of soda as a precipitant. The earliest water-softening plants for American cities were put in use at Winnipeg, Manitoba, in 1901, and at Oberlin, Ohio, in 1904. Since then Columbus, Ohio, Grand Rapids, Mich., McKeesport, Penn., and St. Louis, Mo., among other cities, have included softening with water treatment for other purposes.

Disinfection. As a finishing process after filtration or sedimentation, as an emergency measure where there is no filtration and sometimes as a safeguard until filtration is deemed necessary or becomes financially advisable, some direct attack on possible disease germs in water may be required. This may be met by a chemical germicide, by heat treatment or by ultra-violet rays. Chlorination is an efficient and by far the cheapest of the chemical germicides. The ultimate germicidal action which it produces is really oxidation. The form of chemical employed is almost always either hypochlorite of calcium or lime (bleaching powder) or else liquid chlorine. In place of either hypochlorite of sodium may be produced electrolytically at the water-treatment plant and applied to the water while in a nascent condition, as has been done on a small scale off and on for a quarter of a century or so. Hypochlorite of lime (called hypochlorite for short) was tried more or less experimentally in Germany in the nineties; as an emergency measure during typhoid outbreaks at Maidstone, England, in 1897, and at Lincoln, England, in 1904–05; and at various other places on a small scale for sewage and water in later years. It was first put in use continuously on a large scale at the Boonton reservoir of the Jersey City waterworks to treat 40,000,000 gallons a day in the latter part of 1908. After that its use spread rapidly through the United States and Canada, both where filtration was and was not used. Since about 1912 liquid chlorine has come rapidly into use in place of hypochlorite. The latter is a powder, and has to be dissolved before use. The liquid chlorine is much more easily handled and the rate of application more readily controlled, since it changes to chlorine gas when released from the cylinders into which it is compressed for shipment. Only minute quantities of available chlorine are required per gallon of water. Until prices were raised by the great war the cost of disinfection by either hypochlorite or liquid chlorine was in round average figures some 25 cents per 1,000,000 gallons of water treated. The war doubled the price of liquid chlorine but increased tenfold the price of hypochlorite.

Ozonization is effected by the discharge of electrically-produced ozone directly through the water. In 1916 it was employed by a few small private plants in the United States and had been tried at two or three municipal water works but was not considered commercially practicable. In Europe, the water supplies of a number of scattered cities have been ozonized, beginning about 1900.

The ultra-violet ray for water treatment was in use in 1916 at a number of small private and a few public water-supply plants in the United States, after several years of test and promotion. Broadly speaking, water must be filtered before it can be successfully treated with ozone or ultra-violet rays, thus entailing considerable expense before disinfection is begun.

Distillation, owing to its high cost, is practicable only for small quantities of water under special conditions. It is used largely at arti-

ficial ice plants (see REFRIGERATION) and is sometimes used to freshen sea water. In addition, it is used in connection with various industrial arts. It consists simply in evaporating water in stills by means of heat and subsequently condensing the steam. The heat given off in cooling, in the best large plants, is utilized to aid in raising the water to the boiling point. The process clarifies as well as sterilizes water. Boiling, in any convenient way, is a very cheap and thoroughly effective way of sterilizing water used for household purposes. Both distilled and boiled water must be aërated, or it will be very flat and unpleasant to the taste.

Household Filters, with the exception of a very few kinds, had better be avoided whenever it is feared that there are pathogenic bacteria in the water. There are numerous household filters which are more or less useful as strainers for the removal of mud, and some of the very fine-grained filter tubes do good bacterial work if properly cleaned and sterilized at intervals.

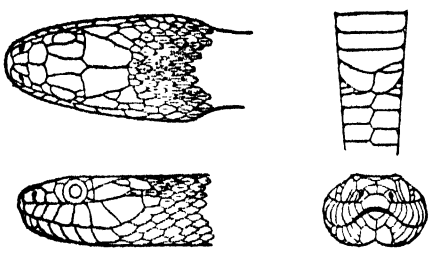
WATER RAM. See HYDRAULIC RAM.

WATER RAT. A large vole (*Microtus amphibius*), 8½ inches in length of head and body and reddish-brown in general color, which is numerous throughout Europe. It is closely related in structure and habits to the voles and American meadow mice, and has similar habits, except that it is more aquatic and diurnal than other members of the genus. It is one of the most familiar of British mammals and typical of the Muridæ.

WATER RIGHTS. A general term used to denote the legal control or use of water. In its narrower sense it means the use of the water of nonnavigable streams, lakes, springs, irrigation canals, and in certain instances of the sea. The term is sometimes incorrectly used to mean the right to the use of the shore and lands under water or between high and low water mark. For the purposes of filling in, wharfing out, or landing such lands are vested in the state, although at times granted to individuals, corporations, or municipalities. See TIDE WATERS; RIPARIAN RIGHTS.

It is of the essence of the doctrine of water rights that the water itself of flowing streams, in the United States, is not deemed capable of private ownership. Every landowner has a natural right to the use and enjoyment of a watercourse which flows through his land. It includes the use of the water for all proper purposes incidental to the land, such as for watering stock, for irrigation, for power in running mills, for fishing and for draining. Such use is limited by the right of every other riparian owner above and below, to the same use. An owner must not interfere with the rights of other owners in any way, by diverting, fouling, damming, or by lessening the steady flow. Any material alteration or infringement is a nuisance which may be abated or restrained by injunction and for which actual damages are recoverable. Abutting owners are entitled to a flow of pure water, subject to the reasonable use of those above.

The pollution of a flowing stream, as, e.g., by the unreasonable discharge of sewage, is actionable, and in some States subject to criminal prosecution. The limitation as to use extends to tributaries and springs and lakes which are sources of flowing streams. In the United States the water and beds of streams may be sold separately, but unless specifically excepted pass with the land and are incidents of ownership. These same general principles apply to clearly defined water courses flowing underground. In many western States owing to changed and modern conditions of mining and irrigation the principle that the water of natural streams is incapable of private ownership has been modified. Those who first appropriated water on public lands were recognized as the owners of such waters, both by acts of Congress and by the statutes of various States, e.g., in Idaho, Montana, Nevada, Oregon, and Wyoming. The immense development of irrigation canals and ditches has to a certain extent modified the law of water rights and given rise to new principles which have grown out of the local customs of miners, and been extended to irrigation. Such is the rule of first appropriation, or the right of condemnation for ditches over public or private lands. Local statutes govern the distribution of water by the various irrigation companies, which are usually stock companies operated for profit, or mutual companies for the benefit of a fixed community. They are considered quasi public concerns and are usually regulated both as to the price and supply of water by water masters or commissioners. The law as to water percolating through the soil or flowing in undefined channels in marshy land, or water collected in wells, cisterns, or artificial ponds, is that it is always subject to private ownership and may be bought and sold as any other commodity. Such water is regarded as part of the soil and as belonging to the owner of the land. He may drain his land and collect such water, even if by so doing he cut off his neighbor's supply. So digging a well on one's own land which renders one on his neighbor's dry, unless it were maliciously done, would not give rise to a cause of action. The extended growth of large water-supply systems is modifying the law in regard to percolating water. In many States commissions of water supply have been authorized by the Legislature to regulate such subjects.



The right to take water from another's land, such as from a spring, is frequently acquired either by grant or prescription, and is defined as an easement (q.v.). Other examples would be the right to fish on a private lake or stream or to cut ice. Under the head of easements over the land of another would be the right to discharge water by drainage, or to flood the land of another by damming back a stream. They are subject to the usual rules for the acquisition of property rights. Formerly in law the theory was that surface water was a common enemy

which the land owners might fight by any means, either by discharging on the land of another or by preventing the fall on his own land, even though by so doing it injured his neighbor. In modern law the principle is that the owner of land has a legal right to a natural drainage on to lower land which may not be interfered with, and this easement has been recognized by statute in certain States. In England rights of a community over private streams or springs for drawing water or watering cattle are sometimes acquired by immemorial usage and are known as customary water rights but are not favored in the United States.

Public Water Rights. It is the general rule of law that the public is entitled to the use of waters whether private or not, which are capable of navigation or transportation for those purposes. Such would be the right to float logs but not the right to fish, to land or to cut ice. The public has the right of anchoring and fishing from boats in navigable water. It has no right of landing on the shore. On land between high and low water mark it may pass and repass, dry nets thereon, fish or take shellfish or sand. Even bathing on the seashore is not a common-law right but is governed by custom and statute. In certain States the seashore is privately owned. Consult C. S. Kinney, *Treatise on the Law of Irrigation and Water Rights* (2d ed., 4 vols., San Francisco, 1912–13), and J. W. Bingham, *Cases on the Law of Water Rights* (Indianapolis, 1916).

WATER SCORPION. Any one of the water-bugs of the family Nepidæ. These insects have swollen forelegs fitted for grasping, thus distantly resembling the cheliceres of a true scorpion. The anal end of the body is furnished with two thin, long, grooved, terminal bristles or sheaths, which when pressed together form a tube, through which the insect obtains its supply of air from above the surface of the water. The water scorpions are carnivorous, feeding upon fishes' eggs, small fish, and water insects. They are of two types: flat and oval or long and thin. The former belong to the genus *Nepa* and the latter to *Ranatra*. The eggs are pushed entirely within slits made by the ovipositor in the stems of aquatic plants. From these slits and attached to the eggs protrude two (in *Nepa*) or five (in *Ranatra*) long supposedly pneumatic filaments.

WATERSNAKE. A harmless colubrine serpent of the genus *Natrix* or *Tropidonotus*, closely related to the garter snakes (q.v.). The common watersnake of the United States is

HEAD AND ANAL PLATES OF WATERSNAKE.

Tropidonotus fasciatus, with several varieties of the species, of which all are southern except variety *sipedon*. This form is the numerous and well-known watersnake of the northern and eastern States as far west as the dry plains. Its average adult length is 3 feet, but it frequently grows larger. The color is a variable brown, with large dark-brown markings on the back and sides, and with the belly yellowish or reddish, spotted with reddish-brown rounded spots (absent in some southern varieties). These colors, together with its habits and somewhat broad head, lead to its often being mistaken for the venomous moccasin snake (q.v.), of which some naturalists consider it a mimic. (See MIMICRY.) This snake is semiaquatic in its habits, being usually found on the borders of the water, especially quiet millponds and sluggish streams, where it takes refuge when alarmed. It is an expert swimmer and diver, and skillful at catching fishes, on which it mainly subsists; it will also eat dead fishes. When cornered it is pugnacious, but its bite is insignificant and harmless. Its young, 16 to 33 in number, are born alive, when about 8 inches long.

The watersnake of Europe is *Natrix natrix*, which in several varieties is to be found all over Europe, western Asia, and the Mediterranean basin. It is much like the American snake in form, colors, and habits, but very variable. This is the only snake except the viper in the British Isles, where it does not occur in Ireland or Scotland, and is commonly known in England as grass snake. The main difference between it and the American watersnake is that the former is more active on land, and lays eggs, which are buried in loose loam, or in manure or dust heaps, and hatch after some time. It is described at length by Hans Gadow, in "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (London, 1901); and by Leighton, *British Serpents* (Edinburgh, 1901). Several other species of the genus occur in the Malayan Archipelago and two in Africa; some of them are large and of savage appearance, but all are harmless. Consult also E. D. Cope, *Crocodilians, Lizards, and Snakes of North America* (Washington, 1900); R. L. Ditmars, *The Reptile Book* (new ed., New York, 1914), and other authorities cited under SNAKE.

WATERS OF MEROM. See MEROM, WATERS OF.

WATER SPIDER. In America any spiders, especially those of the genus *Lycosa*, living near the water and at times running over the surface or diving beneath it. The water mites, common in streams and ponds (see MITE), and the water striders (see WATER STRIDER) are incorrectly called water spiders. True water spiders are those of the genus *Desia* living among coral reefs in the Indian and Pacific oceans and *Argyroneta aquatica* of Europe and Asia. The latter makes a dome-shaped web below water, fastening it to water plants or stones. The web is filled with air carried down entangled in the long hairs of the spider's abdomen. The eggs are laid and the young hatched in these domes. A special winter nest is built in deep water, in which the spider hibernates. Consult bibliography under SPIDER.

WATERSPOUT. A small, rapidly whirling column of air, extending from a cloud down to the ocean or lake, and whose central axis becomes visible as a column of water or cloudy vapor. In some regions, in warm weather, waterspouts are of very frequent occurrence. As they often occur in calm weather, it is evident that they are not necessarily produced by wind, but that, on the contrary, the wind that accompanies them is the result of the same process that forms the spout. The formation of a waterspout is

due to a strong indraft upward beneath the base of a cumulus cloud. The air that supplies this indraft acquires a rapid rotary motion as it ascends. The resulting centrifugal tendency of air in rotation leads to a very decided low pressure in the central axis of the eddy. The rising air flowing into this region expands as it passes into places of low pressure, and is therefore cooled dynamically and becomes visible by the cloudy condensation of a part of its moisture. One may see a perfect axial cloud formed in a precisely analogous manner in the midst of a rapid dust whirl over a city street. The permanence of the waterspout axis depends largely upon the humidity of the inflowing air. A large waterspout at sea is attended by a cloud of flying salt-water spray at its base, but the spout proper consists of fresh water in the form of cloud particles or rain. Heavy rain generally falls upon any vessel that runs into a waterspout, but the only real danger in that case is from the whirling wind. The firing of cannon to break up a distant spout has often been tried at sea, but it is an error to believe that it has any appreciable effect. Spouts generally last but a few minutes, individually, but many of them may form and disappear in succession, owing to meteorological influences. The term "waterspout" is often erroneously applied to any very heavy fall of rain from a cloud causing local destructive floods. Such rains may deliver 5, 10, or 15 inches of water in depth over a small region within an hour's time, and cause great destruction. The popular term "cloudburst" should be applied in these cases, and not the term "waterspout." Consult: William Ferrel, *Recent Advances in Meteorology* (Washington, 1886); id., *Popular Treatise on the Winds* (2d ed., New York, 1893). The waterspout off Cottage City, Mass., Aug. 19, 1896, was most favorably located for photographing; 10 views and detailed weather descriptions will be found in the *Monthly Weather Review* (Washington, 1906), and in Julius Hann, *Handbuch der Meteorologie* (3d ed., Leipzig, 1914).

WATER STRIDER. A slender, long-legged water bug of the family Hydrobatidæ. They live upon the surface of quiet waters and dart about with great rapidity. They prey upon other insects and may even leap into the air in pursuit of their prey. The numerous species are found upon both salt and fresh water. They have prominent eyes, a stout beak, long antennæ, and an abdomen which usually tapers to the tip. Many species are dimorphic, one form being wingless and the other winged. Their eggs are attached to submerged parts of plants. A common species upon ponds and in the United States is *Hygrotrechus remigis*, a moderately stout, dark-brown insect about half an inch long. It hibernates in mud, beneath leaves upon the banks, or at the bottom of the water under stones. A very strange form common in certain portions of the United States is *Rheumatobates rileyi*. While truly aquatic, water striders are structurally more nearly related to the land bugs than to the other water bugs.

WATER SUPPLY. Water for irrigation, navigation, water works, and other industrial and domestic purposes, derived primarily from rainfall and secondarily from running streams and lakes, or surface water; and from springs, wells, tunnels, and infiltration underground. The quality of water supplied for irrigation, water power, and navigation is of small consequence, except that a polluted stream might be a general nuisance, and that the mineral contents of certain waters are harmful to crops. Water made available by water works should be above all question as to sewage pollution and should possess other qualities, natural or artificial, discussed under WATER WORKS and WATER PURIFICATION. A gravity flow is generally an essential as to supplies for navigation and water power. The same is often but not always true of water for irrigation. These limitations are due to the cost of pumping and do not apply to supplies for domestic and manufacturing purposes. Besides volume, there is a further essential to water for power, a sufficient fall to yield the requisite energy for the work. (See WATER POWER.) As has been stated, the common source of all water supplies is rainfall. Some of this finds its way to streams, ponds, and lakes; some sinks into the soil to be utilized by vegetation, or to percolate to lakes and streams; some is stored in the soil and the permeable layers below it, ready to be tapped by wells; a large part is evaporated directly from the surface, only to fall to earth again, as rain, dew, or snow. With a given rainfall in any locality the amount of water naturally available will depend upon the extent, surface slope, and geological formation of the gathering ground, or drainage area, and the nature of the vegetation on that surface. The steeper the slope and the greater the proportion of the rainfall reaching the streams, the less is available as underground supplies. With steep and impervious drainage areas, the streams rise and fall suddenly, leaving little water available for useful purposes, and threatening the stability of such water-supply works as are built. Forested and other well-covered areas retain the rainfalls for longer periods, but, in common with all vegetation, they make demands upon the water stored in the soil. Nevertheless, such areas, and also flat, sandy stretches of country, tend greatly to equalize the seasonal yield of drainage areas. Temperature and humidity are important factors in all water-supply calculations, high temperatures and low humidities increasing evaporation from both land and water. When ground is frozen, water cannot percolate into it and the surface flow, or run-off, is so rapid that little of the rainfall is available, unless there is ample storage. The percentage of water surface to total drainage area plays an important part, since the evaporation from water surfaces is much greater than from the land.

The excellent maps and reports of the United States Geological Survey and some of the State geological surveys often afford sufficient data relating to the extent, surface, and subsurface character of drainage areas for at least preliminary studies of water supplies. Where these maps are lacking or insufficient, special topographical surveys are necessary, but it may not be so easy to secure geological data. In like manner, meteorological statistics (see RAIN) may be secured from the United States, State, and local weather bureaus or meteorological stations. Still further aids are the observations on the flow of streams made for a number of years past by the Hydrographic Department of the United States Geological Survey, by some of the State engineering bureaus, by municipal water departments, and by owners of private water powers. Observations on the amount of

water required for various crops, and various phases of ground-water investigation, have been conducted for years past by the United States and the various State agricultural experiment stations, under the control or leadership of the United States Department of Agriculture.

In developing a water supply for any purpose, the first step is to determine the approximate relation between the quantity needed and the various supplies available. Where the source is to be some large river or lake, or say an artesian well from a basin of known capabilities, and in general where the required supply is obviously only a small part of the minimum yield of the source, no preliminary investigation as to quantity available will be required. But in most cases this point demands at least some consideration. The cardinal principle in estimating quantity of supply is to compare the maximum demand with the minimum supply. Averages are also of great importance, but the foregoing is the crucial test. There should be determined not only the actual or estimated yield of the source of supply during the driest month on record, but also the corresponding yield for the driest two or three years in succession. This will enable calculation as to necessary storage for use during droughts, what supplementary steam plants may be required in connection with water-supply developments, and what delays to navigation may be expected in case it is not feasible to provide all the storage indicated as necessary to maintain the levels of navigable canals or rivers. Although the yields of both surface and underground supplies depend primarily upon the rainfall, other factors vary in the two cases. Streams and lakes are supplied partly from the water that flows into them directly from the surface of the ground (hence the name surface water) and partly from water that percolates through the soil to brooks, rivers, and lakes. The underground supplies are replenished from time to time from that portion of the percolating water that does not find its way to the surface supplies, or else is intercepted by artificial means. The drainage areas of surface supplies are well defined and the flow of streams may be readily measured. The drainage areas of underground sources are not so easily determined, particularly deep-seated waters, and the determination of their volume is often difficult and generally only an approximation. Instead of a stream flowing in a well-defined channel, as is true of surface supplies, underground waters follow a tortuous course through thousands of tiny channels in the voids between the separate grains that compose their water bed. The size of these channels, the general slope of the underground water surface, the depth of the water-bearing stratum, or absence of the pressure that gives rise to artesian conditions, all play their part in the possible yield of wells and springs.

The safest and often the only practicable means of determining the yield of an underground source of supply is to measure it, or a portion of it. In the case of springs this may be done by means of a weir (q.v.). Where wells are proposed one or more may be sunk and tested experimentally, but unless the test is for a long period and the deductions made in the light of the best engineering and geological knowledge the results are certain to be misleading and the future yield grossly exaggerated. If a relatively small supply is all that is required one or more test wells may settle the question of capacity with sufficient definiteness at the outset, with the understanding that when the supply, as finally developed, proves inadequate, the plant will be enlarged. If, however, a quantity close to the probable safe yield of the underground basin be desired, the test wells may be so located as to determine approximately the slope of the water level, the velocity of the underflow of water, and the porosity of the water-bearing material. The velocity may be determined by inserting some easily detected chemical in a well and noting the time that elapses before it appears at a lower well. From these facts combined with other data, an estimate of available supply may be made. The effect of a well is to lower the water level for a greater or less distance around it as a centre, so the new water level in this zone assumes the shape of a flat inverted cone, which has had its surface curved somewhat in the vicinity of the well. The more the water is lowered the flatter in proportion becomes the cone and the greater the area of the zone of influence, until the water practically fails through exhaustion or diminution due to increased friction. In determining the possible yield of surface supplies the first step is to ascertain what gaugings, if any, of the actual flow are available, and particularly whether such gaugings cover a series of years of minimum rainfall. Where no gaugings are to be had it is desirable that a gauging station or stations should be established. If this cannot be done all the available rainfall records in and near the drainage area should be gather and studied. These figures may be compared with the rainfall and corresponding yield, or run-off, of other drainage areas, as nearly similar as possible. Deductions may then be drawn as to the average, minimum, and maximum yields. The latter must be known to make possible the provision of adequate means for the passage of flood waters without damage to any of the structures connected with the supply works.

Storage reservoirs may often be provided to make good the deficiency of run-off or stream flow in dry periods. The extent to which this is feasible will depend partly upon the character of the available reservoir sites and largely upon the economic value of the water thus conserved. Absence of proper reservoir sites frequently turns the scales in favor of some other source of supply. The yield of underground water supplies may be supplemented by storage, also, but to a very small extent, as compared with the storage of surface supplies, since most underground waters would have to be pumped as well as stored, and the conditions for water storage on a large scale are rarely favorable in the vicinity of underground sources. Moreover, underground sources are chiefly used for public water supplies, and ground water in storage for more than brief periods is liable to deteriorate unless protected from the light. The expense of covering large reservoirs would be prohibitive. Relatively small supplies of well water are sometimes stored for irrigation (q.v.).

The yield of drainage areas is expressed in a variety of ways, depending somewhat upon the uses to which the water is put. For preliminary studies the yield may be stated in inches of depth, or in percentage of the total rainfall. The former is readily converted into cubic feet per second, hour, or day, per mile of drainage area, or into millions of gallons per square mile.

The gallon is the most convenient unit where water works are involved, and the cubic foot where water is to be applied for power or navigation. In the case of irrigation either cubic feet or acre feet may be employed. (See IRRIGATION.) Stream gaugings are recorded, primarily, in cubic feet per second. Springs may sometimes have their flow increased by digging a basin or well around them, or by driving a tunnel or gallery into a hillside. By these means the flow of a number of springs may often be united. Walling up and covering in of springs is frequently desirable to exclude foreign matter and to keep the water cool. Underground waters other than springs are developed by sinking wells, building infiltration galleries, driving tunnels, and occasionally by constructing submerged dams. The latter have been employed to intercept percolating waters flowing through valleys in the West, chiefly for use in irrigation. Well sinking, dam building, and tunnel driving are described under their proper heads. Infiltration galleries are generally formed by digging a trench and walling up its sides with timber, brick, or stone, laid with open joints. The top is generally tightly covered and the bottom left open. The water of running streams is sometimes diverted to the canal, headrace, or intake pipe by means of a dam, or in the case of a large stream by a wing dam, extending only part way across. Intake pipes are often laid on the bed of large streams or lakes until a point of sufficient depth or remoteness from the shore is reached, where they terminate in a crib or other arrangement for the protection of the exposed end and the strainer frequently placed upon it. Beneath rivers and for a number of the cities on the Great Lakes, the water supply is sometimes drawn through tunnels. These terminate at the shore end in the pumping station and at the river or lake end in a vertical shaft, protected above by a timber and stone crib and tower. Pumping plants are often important parts of water-supply systems. Their relation to water works and irrigation are described under those heads, and the various classes of pumps are treated under PUMPS AND PUMPING MACHINERY.

Estimates of the probable yields of drainage areas should be made only after due consideration of all the factors reviewed above. This is particularly true of underground supplies. It is a rare thing to find a single group of wells that yield, year after year, more than 5,000,000 to 10,000,000 gallons a day, but sometimes a number of groups may be made tributary to one water-supply system by proper pipe connections and pumping plants.

The yield of surface supplies, as has been stated, is far better known than that of underground waters. A fall of 1 inch of rain on a square mile of area is equal to 2,323,200 cubic feet, or about 17,375,000 gallons. A total flow of 1 cubic foot per second is equal to 646,300 gallons a day. A more detailed study of the records would show that after making allowance for evaporation from water surfaces, there would be a negative yield in some months; or, in other words, the river would run dry were it not for artificial or natural storage. It is to meet just such contingencies that storage reservoirs are provided. There are two ways of considering storage: (1) The amount required to supplement the natural flow so as to give the required daily supply; (2) the economic limit of the storage development. The deficiency is then to be made good by establishing the storage capacity indicated, provided the expense involved is not so great as to render some other source of supply cheaper. The amount of storage will range all the way from nearly the whole run-off of very small streams to a few months' supply for medium-sized ones and nothing for large rivers. But whenever an attempt is made to utilize a large percentage of the total run-off, storage will also have to be provided in large quantities. With adequate storage an average daily yield of 500,000 to 700,000 gallons per square mile may be expected in the New England States, New York, and New Jersey, where all the problems involved have been most carefully studied.

Consult: F. E. Turneaure, *Public Water Supplies* (2d ed., New York, 1908); A. C. Houston, *Studies in Water Supply* (ib., 1914); G. F. Swain, *Conservation of Water by Storage* (New Haven, Conn., 1915); United States Geological Survey, *Water Supply and Irrigation Papers* (Washington, 1896 et seq.); also references given under IRRIGATION; WATER POWER; WATER WORKS. See also ARTESIAN WELLS; RAIN; RIVER; SPRING; WATER. For the development of water supplies and their useful application, see AQUEDUCT; DAMS AND RESERVOIRS; IRRIGATION; WATER POWER; WATER PURIFICATION; WATER WORKS; and WELL SINKING.

WATER THRUSH. A name very suitably applied in Great Britain to the ouzel (q.v.), and transferred in the United States to the terrestrial warblers of the genus *Sciurus*, also better called water wagtails. They are large, handsome birds, golden or olive brown above and satiny white below, with spotted breast. Three species are observable during the irrigation seasons in the eastern United States, where one remains during the summer as a numerous and familiar resident (see OVEN BIRD). All show a fondness for the vicinity of water, frequently ponds and forest streams, near which they make their nests and practice songs surpassed by few American birds in brilliance and melody.

WATER-TIGHT COMPARTMENTS OF VESSELS. See SHIPBUILDING; SAFETY AT SEA.

WATER TOWER. See FIRE PROTECTION.

WATERTOWN. A town in Litchfield Co., Conn., 6 miles northwest of Waterbury, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 3). The most important manufactured products are silk goods, umbrella trimmings, hardware, wire goods, and wool mats and dusters. Pop., 1900, 3100; 1910, 3850.

WATERTOWN, wą'tẽr-toun. A town, including several villages, in Middlesex Co., Mass., 7 miles west of Boston, on the Charles River, and on the Boston and Maine Railroad (Map: Massachusetts, E 3). It has a large public library and a United States arsenal. A prominent residential suburb of Boston, it is also largely interested in manufacturing. The leading products are automobiles, rubber goods, shirts, soap, woolen goods, stoves, furnaces, etc. Watertown was settled and incorporated in 1630, and in 1632, when called upon to contribute toward the erection of a fort at Cambridge, made the first protest ever made in America against arbitrary taxation. In 1775–76 the second and third Provincial Congresses of Massachusetts met here, and here the people of Boston, driven from their homes by the British during the Revolution, held several town meetings. Pop.,

1900, 9706; 1910, 12,875; 1915 (State census), 16,515. Consult: Francis, *An Historical Sketch of Watertown* (Cambridge, 1830); Hurd, *History of Middlesex County* (Philadelphia, 1890).

WATERTOWN. A city and the county seat of Jefferson Co., N. Y., 73 miles north of Syracuse, on the Black River, and on the New York Central and Hudson River Railroad (Map: New York, E 3). Among the prominent buildings are the county courthouse, State armory, post office, and the Young Men's Christian Association building. A memorial library and a bronze monument to ex-Governor Roswell P. Flower and a handsome high-school building are also noteworthy. The charitable institutions include the Henry Keep Home for the Aged, two hospitals, and two orphans' homes. There are several small parks, and a city park covering more than 600 acres. There are, in its vicinity, extensive deposits of iron and limestone. It also has large and varied industrial interests, being especially known for the manufacture of paper and wood pulp, ammunition, and foundry and machine-shop products. The New York Air Brake Company has an extensive plant here. Other establishments include carriage and wagon factories, flouring and grist mills, lumber mills, steam-engine works, farm-implement works, etc. Abundant water power is furnished by the Black River, which has a fall of 112 feet within the city limits. Watertown has adopted the commission-manager form of government, effective in 1918. Pop., 1900, 21,696; 1910, 26,730; 1915 (State census), 26,895.

WATERTOWN. A city and the county seat of Codington Co., S. D., 214 miles, almost due west, from Minneapolis, on the Big Sioux River and on the Chicago and Northwestern, the Chicago, Rock Island, and Pacific, the Great Northern, the South Dakota Central, and the Minneapolis and St. Louis railroads (Map: South Dakota, G 3). It is in a region of attractive scenery, but 3 miles from Lake Kampeska, one of the most picturesque lakes in the State. Noteworthy features are the Carnegie library and two hospitals. The city is an important shipping point for the farming and cattle-raising district adjacent. There are large grain elevators and warehouses, flouring mills, and manufactories of leather, foundry and machine-shop products, agricultural implements, carriages and wagons, oatmeal, etc. Watertown has adopted the commission form of government. Pop., 1900, 3352; 1910, 7010.

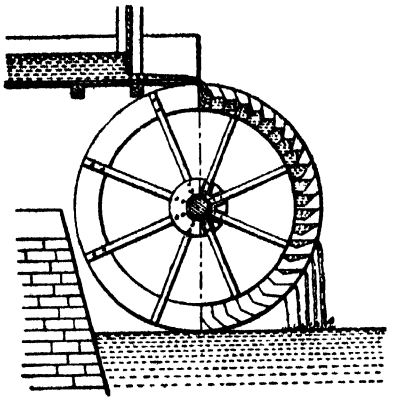
WATERTOWN. A city in Wisconsin, on the boundary line between Jefferson and Dodge counties, 44 miles west by north of Milwaukee (Map: Wisconsin, E 5). It is on the Rock River, and on the Chicago, Milwaukee, and St. Paul, and the Chicago and Northwestern railroads. Watertown is the seat of Northwestern College (Lutheran), opened in 1865, and of Sacred Heart College (Roman Catholic), established in 1872. Other prominent features include the city hall, the high-school building, and the public library. The city manufactures apiary supplies, beer, malt, cheese, lumber products, gas fixtures, flour, shoes, and cigars. It received a city charter in 1853. Pop., 1900, 8437; 1910, 8829; 1915 (U. S. est.), 9034.

WATER TURKEY. See DARTER, or SNAKE BIRD.

WATERVALLEY. A city and one of the county seats of Yalobusha Co., Miss., 98 miles by rail south by east of Memphis, Tenn., on the Illinois Central Railroad (Map: Mississippi, F 2). It derives considerable commercial importance from its location in a district extensively engaged in lumbering and cotton growing, and has railroad repair and construction shops, thread and twine mills, a foundry, cotton mills, and broom manufactories. Pop., 1900, 3813; 1910, 4275.

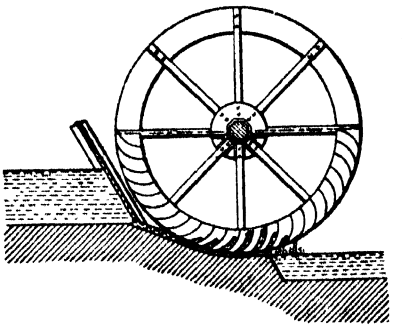
WATER VAPOR PROCESS. See REFRIGERATION.

WATERVILLE, wą'tẽr-vĭl. A city in Kennebec Co., Me., 81 miles north by east of Portland, on the Kennebec River, and on the Maine Central Railroad (Map: Maine, D 6). It is the seat of Colby College (q.v.) and of Coburn Classical Institute and contains a Carnegie library. Waterville is engaged to a considerable extent in manufacturing, the most important products being cotton and woolen goods. There are also railroad shops, ironworks, tanneries, carriage, boat, shirt, and cigar factories, etc. In Winslow, on the opposite bank of the Kennebec, are large paper and pulp mills. Pop., 1900, 9477; 1910, 11,458; 1915 (U. S. est.), 12,501.



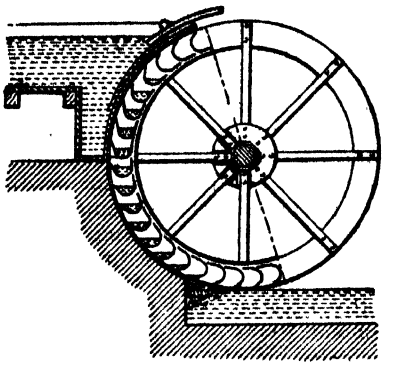
WATERVLIET, wą'tẽr-vlēt'. A city in Albany Co., N. Y., on the Hudson River, opposite Troy, with which it has bridge and ferry connection, and on the Delaware and Hudson Railroad (Map: New York, G 5). It is also near the termini of the Erie and the Champlain canals. The most interesting feature is the United States Government Arsenal, occupying a large tract of land along the river front. The plant was established in 1807 and includes extensive foundries and shops for the manufacture of guns and other war material. Iron and lumber products, bells, harness, wagon and automobile specialties, collars and cuffs and woolen goods are also manufactured in the city. Pop., 1900, 14,321; 1910, 15,074; 1915 (State census), 14,990.

WATER WHEEL AND TURBINE. A wheel for utilizing the weight of falling water to perform mechanical work. (See WATER POWER.) The term "water wheel" is properly applied to all hydraulic motors that rotate, but it has come to be restricted to wheels which act mainly by the weight of water that they receive on their circumferential parts only, which turn on horizontal shafts, and which move with a low velocity and a velocity that has no relation to the head of water under which the wheel works. In all these respects water wheels, as the term is used here, differ from turbines. Water wheels are designated as overshot, breast, undershot, or current types, according as they receive the water at the top, near the centre, or at the bottom; this is shown by the illustrations.



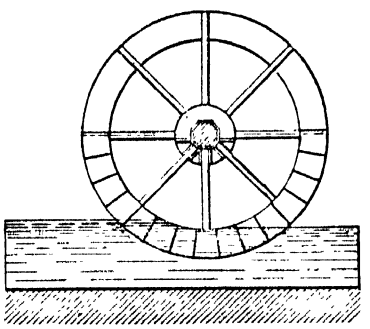
The overshot wheel has a series of buckets arranged on its circumference so that, as the wheel rotates forward, the buckets on the descending side have their top upward. The water is led to the wheel by a trough or flume which discharges at the top of the wheel just forward of a vertical through its axis. This water fills the buckets and its weight causes the wheel to rotate forward. Each bucket is filled as it comes under the discharge from the flume, and each is emptied as the rotation brings it near the bottom. The object of this is to have the weight of each bucketful of water act throughout the entire vertical distance of the fall. The earlier forms of overshot water wheels were built of wood and were enormously massive and clumsy-looking structures. At a later period iron was substituted for wood, with material gain in

lightness and appearance. Overshot wheels were often of enormous size, one of the largest being 72½ feet in diameter, located at Saxey, on the Isle of Man.



The breast wheel, like the overshot wheel, has a series of buckets on its circumference, but they move necessitates cumbrous and expensive gearing to raise the speed to the requirements of industry, which is constantly calling for increased rates of speed. But for small farm powers they have a good field of service, a water wheel as built to-day having an efficiency of

OVERSHOT WHEEL.



UNDERSHOT WHEEL.

BREAST WHEEL.

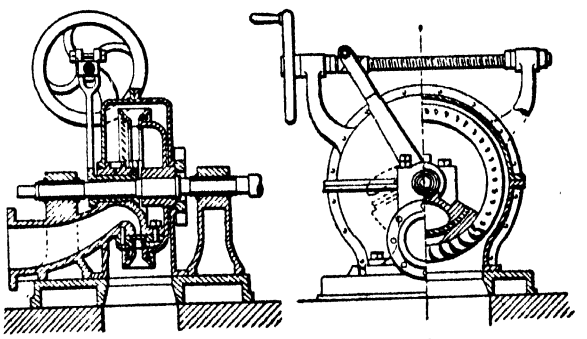
are so arranged that the wheel revolves backward. In the overshot wheel, using the dial of a watch as an illustration, the water enters the bucket at about the point where number I on the dial is located and leaves it about the point where number V is located; in the breast wheel the water enters the bucket at about X and leaves it at about VII; in the undershot wheel the water hits the paddle at about VII and leaves it at about V.

An undershot wheel has instead of buckets a series of vanes or paddles on its circumference, and the water flows under the wheel and pushes the paddles forward. The current wheel is the simplest form of undershot wheel; the paddles are radial and the wheel is set so that they dip just their full depth into the current of a flowing stream. In the more approved form of

CURRENT WHEEL.

undershot wheel the water passes under the wheel in a rectangular sluice concentric with the wheel, in which the paddles revolve with as little clearance as is consistent with movement.

The numerous disadvantages of the water wheels which have been described have caused them to be superseded by the turbine for all large and important work. They occupy much more room than turbines of the same power, and must be inclosed in buildings to prevent obstruction by ice in winter. Backwater affects them injuriously, not only by diminishing the head, but by drowning them and causing them to expend their power uselessly in wallowing, a source of loss from which most turbines are wholly free. The necessarily low velocity with which they



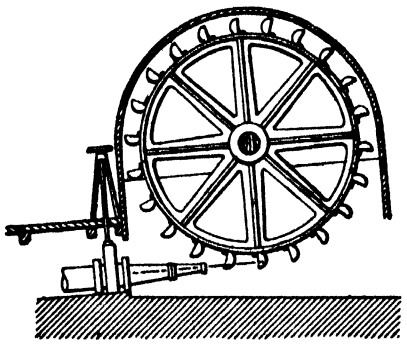
from 70 to 92 per cent, and working well with varying flows of water.

HYDRAULIC TURBINES

The turbine comprises a wheel with buckets or vanes, into which water is directed, and a casing carrying nozzles or vanes to direct the flow. As water flows past the wheel the velocity of the liquid is changed in direction and magnitude; therefore it exerts a turning force on the wheel. Unlike the simple water wheel, motion of the water relative to the buckets at all times is essential to operation.

Turbines are variously classified: (1) according to the action of the water as impulse or reaction; (2) according to direction of flow as radial outward, radial inward, axial or parallel, mixed (combined radial and parallel) and tangential; (3) according to the position of the shaft as vertical and horizontal.

In radial turbines the water in passing through the wheel flows in a direction at right angles to the axis of rotation, or approximately



GIRARD IMPULSE TURBINE.

radially. In axial turbines, or parallel-flow turbines, the water flows through in a direction generally parallel with the axis of rotation. In combined or mixed-flow turbines, both the previously described systems are combined. In a reaction turbine all parts are entirely filled or drowned with moving water; in the impulse turbine the construction is such that the buckets are only partly occupied by the water passing through them, the atmosphere having free ac-

cess to the remaining space. A reaction turbine is driven by the dynamic pressure of the flowing water, which at the same time may be under a certain static pressure, due to the fact that the inflow takes place under pressure, since the wheel is always filled with water. In the impulse turbine the flow past the runner takes place freely under air pressure only.

The Pelton wheel is the only impulse turbine to secure continued use under American conditions. This is classed technically as a tangential turbine but in America it is common to refer to it as a "wheel" in distinction to turbines, the latter term then being generally understood to apply to reaction turbines. In the Pelton wheel the shaft carries a spider or disk bearing on its periphery a series of cups or buckets which receive a stream coming at maximum velocity from a nozzle. The bucket turns the direction of the jet as nearly through 180° as is mechanically possible, and the reaction of the jet on the bucket gives motion and power. The absolute velocity of the water as it is discharged from the buckets is only from three per cent to 10 per cent of the initial velocity. The efficiency of Pelton wheels as now built is about that of a high-grade turbine—75 to 90 per cent. While it is commonly held that impulse wheels

EARLY PELTON WHEEL.

are best used for comparatively high heads, say over 300 feet, yet very successful ones have been developed for as low as 110 feet—e.g., those in Cross Cut Station, Salt River Irrigation Project, Ariz., (1916) where 1000-horse-power units showed an efficiency of 83 per cent. The highest head wheels are the 5412-foot machines in the Lake Fully plant, Switzerland. See WATER POWER.

The speed of Pelton wheels is regulated by using a needle, with a conical head, inside the nozzle to reduce the area of opening. As this changes the flow and if rapid in action is apt to set up dangerous water hammer in the penstocks, it is frequently supplemented by a deflector which drops down in front of the jet to divert more or less of the stream from the buckets. The first impulse wheels were crude affairs (called hurdy-gurdies) built in California in the early mining days (1849) but their design has now been developed to as great a degree of accuracy as the reaction type.

The Girard impulse turbine is a European development which has not had much use in America. When a reaction-turbine runner is not completely filled with water—as happens sometimes, with machines elevated above the tail race, when the gates are nearly closed—then the only effect of the stream is from its velocity as it strikes the runner vanes, and thereupon the machine becomes an impulse turbine. When Girard-type turbines are designed to act on the impulse principle water is admitted to but a few of the buckets or vanes (which resemble those of the reaction wheel) and maximum velocity is developed in the guide passages. Since the discharge from a Pelton wheel or a Girard turbine needs to be free, to prevent wallowing of the runner, no draft tube (the use of which is shown later in connection with reaction turbines) ordinarily is used, though by putting the runner in an air-tight case and running the discharge out in a pipe of proper size the effects of a draft tube can be secured. Practically, however, the difficulties of keeping air out of the case are too great for complete success of the draft tube applied to impulse machines.

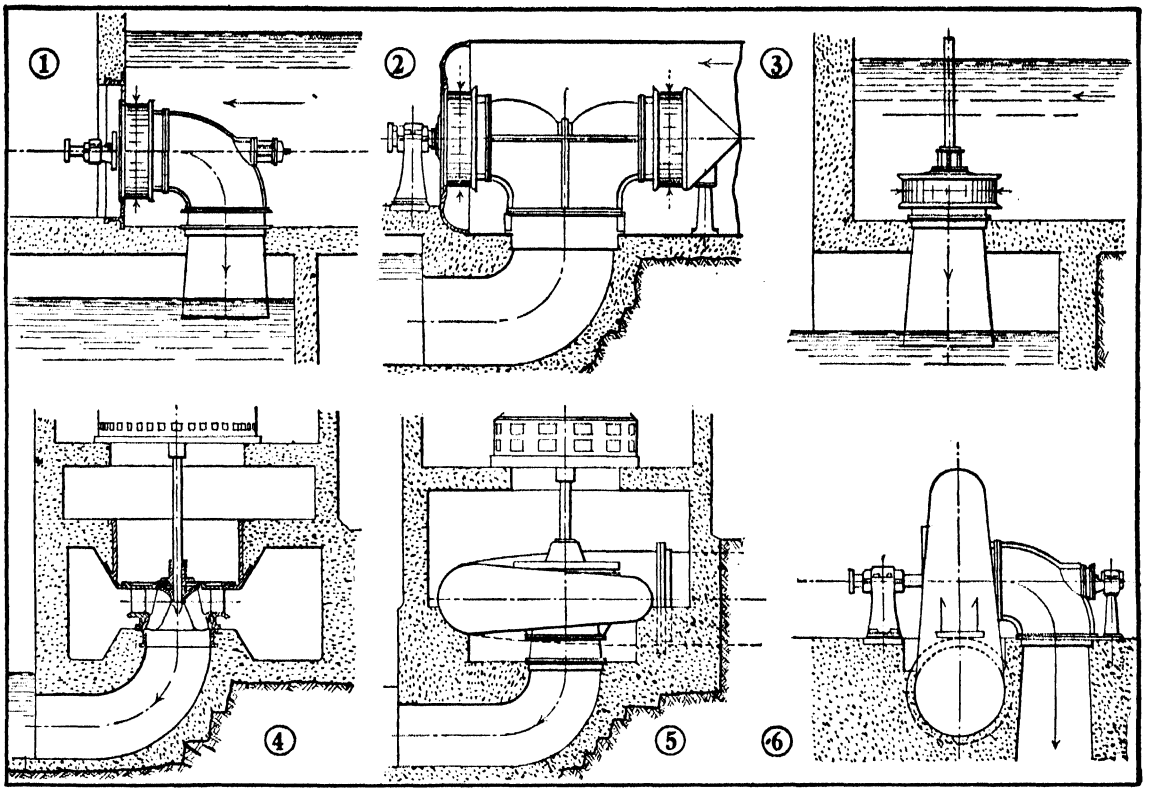
Barker's mill (q.v.), invented about 1740, was the first reaction turbine; this was a simple contrivance consisting of a chamber with a pair of arms spouting water out of orifices on opposite faces. The next step gave the Scotch turbine in which the arms were curved. The number of arms was increased and the orifice enlarged until the vaned wheel resulted. In 1826 Fourneyron placed central guide vanes on the wheel to guide the water out towards the vanes. The Jonval turbine was an old parallel-flow type with fixed guides or vanes above the vanes on the runner wheel.

The Francis turbine is the type which has become practically universal in America—this type indeed being known commonly as the American. There were several early turbines made by American mill-wrights with the water entering the wheel around the periphery and discharging downward parallel to the axis; but these had flat vanes and showed an efficiency of only about 35 per cent so that they were only impulse turbines. Samuel B. Howd of Geneva, N. Y., in 1838 patented a wheel of this sort with curved runner vanes.

J. B. Francis, the eminent hydraulic engineer, about 1849 improved on this early machine, preserving the inward radial flow but shaping the vanes to secure the reaction effect. The bucket shape has since been changed by extending the vanes and bending them so that the water passes down parallel to the shaft and again turns to leave at an angle of some 80° to the shaft. Credit for this has usually been given J. B. McCormick.

The obvious advantages of this type as now designed are many and important: (1) the runner is more compact, can be cast in one piece for all except the largest units, and gives good mechanical construction; (2) higher speed and capacity can be obtained with the same amount of material, which cheapens the cost of construction per horse power; (3) the control gates or wickets are accessible and naturally by their shape cause smaller energy losses by interference with smooth flow; (4) a draft tube can be more easily constructed and efficiently used.

Whether vertical or horizontal shaft turbines are used depends on local conditions and demands. The vertical machine requires less floor space but is less accessible; where it is desired to place the driven machinery above the turbine the vertical shaft type will meet the needs; for large units the bearings are simple. Ordinarily the vertical shaft arrangement is used with low heads.



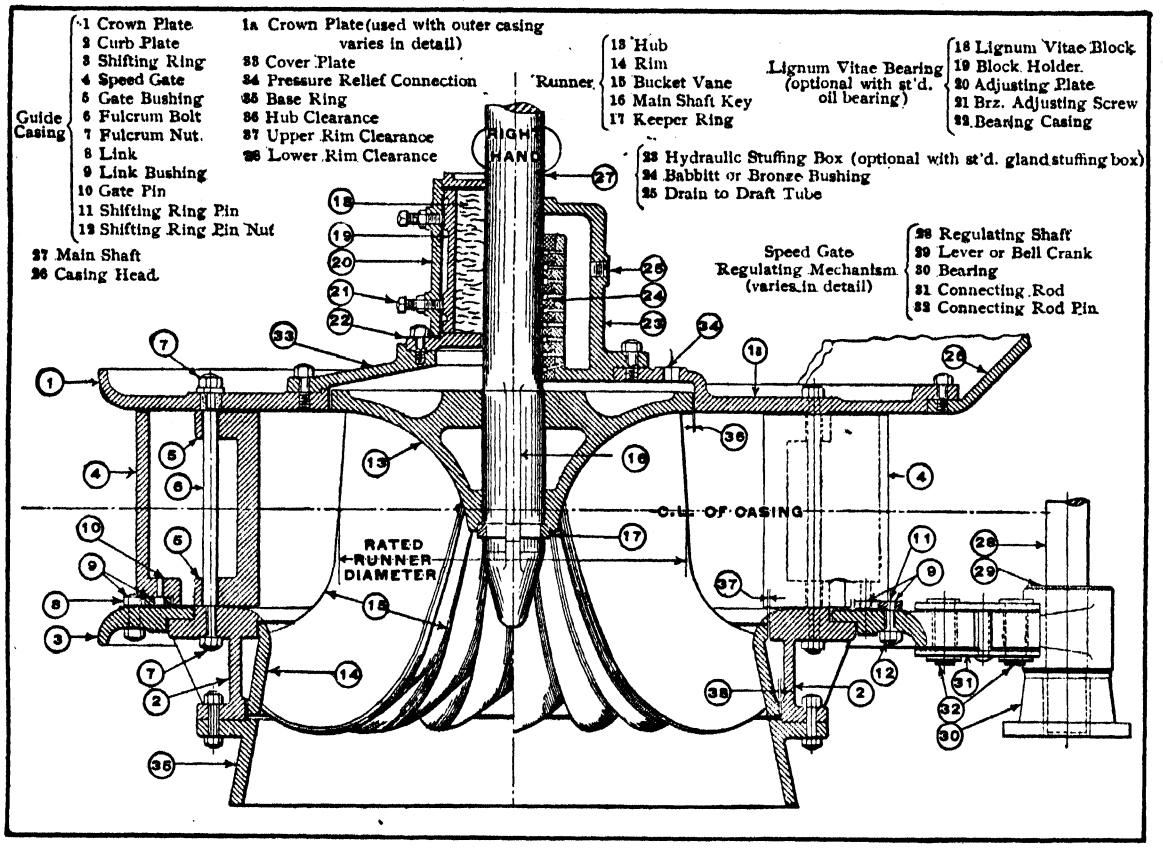
The extensive use of horizontal shaft units is possible because of the development of draft tubes which make useful the head between tur-

bine discharge and tail race. Draft tubes, however, are now an essential part of both high and low head reaction-turbine plants. The draft tube is a section of pipe in which the falling column of water tends to produce a vacuum in the turbine; the effect is to increase the effective head by an amount more or less approaching the drop between turbine and tail race. With simple straight tubes the effective head is appreciably reduced by the velocity of the water, but by flaring the tube up to 1 foot in 3 feet length the velocity at final discharge can be kept down to that required to sweep out the discharge passages. With many vertical shaft machines the draft tube is bent around in a gentle curve so as to discharge its flow parallel to the stream; this helps to efficient operation.

The accompanying sketch shows six typical wheel settings. Three of the designs are more or less antiquated. Three others show accepted practice to-day. The tendency is toward single runners as there is enough interference in the discharges of twin runners on one draft tube so that the efficiency is appreciably reduced.

Structurally, a reaction turbine consists (1) of a ring or a pair of rings, to which are attached the curved vanes arranged uniformly around the circumference, revolving on a shaft or spindle to which the ring or pair of rings is connected by a boss and arms or other suitable means, and (2) of a casing which incloses the part just described, and which generally is provided with guide vanes between which the water enters the wheel, and which cause the water to enter in the desired direction. The supply of water to the turbine is regulated by wickets or gates, which can partially or entirely close the entrances to the guide-vane passages. The guides and wheel with the gates and the surrounding cases are made of iron, steel, or bronze. Numerous forms of turbines with different kinds of gates and different proportions of guides and vanes are on the market. They are made of all sizes from 6 inches to 18 feet in maximum runner diameter.

The speed of rotation of a turbine is regulated by opening and closing the gate which admits the water to the wheel. Where the used power fluctuates, the speed will fluctuate unless some method is adopted to adapt the power developed to the power utilized. This is usually done by means of a governor, which is so devised that when little power is being used the resulting increase in speed will actuate it to close partly the gate, and when much power is being used the decrease in speed will actuate it to open the gate wider.



TYPICAL SETTINGS OF FRANCIS TURBINES.

1, low-head open single runner; 2, low-head double runner in casing; 3, vertical shaft low-head single runner. These settings are being more or less superseded by types similar to 4 and 5. 4, vertical shaft low-head runner with entrance passages molded in foundation concrete; 5, vertical shaft high-head runner in spiral casing; 6, horizontal shaft high-head runner with casing set in generator room.

In the selection of a turbine for a specific installation there may be desired any conceivable combination of power, speed and head, and it could hardly be expected that a single type of runner,—a line of homologous units having the same proportions, bucket angles, etc.,—would meet all demands. To study runners by speed alone or by capacity alone does not help, but studying the combination does. This is done by employing the "type characteristic" which is "the speed which would be attained by a runner if it were reduced in all its dimensions so as to develop one horse power under one foot head," i.e.:

$K_T = \frac{\text{R.P.M.}\sqrt{\text{H.P.}}}{\text{H}^{\frac{5}{4}}}$, since (1) the power of a given machine varies as the $\frac{5}{4}$ power of the head, and (2) the speed and discharge vary as the square root of the head. When a manufacturer

produces a desirable new design of runner he will usually build a stock line of homologous runners in common sizes, say from 6 to 75 inches in diameter, and from this line a runner of diameter suited to the speed and power of a specific case could be picked. If a turbine was needed giving 250 horse-power maximum at 220 revolutions per minute and 25 foot head then the type characteristic, K_T, comes out as 63. Therefore a line having this characteristic specific speed should be selected and out of it a runner having a diameter such that its peripheral speed is $\frac{8}{10}$ the maximum theoretical velocity of water falling through this head ($\sqrt{2g \text{ head}}$)—since experience shows that this proportionate speed gives highest efficiency.

SECTION THROUGH FRANCIS TURBINE, WITH NAMES OF PARTS.

(For a medium head $\phi = \frac{7}{10}$ and for high speed $\phi = \frac{6}{10}$ would be used.) The diameter in inches computed by the resultant expression $D = \frac{1840\,\phi\sqrt{\text{Head}}}{\text{R.P.M.}}$ gives a value in the assumed case of 33½ inches. If the data as to required power, speed and head demand a K_T less than about 12, experience shows that an impulse wheel will be better than a reaction turbine. Runners of $K_T = 12$ to 25 are best suited for high heads; runners of $K_T = 25$ to 45 are best for medium heads; and runners of $K_T = 45$ to 90 are suited to low heads. Where the data would demand a runner with K_T much over 90 the capacity has to be split and two runners or turbines used to bring the K_T down to that of practical and successful runners.

WATER WITCH. Any of various birds quick at diving, as a grebe, bufflehead duck, or dipper.

WATER WORKS. The various structures and devices used to provide water for domestic and industrial uses, fire protection, and other public services. The term is here restricted to plants for the supply of municipalities. Works limited to the needs of a single establishment generally differ little in principle from municipal works, but are smaller and simpler. The main points to be discussed in this article are the quality and quantity of water to be provided; the source and mode of supply, the latter involving a choice between gravity and pumping; the size and character of pumping works, reservoirs, tanks, and standpipes; the distribution system; and various details of public policy.

Quality, or the fitness of water for its various uses, includes freedom from the specific germs of disease and from minor substances deleterious to health, an absence of turbidity and color, unpleasant taste or odors, and of all mineral matters in sufficient quantities to interfere with the various household and industrial purposes for which the water is designed. The most serious menace to water supplies is sewage pollution, which may at any time cause an epidemic of typhoid fever and is likewise one of the chief agents in the spread of cholera. Sedimentary matter, otherwise known as muddiness or turbidity, is generally caused by clay and silt suspended in the water. It is more offensive than dangerous. Color is still more

wholly a matter of offensiveness to the eye, instead of a menace to health, than is sediment. The latter gives rise to an apparent color, which disappears with the sediment. True color, as used in water terminology, is generally a stain, rather than matter in suspension. It is frequently due to infusions of vegetable organic matter, like leaves, grass, and peat. Odor, in any considerable degree, is less frequent and far more troublesome than either sediment or color. It is commonly due to the life processes of minute organisms in the water and is frequently seasonal in its appearance. Sediment, color, odor, and taste, as well as the evil effects of sewage pollution, each yield to proper treatment, as described under WATER PURIFICATION.

Water Analyses and their Interpretation. As an aid to the study of the quality of water recourse is had to an inspection of the drainage area and all possible sources of pollution, and to physical, chemical, and biological examinations of samples of the water. The physical examinations involve observations on temperature, color, odor, and turbidity. Color is generally determined by comparing the samples of water with fixed color standards based on chemical solutions of known composition and regularly varying strength. The most commonly accepted measure of turbidity is the depth at which some bright object will disappear from view if gradually lowered in water. High temperatures give rise to troublesome organic growths. As a rule, however, temperatures are quite beyond control, except in choosing between different sources of supply and in locating the depths of the pipes through which water is drawn from deep lakes and reservoirs. Deep temperature readings are taken by means of the thermophone. Absence of color, odor, and turbidity, combined with low temperatures, are most desirable qualities, but all of them together are of vastly less importance than freedom from organic impurities. Unfortunately, no method of analysis has been discovered which will do more than indicate the probable safety or danger of a given water. Chemical analyses point to past contamination, and give some evidence of its nearness or distance in point of time and whether it was of animal or vegetable origin. Bacterial analyses are of comparatively little avail except to show the numbers of bacteria present, and to throw some light on their probable origin. The differentiation of the typhoid germ, the chief object of fear in America, from the harmless water bacteria is a long, tedious, and at best a very uncertain operation. The more direct microscopical examination of forms of life above the bacteria, although of much future promise, is limited chiefly to determining the absence or occurrence of those growths that cause bad tastes and odors. But when such growths are detected the most that can be done, ordinarily, is to shut off the water in question, take steps for its purification, or exclude light, when the latter is an essential to troublesome visitors. As an aid to detecting organic impurities, chemical determinations of albuminoid and free ammonia, nitrates, and chlorine are made. The first four substances indicate past contamination. Their relative amounts, in the order named, throw some light upon the degree of natural purification, as measured chemically, that has taken place. The chlorine, if above the local normal for unpolluted water, indicates that the organic matter came from sewage. High nitrates and chlorine combined, especially if accompanied by large numbers of bacteria, render water very suspicious. If, in addition, bacillus coli communis, a kind of bacteria found in large quantities in the human intestine, is present, the evidence against the water is often held to be conclusive. It may be accepted as quite so if it is learned that sewage is being discharged into the stream or lake above the point of inlet. See DISEASE, GERM THEORY OF.

Determinations of the mineral contents of surface waters are rarely made unless they come from limestone or alkaline regions and excessive hardness is feared. Underground waters are so likely to contain the sulphates and carbonates that cause hardness, or else other troublesome mineral salts, particularly iron compounds, that it may be well to test for at least those substances when examining well water. Lead poisoning is not due to lead normally in the water, but to lead taken up by the passage of certain water through, and more particularly by its standing in, lead pipes or cisterns. Very soft waters are especially liable to attack lead pipe. Chemical standards for water are very misleading. The best chemists and engineers interpret each set of analyses in the light of all other known facts and attempt to lay down no arbitrary standards. A minimum of 100 to 500 bacteria per cubic centimeter has been set by various authorities; but this, also, depends on all the other local conditions. Hardness is chiefly a question of more or less soap in connection with water used for household purposes, and of scale formation in steam boilers. If excessive, the supply may be rejected, or a softening plant may be supplied. The substitution of pure mountain for contaminated Passaic River water at Newark in 1892, and of filtered for unfiltered water at Lawrence, Mass., in 1893, and at Albany, N. Y., in 1899, caused a marked decline in typhoid mortality.

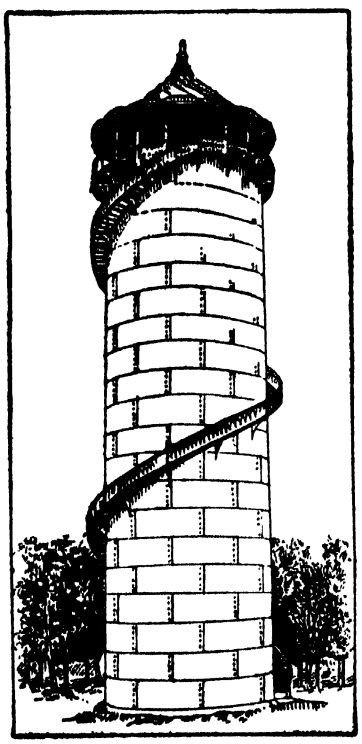
Quantity, while not affecting so vitally the health of a community as quality, since only a small fraction of the total water supply is devoted to hygienic uses, is nevertheless of great importance from the standpoint of health, comfort, æsthetics, and industry. In a purely residential town, with lawn sprinkling for grounds of moderate size, an average daily consumption of 35 to 50 gallons per capita is not only ample for legitimate use, but makes provision for what is termed unavoidable waste. With a moderate amount of manufacturing the consumption ought not to go above 75 gallons; while for all but exceptional conditions 100 gallons per capita should be considered excessive rather than merely ample. For well-managed works, where popular sentiment permits the use of meters, figures no higher than these are reported in America, and still lower ones abroad, but it is no uncommon thing in the United States to hear of cities using (and wasting) all the way from 100 to 200 gallons per capita, while some cities go up to 250 gallons or over, and very likely would go higher still if the capacity of their works were not overtaxed by the excessive demands upon them. Under present conditions few American engineers deem it safe to plan for a water supply of less than 100 gallons per capita, with a provision for some increase in the near future. The tendency of nearly all

American cities for years past has been to show rapid increases in per capita water consumption.

Pressure is that quality which is imparted to mobile liquids, like water, through differences of elevation or head, and is due to the force of gravity; or it may be produced artificially by the use of pumping machinery, and a high-pressure fire service may involve the use of a special pumping, supply, and distribution system. It is essential in water-works systems that the pressure be ample to give a full and constant supply for all domestic and industrial purposes, and particularly for protection against fire. This may be effected by choosing a source of supply far enough above the general level of the community for the difference in level to overcome the pipe friction and cause the water to rise to the upper stories of buildings for ordinary service, and be sufficient to throw several fire streams over the tops of the highest buildings. Where natural pressure cannot be had pumping is necessary.

Source and Mode of Supply. Modes of supply are classed as gravity or pumping, and the latter mode is subclassified as pumping direct to the distributing mains and consumers, to standpipe, to tank, or to reservoir. In some cities a combination of two or all these modes is in use. Where there are marked variations in the levels of a city it is customary to divide the works into high and low and perhaps intermediate services. This saves strain on the street and house pipes in the lower levels, and where the water is pumped it may greatly reduce plumbing expenses. In addition, lower pressures result in less leakage at defective joints and pumping fixtures. Several pumps in one station may raise water to different levels, or the water may be repumped for the higher districts. Whatever the source and mode of supply, an ample quantity of water should always be available near the centre of population and fire risk. To accomplish this end storage reservoirs, or, in the case of pumping plants, duplicate pumps may be required, and several independent lines of main pipes may also be essential.

The choice between the various classes of supply, such as springs, wells, streams, and lakes, will be governed by the relative availability of each possible source to meet the three essentials of quality, quantity, and pressure. For large cities surface supplies are most commonly the chief reliance, and in such cases, for all cities not on the larger rivers and lakes, impounding reservoirs are generally employed. Even relatively small supplies from wells are liable to yield less, after a few years, than their original rated capacity. In point of quality, underground waters, except when drawn from wells in populous areas, are generally free from dangerous organic matter, but they may have, or give rise to, bad tastes and odors, and their water may be hard, or may contain iron in such large quantities as to make it unfit for use. Tastes and odors are liable to develop in water from underground sources when exposed to the light. This is due to the life processes of microscopic organic growths, mostly of vegetable origin. Water containing iron compounds, on exposure to the air, may become fairly red with a precipitate resembling iron rust. Surface waters are generally soft, unless from limestone drainage areas. They sometimes, on storage, foster odor and taste producing organisms. Their chief danger is from sewage pollution. Surface supplies are relatively warm, and underground waters cool. Surface supplies are also liable to be high in color and turbidity. Swampy or peaty gathering grounds, heavily wooded areas, and improperly cleaned sites for storage reservoirs give rise to color, while readily eroded clay or silt lands contribute turbidity. The Ohio, Mississippi, and many Southern and Western rivers are notable for their turbidity. Swamps may sometimes be drained, or cut out of the collecting area. Soils rich in organic matter may be removed from reservoir sites. See WATER SUPPLY.



Pumping Works vary in character with the source and mode of supply, the motive power, the cost of fuel, if fuel is used, and the working pressure on the pumps. The latter is determined by the elevation to which the water is lifted and the frictional resistance in the pipes through which the water is forced. The chief bearing of the source of supply on the pumping plant is the depth of the water below the surface of the earth. If the water is drawn from a depth of more than say 20 to 25 feet as a maximum the pumps must be lowered correspondingly. If the water be very deep-seated some form of deep-well pump, or else the air lift, is required, in order that the motive power may be kept at the surface. In addition to the depth of the source of supply, the necessity of purifying the water is a factor in determining the character of pumping plants. (See WATER PURIFICATION.) Thus, it may be necessary to lift the water from a river to a settling basin, or from a river or other source to filters, after which it will have to be repumped to the distributing system.

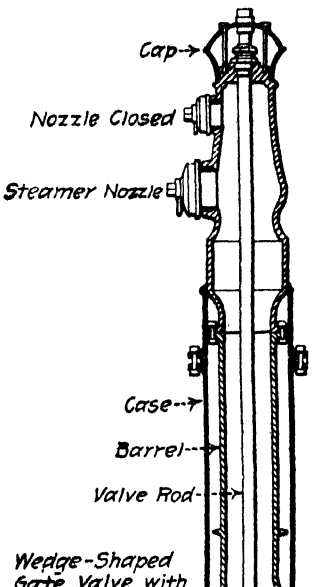
Variations in the mode of supply, the extremes of which are direct pumping, with its liability to great and perhaps sudden changes in working pressure, and pumping to a reservoir, against an almost constant head, have important bearings on the choice of pumping machinery. Direct-pumping plants must be quick to respond to sudden changes in pressure, without injury to the machinery. This calls for variable speeds, automatically regulated, and for strong and simple working parts. If, however, water is pumped against a fairly constant head and at either a uniform rate of speed or under such conditions that the rate may be changed gradually, economy in design and operation may receive more consideration. Questions of motive power, particularly as between steam and water, are frequently settled in advance by nature. If ample water power is at hand it is inevitably chosen, on account of its cheapness. If it is not available the year around it may be supplemented with steam power, or possibly storage reservoirs may be constructed to equalize the stream flow. Since the development of the electrical transmission of power it is sometimes possible to utilize waterfalls remote from pumping plants. Electrically driven pumps may also be used where the dynamos are driven by steam engines or steam turbines, but this is not economical except under special conditions, such as pumping plants remote from coal supplies, or located in the residence districts, where a boiler plant for the generation of steam power would be undesirable, or for special emergency service as in high pressure fire service, where the pumps are started on receipt of an alarm. Compressed air may be transmitted for the operations of small plants at a distance from

the main pumping station or it may be used in the air lift, for raising water from driven and artesian wells. Pumps are also operated by oil or gas engines. Small quantities of water may be lifted by windmills. These various forms of motive power may be applied to any one of a number of kinds of pumps, as explained under PUMPS AND PUMPING MACHINERY.

The vast majority of water-works pumps, however, are driven by steam, the motive power and pump being combined in operation in one machine which is known as a pumping engine. The more expensive becomes the fuel the greater the reason for adopting a high-duty pumping engine, or one which, by means of better and more expensive design and workmanship, performs a relatively large amount of work for a small amount of coal. Uniform rates of pumping, as nearly as may be at the full normal capacity of the pumping engine, aid in securing the maximum duty from any sort of pumping machinery. Pumps working under high pressures are selected with special care as to strength of working parts and cylinders, and if of the reciprocating type they have a slow piston and valve movement. For very high pressures plunger pumps are used. The dividing line between high and low pressures is rather arbitrary, but 50 pounds or under might be termed low; 50 to 100 pounds, medium; while anything above the latter figure might be called high.

Reservoir Tanks and Standpipes are employed to insure a reserve supply of water, to maintain the pressure in the distribution system

STANDPIPE WITH ROOF, DES MOINES, IOWA.



at or above a minimum point, and to equalize both the rate of pumping and the head on the pumps. Tanks and standpipes are forms of reservoirs, but the term "reservoirs" is almost invariably restricted to receptacles built in or partially in the earth, with either earth embankments, masonry walls, or a combination of the two. Tanks and standpipes are built above ground, of wrought iron, steel, or (since about 1905) of reinforced concrete, except that small tanks are very often of wood. Tanks are generally placed on wooden, metal, or masonry towers, and both tanks and standpipes are sometimes inclosed with masonry and covered with some sort of roof. Standpipes rest on masonry foundations, the tops of which are level with or a few feet above the surface of the ground. Metal tanks and standpipes are made from one-fourth to one inch plates of wrought iron or steel, the latter being most commonly employed of late. The plates are riveted together to form the sides and bottom. In recent years the bottoms of elevated steel tanks have been curved to various forms and supported at the circumference of the tank. This is a gain in economy and in appearance. Standpipes are relatively tall for their diameters, a frequent size being from 12 to 20 by 100 feet. Ordinarily only the upper portion of their contents is available, the rest being too low for effective pressure.

Distribution Systems comprise the various pipes used to convey the water to the points of use, the valves and hydrants which control the flow and delivery of water, and the meters for recording the consumption. Sometimes the term includes reservoirs, tanks, and standpipes, and more rarely even the pumping plant.

The pipe system consists of one or more trunk mains and numerous branches and subbranches, continually diminishing in size. Pipes are commonly divided into mains and services, the former including all the pipes laid in the streets and the latter the small pipes laid from the street mains to the several buildings supplied. A trunk line which simply feeds other street pipes, but no service pipes, is called a supply main. The latter term is also applied to pipe lines which convey water from a source of supply to the distributing system or to a reservoir feeding the latter. Where water is pumped through such a pipe line it is called a force main. Mains are most commonly of cast iron. Wood is also used. Wrought-iron pipe, coated and lined with cement, was extensively used some years ago, but most of it has been replaced with cast iron, on account of the frequent failures which occurred. Steel pipes made from thin plates, riveted both circumferentially and longitudinally, have been used for large supply and force mains since about 1890, superseding the wrought-iron pipe of an earlier date. (See PIPE.) The size of main pipes depends upon the volume and velocity of the water conveyed. Cast-iron pipes range from 4 to 48 inches in diameter, with occasional sizes up to 72 inches. Steel and wood supply mains and steel force mains may be built of almost any size. Bored wood pipes are generally confined to relatively small sizes. Pipes which are to afford fire protection should never be less than 4 inches in diameter, and that size should be restricted to a few hundred feet on a short street with only one fire hydrant. In the best distributing systems the area served is gridironed with pipes of liberal size, so arranged that any section may be fed from several directions and pipes in case of heavy local drafts for extinguishing fires. Service pipes are most commonly of lead, wrought iron, or steel, the latter having largely displaced wrought iron since the beginning of the twentieth century. Lead is more expensive than iron, but its flexibility, smooth interior surface, relative noncorrosiveness, and great durability are in its favor. Its chief

objection, aside from high first cost, is the ease with which it decomposes when exposed to certain waters. (See *Quality*, above.) Plain wrought-iron pipe corrodes so rapidly as to be out of the question. Galvanized, or zinc-coated, wrought-iron pipe is fairly durable when used for some waters, but corrodes so rapidly with others as to become almost filled with rust after only a few years. Among the various other methods of treating wrought-iron pipe, besides galvanizing, a japan, or baked varnish, coating has been employed of late. Wrought-iron and steel service pipes are quite frequently lined with lead, tin, or cement to avoid corrosion and clogging and to give the smooth inner surface which is a quality of such materials.

Valves are used in distributing systems to control the flow of water to and through the mains and from the mains to the house services. The latter are generally called corporation cocks, and are set at or near the curb, with a service box for protection and access. The usual type of valve consists of either a disk or wedge, which is lifted vertically or slid horizontally by means of a screw rod and proper gearing. The latter, in the case of large sizes, may be worked by hydraulic pressure from the water main in which the valve is set. Valves are also operated by electricity, particularly when it is desired to open or shut them from a distance. A free use of valves throughout a distributing system contributes greatly to the reliability of the water-works service and the ease of making repairs to the pipe system. Check valves close against a backward flow of water and are used on pumping mains and for the protection of meters against back pressure. Reducing valves are automatic devices for relieving the lower levels of a city from excessive pressure where proper division into high and low service is impracticable. The Venturi principle (see WATER METER) is occasionally profited by to reduce the cost of valves on large mains. That is to say, a 48-inch main may be gradually contracted to 36 inches, and a valve of that size placed, then the main be increased by degrees to its former size. A slight loss of pressure only will result, and where there is pressure enough and to spare a considerable sum of money may be saved.

SECTION THROUGH A WATER-WORKS HYDRANT.

Hydrants consist of a valve set at or near the curb line, on a branch pipe. A vertical tube or barrel extends from the valve to and generally above the ground level, with one and more often two or more nozzles for the attachment of fire hose. Hydrants should rarely if ever be placed more than 500 feet apart, and in closely built business sections may need to be much closer together.

Meters are self-registering devices for measuring the quantity of water supplied to a whole city, a section of it, or a single consumer. They afford the most equitable if not the only fair means for dividing the cost of the water service between the several consumers, and are most efficient agents for the detection of leaks and the prevention of waste. Their construction and operation is described in the article WATER METER. They are set in the line of the service pipe, just inside the cellar or house line; or, where there is no danger of frost, at a convenient point on the house service between the house and the curb, as beneath the sidewalk. In the latter case the meter is set in a box and a dial extension is attached to the registering mechanism, so as to bring the dial up where it may be read with ease.

Waste Prevention is essential to economy of operation of a water-works plant. As suitable water supplies become more scarce and distant, the conservation of quantity becomes almost as essential as the preservation of the purity of water. The first step in waste prevention is good workmanship in the construction of the plant, particularly in all the underground portions where leaks are difficult to detect and costly to repair. The next step is to insist on high-grade self-closing plumbing fixtures, including all faucets or spigots for drawing hot and cold water, and particularly the flushing devices of water closets. To detect leaks or other causes of waste inside the house line either meters or house-to-house inspection may be employed. The latter can be made only at long intervals, at best causes friction, and is insufficient and unsatisfactory. Meters not only detect leaks, but they make the consumer liable for any neglect in stopping them and likewise debit the consumer with all wastefulness due to letting the water run to prevent freezing in cold weather, or to secure cooler water in summer, or because of mere carelessness. Service pipes may be inspected by means of a steel rod with a telephone receiver or similar device at its upper end. The rod is inserted through the service box and placed on the corporation cock. If ever so small a stream of water is running the ear of the trained observer will catch the sound and an inspection is made. Water-waste surveys of a comprehensive sort are now quite commonly effected in the United States with the photopitometer. (See PITOMETER.) With this instrument the volume of flow can be determined at a given point—either the delivery of a pump, or the flow through a section of the water distribution system. By such means a water-work system may be gone over, district by district, from larger to smaller, and waste or leaks located, the process ending with observations on the individual house service. The most thorough, because continuous and self-recording, means of waste control is a large permanent meter on the source of supply, district meters where and if necessary, and a consumer's meter on each consumer. Such simple plans as observing the rate of pumping or the fall of water in reservoirs during the hours of minimum night consumption, or the relative day and night pressures, often assist in proving that waste is taking place.

Public Policy. The only points under this head that can be considered here are the apportionment of the cost of service between the various classes of consumers and one or two phases of the municipal-ownership question. Apportionment of cost of service involves not alone the quantity of water consumed by the various users, but the heavy capital charges incurred to make very large rates of consumption available for the few minutes or at most hours at a time when water is used for the extinguishment of fires. Large reservoirs, pumping plants, and mains are provided for fire protection, and used in the aggregate for a short time only in each year. This makes high capital charges, even though the cost of operation for fire protection is small. The other public uses to which water is put, like street sprinkling, sewer flushing, and the supply of parks and school buildings, may be paid for on the same general basis as water supplied to private consumers. It is a rare thing under either public or private ownership to find a scientific adjustment of the cost of public and private service between the general taxpayers and private consumers, respectively. But equity demands such an adjustment. The fire, school, street, and other departments should be debited and the water department, in the case of municipal ownership, credited with the value of the services rendered to each. The taxpayer should not be called upon to meet bills of private consumers, nor should the man who uses water for a bathtub and lawn sprinkler have included in his bills for these services the heavy cost of fire protection in the business district. As between different individual consumers in the same class the meter is the best means of apportioning the charges for water. So-called fixture rates are arbitrary guesses and compel the careful water user to pay for the waste of the careless. With the growth of public-utility regulation (q.v.) a more equitable division of the cost of the water service between public and private consumers and more equitable rates generally are being required in some States. Outside of Wisconsin, however, the public-utility commissions control the rates and services of privately owned works only, as a rule, leaving municipally owned works to their own devices. Nevertheless, water-rate conditions have improved materially, owing largely to committee reports, papers, and discussions before the various water-works organizations.

Public Ownership demands for its proper consideration, from the economic standpoint, accurate detailed figures of expenses and revenue, on a comparative basis. Such figures are rarely available.

The sanitary interests of a community, depending as they do largely upon police measures, are generally considered to be safer where water works are under public rather than private control, but the differences are less marked than formerly now that State boards of health and State-utility commissions have large measures of control over the character of public water supplies. The course of public ownership in the United States during the past century is shown below in the table giving the number of works at the close of each half decade.

Complete figures for later intervals are not available, but some figures for the United States, Canada, and England may be found under MUNICIPAL OWNERSHIP.

History. The water works of the cities of western Asia, Greece, Carthage, Rome, and the European countries under Roman dominion all depended upon gravity for delivery of water, and were notable chiefly for their aqueducts. Most of the aqueducts were of masonry. (See AQUEDUCT.) The water within the cities was conveyed by means of lead, wood, and more rarely bored stone or baked-clay conduits. (See PIPE.) Some of the earliest pumping works for city supplies, notably those erected at London Bridge in 1562 by Peter Maurice, are described in the article on PUMPS AND PUMPING MACHINERY. In 1613 water was brought into London from a distance by Sir Hugh Myddleton, who with others secured a charter for the New River Company in 1619. The most notable feature consisted of a water-supply canal about 40 miles long, which brought in water from springs distant, in an air line, about 20 miles. The canal was about 18 feet wide, 5 feet deep, and had an average fall of some 4 inches per mile. Valleys were crossed, for the most part, by means of timber flumes, lined with lead. Subsequently the flumes were replaced by earth embankments. A sale of some of the stock of the New River Company, which for many years shared with seven other companies the profits of supplying the Metropolitan water area, brought a fabulous sum, a few years ago, as compared with the original par value.

NUMBER OF PUBLIC AND PRIVATE WORKS IN THE UNITED STATES

AT THE END OF EACH HALF DECADE, BEGINNING WITH 1800

(Compiled from *The Manual of American Water Works* for 1891 and 1897)

YEAR	Public	Private	Total	PER CENT OF TOTAL	
				Public	Private
1800	1	15	16	6.3	93.7
1805	2	21	23	8.7	91.3
1810	5	21	26	19.2	80.8
1815	5	21	26	19.2	80.8
1820	5	25	30	16.6	83.4
1825	5	27	32	15.6	84.4
1830	9	35	44	20.5	79.5
1835	15	39	54	27.8	72.2
1840	23	41	64	35.9	64.1
1845	27	43	70	38.6	61.4
1850	33	50	83	39.7	60.3
1855	48	58	106	45.3	54.7
1860	57	79	136	41.9	58.1
1865	68	94	162	42.0	58.0
1870	116	127	243	47.7	52.3
1875	227	195	422	53.8	46.2
1880	293	305	598	49.0	51.0
1885	447	569	1013	44.1	55.9
1890	806	1072	1878	42.9	57.1
1896	1690	1489	3196	53.2	46.8

Include 12 of joint and 5 of unknown ownership.

The first public water supply in America was introduced in Boston in 1652 by the Water Works Company. It consisted of a reservoir about 12 feet square, to which water was conveyed through wooden pipes from neighboring springs and drawn upon for both domestic and fire purposes. The second American water-works plant was built at Bethlehem, Pa. It was begun in 1754 by a Danish millwright named Hans Christopher Christiansen and was finished in 1761. Water from a spring was piped for 350 feet to a cistern, or well, from which a wooden pump, 5 inches in diameter, forced it through bored hemlock logs to a wooden tank in the village square, 70 feet above the pumps.

In 1761 Christiansen and others built larger works, including three simple-acting iron force pumps, 4 inches in diameter and with a stroke of 18 inches, driven by an undershot water wheel. The new pipe from the pump to the tank was of gum wood, and the distributing pipes were of pitch pine. In 1769 the latter had to be renewed and in 1786 lead pipes were substituted for both the force pump or force main and most of the distributing pipes. In 1813 iron pipes were introduced, with leather-packed joints, clamped together with iron. The pumps installed in 1761 were used for 71 years, when they were supplanted by 5 × 36-inch double-acting pumps, which were in use as late as 1887. Steam was not substituted for water power until 1868. In 1871 the borough bought the works from their private owners, the Bethlehem Water Company.

To the close of the year 1800 there had been built in the United States 16 water-works plants. All but one of these were originally owned by private companies, but during the nineteenth century 14 of the 15 remaining cities changed from private to public ownership. The names of the 16 cities, the dates the original works were constructed, and the years of change to public ownership are as follows:

WATER WORKS IN THE UNITED STATES AT THE CLOSE OF 1800

(From *The Manual of American Water Works* for 1891)

Located at	Date built	Change to public ownership
Boston, Mass.	1652	1848
Bethlehem, Pa.	1761	1871
Providence, R. I.	1772	1871
Geneva, N. Y.	1787	1896
Plymouth, Mass.	1796	1855
Salem, Mass.	1795	1875
Hartford, Conn.	1797	1854
Portsmouth, N. H.	1798	1891
Worcester, Mass.	1798	1852
Albany, N. Y.	1798 or 1799	1851
Peabody, Mass.	1799	1873
New York, N. Y.	1799	1845
Morristown, N. J.	1799	Still private
Lynchburg, Va.	1799	1828
Winchester, Va.	Before 1800	Always public
Newark, N. J.	1800	1860

Fanning, *Practical Treatise on Hydraulic and Water Supply Engineering* (16th ed., ib., 1906); Turneaure and Russell, *Public Water Supplies* (2d ed., ib., 1908); A. P. Folwell, *Water Supply Engineering* (2d ed., ib., 1909); *McGraw Water Works Directory* (ib., 1915).

WATER YAM. See LATTICE-LEAF.

WATFORD, wŏt'fẽrd. A market town in Hertfordshire, England, picturesquely situated on the Coln, 17 miles northwest of London (Map: London, B 3). It has fine public buildings, including a restored Perpendicular church and the well-known London Orphan Asylum. There are silk, paper, and flour mills. Pop., 1901, 29,023; 1911, 40,939.

WATKIN, wŏt'kĭn, SIR EDWARD WILLIAM (1819–1901). An English railway promoter, born at Salford. In 1845 he became secretary of the Trent Valley Railway, retaining this position when the line became a part of the London and North-Western Company. He was also appointed in 1853 general manager of the Manchester, Sheffield, and Lincolnshire Railway (later the Great Central), which he extended to London, and in 1867 he assumed the chairmanship of the South-Eastern. He sat in Parliament (1857–58, 1864–68, and 1874–95), and was knighted in 1868 and created a baronet in 1880. Sir Edward was author of *Canada and the States* (1887).

WATKINS, wŏt'kĭnz. A village and the county seat of Schuyler Co., N. Y., 22 miles north by west of Elmira, on Seneca Lake, and on the New York Central and the Pennsylvania railroads (Map: New York, D 6). The vicinity abounds in picturesque lakes and mineral springs, but is better known for its numerous glens and ravines. Watkins Glen, with its cascades and waterfalls, acquired by the State for a park in 1906, and the group of springs known as the Glen Springs, are especially noteworthy. Other features are the Glen Springs Sanatorium and the public library. The village has large salt works and manufactories of flour, grape juice, baskets, and iron and lumber products. Pop., 1900, 2943; 1910, 2817.

WATKINS GLEN. See WATKINS.

WATLING'S (wŏt'lĭngz) **ISLAND.** A small island of the Bahamas, situated in the east central part of the group, 46 miles southeast of Cat Island (Map: West Indies, D 1). It is generally identified with Guanahani or San Salvador, the first landing place of Columbus.

WAT'LING STREET (AS. *Wætlinga strǽt*). A celebrated Roman highway of Britain, beginning at Dover, passing through Canterbury and Rochester to London, and thence through Wroxeter and Chester to Caer-Seiont, the ancient *Segontium*, in Caernarvonshire. From Wroxeter a branch proceeded north by Manchester, Lancaster, and Kendal, into Scotland, but many antiquaries deny that this is part of the original Watling Street. Traces of the ancient road exist and in some parts of its course it is still an important highway. It forms the boundary between Warwickshire and Leicestershire. The origin of the name is uncertain; the original name was probably Stratum Vitellianum. See FOSSWAY.

WATROUS, wŏt'rŭs, HARRY WILSON (1857–). An American figure and genre painter. He was born in San Francisco, Cal., and studied with Bonnat, Boulanger, and Lefebvre in Paris. Returning to America, he settled in New York and became well known for his small, highly finished, sometimes bizarre, figure compositions of modern city life. He was elected a member of the National Academy in 1895 and in 1898 became its corresponding secretary. Good examples of his work include "Passing of Summer" (Metropolitan Museum, New York); "A Study in Black" (St. Louis Museum); "An Auto Suggestion" (Buffalo Fine Arts Academy); "The Drop Sinister" (1914); "Who Cares" (1915); "The Line of Love" (1915). He was awarded a gold medal at St. Louis in 1904.—His wife, ELIZABETH NICHOLS WATROUS, painted pictures resembling her husband's.

WATSON, wŏt's'n, DAVID THOMPSON (1844–1916). An American lawyer. Born at Washington, Pa., he graduated from Washington (now Washington and Jefferson) College in 1864, and from Harvard (LL.B.) in 1866. After 1868 he practiced law at Pittsburgh, Pa. Watson was United States counsel before the Alaska Boundary Commission in 1903, and also counsel for the government in the merger cases, his brief on the Standard Oil case being published in 1910.

WATSON, HENRY BRERETON MARRIOTT (1863–). An English novelist, born at Caulfield, a suburb of Melbourne, Australia, where his father was then settled as a clergyman. He was educated at Canterbury College, New Zealand, went to England in 1885, and soon became a journalist. He is known through his contributions to *The National Observer* and as assistant editor of *Black and White* and of the *Pall Mall Gazette*. His writings, mostly stories of adventure, sometimes with a historical setting, include: *Marahuna* (1888); *Lady Faintheart* (1890); *The Web of the Spider* (1891); *Diogenes of London* (1893); *Galloping Dick* (1895); *At the First Corner* (1896); *The Heart of Miranda, and Other Stories* (1898); *The Adventurers* (1898); *The Princess Xenia* (1899); *Chloris of the Island* (1900); *The Rebel* (1900); *The Skirts of Happy Chance* (1901); *The House Divided* (1901); *Godfrey Merival, Being a Portion of his History* (1902); *Hurricane Island* (1905); *Twisted Eglantine* (1905); *At a Venture* (1911); *The Big Fish* (1912); *Rosalind in Arden* (1913); *The House in the Downs* (1914); *Chapman's Wares* (1915). For his wife, see WATSON, ROSAMUND.

WATSON, HEWETT COTTRELL (1804–81). An English botanist, born at Firbeck, Yorkshire, and educated at the University of Edinburgh. In 1831 he won the professor's gold medal for an essay on the geographical distribution of plants, a subject which later became his chief scientific interest. He went with a survey to the Azores, where he spent three months collecting specimens, several of which were entirely new in the British Gardens. His writings include: *The New Botanist's Guide to the Localities of the Rarer Plants of Great Britain* (1835); *The London Catalogue of British Plants* (6th ed., 1867); and *Cybele Britannica, or British Plants and their Geographical Relations* (1847–60).

WATSON, JAMES CRAIG (1838–80). An American astronomer, born in Ontario, Canada, of American parents. He graduated at the University of Michigan, 1857, and was instructor there in mathematics and assistant at the observatory. He became professor of astronomy in 1859, of physics and mathematics in 1860, and director of the observatory in 1863. He discovered many planetoids (q.v.), and had charge of the American expedition to observe the transit of Venus at Peking, China, 1874. He prepared astronomical charts, but his principal work was his *Theoretical Astronomy* (1868). This is now a classic treatise on the theory of the motions of comets and planets. Watson left a large sum of money to the National Academy of Sciences (the Watson Fund), its interest to be used to further astronomical research.

WATSON, JOHN (1847–). A Canadian philosopher. He was born at Glasgow and graduated at Glasgow University in 1872. In the same year he was appointed professor of logic, metaphysics, and ethics at Queen's University, Kingston, Canada. He is to be classed as an intellectual idealist. Apart from his constructive work he made a valuable contribution in his exposition of Kant. Aside from numerous papers in philosophical journals, his publications include: *Kant and his English Critics* (1881); *Schelling's Transcendental Idealism* (1882); *The Philosophy of Kant as Contained in Extracts from his Own Writings* (1888); *Comte, Mill, and Spencer* (1895); *An Outline of Philosophy* (1898); *The Philosophical Basis of Religion* (1907); *The Philosophy of Kant Explained* (1908); *The Interpretation of Religious Experience* (1912).

WATSON, JOHN (1850–1907), better known as IAN MACLAREN. A British Presbyterian clergyman and author. He was born of Scottish parents at Manningtree, Essex, and studied at Edinburgh University, New College (Edinburgh), and Tübingen. Licensed by the Free Church of Scotland in 1874 he became assistant at the Barclay Church, Edinburgh. The following year he was ordained minister of the Free Church at Logiealmond, Perthshire. In 1877 he went to Free St. Matthew's, Glasgow, and from 1880 to 1905 was in charge of Sefton Park Presbyterian Church, Liverpool. He became widely known for his humorous, sympathetic, and entertaining stories descriptive of Scottish life and character, among the best of their kind. These include: *Beside the Bonnie Brier Bush* (1894); *The Days of Auld Lang Syne* (1895); *Kate Carnegie* (1896); *A Doctor of the Old School* (1897); *Afterwards* (1898); *Rabbi Saunderson* (1898); *Young Barbarians* (1901); *His Majesty, Baby* (1902). In 1896 Watson gave the Lyman Beecher lectures at Yale, published under the title *The Cure of Souls* (1896), and in 1907 he again lectured in the United States, and during this tour he died. He wrote also: *The Upper Room* (1895); *The Mind of the Master* (1896); *Companions of the Sorrowful Way* (1898); *Doctrines of Grace* (1900); *The Life of the Master* (1901); *Inspiration of our Faith: Sermons* (1905); *Children of the Resurrection* (1912). Consult W. R. Nichol, *"Ian Maclaren": Life of the Rev. John Watson* (New York, 1908).

WATSON, JOHN BROADUS (1878–). An American psychologist, born at Greenville, S. C. He was educated at Furman University (A.M., 1900), and at the University of Chicago (Ph.D., 1903), where he was afterward assistant and instructor in psychology till 1908, when he was appointed professor of experimental and comparative psychology at Johns Hopkins. Watson became joint editor of the *Journal of Animal Behavior*, and was editor of the *Psychological Review* after 1908. Besides contributions to animal psychology he wrote *Animal Education* (1903) and *Behavior—An Introduction to Comparative Psychology* (1914).

WATSON, JOHN CHRISTIAN (1867–). An Australian politician and labor leader, born at Valparaiso, Chile. He worked early as a typesetter, was a member of the New South Wales Assembly from 1894 to 1901, and served as president of the Sydney Trade and Labor Council in 1893–94 and of the Australian Labour Federation in 1895. He was leader of the powerful Federal Labor party in the Commonwealth Parliament in 1901–07, having been elected to the first Commonwealth Parliament in 1901, and reëlected in 1903 and 1906. In 1904 he was

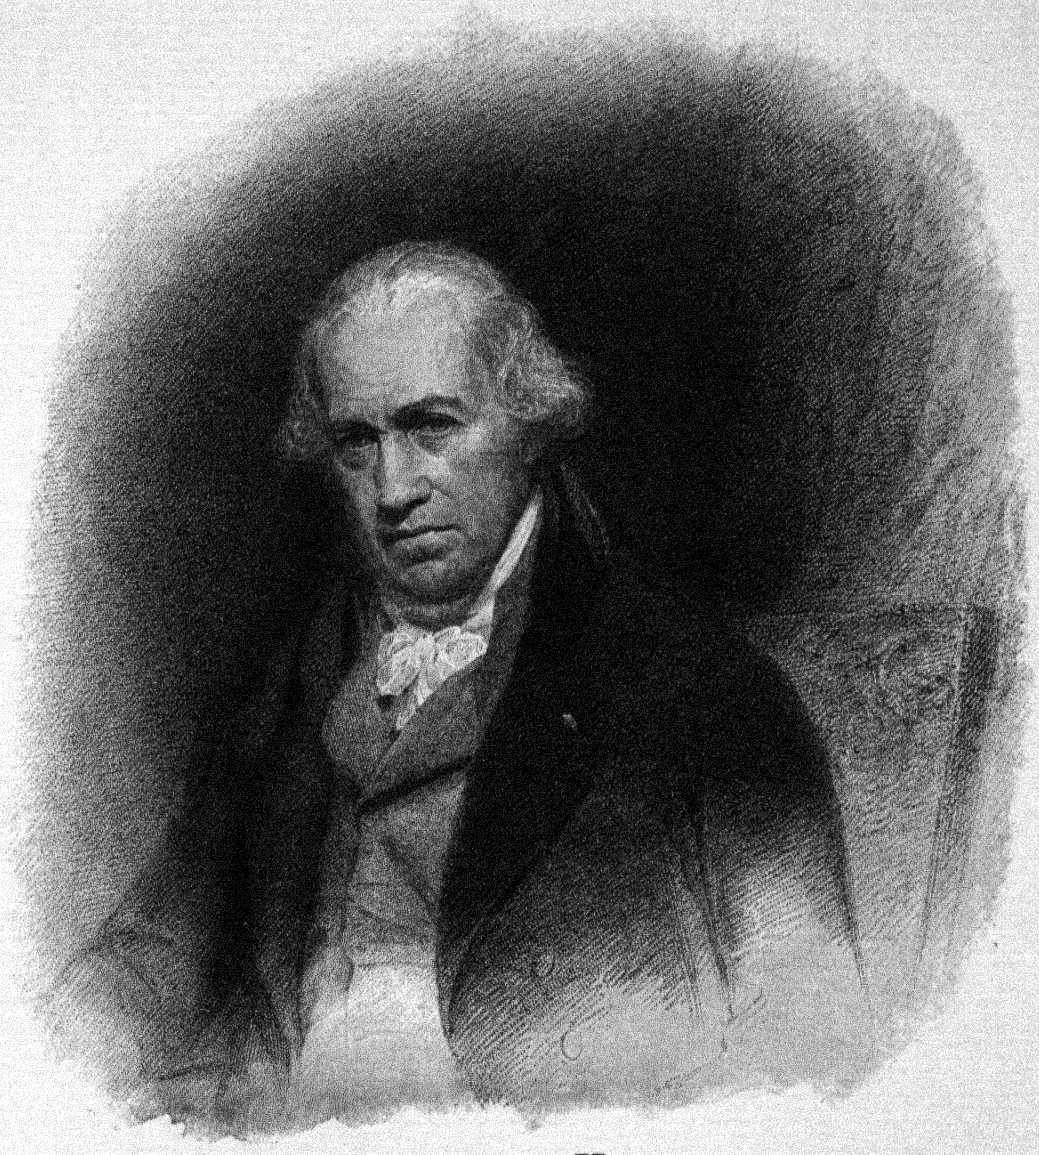
Premier and Treasurer of Australia. In 1910 he retired from politics.

WATSON, JOHN CRITTENDEN (1842–). An American naval officer, born in Frankfort, Ky. He was educated at the United States Naval Academy, became a master in the navy in 1861, and served throughout the Civil War, after July, 1862, as a lieutenant. He became a captain in 1887 and a commodore in 1897, and in the Spanish-American War commanded the blockading squadron on the North Cuban coast from May to June, 1898, when he was made commander in chief of the Eastern Squadron, which was to threaten the Spanish coast and thus force the return of the Spanish fleet, under Camara, bound for Manila. News of the movement having reached Spain, Camara was recalled before Watson could execute his orders, and Watson subsequently resumed charge of the blockade of the northern coast of Cuba. He was then commandant of the Mare Island Navy Yard from October, 1898, to May, 1899, became rear admiral in March, 1899, was commander in chief of the naval forces on the Asiatic Station from June, 1899, to April, 1900, and president of the Naval Examining and Retiring Boards in 1902. He retired from active service in 1904.

WATSON, RICHARD (1737–1816). Bishop of Llandaff. He was born at Heversham, Westmoreland, England; graduated at Trinity College, Cambridge, 1759; obtained a fellowship, 1760; was appointed professor of chemistry, 1764; regius professor of divinity, Cambridge, and rector of Somersham, 1771; Archdeacon of Ely, 1779; and Bishop of Llandaff, 1782. He is now chiefly remembered for his *Apology for Christianity, in a Series of Letters, addressed to Edward Gibbon, Esq.* (1776); and his *Apology for the Bible, in a series of Letters, addressed to Thomas Paine* (1796). His autobiography, edited by his son, appeared at London in 1817.

WATSON, RICHARD (1781–1833). An English Wesleyan theologian. He was born at Barton-upon-Humber, England, joined the Methodists, 1796; and became a member of the Conference, 1800. He joined the Methodist new connection (1803), returned to the regular Wesleyan connection, and edited the Liverpool *Courier* (1808); was one of the secretaries of the missionary society in London (1816); and was elected president of the Conference in 1826. He published: *Remarks on the Eternal Sonship of Christ* (against Adam Clarke, 1818); *Theological Institutes* (1823–29; new ed., 1877); *Biblical and Theological Dictionary* (1831); and *Life of Rev. John Wesley* (1831). His works were edited with a *Life* by Thomas Jackson (12 vols., London, 1834–37; new ed., 13 vols., 1847). Consult also J. Bunting, *Memorials of the late Richard Watson* (London, 1833).

WATSON, ROBERT SPENCE (1837–1911). An English economist and educator. He was born at Gateshead and was educated at the Friends' School, York, and at University College, London. From 1890 to 1902 he was president of the National Liberal Federation. In 1910 he became president of Armstrong College, Newcastle. He wrote: *History of English Rule and Policy in South Africa* (1879); *Irish Land Law Reform* (1881); *Boards of Conciliation and Arbitration* (1886); *The Peaceable Settlement of Labor Disputes* (1889); *Labor, Past, Present, and Future* (1889); *The Recent History of Industrial Progress* (1891); *The Duties of Citizenship* (1895); *The Reform of the Land Laws* (1906).



WATSON, ROSAMUND (1863–1911). An English author, wife of H. B. Marriott Watson (q.v.). She was born in London. Her writings include: *Ballad of The Bird-Bride* (1889), *A Summer Night* (1891), and *Vespertilia* (1895), collections of verse; *After Sunset* (1895); *The Art of the House* (1896); *The Heart of a Garden* (1905). Consult William Archer, *Poets of the Younger Generation* (London, 1902).

WATSON, SERENO (1826–92). An American botanist, born at East Windsor Hill, Conn., and educated at Yale and the medical department of the University of New York. He was botanist of the United States Geological Survey under Clarence King, collecting in the Great Basin region, and publishing his results as a volume of King's *Report* in 1870. Upon his return from this survey, he became an assistant in the Gray Herbarium at Harvard, and at the death of Dr. Asa Gray in 1888 he was made curator. He also wrote *Botany of California* (1876), with Professor Gray and W. H. Brewer; *Bibliographical Index to North American Botany* (1878); numerous papers entitled *Contributions to American Botany* (1873–91); and with J. M. Coulter revised and extended Gray's *Manual of Botany* (1890).

WATSON, THOMAS (?1557–92). An English poet, born probably in London, and probably a student at Oxford. Watson's first appearance as an English poet was in the *Passionate Century of Love* (1582), made up of a series of poems, which have the aspect of sonnets, but are really composed of three six-line stanzas each. This was followed by his best volume, a collection of true sonnets entitled *Tears of Fancy* (posthumous, 1593). Meres couples his name with the names of Shakespeare, Peele, and Marlowe as a tragic writer, but no play of Watson's is extant. Watson translated into Latin the *Antigone of Sophocles* (1581) and Tasso's *Aminta* (1585). Consult Arber, *English Reprints* (London, 1870; reissue, 1895).

WATSON, THOMAS E(DWARD) (1856–). An American politician and author, born in Columbia Co., Ga. He was educated at Mercer College, was admitted to the bar in 1875, and served in the Georgia Legislature in 1882–83, and in Congress as a Populist in 1891–93. In 1896 he was vice-presidential nominee on the Democratic ticket with W. J. Bryan. In 1904 he was nominated for President by the People's party. He was editor and publisher of *Tom Watson's* magazine in 1905–06, and of the *Weekly Jeffersonian* thereafter. In 1915 he carried on a virulent editorial campaign against Leo M. Frank, who was serving a life sentence for murder, and Frank was later lynched. His publications include: *The Story of France* (2 vols., 1898); *Napoleon* (1902; new ed., 1913); *Life and Times of Thomas Jefferson* (1903); *Bethany, a Story of the Old South* (1904); *Life and Times of Andrew Jackson* (1907); *Handbook of Politics and Economics* (1908); *Life and Speeches of Thomas E. Watson* (1908); *Is Roman Catholicism in America Identical with That of the Popes?* (1914); *The House of Hapsburg* (1915).

WATSON, WILLIAM (1858–). An English poet, born at Burley-in-Wharfedale, Yorkshire. His *Epigrams of Art, Life, and Nature* (1884) was his first book to attract attention. During the following year he published in the *National Review* a series of sonnets entitled *Ver Tenebrosum*, in which he attacked the British

JAMES WATT

FROM AN ENGRAVING BY C. PICART, AFTER A DRAWING BY W. EVANS

policy in Egypt. In 1890 appeared his poem "Wordsworth's Grave" and in 1892 "Lachrymæ Musarum," a fine ode in memory of Tennyson. In 1913, after the death of Alfred Austin (q.v.) it was thought by many that Watson would be appointed poet laureate; instead Robert Bridges (q.v.) received the honor. His verse is careful, delicate, and sure in workmanship and is reflective in tone. His sonnets in the *Purple East* contain some of his best work. Among his later books are: *Lyric Love* (1892); *The Eloping Angels* (1893); *Excursions in Criticism* (1893); *Odes and Other Poems* (1894); *The Father of the Forest* (1895); *The Purple East* (1896); *The Year of Shame* (1896), a forceful and ringing indictment of England's policy in the Orient; *The Hope of the World* (1897); *Ode on the Coronation of King Edward VII* (1902); *Collected Poems* (2 vols., 1906); *New Poems* (1909); *Sable and Purple* (1910); *The Heralds of the Dawn* (1912); *The Muse in Exile* (1913). Consult Collins, *Studies in Poetry and Criticism* (New York, 1906).

WATSON-GORDON, Sir John. See Gordon, Sir John Watson-.

WATSONVILLE. A city in Santa Cruz Co., Cal., 53 miles south of San José, 5 miles from Monterey Bay, on the Southern Pacific and the Pajaro Valley consolidated railroads (Map: California, D 6). It ships large quantities of apples, apricots, and berries. The city has a Carnegie library. Pop., 1900, 3528; 1910, 4446.

WATSON-WENTWORTH, Charles. See Rockingham, Marquis of.

WATT, wŏt (named in honor of James Watt). The practical unit of power (q.v.) or activity. The C. G. S. unit of power is 1 *erg* per second, and the watt is 10^7 of these units, or 1 *joule* per second. A horse power is 33,000 foot pounds per minute and therefore equals 746 watts approximately; 1 watt = 0.0013406 horse power. The kilowatt, or 1000 watts, is the unit in ordinary use, for the rating of electric machinery. See C. G. S. System.

WATT, James (1736–1819). A British mechanical engineer, famous for his improvements on the steam engine, which were so important and fundamental as often to lead to his being styled its inventor. He was born at Greenock, Scotland, the son of a carpenter and merchant, who occasionally held such town offices as treasurer and chief magistrate. His early education was at the town schools, which he was unable to attend regularly on account of ill health. At this time he was learning the use of wood and metal working tools and constructing ingenious models and original mechanisms. He evinced a taste for mathematics and a fondness for reading which he maintained through life. When eighteen years old Watt went to Glasgow to learn the trade of an instrument maker, but soon proceeded to London, where he followed this calling for a year. In 1756 he returned to Glasgow, but experienced difficulty in starting in business on his own account, owing to the opposition of workers in the same trade. He became connected with the university as an instrument maker, and remained until 1760, when he established himself independently, working also at times as a civil engineer. While at the university he became acquainted with the various professors and students and received from them instruction and suggestions. As early as 1759 he turned his attention to the construction of a steam carriage, and in 1764 he was called upon to repair the model of the Newcomen engine in the cabinet of the university. Studying this machine thoroughly, he soon realized its defects and lack of efficiency, and determined that the losses of heat in the cylinder could be corrected, and the imperfect method of condensing the steam could be improved. He contrived an independent condenser where the steam was exhausted and condensed after doing its work on the piston, instead of being condensed by a jet of cold water in the cylinder, as in the Newcomen engine. To develop this Watt secured the financial coöperation of Dr. John Roebuck, the founder of the Carron Iron Works, and in 1765 constructed a small engine, which was operated with some success. Watt was in the meanwhile spending all of his resources, but also making considerable progress in engine building, until financial misfortunes deprived him of the cooperation of Dr. Roebuck. At this time (1767) an enterprising manufacturer, Matthew Boulton (q.v.), joined with Watt, and their names were subsequently associated in the manufacture and improvement of steam engines that resulted from the partnership.

In 1774 a steam engine was completed, noteworthy in that it embodied the essential features of the modern steam engine. So much time had been spent in the development of the engine that in 1775 an act to prolong the life of Watt's original patent until 1800 was passed by Parliament, and during this interval other valuable patents were acquired and many engines were manufactured and sold to mines and collieries. Next to the external-condensation principle the important features were: The making of the engine double-acting by the addition of valves, instead of having the steam act only on one side of the piston, which was then returned to its original position by a counterweight; and the use of steam expansively. With the double-acting engine by the use of a flywheel it was possible to have continuous rotary motion through the medium of a crank, which, while claimed as an invention of Watt, was actually patented by one Pickard, a former employee of his, and disposed of to a Mr. Washbrough of Bristol. To meet this deficiency Watt contrived various devices, of which the sun and planet gear wheels were the most successful, for changing the reciprocating into rotary motion. The application of the centrifugal governor to the steam engine, the invention of the water gauge, the mercury steam gauge, and the indicator are but a few of the many improvements contributed by Watt to the steam engine. With his many improvements and additions to the steam engine it was somewhat singular that Watt did not employ steam at high pressures, as was suggested by Trevithick and others, and which was the next important step in the development of the steam engine. The invention of the steam hammer naturally resulted from his work on the steam engine, but the copying press, a spiral oar or screw propeller, the discovery of the composition of water, a machine for reproducing sculpture, and numerous physical instruments and methods show the diversity of his researches and the breadth of his talents.

Retiring from business in 1800, he turned over to his two sons his interest in the large and remunerative business which had been built up at Soho by Boulton's effort. He died at Heathfield, in Staffordshire, on Aug. 25, 1819. He was elected a fellow of the Royal Society of Edin-

burgh in 1784; a fellow of the Royal Society of London in 1785; and in 1808 a corresponding member, and afterward a foreign member of the Institute of France. The University of Glasgow conferred on him the degree of LL.D. in 1806. A statue, the funds for which had been raised by public subscription, was erected at Birmingham, while a national monument was placed in Westminster Abbey, on which an appropriate inscription written by Lord Berryham was inscribed. Consult: J. P. Muirhead, *Origin and Progress of the Mechanical Inventions of James Watt* (London, 1854); id., *Life of Watt* (ib., 1858); Andrew Carnegie, *James Watt* (New York, 1905); Samuel Smiles, *Lives of the Engineers*, vol. iv (ib., 1905); and "Some Unpublished Letters of James Watt" in *Journal of Institution of Mechanical Engineers* (London, 1915).

WATTEAU, vȧ'tō', ANTOINE (1684–1721). A French genre painter, the most important of the eighteenth century. He was born at Valenciennes, Oct. 10, 1684, the son of a roof slater, and at first studied with a local painter named Gérin. At 18 he went to Paris, where he worked with the theatre decorator Claude Gillot. About 1708 he became associated with the painter Claude Audran, custodian of the Luxembourg Palace, whose graceful decorations and designs considerably influenced Watteau's subsequent style. Through his vivid impressions of the many fêtes and gatherings of the court in the picturesque Luxembourg gardens, he was inspired to originate the style which he himself called *Peinture de fêtes galantes*. Much of his mastery of color and freedom of execution is probably the result of his study of the works of Rubens and Veronese in Luxembourg palace. Failing of the Prix de Rome in 1709, he retired to Valenciennes; but returning to Paris, he was befriended by La Fosse, the director of the Academy, through whose influence he became a member of the Academy in 1717. His diploma piece was the celebrated "Embarkment of Cythera" (Louvre), probably his masterpiece, of which an excellent replica with more numerous figures is in the Royal Palace, Berlin. His fame spread over Europe, and he labored unremittingly until his untimely death from pulmonary consumption at Nogent sur Marne, July 18, 1721.

Watteau was the most original genius of French rococo painting. His pictures, in spite of their gayety and frivolity, are imbued with haunting, wistful sentiment. The figures, solidly and carefully modeled, are bathed in a wonderfully bright and lambent atmosphere, giving an ethereal effect; the composition is charmingly irregular, the color scheme warm and glowing, combining daintiness with richness of effect. Next to the Louvre, which contains 12 of his works, including "Gilles," "Assembly in a Park," "L'Indifferent," and "Jupiter and Antiope," Watteau may be best studied at Berlin and Potsdam, which together have fifteen examples. Of these the most notable are perhaps "The Village Bridal Procession" (c.1715, San Souci), with more than a hundred figures, the "Picnic" (Berlin Museum), and "Gersaint's Sign," his last work (Royal Palace, Berlin). He is represented in nearly all the large public galleries of Europe, including the Hermitage, St. Petersburg, with eight; the Dresden Gallery, the Prado, Madrid; Chantilly Museum, Paris; the National galleries of Scotland and Ireland; the Dulwich Gallery, London; Buckingham Palace, London, with the beautiful "Concert Champêtre," and "The Surprise"; and especially in the Wallace collection, London, with 10 examples, including the "Village Fête." Engravings after Watteau's works comprise more than 560 plates, many by famous masters. The most important of his followers were Lancret and Pater (qq.v.).

WATTENBACH, vät'en-bȧG, WILHELM (1819–97). A German historian and paleographer. He was born at Ranzau, in Holstein, and studied in 1837–42 at the universities of Bonn, Göttingen, and Berlin. In 1862 he was called to Heidelberg as professor of history, and in 1872 to Berlin. His publications include: *Beiträge zur Geschichte der christlichen Kirche in Böhmen und Mähren* (1849); *Deutschlands Geschichtsquellen im Mittelalter* (1858; 6th ed., 2 vols., 1893–94); *Anleitung zur griechischen Paläographie* (1867; 3d ed., 1895); *Anleitung zur lateinischen Paläographie* (1869; 4th ed., 1886); *Das Schriftwesen im Mittelalter* (1871; 3d ed., 1896); *Geschichte des römischen Papsttums* (1876). He directed the *Monumenta Germaniæ Historica* after 1872.

WATTENSCHEID, vät'en-shīt. A town of the District of Arnsberg, Prussia, 4 miles west of Bochum. Pop., 1900, 20,295; 1910, 27,636.

WATTERSON, wȧt'ẽr-sŭn, HENRY (1840–). An American journalist and orator. He was born in Washington, D. C., and was educated for the most part privately. He entered journalism in Washington as reporter and editorial writer for the *States*, served in the Confederate army in 1861–62 as private soldier and aide-de-camp successively to generals Forrest and Polk, and in 1862–63 edited the Chattanooga *Rebel*. In 1864 he was again in military service as chief of scouts to Gen. Joseph E. Johnston. He edited the *Republican Banner* of Nashville in 1865–68 and then became editor in chief of the Louisville *Journal* which with the *Democrat* he and W. N. Haldeman combined in 1868 to make the *Courier-Journal*, of which Watterson became the editor. Under his direction this newspaper came to occupy a foremost place in American journalism. He was perhaps most widely known as an advocate of conciliation between North and South, an opponent of the Ku Klux Klan (q.v.) movement, a leader in the Liberal Republican movement of 1872, and an opponent of the Greenback and Free Silver parties. In 1876–77 he represented the Louisville district in Congress as a Democrat and in 1876 was temporary chairman of the National Democratic Convention at St. Louis, and in various other national conventions was chairman of the Platform Committee. He was considered to be the author of the phrase "Tariff for revenue only." In 1896 he declared himself a Gold Democrat. He denounced the trusts and capitalistic organi-

WATTEAU

"THE FRENCH COMEDY" FROM THE PAINTING IN THE ROYAL MUSEUM BERLIN

zation of industry. In later years he lived much of the time in Europe, but kept in active touch with his paper. In 1912 he became involved in the disagreement between Woodrow Wilson (q.v.) and Colonel Harvey. He opposed Wilson's nomination and only casually supported the Democratic ticket, but in 1915 the President and he were partially reconciled. In the same year he denounced the hyphenated Americans of divided allegiance, and supported a vigorous foreign policy. He was sometimes spoken of as "Marse Henry" Watterson. His publications include: *Oddities in Southern Life and Character* (1882); *History of the Spanish-American War* (1899); *The Compromises of Life: Lectures and Addresses* (1903; new ed., 1906).

WATTLE. A method of marking range cattle for identification; at one time used in addition to the brand (see BRANDING) as a substitute for, or in addition to, the earmark (q.v.). The wattle was made by slitting the dewlap in such a manner that when the animal was viewed in profile, characteristic knobs, loops, or pendants would show. Wattles were occasionally made on the jaw or shoulder by making a cut thus Λ. The small flap of skin would hang down and heal into a projecting hairy lump.

WATTLE. See ACACIA.

WATTLE BIRD. An Australian honey-eater (*Anthochæra carunculata*) about the size of a magpie, grayish brown above, each feather striped, and bordered with white; the tail brown, long, wide, and graduated. It derives its name from a pendulous reddish wattle on each side of the throat, half an inch long. An allied species in Tasmania has the wattles an inch long.

The wattle crow or kokako of the Maoris, of New Zealand, is a very different bird, nearly allied to the jays, with gray and brown plumage and a black face. It sings well. There are two species, *Callœas cinerea* of the South Island and *Callœas wilsoni* of the North Island.

WATTLE GUM. See GUMS.

WATTLESS CURRENT. See TRANSFORMER.

WATTRELOS, vȧ'tr'lō'. A town of the Department of Nord, France, on the Belgian frontier, two miles northeast of Roubaix (q.v.), of which it is a suburb. Pop., 1901, 25,884; 1911, 29,089.

WATTS, ALARIC ALEXANDER (1797–1864). An English journalist and poet, born in London. He was editor of the *Leeds Intelligencer* (1822–25) and the *Manchester Courier* (1825–26), took part in establishing the London *Standard* (1827), a Conservative newspaper, and founded the *United Service Gazette* (1833). In the meantime he had begun the *Literary Souvenir* (1824), which was one of the most successful of the annuals down to its suspension in 1838. During the next 10 years he was engaged in starting several provincial newspapers in the Conservative interest. Though these undertakings led to bankruptcy (1850), he had organized the subsequently popular plan of supplying sheets of general news printed in London to supplement the local news of country newspapers. In 1856 he projected and edited *Men of the Time*, a useful biographical dictionary of contemporary men, which, under varying titles, was continued till 1901, when it was incorporated with *Who's Who*. As an agreeable poet, Watts enjoyed a wide reputation for *Poetical Sketches* (1823; privately printed 1822), and *Lyrics of the Heart* (1850). Consult *Alaric Watts: A Narrative of his Life*, by his son, A. A. Watts (London, 1884).

WATTS, GEORGE FREDERIC (1817–1904). An eminent English painter and sculptor. He was born in London, and while still a boy was admitted to the schools of the Royal Academy, and also spent some time in the studio of the sculptor Beanes. He learned far more, however, from his study of the Elgin marbles in the British Museum, the influence of which may be seen in the classical outlines and ideal character of his figures. A prize obtained in 1842 in the competition for the decoration of the new Houses of Parliament enabled him to visit Italy (1843–44). Here he was chiefly influenced by the Venetians, especially Tintoretto. In 1847 he obtained another prize with his cartoon "Alfred Inciting the Saxons to Prevent the Landing of the Danes," now in the committee room of the House of Lords, which also led to the commission for the fresco, "St. George and the Dragon," in the Hall of Poets. Watts lived a quiet, simple life, devoted to his art. An early union with Ellen Terry, the actress, was dissolved, and in 1886 he married Miss Mary Fraser-Tytler, whom he greatly assisted in her well-known art pottery works at Compton, Surrey. With a disinterested spirit he devoted himself to the artistic interests of the nation. He gratuitously decorated the dining hall of Lincoln's Inn (one of the Inns of Court) with the fine fresco "Justice: a Hemicycle of Lawgivers." He built the first memorial wall at St. Botolph's, in honor of those who had lost their lives in saving others, for which he received the Order of Merit upon its institution by the King in 1902. Refusing to sell the best part of his work, with the intention of presenting it to the nation, he was enabled to see it form the nucleus of the National Gallery of British Art (Tate Gallery), the best portraits going to the National Portrait Gallery. An Academician in 1867, he twice declined a baronetcy; he took first class medals at Paris and Antwerp, and was elected to the French Institute in 1903.

Watts's art is didactic in the extreme. Each canvas is a kind of sermon; but they are usually invested with a strong artistic element. Although deficient in academic training, Watts's drawing is good in a large constructive sense, while at times his color is powerful and pure. His most interesting work is perhaps the symbolical pictures forming his message to the age —the danger of riches, the cruelty of greed, and, above all, the power of love and the fallacy of the fear of death. The Tate Gallery possesses 27 examples, including "Love and Life" (1885), replica in the White House, Washington (1916), which the artist said best portrayed his message to the age; "Love and Death" (1877–96); and "Love Triumphant" (1898); "Hope" (1885); "Faith" (1890); "Time, Death, and Judgment." Others are: "The Good Samaritan" (City Hall, Manchester), "Sir Galahad," "Orpheus and Eurydice." There are modern portraitists of greater technical ability than Watts, but in force of expression, in freedom and simplicity of technique he is unsurpassed, and will even bear comparison with Tintoretto. No other has depicted so many distinguished contemporaries. His sitters include Gladstone, the Duke of Devonshire, Lord Salisbury, John Burns, Tennyson, Browning, Swinburne, Matthew Arnold, William Morris, John Stuart Mill, Carlyle, Meredith; himself (many times), Lord Leighton, Rossetti,

and Burne-Jones; and foreign celebrities like Garibaldi, Thiers, Guizot, and Jerome Bonaparte.

In his few works of sculpture Watts stands unsurpassed among modern Englishmen in boldness and breadth of treatment, and in nobility of style. Such works are: the bust of "Clytie"; "Bishop Lonsdale," in Lichfield Cathedral; "Lord Lothian," in Bickling Church; "Hugo Lupus," a large bronze equestrian statue at Eaton Hall; "Physical Energy" (1902, Matoppo Hills), symbolizing the character of Cecil Rhodes, and Lord Tennyson (1902), for Lincoln's Inn. Consult: W. C. Monkhouse, *British Contemporary Artists* (London, 1889); G. F. Bateman, *Watts* (New York, 1901); Otto von Schleinitz, "George Frederick Watts," in *Künstler-Monographien, No. 73* (Bielefeld, 1904); Mrs. Russell Barrington, *G. F. Watts: Reminiscences* (London, 1905); Arthur Symons, *Studies in Seven Arts* (New York, 1906); G. K. Chesterton, *G. F. Watts* (New York, 1909); Mary S. Watts, his wife, *George Frederic Watts: The Annals of an Artist's Life* (3 vols., London, 1912).

WATTS, HENRY (1815–84). An English chemist, born in London. He was educated at University College, London, and was for years assistant in chemistry there. His writings on chemistry are numerous and very extensive. He translated from the German Gmelin's voluminous *Handbook of Chemistry,* edited Fownes's *Manual of Chemistry,* and was for many years editor of the *Journal of the Chemical Society.* He is best known for his excellent and comprehensive *Dictionary of Chemistry* (5 vols., completed 1868; new ed., rev. by Muir, Morley, and others, 1907–12).

WATTS, ISAAC (1674–1748). An English Independent minister and hymn writer. He was born at Southampton, and was educated at an academy at Stoke-Newington. In 1696 he became tutor in the family of Sir John Hartopp, at Stoke-Newington, with whom he remained five years. During the latter part of this time he officiated as assistant to the Rev. Dr. Chauncey, minister of the Independent Church in Mark Lane, London, whom he succeeded in 1702. His health was infirm; and in 1712 he was prostrated by an illness from which he never thoroughly recovered. A visit which he paid in 1712 to Sir Thomas Abney, at Theobalds, for change of air, resulted in his remaining there till his death. In theology he was practically an Arian. He was a popular writer and his theological works were numerous. His *Catechism* (1730) and *The Improvement of the Mind* (1741) are still remembered, and his treatise on *Logic* (1725) had in its day a considerable reputation. But upon his hymns his permanent reputation rests. His poetical works are: *Horæ Lyricæ* (1706); *Hymns and Spiritual Songs* (1707); *Psalms of David in the Language of the New Testament* (1719); and *Divine and Moral Songs for Children* (1720). A complete collection of his works by Jennings and Doddridge in six volumes was published at London in 1753; with memoir by Burder, 1810. Consult: Julian, *Dictionary of Hymnology* (2d ed., New York, 1907); Thomas Wright, "Isaac Watts and Contemporary Hymn-Writers," in the *Lives of the British Hymn-Writers,* vol. iii (London, 1914); L. F. Benson, *The English Hymn: Its Development and Use in Worship* (New York, 1915). See HYMNOLOGY.

WATTS, MARY (*née*) STANBERY (MRS. MILES TAYLOR WATTS) (1868–). An American novelist, born in Delaware Co., Ohio, and educated in Cincinnati. Her work is characterized by frank, faithful, and sympathetic portrayal and interpretation of American life. Her first novel, *The Tenants* (1908), was followed by *Nathan Burke* (1910), an historical novel of the Mexican War; *The Legacy* (1911); *Van Cleve* (1913), set in the time of the Spanish-American War; *The Rise of Jennie Cushing* (1915), applying a very modern touchstone to moral values; *The Rudder* (1916).

WATTS, SIR PHILIP (1850–). A British naval constructor. He was educated at the College of Naval Architecture and was then a constructor at the Admiralty till 1885. In this year he succeeded (Sir) William White as chief constructor in charge of the recently organized shipbuilding department of the Armstrong Works at Elswick and he remained there for 16 years. During this time his department was very greatly increased in size and importance and he designed and built many notable ships. His successful work at Elswick led to his appointment as director of naval construction in the Admiralty in 1901, again succeeding Sir William White (q.v.). While acting in that capacity he revolutionized naval tactics and battleship design by bringing out the *Dreadnought* and the first battle cruisers. He resigned the directorship in 1911, but from 1912 was an adviser on naval construction.

WATTS, ROBERT (1820–95). An Irish Presbyterian minister and theologian, born at Moneylane, County Down. He came to the United States in early manhood, and graduated at Washington College, Lexington, Va., in 1849, and at Princeton Theological Seminary in 1852. He founded at Philadelphia in 1852 a Presbyterian mission which was organized under his pastorate as the Westminster Church in 1856. In 1863 he accepted a call to the Lower Gloucester Street Church, Dublin. He became professor of systematic theology in the Assembly's College, Belfast, in 1866. Watts was a strong conservative in theology, and was especially opposed to the influence of German exegesis. He published: *Calvin and Calvinism* (1866); *Utilitarianism* (1868); *What Is Presbyterianism?* (1870); *Arminian Departures from Reformation Principles* (1871); *Dr. Briggs's Theology Traced to its Organific Principle* (1891); and *Driver's Introduction Examined* (1892).

WATTS, THOMAS HILL (1819–92). An American lawyer and political leader, born in Butler Co., Ala. He graduated from the University of Virginia in 1840, and in 1841 was admitted to the bar. In politics he was a strong Henry Clay Whig, and as such was elected from Greenville, Ala., to the State Legislature in 1842, 1844, and 1845. In 1847 he settled in Montgomery, which he represented several terms in both Houses of the Legislature. As the Civil War approached, he exerted himself continually to keep his State in the Union, but after it had seceded supported the Confederacy. For a time in 1861–62 he served in the field as colonel of the Seventeenth Alabama Infantry, but in April, 1862, entered the cabinet of Jefferson Davis as Attorney-General. From the fall of 1863 until the end of the war he was Governor of Alabama. After the war he devoted himself to his law practice, and save for a single term in the State Legislature in 1880–81 never held public office.

WATTS, WILLIAM WHITEHEAD (1860–). A British geologist. He was educated at Den-

stone College, and at Sidney Sussex College, Cambridge, of which he was a fellow in 1888–94, and he was also an extension lecturer of the university in 1882–91. He taught geology at Oxford in 1888, and at Birmingham University from 1897 to 1906, when he accepted the chair of geology at the Imperial College of Science and Technology, South Kensington. In 1891–97 he was a member of the Geological Survey. Watts served as secretary (1898–1909) and as president (1910–12) of the Geological Society, which organization awarded him the Murchison medal in 1915. He edited *British Geological Photographs*, and published *Geology for Beginners* (1898) and numerous papers and memoirs.

WATTS-DUNTON, THEODORE (1832–1914). An English critic, romanticist, and poet. He was born at St. Ives, in Huntingdonshire, and was privately educated in Cambridge. In 1897 he added his mother's name Dunton to his father's. He studied law, and was called to the bar in 1863, but soon turned to literature. His sonnets attracted the attention of Rossetti, under whose influence he studied art in Italy. Returning to England, he joined the staffs of the *Examiner* (1874) and the *Athenæum* (1875), and soon became one of the most influential literary and art critics of the day, contributing important critical articles to works of reference and to the more important magazines and reviews. Rossetti, depicted as D'Arcy in *Aylwin* (1898; 19th ed., 1900), Watts-Dunton's romance, dedicated to him his *Ballads and Sonnets*. Swinburne was also an intimate friend; the two were housemates for 30 years. As a poet Watts-Dunton displays rare power of thought and a fine technique, particularly in the sonnets. Other writings than those mentioned include: *Jubilee Greeting at Spithead to the Men of Greater Britain and Other Poems* (1897); *The Coming of Love: Rhona Boswell's Story* (1897; 8th ed., 1907); *The Christmas Dream*, a dramatic idyl (1901); *David Gwynn's Story* (1901); *The Renaissance of Wonder: A Treatise on the Romantic Movement* (1903); *The Work of Cecil Rhodes: A Sonnet Sequence* (1907). Posthumously appeared his recollections, *Old Familiar Faces* (1916), and *Poetry: The Renascence of Wonder* (1916), essays. His editorial work was of the highest quality, and he edited many English classics admirably. Out of his full knowledge of gypsy lore, came his introductions and notes to Borrow's *Lavengro* and *Romany Rye*. Consult J. Douglas, *Theodore Watts-Dunton* (New York, 1904), and A. H. Miles, ed., *The Poets and the Poetry of the Nineteenth Century*, vol. iv (12 vols., ib., 1905–07).

WAT TYLER. See TYLER, WAT.

WAUBESA, wą-bē'sȧ, LAKE. One of the so-called "Four Lakes" (q.v.) of Wisconsin.

WAUGH, wą, ARTHUR (1866–). An English author, born at Midsomer Norton, Somersetshire. He was educated at New College, Oxford, where he won the Newdigate prize for English verse in 1888, and graduated with classical honors in 1889. Settling in London in 1890, he became subeditor of the *New Review* (1894), and then literary adviser to the publishing house of Kegan Paul & Co., until 1902. Subsequently he was managing director of Chapman and Hall, Ltd. His writings include: *Gordon in Africa* (1888); *Schoolroom Theatricals* (1890); *Alfred, Lord Tennyson, a Study of His Life and Work* (1892); *Legends of the Wheel* (1898); *Robert Browning* (1900), in the "Westminster Biographies"; *Reticence in Literature* (1915). He edited Johnson's *Lives of the Poets* (6 vols., 1896), the *Pamphlet Library* (1897), *George Herbert* (1907), in "World's Classics," and the works of other English writers.

WAUGH, BENJAMIN (1839–1908). An English philanthropist, born at Settle, Yorkshire. He studied at Airedale College, Bradford, and after entering the Congregational ministry held charges at Newbury (1865–66), Greenwich (1866–85), and New Southgate (1885–87). He is remembered chiefly for his part in establishing in 1884 and in promoting the interests of the London Society for the Prevention of Cruelty to Children, of which he was honorary secretary and, from 1889 to 1905, director. Waugh was largely instrumental in obtaining needed legislation for the protection of children. He wrote *The Gaol Cradle: Who Rocks It?* (1873).

WAUGH, FREDERICK JUDD (1861–). An American marine painter and illustrator. He was born in Bordentown, N. J., and studied at the Pennsylvania Academy, Philadelphia, and in Paris. From 1892 to 1907 he lived in Europe, exhibiting at the Paris Salon and the Royal Academy, London, and illustrating for the London papers. Upon his return to the United States he settled in Montclair, N. J., and soon became one of America's foremost marine painters. His art is characterized by firm, careful execution, realistic treatment, and a cold, well-modulated color scheme. He is represented in most American and in some English public collections, among his paintings being "The Great Deep" and "The Roaring Forties" (Metropolitan Museum, New York); "The Outer Surf" and "Surf and Fog, Monhegan" (Art Institute, Chicago); "After a North Easter" and "Southwesterly Gale, St. Ives" (National Gallery, Washington); and "The Blue Gulf Stream" (Pennsylvania Academy, Philadelphia). In 1911 he became a member of the National Academy of Design, and he was awarded various prizes.

WAUKEGAN, wą-kē'gan. A city and the county seat of Lake Co., Ill., 35 miles north of Chicago, on Lake Michigan, and on the Chicago and Northwestern, and the Elgin, Joliet, and Eastern railroads (Map: Illinois, J 1). It is situated at an elevation of more than 100 feet, on a bluff overlooking Lake Michigan. The streets are well paved and for the most part beautifully shaded. The city is a popular summer resort, with excellent bathing facilities and mineral springs, and is the home of many Chicago business men. Sheridan Drive extends along the lake front, affording a magnificent view. The most prominent buildings are the county courthouse, public library, Y. M. C. A., high school, and the Masonic Temple. Waukegan has a fine harbor. A considerable trade in farm and dairy products is carried on. It is especially known for its manufactures of wire and tannery products. There are also brass and iron works, a sugar refinery, a brewery, and manufactories of ladies' garments, boats, electric scales, sashes, doors, and organ stops. It has adopted the commission form of government. Pop., 1900, 9426; 1910, 16,069; 1915 (U. S. est.), 19,571.

WAUKESHA, wą'kē-shȧ. A city and the county seat of Waukesha Co., Wis., 17 miles west of Milwaukee, on the Little Fox River, and on the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map:

Wisconsin, E 5). It is the seat of Carroll College (Presbyterian) and of the State Industrial School for Boys. Other features include the courthouse, the Waukesha Springs and the Rest Haven sanitariums, the public library, city hospital, and three parks—Bethesda, Silurian, and Cutler. Waukesha has gained considerable prominence as a health resort owing to its numerous mineral springs. The preparation and shipment of mineral waters is one of the most important industries of the city. There are also iron works, steel bridge works, plow works, motor works, furniture manufactory, etc. Pop., 1900, 7419; 1910, 8743; 1915 (U. S. est.), 9436.

WAUPACA, wą-păk'ä. A city and the county seat of Waupaca Co., Wis., 131 miles northwest by north of Milwaukee, on the Minneapolis, St. Paul, and Sault Ste. Marie and the Waupaca-Green Bay railroads (Map: Wisconsin, D 4). It is the seat of the Wisconsin Veteran's Home, and contains the Danes Home, Bethany Orphan School, a Carnegie library, and several beautiful lakes, which have given the city some popularity as a summer resort. Pop., 1900, 2912; 1910, 2789.

WAUPUN, wą-pŭn'. A city in Dodge and Fond du Lac counties, Wis., 18 miles southwest of Fond du Lac, on Rock River, and on the Chicago, Milwaukee, and St. Paul Railroad (Map: Wisconsin, E 5). It has important manufactures, including boots and shoes, carriages and wagons, tire vulcanizers, windmills, umbrellas, and knit goods. The Carnegie library, the State Prison, and State Hospital for the Insane are noteworthy features. Pop., 1900, 3185; 1910, 3362.

WAURIKA, wą-rē'ką. A city and the county seat of Jefferson Co., Okla., 100 miles south by west of Oklahoma City, on the Chicago, Rock Island, and Pacific Railroad (Map: Oklahoma, D 4). It contains a well-equipped library and good schools. Repair shops and yards of the Rock Island system constitute the chief industrial interests. There are also a cotton compress and cotton gins. Pop., 1900, 696; 1910, 2928.

WAURIN, JEHAN DE. See WAVRIN.

WAUSAU, wą'są. A city and the county seat of Marathon Co., Wis., 180 miles by rail northwest of Milwaukee, on the Wisconsin River, and on the Chicago, Milwaukee, and St. Paul and the Chicago and Northwestern railroads (Map: Wisconsin, D 4). It is on elevated ground on both banks of the river. There are a fine natural park, the Marathon County Training School for Teachers, the County School of Agriculture and Domestic Science, the County Asylum for the Chronic Insane, St. Mary's Hospital, the County Home for Poor, a tuberculosis sanitarium, and a public library. It has three paper mills and extensive granite quarries. Other manufactured products include sashes, doors, and blinds, furniture, toys, veneer, boxes, sandpaper, sawmill machinery, bridges, cereals, flour, leather, canned vegetables, etc. Good water power is furnished by the Big Bull Falls. Pop., 1900, 12,354; 1910, 16,560; 1915 (U. S. est.), 18,778.

WAUSEON, wą'sē-ŏn. A village and the county seat of Fulton Co., Ohio, 33 miles west by south of Toledo, on the New York Central, the Wabash, and the Detroit, Toledo, and Ironton railroads (Map: Ohio, B 2). Among the important public institutions are the Carnegie library, city hospital, courthouse, and county normal school. There are flour mills, a milk condensery, and manufactories of malleable iron castings, windmills, cement stave silos, etc. Cattle, hogs, and eggs are shipped in large quantities. Pop., 1900, 2148; 1910, 2650.

WAUTERS, vō'târ', EMILE (1846–). A Belgian portrait and historical painter. He was born in Brussels and studied there at the Academy under Portaëls, and under Gérôme in Paris. Later he traveled in Italy and Germany. His reputation started with a series of historical paintings, chief among which are "The Madness of Hugo van der Goes" (Brussels Gallery) and "Mary of Burgundy before the Magistrates of Ghent" (Liége Museum). He attended the opening of the Suez Canal and revisited Egypt in 1880; the fruits of these sojourns in the East were numerous Oriental scenes and the fine panorama "Cairo and the Banks of the Nile" (Parc du Cinquantenaire, Brussels). In 1890 he removed to Paris and devoted himself almost exclusively to portrait painting in oil and pastel, numbering among his sitters Mesdames Somzée, Melba, and John Astor; Princess Clementine of Belgium (Brussels Gallery); Baron Lambermont (Brussels Gallery); General Goffinet and M. Schollaert. His paintings are naturalistic, forceful, and well composed; his portraits are powerful in characterization and color, but he lacks temperament and depth of feeling. He received many honors and awards.

WAUWATO'SA. A city in Milwaukee Co., Wis., one and one-half miles west of Milwaukee, on the Chicago, Milwaukee, and St. Paul Railroad (Map: Wisconsin, F 5). It has the county hospital and almshouse, the Milwaukee Insane Hospital, two sanitariums for nervous diseases, a tuberculosis sanitarium, the Harwood Library, an agricultural school, and the Kinderheim. Among the industrial establishments are planing mills, a pickle factory, stone quarries, chemical works, a patent-leather factory, and a brick kiln. Pop., 1900, 2842; 1910, 3346.

WAVELLITE, wā'vel-īt (named in honor of its discoverer, William Wavel, an English physician of the early nineteenth century). A mineral hydrated aluminium phosphate crystallized in the orthorhombic system, but very seldom found in distinct crystals. It has a vitreous lustre, and is yellow or green, varying to brown and black, in color. It occurs on the sides and cracks of schistose rocks, frequently in little spherical aggregates which are made up of convergent crystals.

WA'VERLEY, OR 'TIS SIXTY YEARS SINCE. A novel by Scott published anonymously in 1814. It attained immediate success and gave the name to Scott's series. The identity of the author was successfully concealed for 13 years. The title was suggested by an abbey, near Farnham.

WAVERLEY NOVELS. See SCOTT, SIR WALTER.

WAVERLY. A city and the county seat of Bremer Co., Iowa, 71 miles northwest of Cedar Rapids, on the Cedar River, and on the Chicago Great Western, the Illinois Central, the Waterloo, Cedar Falls, and Northern, and the Chicago, Rock Island, and Pacific railroads (Map: Iowa, E 2). It has the Wartburg Teachers' Seminary and Academy, the Lutheran Orphans Home, St. Joseph's Mercy Hospital, and a Carnegie library. Waverly carries on a large trade in its manufactured products, which include condensed milk, butter, canned goods, fruit, etc. Pop., 1900, 3177; 1910, 3025; 1915 (State census), 3547.

WAVERLY. A village in Tioga Co., N. Y., 18 miles southeast of Elmira, on the Cayuta Creek, and on the Erie, the Lehigh Valley, and the Delaware, Lackawanna, and Western railroads. It manufactures furniture, tools, railway supplies, car wheels, gloves and mittens, paints, cereals, and metal shingles. Waverly is also an important distributing point for the Wyoming Valley coal field and has extensive sand and gravel works. Pop., 1900, 4465; 1910, 4855.

WAVES (AS. *wafian*, to wave, fluctuate, waver, MHG. *waben*, to wave, Bavarian Ger. *waiben*, to waver, totter). Wave motions are of two kinds: one is the advance of a disturbance into a medium, and the other is its advance along a surface. Illustrations of the former kind are given by waves produced in air or in the interior of water by a vibrating body such as a bell, and those produced in the ether by an electrical vibration; illustrations of the latter kind are given by waves on the surface of a lake or ocean. The former class of waves are due to the elasticity and inertia of the medium; and the velocity with which the disturbance spreads out from the vibrating centre depends upon these two properties of the fluid alone. Elastic waves in homogeneous media have a velocity given by the formula, velocity $= \sqrt{\frac{E}{d}}$ where E is the coefficient of elasticity and d is the density. See ACOUSTICS; ETHER; ELECTRICITY.

Waves on the surface of a liquid are due to the action of gravitation, which tends to make the surface of a liquid horizontal (to the surface-tension if the waves are nothing but ripples), and to the inertia of the liquid. (For a discussion of these water waves, see HYDROSTATICS.) The wave front of a train of waves is the surface which at any instant includes all those points of the medium which the disturbances have just reached; or, more generally, it is a surface in the medium including those points where the motion is in the same phase. The wave front from a point source is a sphere in the case of an elastic wave in an isotropic medium; it is a circle for waves on the surface of water.

Since all waves consist in the motion of portions of matter, and since the medium carrying the waves is not in its natural position or condition, there is both kinetic and potential energy associated with wave motion. This energy is lost by the vibrating source and gained by the body absorbing the waves. The intensity of the waves is defined to be the energy carried in unit time through an area of one square centimeter of surface at right angles to the direction of advance of the waves. Thus, if the source of waves is a point and if the energy emitted per unit time is E, the intensity of the waves at a distance, r_1 is $I_1 = \frac{E}{4\pi r_1^2}$, because the area of the surface of a sphere of radius r_1, inclosing the point source as a centre, is $4\pi r_1^2$. Similarly, the intensity at a distance r_2 is $I_2 = \frac{E}{4\pi r_2^2}$. Therefore

$$\frac{I_1}{I_2} = \frac{r_2^2}{r_1^2},$$

or the intensity of the waves from a point source varies inversely as the square of the distance.

Since waves are due to some vibrating centre, the simplest type of train of waves will be one produced by the simplest vibration, that is, a simple harmonic vibration, such as that of a tuning fork in the case of aërial waves. A train of waves produced by a simple harmonic vibration is called a simple harmonic train. It is characterized by its amplitude and its wave length or wave number. The amplitude is the extent of the displacement of any individual particle of the medium owing to the passage of the waves. The wave length is the distance from any one point in the medium to the next point, in the direction of advance of the waves, where the conditions are at any instant exactly the same—both in displacement of the particle of the medium and in its velocity. The wave number is the number of complete vibrations which each particle of the medium makes in one second; or, what is the same thing, it is the number of waves which pass any one point of the medium in one second. The velocity of the train of waves is, then, obviously the product of the wave length and the wave number. Moreover, since, in the case of waves due to the elasticity of a homogeneous medium, their velocity depends upon the elasticity and inertia alone, it is the same for waves of all lengths. Therefore, for a given medium, if the wave length is known, the wave number may be at once calculated. If the medium is not homogeneous, waves of different length have different velocities. (See LIGHT and DISPERSION.) It is not difficult to prove that the energy carried by a train of waves varies as the square of the amplitude; and, since in the case of waves emitted by a point source the intensity of the waves varies inversely as the square of the distance from the source, the amplitude of the waves must vary inversely as the distance itself.

A complex vibration, made up of several simple harmonic vibrations, will produce a complex train of waves which is equivalent to the superposition of several trains of simple harmonic waves. The characteristics of such a complex train of waves are, first, the number of the component trains, and, secondly, their amplitudes, wave numbers, and relative phases. By relative phases is simply meant their relative positions in the medium. (See ACOUSTICS.) As trains of waves pass through any medium some energy is always absorbed, as is shown by the gradual decrease in amplitude. This is called attenuation; and it is found that long waves are less attenuated than short ones in general. Consequently, as a complex train of waves advances, its different component trains are attenuated to different degrees, and the shape of the wave changes. This is called distortion. If the inertia of the medium is very great, the attenuation is diminished, and the distortion almost vanishes. Waves along stretched cords are special cases of elastic waves. See ACOUSTICS.

Stationary Waves are the particular kind of vibration observed in stretched cords, the air in organ pipes, etc. (See ACOUSTICS.) It is evident that, if waves are sent down a stretched rope towards the end which is fastened to some rigid support, they will be reflected when they reach the end. Consequently, if waves are continued to be produced, there will be in the rope at any instant two trains of waves of the same wave length, velocity, and amplitude, but advancing in opposite directions. It must happen at certain points in the rope that one train of waves neutralizes the action of the other; and it is evident that these points must lie at a distance of half a wave length apart. These posi-

tions of no motion are called nodes; and the fixed end of the rope is one. In between two nodes the rope vibrates exactly like a short rope of a length equal to the distance from node to node and fastened at its two ends. A point midway between two nodes is called a loop. If a long rope is hanging vertically from a balcony, with its lower end free, waves sent down it will be reflected; and there will be nodes and loops as before, only in this case the free end is a loop. Such a vibration is called a stationary wave, an extremely poor name, because it is not a wave motion at all. The vibrations of the air in an organ pipe are of this kind; the nodes are points where there is the least motion but the greatest fluctuation in pressure, while the loops are the points of greatest motion but the least change in pressure. The open end of an organ pipe is a loop. The effect of opening a hole in a flute is to make that point a loop. Stationary waves may be produced by the ether waves, as has been shown by Wiener and others.

The electromagnetic waves or periodic disturbances in the ether resulting from the variation in an electric current and the corresponding modification of the electric and magnetic forces travel out into space with a definite and finite velocity. Thus from the variation of current in a Hertz oscillator (see WIRELESS TELEGRAPHY) waves are sent out disconnected from all electric conductors and become purely electromagnetic radiations in the dielectric. Under other conditions waves may be manifested on the conductor or in its vicinity, while in the case of the waves of wireless telegraphy periodic disturbances occur both in the dielectric above the earth surface and in the form of electric current in the earth itself. Consult: J. A. Fleming, *Waves and Ripples in Water, Air, and Ether* (London, 1902); D. du B. Gaillard, *Wave Action in Relation to Engineering Structures* (Washington, 1904); W. H. Wheeler, *Practical Manual of Tides and Waves* (New York, 1906); Vaughan Cornish, *Waves of the Sea and Other Waves* (Chicago, 1910); id., *Waves of Sand and Snow and the Eddies which Make Them* (London, 1914). See LIGHT; ELECTRICITY, paragraphs on *Alternating Currents* and *Electrical Waves Along Conductors*.

WAVRE, vä'vr'. A town of the Province of Brabant, Belgium, on the Dyle, 15 miles southeast of Brussels (Map: Belgium, C 4). There are breweries, tanneries, paper mills, and cotton manufactures. Pop., 1899, 8200; 1910, 9102. Here on June 18, 1815, after their defeat at Ligny (q.v.), the Prussians under Thielmann repulsed a greatly superior force of the French under Grouchy, and thereby prevented the latter from bringing timely assistance to Napoleon at Waterloo (q.v.).

WAVRIN, vä'vrăN' (or WAURIN), JEHAN DE, SEIGNEUR DU FORESTEL (c.1394–c.1474). A French chronicler of England, whose work covers the history of Great Britain, both real and fabled, from the earliest time to 1471. It has been edited by Sir W. Hardy and translated by E. L. C. P. Hardy, under the title "Recueil des Croniques et anciennes Istories de la Grant Bretaigne à présent nommé Engleterre" ("Master of Rolls Series," 1864–91). Consult *Anciennes croniques d'Engleterre, choix de chapitres inédits*, edited by Mlle. Dupont (published by the Société de l'Histoire de France, Paris, 1858–63).

WAX. See WAXES.

WAX, MINERAL. See OZOKERITE; ASPHALT.

WAXAHACHIE, wăks'ȧ-hăch'ē. A town and the county seat of Ellis Co., Tex., 30 miles south of Dallas, on the Missouri, Kansas, and Texas, the Trinity and Brazos Valley, and the Houston and Texas Central railroads (Map: Texas, D 3). Cotton gins, cottonseed-oil mills, a flour mill, and lumber yards are among the more important industrial establishments. Noteworthy features are Trinity University, the N. P. Sims Library, and the courthouse. Pop., 1900, 4215; 1910, 6205.

WAXBILL. One of several weaver birds (q.v.) having a coral-red, waxy beak; especially the astrild (*Estrilda astrilda*), a near relative of the amidavad (q.v.)—a common cage bird.

WAX CLUSTER. See GAULTHERIA.

WAXES. A class of substances of animal or vegetable origin containing mainly one or more esters (q.v.) composed of higher monatomic or diatomic alcohols and higher fatty acids. They have a somewhat characteristic consistence, similar to that of their prototype, beeswax, although some (as the so-called sperm oil) are liquid, and others (carnauba wax) are so hard that they can be pulverized in a mortar. The principal chemical difference between waxes and fats consists in the fact that the alcohol found combined in the latter is invariably glycerin (a triatomic alcohol) which never occurs in waxes. The term "waxes," as used commercially, is often extended to substances having a waxy consistence, but containing no ester of a monatomic or diatomic alcohol. Thus the so-called Japan wax is really a fat, almost entirely composed of glycerin and palmitic acid; the so-called myrtle wax consists of about 20 per cent of tripalmitin (i.e., the fat composed of glycerin and palmitic acid) and about 80 per cent of free palmitic acid. On the other hand, the term "oil," which is generally applied to the true liquid fats, is in commercial usage extended also to liquid waxes, like the sperm oil mentioned. Free fatty acids (as well as free monatomic or diatomic alcohols and hydrocarbons) are found also, in limited quantities, in the true waxes. But if waxes are at all to be classed separately from the fats, the term "waxes" should not be applied to materials containing glycerides, and the term "oils" should not be applied to materials containing no glycerides and composed chiefly of the substances that characterize the true waxes. Of course, since the true waxes contain no glycerin, the latter does not appear among their saponification products, nor can acrolein be produced during their combustion. (See FATS.) Another difference between waxes and fats becomes apparent when they are subjected to processes of saponification. Thus, while any fat may be more or less readily saponified by alkalies dissolved in water, waxes can hardly be thus saponified at all, so that it is necessary to use potash or soda dissolved in alcohol when it is required to effect the saponification of a true wax. The following paragraphs describe the principal waxes. They may be divided into liquid and solid waxes, the former including sperm oil and bottlenose oil, both of animal origin. Solid waxes may be subdivided into those of animal and those of vegetable origin. The former include spermaceti, beeswax, wool wax, and serum wax. The solid waxes of vegetable origin include carnauba wax, Chinese wax, opium wax, palm wax, ocuba wax, getah wax, ocotilla wax, and cottonseed wax.

Sperm Oil is derived from the head matter of the sperm whale (*Physeter macrocephalus*). The

blubber (the material containing the wax) when tried out yields a crude oily liquid composed chiefly of sperm oil and spermaceti (see below), the latter being subsequently removed by chilling and pressure. Sperm oil is a pale yellow thin liquid with a slight odor. Its specific gravity is from 0.875 to 0.880. If of good quality it contains very little free fatty acid. Its composition is as yet in dispute. By some authorities it is said to contain dodecatyl and cetyl alcohols. Its viscosity, which is high for a low-gravity oil, does not change materially with rise of temperature as is the case with fatty oils, and, as it is a nondrying substance and not liable to become rancid, it has long been a favorite lubricant for light high-speed machinery. Sperm oil is often adulterated, mainly with other fish oils. These are usually quite easy to detect by their odor, especially on heating. Mineral oils can be best detected by the flash test. (See OIL.) As an illuminant sperm oil has been almost entirely superseded by the cheaper mineral oils.

Bottlenose Oil is derived from the so-called Arctic sperm whale (*Hyperoödon rostratus*). It is a liquid darker than sperm oil and has a peculiar and characteristic taste and odor. It is more likely to gum than sperm oil. But chemically considered the two liquid waxes are probably identical, the main constituent of either being the ester composed of dodecatyl alcohol and doeglic acid. Bottlenose oil is chiefly used as a lubricant and as an adulterant for sperm oil.

Chinese Wax is secreted by the *Coccus ceriferus* (an insect) and deposited on the twigs of the Chinese ash. It is removed by hand and melted in hot water to remove mechanical impurities. It is a hard, white, crystalline solid, without taste or smell, resembling spermaceti, but harder and more fibrous. It is slightly soluble in alcohol and completely so in light hydrocarbons. It consists chiefly of ceryl cerotate. Its specific gravity is 0.970 and its melting point is 82° to 83° C. (about 180° F.). Chinese wax is used in the East as a substitute for beeswax, but is rarely brought to the United States.

Wool Wax is obtained as a by-product in the wool-washing process, either by alkaline water or by some hydrocarbon solvent. Wool wax is in reality the sweat of the sheep exuding from the skin of the animal, and is a very complex mixture, but contains among other compounds large quantities of the stearic and palmitic esters of cholesterin and isocholesterin, and potassium salts of various fatty acids. As prepared by acidifying the wash waters, or distilling off the organic solvent, it is a dark-brown compound with a disagreeable odor resembling that of the sheep; by repeated washing in water the soluble compounds are removed, the residue is melted over water, cooled, and allowed to solidify. In this purified state wool wax is a pale-yellow, soft, translucent substance with little odor. Its specific gravity is 0.973. A most remarkable property of this substance is its capacity for combining mechanically with as much as 80 per cent of its weight of water. The neutral wax with 22 to 25 per cent of water is sold under the name of lanolin and is used in pharmacy as a basis for ointments. Wool wax is used as a leather dressing and as a lubricant for wool yarn.

Carnauba Wax is derived from the carnauba palm (q.v.) (*Copernicia cerifera*) indigenous to Brazil. The wax forms a coating on the leaves and is removed by shaking and pounding the trees. The raw wax is of a dirty greenish-yellow color and so hard as to pulverize readily. When pure it is odorless and tasteless, melts at 83° to 88° C. (186.5° to 190.5° F.), and has a specific gravity of 0.990 to 0.999. Its composition is very complex. The main ingredient is myricyl cerotate, with small quantities of free cerotic acid and myricyl alcohol. Besides these, there are present a hydrocarbon melting at 59° C. (138° F.), a diatomic alcohol, and carnaubic acid. The wax is chiefly used in the manufacture of candles and wax varnishes, and as an admixture with commercial stearic acid, cerasin, and paraffin, for the purpose of raising their melting points. See BEESWAX and SPERMACETI for treatment of those materials. See also ESTERS; FATS; OIL.

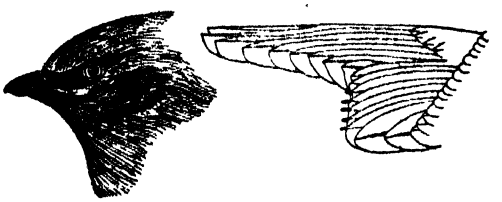
WAX INSECT. A name for two or more scale insects, but also equally applicable to several other insects. *Ericerus pela*, called by the Chinese lah-shoo, which makes the so-called Chinese white wax, is found about the beginning of June on the branches of an ash (*Fraxinus sinensis*) and certain other trees. It has long been cultivated in China for its wax, which is used chiefly in candle making, although the industry has declined since the introduction into China of kerosene oil. Though little is known of the insect, it is altogether likely the females produce larger quantities than the winged males, which are popularly reputed to be producers. It is said that the wax is scraped off of the branches towards the end of August, melted with boiling water, and strained through cloth. The insect has been introduced into Algeria by the French. The East Indian wax insect (*Ceroplastes ceriferus*), which is found on *Celastrus ceriferus* and other trees, is rather rare and has not been used commercially. Its wax is not altogether suitable for candle making, as both the wax itself and its mixtures with olive oil burn with a dim, smoky light, and give out a resinous odor. The wax, which is reputed medicinal, is sweet when fresh and is eaten by children.

Two American scale insects, the barnacle scale (*Ceroplastes cirripediformis*) and *Ceroplastes floridensis*, are known as wax scales. No commercial use has been made of their wax. Nearly all of the Coccidæ secrete wax in varying proportions, most of them only in small amounts. Several species of the genus *Icerya*, however, secrete large quantities. In *Icerya ægyptiacum* and *Icerya montserratensis* wax is secreted to form the egg sac and also in long filaments which so readily break off that a jar or a shake of a badly infested tree will bring down the wax in quantity. In the genus *Pulvinaria* also white wax is secreted for the protection of eggs.

Certain of the lantern flies (q.v.) of the fam-

ily Fulgoridæ secrete large quantities of a white flocculent wax, and in tropical America the small lantern flies of the genus *Phenax* fly about with large masses of this waxy substance sometimes twice as long as their bodies. This fulgorid wax is said to be used in China for candles, etc. The larvæ of an East Indian species (*Phromnia marginella*) are covered with masses of white wax which is secreted by small glands distributed over the abdomen.

Various plant lice or aphids (q.v.), especially the genera *Pemphigus*, *Chermes*, and *Schizoneura*, also secrete white wax from glands which replace the honey tubes. One species (*Lachnus longistigma*) infests certain coniferous trees in the United States, and when abundant the insects may be scraped off and sifted to obtain the wax. Some of the Psyllidæ also produce waxen threads. Certain caterpillars secrete wax, as the larvæ of one of the Tortricidæ (*Retinia resinella*) and of a butterfly (*Parnassius apollo*); the bodies of certain sawfly larvæ are covered with a white, powdery, waxen secretion, in one case (genus *Selandria*) nearly concealing the body. The wax in all of these insects is secreted by small one-celled skin glands which in the Hemiptera are distributed nearly all over the body, but in the bees are restricted either to the under or upper side of the end of the abdomen. See BEE.



WAX MOTH, or HONEY MOTH. See BEE, *Winter Life and Enemies*.

WAX MYRTLE. See CANDLEBERRY.

WAX SHRUB. See CANDLEBERRY.

WAXWING, or CHATTERER. Any bird of the genus *Ampelis*, more recently called *Bombycilla*, of the passerine family Ampelidæ or Bombycillidæ, characterized by having a short, straight, elevated bill, with a very wide gape, as in the flycatchers, but without bristles; both mandibles notched at the tip; the wings rather long, broad, and pointed; the legs short. The genus *Bombycilla* is peculiar in having many of the shafts of the wing quills tipped with a horny material resembling red sealing wax. The three species are widely diffused over northern regions and are much alike. One, the Bohemian waxwing (*Bombycilla garrula*), inhabits the Arctic regions, breeds to near the limit of timber growth, and makes its nest in a tree long before the winter snows have melted. It migrates southward in winter, and in severe seasons reaches the United States, but always irregularly and at long intervals. It feeds on insects and caterpillars, the cankerworm being especially desired. They also eat seeds, berries, and other fruits. It is a handsome bird, nearly as large as a thrush; is reddish gray, with a black patch on the throat and a black band on the forehead; the tail coverts brownish orange; the primaries, secondaries, and tail feathers tipped with yellow, two white bands on the wings; the lower parts silvery gray. The head is surmounted by an erectile crest of brownish-orange feathers. The song of the waxwing is a weak whistling, bearing a little resemblance to that of the thrush. It is easily tamed.

The more common American waxwing, cherry bird, or cedar bird (*Bombycilla cedrorum*) is a very similar but smaller species, found from Canada to Central America, less migratory, and never visiting Arctic regions. The general color is purplish cinnamon in front and ash color behind; the chin, forehead, and a stripe through the eye black; no white on the wings; the belly yellow, fading into white on the under tail coverts. It is crested. Great flocks of cedar birds collect in the end of summer. They feed on cherries and garden berries, and are particularly fond of those of the red cedar, but

HEAD AND WING OF A WAXWING.
Head of cedar bird (*Bombycilla cedrorum*); wing of same showing the sealing-wax tips of the secondaries.

they eat seeds and insects too. They breed late in the summer, and build a bulky nest of grass, bark, rootlets, and the like, in which the female deposits 3 to 5 eggs, pale bluish gray, spotted with black.

The third species of waxwing is a native of eastern Asia and Japan. Consult E. H. Forbush, *Useful Birds and their Protection*, published by the Massachusetts Board of Agriculture (Boston, 1913).

WAXWORK (so called from the waxy scarlet aril), STAFF TREE, or SHRUBBY BITTERSWEET (*Celastrus scandens*). An American climbing shrub of the family Celastraceæ. It flourishes in most soils from Canada to South Carolina, and west to South Dakota and New Mexico, climbing upon rocks and trees to a height of 20 feet or more. When the globular, rich orange pods open they expose beautiful crimson seeds which are especially attractive in autumn. The fibre of the bark has been shown experimentally to be valuable, but little if any use is made of it. *Celastrus articulatus* or *Celastrus orbiculatus*, a native of China and Japan, which is somewhat cultivated, differs mainly in the shape of the leaves.

WAXWORK. The use of wax, generally beeswax, with or without the addition of other material, for the execution of statues, busts, medallions, etc., as well as for modeling a great variety of objects from which metal castings are to be made. Wax is used extensively by sculptors to embody an initial conception later to be worked out in clay or other material. From very early times in imitative art, waxworking was practiced in various parts of the world. The Egyptians made wax figures of their deities for use in funeral rites and put them in the graves of distinguished persons. At one period of Greek art, wax statuettes of the deities, as well as wax dolls, were quite common. Pliny records that Lysistratus, about 300 B.C., made colored portraits in wax from plaster molds; while in Rome, patrician families were in the habit of puttting these wax masks of ancestors as well as of living members of the family in the vestibules of their houses, as the possession of such articles was considered a mark of distinction. During the Middle Ages, especially in Italy, wax was widely used for making portraits, figures of the saints, and ecclesiastical objects such as the Agnus Dei (q.v.). About this period some of the finest examples of metal candelabra, Chandeliers, etc., were made from wax originals. Spanish art shows many beautiful specimens of waxwork in the shape of images of the saints, notable for excellence of form and

beauty of coloring. In the fifteenth century Andrea del Verrocchio (q.v.) and Orsino were the first to make human figures of wax on a wooden framework or skeleton, and having glass eyes and natural hair. In the seventeenth century Gaetano Giulio Zummo invented anatomical and pathological midels in wax. Waxwork as a medium of artistic expression reached its climax about the close of the eighteenth century, when wax portraits, usually in relief and often of considerable merit, acquired wide vogue. Later, life-size figures of notable persons began to be made for purposes of popular exhibition, and in some cases these figures were capable of movement through suitable mechanism. In London Madame Tussaud's, and in New York the Eden Musée were formerly exhibitions of figures of historic and current interest, the latter establishment passing out of existence in 1915.

Consult E. S. Bolton, *Wax Portraits and Silhouettes* (New York, 1910) and *Descriptive Catalogue of the Spitzer Collection* (Paris, 1892).

WAXY (or **AMYLOID**) **DEGENERATION.** A morbid process in which the healthy tissue of various organs is replaced by a nitrogenous substance, resembling in some respects amyloid compounds. Organs affected by this degeneration have a certain resemblance in consistency and physical character to wax. They are abnormally translucent, increased in volume, solidity, and weight. When a solution of iodine is brought in contact with such tissues, a mahogany-brown color is produced; iodine and sulphuric acid yield a blue color. Although amyloid degeneration is common to many tissues and organs, the parts most frequently affected are the spleen, liver, and kidneys. The heart muscles, the suprarenal capsules, the lymphatic glands, and the intestinal mucous membrane may also be involved. The causes of waxy degeneration are chronic suppuration, especially of bone, as well as syphilis, tuberculosis, cancer, and possibly gout.

WAY (AS. *weg*, Goth. *wigs*, OHG. *wec*, Ger. *Weg*, way; connected with Lat. *via*, road). In law, an easement consisting in the right to pass over land. This right may inhere in a person, who thus may pass over land owned by some other person; or, as is more usual, it may inhere in another piece of land to be used by whoever happens at a given time to be the owner of the latter parcel. The term is also employed to denote a path or road over which a right of way may be exercised. Where the right of way can be used only by one person, or a limited number of individuals, it is considered private. Where it may be used by all persons in common it is public. Twenty years' open and adverse exercise of a right of way makes it a permanent easement by prescription. Where such a right of way exists in the public generally it may not be lost by mere prescription, because of its public character. A way by necessity arises where a person sells to another a portion of his land, to which there is no road or way leading to a public highway, or which is so located as to cut off access from the remainder of the vendor's land to the highway. The person whose land is thus cut off from access to a public highway may pass over the vendor's or purchaser's land, as the case may be, by the most convenient and direct route to the nearest highway, having due regard for the best interests of the person over whose land he passes. A way may consist merely of the right to pass over a narrow path on foot, or on horseback, or may extend to the use of vehicles of any description. A private way may be dedicated to the public, but a mere license to the public to pass over a way will not destroy its private character. See EASEMENT and consult authorities under REAL PROPERTY.

WAY, ARTHUR S. (1847–). An English classical scholar and poet, born at Dorking. He was educated at Kingswood School, Bath, and at Queen's College, Melbourne (Australia), where he was afterward fellow. In 1870–76 he was a lecturer at Queen's College, Taunton, in 1876–81 vice master of Kingswood School, Bath, and from 1882 to 1892 head master of Wesley College, Melbourne, Australia. He published verse translations of the *Odyssey*, the *Iliad*, Euripides, the *Epodes* of Horace, Æschylus, Sophocles, Vergil's *Georgics*, the *Nibelungenlied*, the *Chanson de Roland*, Theocritus, Bion, and Moschus. These are all notable examples of translation.

WAY BILL. See RAILWAYS.

WAY'CROSS. A city and the county seat of Ware Co., Ga., 96 miles southwest of Savannah, on the Atlantic Coast Line, the Waycross and Southern, the Waycross and Western, and the Atlanta, Birmingham, and Atlantic railroads (Map: Georgia, D 4). Its business interests are centred chiefly in lumber and naval stores. There are large car and repair shops, a turpentine plant, a cotton gin, abattoir, cold-storage plant, and a saw and planing mill. The Atlantic Coast Line maintains shops here. Noteworthy structures are Piedmont Academy, King's Daughters Hospital, the post office, and the two Y. M. C. A. buildings. Pop., 1900, 5919; 1910, 14,485; 1915 (U. S. est.), 19,001.

WAYLAND, FRANCIS (1796–1865). An American educator, born in New York City. He graduated at Union College in 1813, studied medicine for three years, and in 1816 entered Andover Theological Seminary. Before graduating he left to become a tutor at Union College, where he remained four years. In 1821 he accepted a call to the pulpit of the First Baptist Church in Boston, where he became known as a preacher of great ability and energy. After a year's professorship at Union College in 1826–27 he left in February of the latter year to accept the presidency of Brown University at Providence. The 28 years (1827–55) during which he remained at the head of this institution saw its rapid development and change from a narrow sectarian college to a modern college on more liberal lines. These reforms marked Dr. Wayland, although a conservative in most matters, as a leader in educational reform. He himself delivered lectures in psychology, political economy, and ethics. Retiring from the presidency of the university in 1855, he served for some time as pastor of the First Baptist Church, Providence, and devoted himself to prison reform and other movements of a similar nature. His works include, in addition to numerous individual sermons and addresses: *Occasional Discourses* (1833); *Elements of Moral Science* (1835), which has run through a number of editions and revisions and has been translated into several foreign languages; *Elements of Political Economy* (1837); *Moral Laws of Accumulation* (1837); *The Limitations of Human Responsibility* (1838); *The Present Collegiate System in the United States* (1842); *Domestic Slavery Considered as a Scriptural Institution* (1845); *Sermons Delivered in the*

Chapel of Brown University (1849); *Memoirs of Adoniram Judson* (2 vols., 1853); *Elements of Intellectual Philosophy* (1854); *Notes on the Principles and Practices of the Baptist Churches* (1857). Consult Francis and Henry L. Wayland, his sons, *Life and Labors of Francis Wayland* (New York, 1867); J. O. Murray, *Francis Wayland* (Boston, 1891). See BROWN UNIVERSITY.

WAYLAND, FRANCIS (1826–1904). An American lawyer and educator, son of Francis Wayland (1796–1865). He was born in Boston, graduated at Brown University in 1846, studied law at Harvard, and began practice at Worcester, Mass., in 1850. Eight years later he removed to New Haven, Conn., where he was judge of probate in 1864–65. In 1869 he was Lieutenant Governor of Connecticut, and in 1872 became professor of jurisprudence in Yale University, of whose law school he served as dean from 1873 until 1903. He was president of the American Social Science Association in 1880, and, after 1872, of the Prison Aid Association. Besides papers and addresses on social science, he, with his brother, Henry L. Wayland, published a book on their father, *Life and Labors of Francis Wayland* (2 vols., 1867).

WAYLAND THE SMITH (AS. *Wēland*, OIcel. *Völundr*, Ger. *Wieland*). A famous Germanic hero, originally a semidivine goldsmith. According to the usual account, he was a son of the sea giant Wade, who apprenticed him to Mimir, a skilled smith. He was then taken across the sea to the dwarf's, whom he soon surpassed at the forge. He afterward long dwelt in Ulfdaler (the Wolf's valley) along with his two brothers, Slagfidr and Eigil. Here the brothers met three swan nymphs, with whom they lived for seven years. Afterward Wayland came to King Nidung, who cut the sinews of his feet, thus laming him forever, and then imprisoned him. For this cruel treatment Wayland put the King's two sons to death and violated his daughter Beadohild, who became the mother of Wittich, a mighty champion. Wayland then made a feather robe in which he flew away. The legend, with many variations and episodes, was long a favorite among the Germanic peoples. Wayland also appears as Galant in the French *Chansons de Geste*. But the fullest single account is to be found in the *Elder Edda* and in the *Wilkina Saga*. A still older version of the story is contained in *Déor*, an old English lyric. By piecing together the old legends and filling in here and there, Karl Simrock reproduced the saga in his poem *Wieland der Schmied* (Bonn, 1835), and again in the fourth part of his *Heldenbuch* (Stuttgart, 1843). The Germanic origin of the Wayland legend has been questioned. It is clear that it is related to the Greek myths of Hephæstus and Dædalus. Consult the *Corpus Poeticum Boreale*, ed. with *translations by Vigfusson and Powell* (2 vols., Oxford, 1883); J. Grimm, *Deutsche Mythologie* (4th ed., Berlin, 1875–78); Golther, "Die Wielandsage," in *Germania*, vol. xxxiii (Vienna, 1888); Maurus, *Die Wielandsage in der Litteratur* (Leipzig, 1902; English translation by Stallybrass, 4 vols., London, 1882–88).

WAYNE. A city and the county seat of Wayne Co., Neb., 46 miles southwest of Sioux City, Iowa, on the Chicago and Northwestern Railroad (Map: Nebraska, H 2). The Nebraska Normal College is situated here, and there are also a Carnegie library, and fine courthouse, city hall, and school buildings. Pop., 1900, 2119; 1910, 2410.

WAYNE, ANTHONY (1745–96). An American soldier, prominent in the Revolutionary War. He was born at Easttown, Pa., Jan. 1, 1745, and was educated at Philadelphia. At the age of 18 he was employed as a land surveyor, and in 1765 was selected by Benjamin Franklin and his associates to act as agent and surveyor of a projected settlement in Nova Scotia. He was for two years (1774–75) a member of the Pennsylvania Legislature, and in 1775 he also became a member of the Committee of Safety. At the outbreak of hostilities with England he raised a regiment of volunteers, of which, in January, 1776, he was appointed colonel, and was sent to Canada, where he covered the retreat of the American forces at Three Rivers. He commanded at Ticonderoga until 1777, when he was made brigadier general and joined Washington in New Jersey. He commanded the rear guard in the retreat at Brandywine; led the attack at Germantown; captured supplies for the distressed army at Valley Forge; distinguished himself at Monmouth; was defeated at Paoli, and finally achieved a brilliant victory in the storming of Stony Point (q.v.), July 16, 1779. His courage and skill greatly aided Lafayette in Virginia in 1780, where he also took part in the siege of Yorktown. Later he served in Georgia, and finally occupied Charleston, S. C., on its surrender by the British, Dec. 14, 1782. On Oct. 10, 1783, he was made brevet major general, and in the following year, having retired from the army, he entered the Pennsylvania Legislature, and in 1787 was a member of the Pennsylvania convention which ratified the Federal constitution. Having removed to Georgia and settled on a plantation given him by the State in recognition of his services, he entered Congress from that State in 1791, but in 1792 upon a contest his seat was declared vacant, and in April of that year he became commander in chief of the national army with the rank of major general. His reputation as the "Mad Anthony" of the Revolution survived and he was now called upon to end the Indian troubles on the frontier, where Harmar and St. Clair had failed. He began his campaigns in Ohio in the fall of 1793; in 1794 he was active on the Maumee, and on August 20 defeated the Indians decisively at Fallen Timbers, and in August, 1795, he, with 12 of the Northwestern tribes, signed the Treaty of Greenville by which the United States acquired a large tract of territory. While still engaged on this service his death occurred at Erie, Pa. Consult *Wayne's Orderly Book of the Northern Army at Fort Ticonderoga and Mount Independence*, edited by J. Munsell (Albany, 1859); C. J. Stillé, *Major General Anthony Wayne and the Pennsylvania Line* (Philadelphia, 1893); J. R. Spears, *Anthony Wayne* (New York, 1903).

WAYNE, JAMES MOORE (1790–1867). An American jurist, born in Savannah, Ga., and educated at Princeton College, where he graduated in 1808. He then studied law, was admitted to the bar, and practiced at Savannah. In 1829–35 he was a member of Congress. He was appointed associate justice of the United States Supreme Court in 1835. Wayne was an able orator and logician, and an authority upon admiralty jurisprudence. He favored free trade, but opposed internal improvements by Congress,

except of rivers and harbors, and opposed the rechartering of the United States Bank.

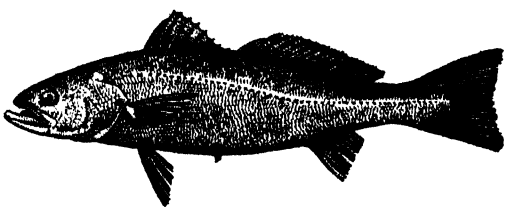
WAYNESBORO. A borough in Franklin Co., Pa., 78 miles by rail northwest of Baltimore, Md., on the Western Maryland and the Cumberland Valley railroads (Map: Pennsylvania, F 8). It is chiefly an industrial town, being especially known for the manufacture of engines, boilers, grinders, threshers, boring machines, bolt cutters, wood and iron workers' vises, nut facers, etc. There are also foundries and machine shops, and manufactories of lumber products. Pop., 1900, 5396; 1910, 7199.

WAYNESBURG. A borough and the county seat of Greene Co., Pa., 60 miles by rail south by west of Pittsburgh, on the Waynesburg and Washington Railroad (Map: Pennsylvania, A 8). It is the seat of Waynesburg College. The region is underlaid with a stratum of coking coal, and there is an abundance of oil and natural gas. There are four large gas compressing stations near here, and a shovel factory. Pop., 1900, 2544; 1910, 3545.

WAYNFLETE, or **WAINFLEET,** WILLIAM OF (?1395–1486). An English bishop and statesman. He was born at Wainfleet and probably educated at Winchester and New College, Oxford. He was ordained priest in 1426, and on the foundation of Eton College, became in 1440 a fellow, becoming the second provost in 1443. He succeeded Cardinal Beaufort as Bishop of Winchester in 1447, and a year later obtained letters patent for the foundation of a hall at Oxford to promote the study of theology and philosophy, which 10 years later he merged into his foundation of Magdalen College. As a member of the Royal Council, he was called upon to treat with the rebel Jack Cade, and incurred the hatred of the Yorkist party by his intervention. He was appointed Lord Chancellor by Henry VI in 1456, and took a decided part against the Yorkists when the crisis became acute. He lost his office on their triumph in 1460, acquiesced for the time in the rule of Edward IV, but released Henry VI from the Tower in 1470, and was obliged to purchase a pardon in 1471. After this he was much at court, and occupied with the completion of Eton and Magdalen colleges. In 1484 he founded a free school at Wainfleet. The last months of his life were spent at South Waltham, Hampshire.

WAY OF THE WORLD, THE. The last play of William Congreve, produced in 1700 at Lincoln's Inn Fields.

WAYS AND MEANS, COMMITTEE OF. In the United States, the most important committee both in the State and national legislatures, having been borrowed from the usage of Great Britain. In the House of Representatives the chairmanship of the committee usually goes to one of the acknowledged leaders of the majority party and is regarded as second only in rank to the Speakership. The Committee of Ways and Means was employed in the first Congress of 1789 and became a standing committee in 1795. It is charged with the preparation of all legislation as to raising of revenue or the payment of the national bonded debt. The committee is appointed by the Speaker; the number of members was originally seven, but is now 17; the minority party is usually given from one-fourth to one-third of the places on the committee. For dispatch of business the committee usually appoints several subcommittees. In 1850 it was given a temporary right of way over other committees of the House, and at the outbreak of the Civil War the privilege became permanent. Until 1865 the Ways and Means Committee also considered appropriation measures, but later that duty devolved upon a Committee of Appropriations, which ranks second in importance among House committees. Consult L. G. McConachie, *Congressional Committees* (New York, 1898), and Woodrow Wilson, *Congressional Government* (15th ed., Boston, 1900).



WAYZ-GOOSE. See BEAN FEAST.

WAZAN, wä-zän'. A holy city of Morocco, situated about 53 miles north of Fez. It has a number of fine mosques and a fine palace. The shereef, to whose residence Wazan owes its importance, is regarded as the spiritual ruler of Morocco, and as such is superior even to the Sultan himself. The town is outside of the jurisdiction of the Sultan and is regarded as an asylum by fugitives from justice, whence it is known as Dar D'manah or House of Safety. The inhabitants of Wazan, estimated at 10,000, are mostly descendants of the shereefs and are engaged in the manufacture of the white woolen cloth from which *jirbahs* or hooded Moorish cloaks are made.

WAZIRISTAN, wä-zē'rē-stän'. A mountainous region in northwest India bordering upon Afghanistan and included in the territory between the Gomul and Tochi rivers. It is well watered and the higher altitudes abound in picturesque scenery and have a healthful climate. Iron mining and the breeding of horses and donkeys are the principal industries. Its isolated situation renders Waziristan practically independent, although in 1897, as a result of depredations committed by the inhabitants, a British force took possession of the Tochi valley. It consists of two political agencies, northern and southern Waziristan, but the British exercise a minimum of interference with tribal chiefs. The chief town is Kanigoram.

WEA, wē'ä (abbreviated from *Wawiatenong*, referring to a settlement near an eddy in a stream). A subtribe of the Miami (q.v.). At the beginning of the nineteenth century they were resident upon the Upper Wabash River, with their principal village, known to the French as Quiatenon, just below the mouth of Wea Creek, below the present site of Lafayette, Indiana. In 1820 the Wea sold their reserved lands in Indiana and removed with the Piankishaw to Illinois and Missouri, whence they afterward removed to Kansas. In 1854 the two tribes, reduced to a mere remnant, united with the remnants of the Peoria (q.v.) and Kaskaskia (q.v.), all that were left of the ancient Illinois (q.v.).

WEAKFISH (so called on account of its tender mouth), or SQUETEAGUE. A common

WEAKFISH.

fish of the family Sciænidæ (*Cynoscion regalis*), found on sandy shores along the Atlantic coast of the United States. It is pale brownish above

with a greenish tinge, grading into silvery along the sides and belly, variegated with brown vermicular blotches, some of which form undulating lines running downward and forward. Its average weight is about five pounds, but it may attain a weight of 30 pounds. From its shape and habit of taking the hook it is sometimes called sea trout and is sold in the markets under this name. It is an important food fish along the eastern coast. It spawns in May and June. The eggs after being laid, are buoyed up by tiny oil drops and hatch in about 48 hours.

WEAK SIGHT. See ASTHENOPIA.

WEALDEN (wēl'den) **FORMATION.** An important series of fresh-water strata belonging to the Lower Cretaceous series as developed in England. Having been originally studied in the parts of Kent, Surrey, and Sussex called the Weald, this local name was given to the formation. It has been divided into two series, which do not differ very materially from each other, viz., Weald clay, 560 feet; Hastings sand, 740; total, 1300. The formation was deposited in an inland sea which covered much of southern England and extended into Germany.

WEALTH (ME. *welthe, weolthe,* OHG. *welida, welitha,* wealth, from AS. *wel, well,* Goth. *waila,* OHG. *wela, wola,* Ger. *wohl,* well; connected with Gk. *βέλτερος, belteros,* better, Skt. *vara,* better, wish, from *var,* to choose). The term "wealth" in political economy is applied to all objects possessing value (q.v.). As a rule, objects which fall under the category of wealth are useful, limited in supply, and transferable. Some authors would exclude, others include, under wealth personal services; a few would include health, strength, intelligence, and other personal attributes. The best usage confines the term to objects that are external to man. See POLITICAL ECONOMY; VALUE.

WEALTH OF NATIONS, THE. See SMITH, ADAM.

WEANING (from *wean,* AS. *wenian,* Ger. *gewöhnen,* to accustom). The substituting of artificial food for breast milk, in the case of an infant. This process should be gradual. If sudden, the mother suffers from painful breasts, and the child from indigestion. Weaning should not be accomplished in hot weather, because food, and particularly milk, is apt to be contaminated at this time. Nursing should be continued in normal cases for nine months after birth. If it be protracted beyond this the vitality of the mother may suffer, and the child may lose weight from insufficiently nourishing food. A stationary weight or a loss of weight in the child is a signal that nutrition needs supplementing, and weaning must be accomplished, even though the child seems well and is natural. Pregnancy in the mother is an imperative reason for weaning. It is wise to accustom every child to take water from a bottle after it is a few months old, before the time for weaning approaches. Sudden weaning may become imperative because the mother has no milk, or becomes the victim of an acute disease, such as pneumonia, typhoid fever, Bright's disease, or tuberculosis. Inflammatory disease of the breast is also a contraindication for nursing. During a short acute illness, the breasts may be emptied at regular intervals with a pump, while the child is fed from a bottle, and breast feeding may be resumed upon the mother's recovery. If the mother has no milk, the child must be weaned as soon as the breasts have been emptied of colostrum. It is safe to wait for two days for the milk to appear in the breasts. When weaning is sudden, reason must be employed in the use of artificial food. That is, a five-month-old child must not be put at once on a diet for that age, but gradually brought up to it after beginning with food which is proper for a child of a month old. See INFANTS, FEEDING OF.

WEARE, wâr, MESHECH (1713–86). An American political leader, born at Hampton Falls, N. H. He graduated at Harvard in 1735, studied for the ministry, and preached for a short time. He later studied law; represented his town for many years in the New Hampshire General Court; was Speaker in 1752; and served as a justice, and then Chief Justice, of the Superior Court of Judicature. He was also colonel of a regiment of militia, and was a commissioner to the famous Albany Congress of 1754. At the beginning of the Revolutionary War he was made chairman of the Committee of Public Safety; when the new courts were organized, was placed at their head; and was active in raising troops to oppose the British under Burgoyne. Under the temporary constitution of 1776 he was annually elected President of the State until 1784, when he was almost unanimously chosen under the new constitution, but resigned before the end of his term.

WEARING. See TACKING AND WEARING.

WEARING OF THE GREEN, THE. An Irish ballad by an unknown writer. It first appeared during the activities of the United Irishmen (q.v.) in 1797. Later, at the time of the Fenian troubles, a revised version was introduced by Dion Boucicault (q.v.) in his play *Arrah na Pogue,* the hero being Napper Tandy (see TANDY, JAMES NAPPER).

WEASEL, wē'z'l (AS. *weasle,* Ger. *Wiesel,* weasel; of uncertain etymology, perhaps akin to Gk. *αἴλουρος, ailouros,* cat, weasel; possibly connected, from its habitat, with OHG. *wisa,* Ger. *Wiese,* meadow). One of the small, slender carnivores of the family Mustelidæ, typical of the genus *Putorius.* The name was first applied to the small European *Putorius vulgaris,* noted for its constant pursuit of moles and field mice (voles), other European species being known as polecats (q.v.) and stoats. The latter animal (*Putorius ermina*) turns white in winter in northern localities, and its fur is ermine (q.v.). In North America are several species or varieties of weasels, all similar to one another and to the European ones. The one most familiar is the long-tailed or New York weasel (*Putorius noveboracensis*) of the Eastern States; the male is 16 inches long, the female only 13 inches, more than one-third of which belongs to the tail. It is dark chocolate-brown above and white beneath, with the end of the tail black. This stoat-like weasel turns pure white in winter wherever the climate is cold, except (as in all other species) for the black tip of the tail. A smaller species, more widely distributed through the northern United States and Canada, is the short-tailed, or Bonaparte's, weasel (*Putorius cicognani*), the male and female measuring 11 and 9 inches respectively, of which the tail takes less than a quarter; its brown is darker and its white rather yellowish. This is the one which supplies most of the ermine procured in British America in winter, although the Arctic least weasel (*Putorius rixosus*) supplies some. This last species is

only 6 inches long. Another least weasel (*Putorius alleghaniensis*) dwells in the western Alleghanies; while Florida and Texas have large species that never turn white.

Weasels are alike in disposition and habits—slim, lithe, swift, muscular, ferocious little beasts, persevering in pursuit of prey, and alert in escaping its enemies, chiefly hawks and owls. It is an admirable hunter, its scent as keen as its sight. It wearies out animals larger and apparently much stronger than itself, preying on mice, rats, birds, and other small animals, sometimes even on hares and rabbits, robbing birds' nests, devouring the young or sucking the eggs, and is often troublesome in poultry yards. It also does great good by devouring field mice, etc., about barns and granaries. It climbs walls and trees with agility, and does not hesitate to plunge into water after the water rat. It abstracts the blood of the animal which it has killed, and generally devours the brain; but when food is abundant it carries the body to its retreat, where a considerable quantity of prey is often found, the weasel continuing to eat it in a half-putrefied state. It apparently kills for the love of killing, or at least this is suggested by the slaughter sometimes worked in a poultry yard, and the fact that many of the chickens killed are left untouched, and seemingly without even having had their blood sucked. The weasel generally sleeps during the day, and is most active at night. It has a disagreeable smell, which is strongest in hot weather, or when it has been pursued or irritated. It is capable of being tamed when taken young, and becomes docile and gentle. The female weasel makes a nest of straw, leaves, and moss for her young, which are produced in spring, four or five in a litter, often in a crevice of a bank or in a hollow tree. See FUR-BEARING ANIMALS, and the bibliography and references there given. Consult C. H. Merriam, "Synopsis of the Weasels of North America," in *North American Fauna*, No. 11, published by the United States Biological Survey (Washington, 1896).

WEATHER, wĕTH'ĕr (AS. *weder*, Ger. *Wetter*). The condition of the atmosphere at any time in respect of temperature, moisture, precipitation, sunshine, wind, electricity, dust, or any other meteorological element. The study of weather is of importance to mankind, and has always received great attention, especially because of the desire to anticipate or predict approaching important changes in the weather. The weather bureau (q.v.), or meteorological office, as now established in nearly every civilized nation of the globe, represents the latest practical application of physical science to the needs of mankind; its primary duty is to preserve and study the records of local weather in order to make satisfactory local forecasts.

Modern physical meteorology with its elaborate weather records may be said to have begun in 1653, when Ferdinand II, Grand Duke of Tuscany, distributed thermometers to several cloisters in Italy and organized a system of daily records under the general oversight of Father Luigi Antinori. In 1657 barometers, wind-vanes, and hygrometers were added to the equipment of these stations. Continuous automatic records of the individual features of the weather probably began in England between 1666 and 1670, with the Moreland barometer and other apparatus devised by a special committee of the Royal Society, of which Sir Christopher Wren was chairman. A great advance has been made in meteorology since the great exhibition or World's Fair of 1851 at London, when for the first time the items appropriate to the weather map were telegraphed for display upon charts. At the present time similar daily weather maps are compiled by all nations, so that the student quickly acquires a comprehensive view of the conditions existing in any part of the world. In 1873 the United States Weather Bureau, then a part of the Signal Service of the army, commenced the formation of a daily weather map of the whole Northern Hemisphere, which was published continuously from 1875 to 1883, inclusive, and was kept up in manuscript for ten years later. This gigantic undertaking included observations from the ocean as well as the land, and only by the use of similar maps can we hope to understand and predict changes of the weather in distant parts of the globe. In order to make satisfactory predictions of the monsoon rains in India, a daily weather map of the Indian Ocean, or the monsoon area, was compiled at Calcutta during the years 1893–99, and by agreement between the Secretary of War and the Secretary of the Navy daily weather maps of the Atlantic and Pacific oceans have been compiled by the United States Hydrographic Office since 1888. (See Page, *Instructions to Voluntary Observers of the Hydrographic Office*, Washington, 1901.) Similar maps for the North Atlantic for 1881–82 were issued by the London Meteorological Office.

Weather Forecasts are based on the general study of types of weather, combined with the study of the series of the daily weather maps for a few days immediately preceding the period for which predictions are to be made. No forecast of weather is made for a period in advance longer than is warranted by the rapidity with which atmospheric changes happen to be going on at that time. The forecast usually covers all questions bearing on destructive winds, excessive heat or cold, rain or snow, river floods, etc. Special forecasts of the weather for any given locality or time are usually made when requested. Consult: W. L. Moore, *Descriptive Meteorology* (New York, 1910); W. N. Shaw, *Forecasting Weather* (London, 1911); W. I. Milham, *Meteorology* (New York, 1912), containing a bibliography; and publications of the United States Weather Bureau (Washington). See CLIMATE; METEOROLOGY; WEATHER BUREAU; ETC.

WEATHERBEE, wĕTH'ĕr-bē, SIR RICHARD LINTON (1836–). A Canadian lawyer and jurist. He was born at Bedeque, Prince Edward Island, and in 1858 graduated at Acadia University, Wolfville, N. S. After a few years' newspaper work, during which he contributed chiefly to the *Acadian Recorder*, he was called to the bar in 1863, and practiced his profession in Halifax, where he became one of the leaders of the provincial bar. In 1877 he was counsel for the Dominion before the Halifax Fisheries Commission (see FISHING LAWS). He was a puisne judge of the Supreme Court of Nova Scotia in 1878–1905, and then Chief Justice until his retirement in 1907.

WEATHER BUREAU. The specific meaning of this term is derived from the Act of Congress of Oct. 1, 1890, portions of which read as follows:

"That the civilian duties now performed by the Signal Corps of the army shall hereafter devolve upon a bureau to be known as the

Weather Bureau, which, on and after July 1, 1891, shall be established in and attached to the Department of Agriculture."

The duties devolving upon the Weather Bureau are defined by sec. 3 of said Act, as follows:

"That the Chief of the Weather Bureau, under the direction of the Secretary of Agriculture, on and after July 1, 1891, shall have charge of the forecasting of weather, the issue of storm warnings, the display of weather and flood signals for the benefit of agriculture, commerce, and navigation, the gauging and reporting of rivers, the maintenance and operation of seacoast telegraph lines, and the collection and transmission of marine intelligence for the benefit of commerce and navigation, the reporting of temperature and rainfall conditions for the cotton interests, the display of frost and cold-wave signals, the distribution of meteorological information in the interests of agriculture and commerce, and the taking of such meteorological observations as may be necessary to establish and record the climatic conditions of the United States, or as are essential for the proper execution of the foregoing duties."

Among early meteorological services of importance were those of the Surgeon-General of the United States army (1818); Russia (1837); Austria (1848); Prussia (1848); Smithsonian Institution (1849); Netherlands (1849); England (1860); and France (1863). At present nearly every civilized nation has its weather bureau or meteorological office, and many have also marine or hydrographic offices. The United States Weather Bureau was originally organized under the Chief Signal Officer of the army, and its history goes back to Feb. 9, 1870. But in fact the system of observation by voluntary and unpaid observers, which forms so large a part of the old records of the bureau, goes back to the year 1849, when the Secretary of the Smithsonian Institution began to organize this corps of observers; indeed, one may go back to the year 1817, when Josiah Meigs issued his meteorological instructions to the registrars of the United States Land Office, and 1818, when Dr. Lovell, Surgeon-General United States army, issued similar instructions to his officials. In 1838 Prof. James P. Espy secured the appointment of a joint committee on meteorology, representing various scientific interests in Philadelphia. This committee began the collection of daily observations and the preparation of daily weather maps. In 1842 Espy was appointed meteorologist to the government, and assigned to duty in the War Department, where he continued to compile and study daily weather maps. In 1851 he was ordered to continue his work under Professor Henry as Secretary of the Smithsonian Institution; in 1854 the latter began the preparation for the daily display of weather maps based on telegrams from all parts of the country, and from 1856 to 1861 such a map was daily exhibited and studied, and frequently made the basis of weather prediction. This work was discontinued on account of the irregularities in the telegraph service incident to the Civil War, and was taken up again jointly by the observatory of the Astronomical Society and the Chamber of Commerce in Cincinnati in 1868. In February, 1870, an Act of Congress ordered the Secretary of War to provide for the observation and prediction of storms, to which subsequently were added floods and weather. The work that was then being carried on at Cincinnati was therefore transferred to Washington. In 1891 these duties were transferred to the Weather Bureau, which was reorganized under the Department of Agriculture.

As at present organized, the Weather Bureau comes under the rules governing the civil service of the country. Its first chief was Prof. Mark W. Harrington (q.v.), to whom Prof. Willis L. Moore (q.v.) succeeded July 4, 1895, who in turn was succeeded by Prof. Charles F. Marvin (q.v.) Aug. 4, 1913. The Weather Bureau employs the whole time of about 800 paid employees, located at about 200 stations, distributed throughout the United States and the West Indies. It also receives reports of temperature or rain or rivers from several hundred special observers and from over 4000 cooperative observers of local climatological matters; also about 20,000 special reports on the condition of the growing crops from a meteorological point of view.

The bureau receives daily two regular sets of weather telegrams at 8 A.M. and 8 P.M., on which are based the morning and evening weather charts and the forecasts for the next 36 hours. These forecasts are immediately telegraphed to all concerned throughout the country and to vessels about to sail in any direction over the adjacent oceans; they are published in local newspapers, on special telegraph forms, on special postal cards, by flag signals, and by other methods of communication, so that within an hour's time after the forecasts leave Washington they can be obtained by any one who lives within access of a telegraph or telephone office. Those who can be reached only by mail receive the forecasts a few hours later. The forecasts of heavy storms, cold waves, and injurious frosts and specially hot weather are verified almost without exception; the forecasts of rain are the least successful of all. (See STORM AND WEATHER SIGNALS.) A system of so-called wireless agencies of communication is now extensively employed both for collecting weather reports and disseminating forecasts and warnings. The condition of the rivers, especially in times of flood, is telegraphed to all those interested; predictions of the rise and fall of the water are made oftentimes with remarkable success, and are of the greatest value to life and property interests located in river valleys subject to floods and overflows. *The National Weather and Crop Bulletin* is published weekly during the summer season, and monthly from October to April, giving full details of the temperature and rainfall as compared with normal conditions, and showing the influence of the weather on the development of the future crop. In the winter a *Snow and Ice Bulletin* is published weekly, showing the quantity of snowfall, the ice in the rivers, the opening and closing of navigation, the condition of winter wheat, and the injury done to crops by cold waves, frosts, or floods.

In addition to the central forecast district at Washington, five others are maintained, having their centres at Chicago, New Orleans, San Francisco, Portland (Oregon), and Denver, each of which issues independent forecasts. In the interests of local climatology, the larger States, or groups of smaller States, are organized as sections, and publish monthly a section report, which gives every observation of rainfall and temperature made during the month, as also charts of isotherms and rainfall. There are at

present 45 such sections, including those of Cuba and Porto Rico. The analogous publications for the Hawaiian Islands and for the Philippines are specially provided for by those territories. The general climatology of the United States is provided for by the publication of the *Annual Report of the Chief of the Weather Bureau*, which contains several hundred quarto pages of tabular matter and additional special reports or memoirs. In order to secure prompt publication of general climatological data, the bureau publishes a *Monthly Weather Review*, which contains not only a summary relative to storms, forecasts, and warnings, and the general climate and crop conditions, but also 10 or 20 pages of special contributions and notes bearing on questions of meteorology, seismology, aërology, etc.

All apparatus used by the bureau is carefully tested, and all stations are frequently inspected, so as to secure the greatest possible exactness and uniformity. The Instrument Division is in charge of apparatus and methods of observation. New instruments and improvements on old apparatus emanate from this division. When ordinary telegraph and telephone lines and cables are not otherwise available, the bureau builds and controls its own lines. Special researches of any magnitude are generally published as bulletins, of which there are an octavo and a quarto series. Among these are those relating to international weather charts and storm tracks for the Northern Hemisphere; the results of observations with kites; and the study of the radiation of heat by the air. The headquarters of the Weather Bureau are located in a special building in Washington, D. C. The early history of this and other national weather bureaus is given in *Bulletin No. 11;* many additional details will be found in Moore, *Meteorology, Practical and Applied* (London, 1894). Consult also Abbe, *Aims and Methods of State Weather Services* (Baltimore, 1900); Bayard, *Annual Presidential Address*, before Royal Meteorological Society (London, January, 1899); Bartholomew, *Physical Atlas*, vol. iii, "Meteorology" (ib., 1900). See METEOROLOGY; SIGNALING AND TELEGRAPHING, MILITARY; STORM AND WEATHER SIGNALS; WEATHER; ETC.

WEATHERFORD, wĕTH'ĕr-fĕrd. A city and the county seat of Parker Co., Texas, 31 miles by rail west of Fort Worth, on the Texas and Pacific, the Gulf, Colorado, and Santa Fe, the Gulf, Texas, and Western, and the Weatherford, Mineral Wells, and Northwestern railroads (Map: Texas, D 3). It is the seat of Weatherford College (Methodist Episcopal, South) and the Texas Fairmont College and Conservatory of Music. There are also a Pythian home for orphans, a sanitarium, and a courthouse. Weatherford has among its industries a cotton mill, cotton gins and a compress, bottling works, a peanut factory, foundry and machine shops, railroad shops, a creamery, and manufactories of flour, pottery, and lumber products. Pop., 1900, 4786; 1910, 5074.

WEATHERFORD, wĕTH'ĕr-fĕrd, WILLIAM (c.1780–1826). A mixed-blood chief of the Creek Indians, the leader of the hostiles in the Creek War of 1813–14. He was the son of a white father by a half-breed woman whose father was a Scotchman. He first came into prominence by leading the attack upon Fort Mims (q.v.), Aug. 30, 1813. It is maintained, with apparent truth, that he did his best to prevent the excesses following the victory, and left the scene rather than witness the atrocities. At the battle of the Holy Ground in December, 1813, he was defeated and narrowly escaped capture by Claiborne's troops. When the last hope of the Creeks had been destroyed by the bloody battle of the Horseshoe Bend, March 27, 1814, in which nearly 1000 Creek warriors perished, Weatherford voluntarily surrendered to Jackson, creating such an impression by his straightforward manner that the general allowed him to go back alone to collect his people preliminary to arranging terms of peace. After the treaty he retired to a plantation at Little River, Ala., where he passed the remainder of his life.

WEATHERLY, wĕTH'ĕr-lē. A borough in Carbon Co., Pa., 12 miles northwest of Mauch Chunk, on the Lehigh Valley Railroad (Map: Pennsylvania, K 5). There are silk mills, foundries, a candy factory, a fabricating plant, and a cigar factory. Pop., 1900, 2471; 1910, 2501.

WEATHERLY, wĕTH'ĕr-lē, FREDERIC EDWARD (1848–). An English song writer, born at Portishead, Somersetshire. He graduated at Brasenose College, Oxford, in 1871, and was called to the bar at the Inner Temple in 1887. Beginning with *Muriel and Other Poems* (1870), he wrote many popular songs, especially for children, among them: "London Bridge," "The Three Old Maids of Lee," "Darby and Joan," and "The Holy City." Among the best known of his writings are *Lays for Little Ones* (1898), and many delightful stories and sketches, such as *Wilton School* (1872), *Oxford Days* (1879), and *Two Children* (1884). He also wrote *The Rudiments of Logic* (1879) and *Questions in Logic* (1883).

WEATHER SIGNALS. See STORM AND WEATHER SIGNALS.

WEATHER VANE. See ANEMOGRAPH; ANEMOSCOPE.

WEA'VER, EMILY POYNTON (1865–). A Canadian author. She was born near Manchester, England, went to Canada with her parents in 1880, and lived in Oxford County, Ontario, Toronto, Halifax, and again in Toronto. She contributed short stories and historical essays to the leading British and American periodicals and published: *My Lady Nell* (1890); *The Rabbi's Sons* (1892); *Prince Rupert's Namesake* (1893); *The Rainproof Invention* (1896); *A Canadian History for Boys and Girls* (1905); *Builders of the Dominion: Men of the East* (1907); *Old Quebec: The City of Champlain* (1908); *The Trouble Man* (1910); *The Story of the Counties of Ontario* (1913); *Canada and the British Immigrant* (1914).

WEAVER, HENRY A. (1832–1903). An American actor. He was born in London, England, but was brought to the United States when a child. His début on the professional stage was made in Brooklyn in 1853. During his long career he supported "Lotta" (playing Quilp in her *Little Nell and the Marchioness*, Boston, 1866), Mme. Janauschek, J. B. Booth, Tommaso Salvini (with whom he played Iago), Mrs. Langtry, Julia Marlowe, Stuart Robson (with whom he played Doctor Johnson in *Oliver Goldsmith*), and Mrs. Leslie Carter.

WEAVER, JAMES BAIRD (1833–1912). An American political leader, born at Dayton, Ohio. He graduated at the Cincinnati Law School in 1854, practiced law in Iowa, and served in the Civil War, being brevetted brigadier general of

volunteers in 1865. In 1866–70 he was district attorney for the Second Judicial District of Iowa, and in 1867–73 also an assessor of the United States internal revenue. For a time he edited the Iowa *Tribune* at Des Moines. He was active in the organization of the National Greenback party, was elected to represent that party in Congress in 1878, and in 1880 was its candidate for the presidency, receiving a popular vote of 308,578. In 1884 and 1886 he was again elected to Congress by a fusion of Democrat and Greenback votes, but was defeated in 1888. In 1892 he was the candidate of the People's party for the presidency, receiving 22 electoral votes, and a popular vote of 1,041,028. He was mayor of Colfax, Iowa, in 1904–06. He published *A Call to Action* (1892), and *Past and Present of Jasper County, Iowa* (1912).

WEAVER, JONATHAN (1824–1901). A bishop of the United Brethren in Christ. He was born in Carroll Co., Ohio; entered the ministry in 1847 and became Bishop in 1865; in 1893 he was made emeritus. He published *Universal Restoration Not Sustained by the Word of God* (1878), *Practical Comment on the Confession of Faith of the United Brethren* (1892), and *Christian Theology* (1900). Consult H. A. Thompson, *Biography of Jonathan Weaver* (Dayton, 1901), and Daniel Berger, *History of the United Brethren in Christ* (ib., 1897).

WEAVER BIRD. The popular name for a group of birds, forming the family Ploceidæ, similar to the finches. The name refers to the structure of the nests of these birds, which are woven in a wonderful manner of various vegetable substances. About 275 species of Ploceidæ are known, of which over 200 are found in Africa, and the remainder in tropical Asia, the Philippines and other East Indian islands, and Australia. They are small birds, with a strong conical bill, sometimes coral red. The claws are large and very long. The wings are pointed, the first quill remarkably short. There is great diversity in the form and appearance of the nests constructed by different species. One of the best-known species is the yellow weaver (*Ploceus philippinus*), the baya (q.v.) of India. Many other weaver birds construct nests much on the same plan—pouches elongated into tubes, entered from below; some are kidney-shaped, with entrance at the side. They often suspend their nests in the same way from the extremities of branches, and prefer branches which hang over water, probably as affording security against enemies. Social habits are prevalent among them, and many nests of the same species are often found close together. Some of them attach one year's nest to that of the year preceding, as certain Madagascan species, which sometimes thus make five nests in succession, one hanging to another. Some of the African species build their nests in company, the whole forming one structure. The social weaver birds (*Philetærus socius*) of South Africa construct in communities an umbrella-shaped roof in a tree, beneath which may be 300 bird homes. An acacia with straight, smooth stem, such as predaceous animals cannot climb, is often selected. The birds begin by constructing the roof (of coarse grass), each pair afterward building their own nest, formed in an excavation on the under side of the roof. As new nests are built every year, the weight of the structure often becomes so great as to break down its support. The waxbills, Java sparrows, nutmeg birds, African oxpeckers, and other species elsewhere described belong to this large family, and make remarkable community nests. The widow birds (q.v.) are closely related to them. See Plate of NESTS OF WEAVER BIRDS.

WEAVER'S-SHUTTLE SHELL. A smooth, usually white gastropod, related to the cowry (q.v.), whose aperture is drawn out into a long canal at each end. The foot is narrow and adapted for clasping the round stems of the

WEAVER'S-SHUTTLE SHELL.

alcyonarian coral Gorgonia, on which the mollusk feeds. The best-known species is *Ovulum volva*. The genus contains many species inhabiting all warm seas, and the group is sometimes called China shells.

WEAVING (from *weave*, AS. *wefan*, Ger. *weben*, to weave). The art of making cloth on a loom (q.v.) which in its simplest form is merely a frame to hold the warp threads parallel and regular, and enable sheds to be formed through which the wefts can move freely in a straight line without the necessity of passing over and under, as in plaiting, or in making lace (q.v.) on the pillow.

The three fundamental steps in weaving after the loom has been warped are: (1) pulling the lisses or healds to form the new shed; (2) passing the weft (usually called filling in machine weaving) through the shed; (3) pressing home the weft.

The three fundamental weaves are plain, twill, and satin. All others are merely variations and complications of these.

In plain weave the warp is divided into only two systems, the odd threads being attached to one set of lisses, the even threads to another. The passes of the weft to the left are through a shed that has the odd warps next to the weaves; the passes of the weft back to the right are through a shed that has the even warps next the weaver.

In twill weave the warp is divided into at least three systems, and there is not complete alternation of warp and weft as there is in plain weave. In a two-one twill the first weft passes over warp one, under warps two and three, over warp four, under warps five and six, etc.; the second weft over warps two, five, eight, etc., and under the others; the third weft passes over warps three, six, nine, etc., and under the others. This of course leaves only half as much weft as warp on the surface, and forms the diagonal ribs or ridges that are characteristic of twills.

In satin weave, which demands small silky threads, and which is primarily a silk weave, the warp is divided into at least five systems, and the weft is so passed that not more than one-fourth as much weft as warp remains on the surface, also the points where the weft comes to the surface are placed irregularly to avoid twill or diagonal effects. The result is that the wefts are practically negligible, and the surface appears to consist entirely of short lengths of parallel warps, thus giving the glossy effect characteristic of satin.

Figs. 1, 2, and 3 illustrate plain, twill, and satin weaves as plotted for a machine loom. In *A* the horizontal lines represent the healds or

loom harness with the disposition of the warp threads; the weave is shown at *B* written out on squared design or cross-section paper, each section representing the crossing of a warp and filling thread and the X marks showing that the warp is above the filling at the point they appear; the blank sections show that the filling is above the warp; the threads as interlaced are shown at *C*, and a section of the fabric cut through the warp is shown at *D*.

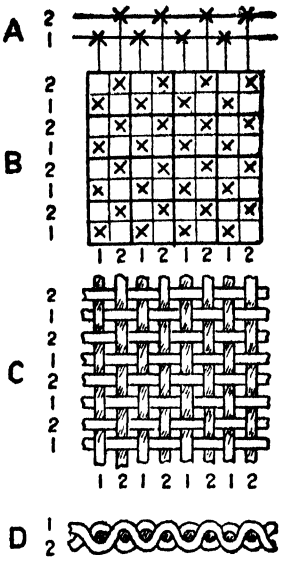


FIG. 1. PLAIN WEAVE.

The plain weave (Fig. 1) is the simplest form of weaving, requiring but two different movements of the warp threads. Four repeats of the weave in warp and filling are shown. From an examination of the several diagrams it will be seen that the movements of threads marked 1 are identical and of threads marked 2, while all alike, are exactly opposite to the movement of the former; this makes it possible to arrange the warp for the loom on the harness frames, as at *A*, and by raising No. 1 and depressing No. 2 the shed is formed while the first pick, or shot, of the filling is passed through, then harness No. 1 is depressed and No. 2 raised and the second filling thread is passed through the new shed; the third shed is like the first, the fourth like the second, and the weave repeated forms the fabric with the plain weave. Patterns in this weave can only be produced by the use of threads of different colors or material. It is not only the simplest but the firmest and strongest of weaves.

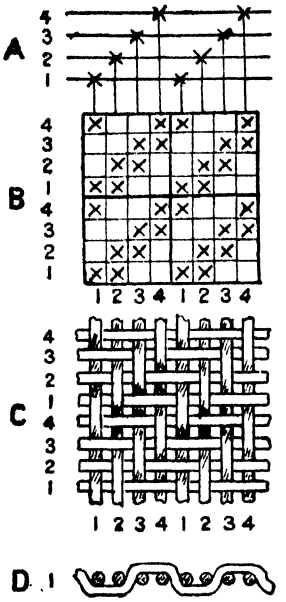

FIG. 2. TWILL WEAVE.

The twill weave, as illustrated in Fig. 2 by one of the simplest forms, is a weave in which the filling threads pass over or under two or more adjacent warp threads at a time, at least once in a repeat, each of the picks being alike except that each is stepped one thread to the right or the left of the one preceding it. The simplest twills may be woven on three harness and are technically "one up and two down," $\frac{1}{2}$, or "two up and one down," $\frac{2}{1}$, twills, the former being a filling-face and the latter a warp-face weave as the warp or filling predominates on the face. The next twills are the four harness twills, $\frac{2}{2}$, $\frac{3}{1}$, which are warp-face and filling-face weaves respectively, and $\frac{2}{2}$, which is even-sided; the twill used in the diagrams under Fig. 2 is a $\frac{2}{2}$ twill. The twill weave is distinguished by having a distinct wale or diagonal pattern, and by changing the number of threads taken up a great variety of twill weaves may be produced. Twill weaves are designated as right twills and left twills, as the diagonal, when traced from the bottom of a piece of cloth held lengthwise, leads to the right or left respectively. The twill shown in Fig. 2 is a right twill. By various arrangements of the twill weaves, curved twills or weaves may be formed instead of plain diagonals. By drawing the warp threads in different ways on the loom harness fancy weave effects are produced, such as the herringbone, where a section of right twill and a section of left twill alternate.

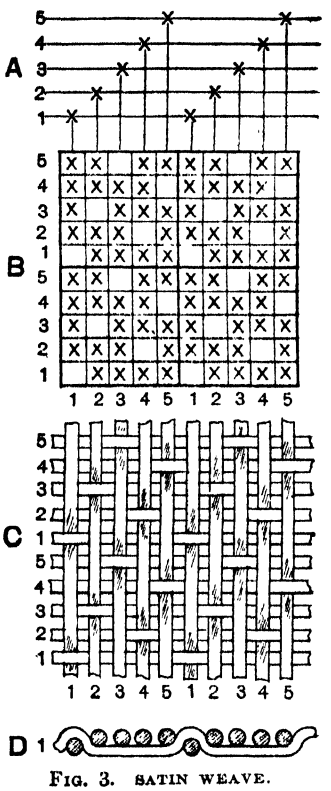

FIG. 3. SATIN WEAVE.

The simplest satin weave is produced with five harness and is illustrated in Fig. 3. An examination of the diagram shows that the stitching of the warp threads to the filling is so distributed that no two intersections are adjacent; and in order to make a smooth surface the warp threads stitch down to but one filling thread in a repeat of the weave. The weave as shown produces a fabric with warp satin face and filling satin back.

Rep and Taffeta Weaves. The simplest forms of plain weave have warp and weft threads of equal size and equal number to the inch, and showing equally on the surface, as in hard-spun etamines or rough-spun burlaps. Increasing the size and hardness of the warps, and decreasing the size while increasing the number and softness of the wefts, and pressing the wefts home hard, buries the warps entirely and produces a ribbed surface consisting entirely of wefts, the ribs marking the position of the hidden warps. This is the so-called rep weave, except that usually on the shuttle loom the warps are fine and the wefts are coarse, and the result is a warp rep instead of a weft rep. When the weft rep on a bobbin loom is figured by blocking in the colors with short passes, instead of sending the weft the full width of the warp as on the shuttle loom, the result is real tapestry. (See TAPESTRY.) On the other hand, if on a shuttle loom we have coarse wefts with fine warps, but the warps are so few that instead of covering the wefts they serve merely as binders, the result is taffeta. If the warps are numerous, but the wefts are inserted in satin weave, then the result will be warp satin on one side and will look like taffeta on the other.

Damasks and Brocades. These, like satins, are primarily silk weaves developed on the shuttle loom in China, the home of silk, just as twills and tapestries were developed in wool on

the bobbin loom in Flanders. Damask is a weave with warp satin ground and weft satin, twill, or taffeta figures, or vice versa. Brocade, derived from the Spanish for brocaded, and ultimately from the broche, i.e., the pointed bobbin of the high-warp loom, originally meant the combination of bobbin and shuttle effects; in other words, figures inserted with bobbins during the process of weaving a shuttle fabric. Ancient shuttle silks containing gold are usually called brocades, because the gold thread was inserted from bobbins, even in what would otherwise be damasks. Nowadays the brocaded effects, even on many hand looms, are usually inserted with extra shuttles. Of brocaded figures in general it may be said that they are weft effects, apt to be small and detached and in relief and in color, as contrasted with most damask figures that are large and flat and usually in the same color as the ground, but with contrasting tone produced by the contrast of weaves. The technical term for damask with ground of different color from the figures is "lampas." Brocatelle is a damask with large satin figures that are forced out into bold relief by the coarseness of the linen or cotton weft. Light-weight brocaded silks are usually called *soies brochées*, by way of distinction from the rich and heavy brocades based upon ancient cloths.

Velvet. Velvets are also primarily a silk weave, corresponding in wool to the hand-knotted Oriental rugs. (See RUGS, ORIENTAL.) Brussels and Wilton carpets (see CARPETS AND RUGS), and their printed imitations called tapestry carpets and velvet carpets, are merely the velvet weave applied to floor coverings of wool. Corduroys and velveteens are fabrics with pile surface, formed by bringing weft threads in loops to the surface and then cutting the loops. The primitive form of these can be seen in the Coptic velvets with uncut woolen weft pile, of which there are several important examples in the New York Metropolitan Museum of Art. The pile of modern velvets is produced not by extra wefts, but by extra warps that loop over wires which are withdrawn after the passage of the binding weft. When the velvet is to be cut velvet, the wires often have knives on the end that do the cutting automatically as the wires are withdrawn. Plain velvets are often woven double, with a common pile the cutting of which produces two complete velvets, one facing up and the other down. Velvets are figured by using several systems of warps of different colors, as in Brussels and Wilton carpets; by leaving part of the surface without pile and in satin or twill or taffeta; by contrasting surfaces of cut pile with surfaces of uncut pile; and by contrasting pile of two different heights. The more elaborate and complicated effects have never been produced in America, and in Europe on hand looms only. Terries and Turkish toweling are woven plain with uncut loops.

In gauze and other crossed weaves the warps twist over each other back and forth producing embroidered effects as in lappets, or openwork effects as in lenos and woven laces. In plain gauzes the warps twist in pairs around the filling threads, and produce a structure that, though light and open, is comparatively firm. A fair comparison is that between madras and crete, the former having a gauze and the latter an etamine ground. Leno is muslin with gauze effects introduced at regular intervals. The introduction of crossing threads that differ in color or count from the rest, as well as variation in the number of threads that cross and in the weft threads that are crossed, and the combination of gauze with twill, satin, brocade, or velvet weaves, produces some of the most delightful and unconventional stuffs that are known. In lappets the surface of a plain or gauze fabric is diapered with simple embroidery effects, by drawing with the lappet needle extra warp threads back and forth from point to point, binding them with the weft only at the outlines of the figures, and floating them loosely between.

Swivel weaving is accomplished by a special attachment described in the article LOOM. The swivel introduces a special filling to form figures on the face of the fabric—usually at a distance one from another—and while the result is similar to that secured by lappet weaving, much more elaborate effects can be produced, as the warp threads may be manipulated to bind the filling in a weave which, while causing it to predominate on the face of the fabric, does not make it float as in the lappet weave, where the figuring thread is bound down only at the right and left sides of the figure to be produced, with no intermediate stitches. By the use of a tier of shuttles in the swivel attachment several colors may be introduced in the figure, as when weaving a fabric where the ground may be figured in an all-over pattern of leaves or vines produced by the regular warp and filling, and the flowers are scattered over the surface and blended of two or three different colored threads by the swivel attachment. The great advantage of producing figured effects by lappet or swivel weaving over the use of a regular warp or filling is that in the latter the warp or filling floats from figure to figure on the back of the fabric, there being as many floating threads as there are threads in the figure; and these threads must be trimmed off after weaving, causing a great waste of material, while in the former mode of weaving the special warp or filling floats from figure to figure in but a single thread.

As the space in the power loom usually limits the number of harness frames to 24, great ingenuity is displayed by designers in the effort to produce complicated warp movements simply. A simple illustration of this feature of weaving

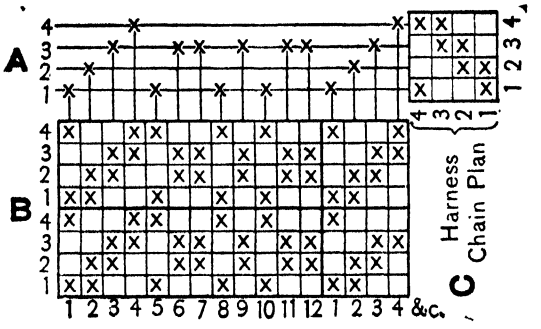

FIG. 4. DRAWING-IN DRAFT AND HARNESS—CHAIN PLAN.

is shown in Fig. 4. The weave *B* repeats itself on 12 threads and could be woven on 12 harness, but the number of harness may be reduced to four by drawing all threads which have like movements on the same harness as designated at *A*. The same principle is applied to more elaborate patterns where the weave may repeat on 100 or more warp threads and could be reduced, by the special drawing-in, to a number of harness which can be handled in the loom. In the harness looms the movements of the various harness

are governed either by cams or a pattern chain which is so arranged that as it passes over a small intermittently revolving cylinder the bars of the chain, which are supplied with a roll or small cam for each harness that is to be raised, act on certain levers which control the harness and raise or lower them according to the arrangement of the harness chain. Diagram *C* in Fig. 4 is the plan for the harness chain to produce the weave *B* when the warp is drawn in the harness as at *A*.

For patterns where the warp threads interlace with so many different movements that the weave may not be reduced as above, the patterns must be produced in a loom supplied with the Jacquard machine, which is a special head motion or harness motion, described in the article LOOM.

WEBB, ALEXANDER STEWART (1835–1911). An American soldier and educator, born in New York City. He graduated at West Point in 1855; was assistant professor of mathematics there in 1857–61; and during the Civil War served in the defense of Fort Pickens, at the first battle of Bull Run, and in the Peninsular and Maryland campaigns, and was made a brigadier general of volunteers in June, 1863. At Gettysburg his brigade played a conspicuous part in repelling Pickett's famous charge. He commanded a division in the Rapidan campaign, and a brigade in the campaign of the Wilderness; was severely wounded at Spottsylvania; and acted as chief of staff to General Meade after his return to active service. In August, 1864, he was brevetted major general of volunteers for his services at Gettysburg and in the Wilderness campaign, and in March, 1865, was brevetted brigadier general in the regular army for his services in the last campaign against General Lee, and major general for his services during the war. In December, 1870, at his own request, he was honorably discharged. From 1869 until 1903 he was president of the College of the City of New York. He published *The Peninsula: McClellan's Campaign of 1862* (1882).

WEBB, SIR ASTON (1849–). An English architect, born in London. He served as president of the Architectural Association (1884) and of the Royal Institute of British Architects (1902–04); in 1903 was elected to the Royal Academy; received in 1905 the gold medal of the Royal Institute of British Architects and in 1907 that of the American Institute of Architects. Webb was knighted in 1904 and received the K.C.V.O. in 1914. His works include: the Birmingham Assize Courts; the Admiralty Arch at the east end of the Mall, London; the Britannia Royal Naval College and Sick Quarters at Dartmouth; the new buildings of the Victoria and Albert Museum, the Royal College of Science, and the Imperial College of Science and Technology, all at South Kensington; the French Protestant Church, Soho; London offices for the Grand Trunk Railway of Canada; architectural surroundings for the Victoria Memorial at Buckingham Palace, and the new façade of the palace itself.

WEBB, BEATRICE, *née* POTTER (1858–). An English economist. After receiving a private education she engaged in the investigation of social and industrial conditions. She was married to Sidney Webb (q.v.) in 1892. In 1905–09 she served on the Royal Commission on Poor Law and Unemployment, of whose minority report she was joint author, and after 1909 was honorary secretary of the National Committee for the Prevention of Destitution. She edited *The Case for the Factory Acts* (1901) and *The Case for the National Minimum* (1913); wrote *The Coöperative Movement in Great Britain* (1891; new ed., 1904); and was joint author of several important works noted in the article on her husband. She became one of the leading members of the Fabian Society. Manchester University honored her with the degree of D.Litt.

WEBB, CHARLES HENRY (1834–1905). An American author, born at Rouse Point, N. Y. He ran away to sea in his youth, was on the staff of the New York *Times* in 1860–63, and, having in the latter year gone to California, there founded *The Californian*, which he edited until 1866. He subsequently contributed to the New York *Tribune* humorous articles over the signature John Paul. His publications include *Liffith Lank* (1866), *John Paul's Book* (1874), *Parodies, Prose, and Verse* (1876), *Vagrom Verse* (1889), and *With Lead and Line Along Varying Shores* (1901).

WEBB, JAMES WATSON (1802–84). An American journalist. He was born in Claverack, N. Y. In 1819 he entered the United States army as second lieutenant of artillery, was stationed in the West, and in 1827 resigned his commission. The same year he became editor of the New York *Morning Courier*, and having united with this the *Enquirer*, edited the *Morning Courier and New York Enquirer* until 1861. It was the leading Whig journal until that party was dissolved. He was in 1843 appointed engineer in chief of the State of New York, with rank of major general, and in 1861 Minister and Envoy Extraordinary to Brazil. In 1865 he negotiated the secret treaty with the French Emperor for the removal of French troops from Mexico, and in 1869 resigned. After his return from Brazil he lived in New York till his death. He published: *Altowan, or Incidents of Life and Adventure in the Rocky Mountains* (1846); *Slavery and its Tendencies* (1856); and *National Currency*, a pamphlet (1875).

WEBB, JOHN RICHMOND (c.1667–1724). An English general, born probably at Rodbourne Cheney, Wiltshire, an old possession of the family. He distinguished himself under Marlborough at Blenheim and at Oudenarde, where he commanded the left. He became brigadier general in 1704 and major general in 1706. His clever victory at Wynendaele, Belgium, in 1708 over a French force three times as large as his own was credited by the Whigs at home, notably Addison, to Cadogan, a junior officer, an injustice which heightened rather than lowered

the popularity of Webb, who readily took the cue from his Tory friends and played the part of one persecuted for politics' sake. In 1709 he became lieutenant general and was severely wounded at Malplaquet. From 1712 to 1715 he was general and commander of the land forces in Great Britain, but the Whigs turned him out, and in 1722 by charging him with membership in a Jacobite society forced his retirement from public life. His character as the big, handsome soldier and simple politician is excellently portrayed in *Henry Esmond* by Thackeray, who through his paternal grandmother was descended from Richmond Webb, the general's second cousin.

WEBB, SAMUEL BLATCHLEY (1753–1807). An American soldier, born at Wethersfield, Conn. He early joined the Patriot party, and as lieutenant in the Second Connecticut Company, joined the Continental army at Cambridge. He served with great gallantry and was wounded at Bunker Hill, and in 1775, became aid-de-camp to General Putnam, with the rank of major. In 1776 he was chosen by Washington as his private secretary and aid, with the rank of lieutenant colonel, and as such wrote the order for promulgating the Declaration of Independence in New York City. He participated in the battles of Long Island, White Plains, Trenton, and Brandywine, being wounded at White Plains and Trenton, and on Dec. 10, 1777, during an expedition to Long Island, was taken prisoner. Exchanged in December, 1780, he was transferred to the Third Connecticut Regiment in January, 1781, and in September, 1783, was brevetted brigadier general. He was one of the 16 officers who on June 19, 1783, founded the Society of the Cincinnati.

WEBB, SIDNEY (1859–). An English economist and Socialist, born in London. He was educated in Switzerland, Germany, and at the City of London College. In 1878 he entered the English civil service, where he was employed in many capacities until 1891. He was called to the bar in 1885; and served in the London County Council from 1892 to 1910 and on various royal commissions. He was a founder of the London School of Economics and Political Science and became honorary professor of public administration in the University of London. One of the first members of the Fabian Society (q.v.), he contributed to *Fabian Essays* and wrote *Socialism in England* (1890). His most important books, written in collaboration with his wife, Beatrice Potter Webb (q.v.), include: *The History of Trade Unionism* (1894; new ed., 1902); *Industrial Democracy* (1897; new ed., 1902); *English Local Government* (1906–13); *Minority Report of the Poor Law Commission* (1909); *English Poor Law Policy* (1910); *The State and the Doctor* (1910); *The Prevention of Destitution* (1911). As editor of the *New Statesman* and through his speeches and writings Webb exerted a powerful influence on the development of English public opinion on political, economic, and especially social questions. Consult A. G. Gardiner, *Pillars of Society* (London, 1913).

WEBB, THOMAS (1724–96). A British soldier and Methodist lay preacher. He was a man of wealth and education, and for several years was lieutenant of the Forty-eighth Regiment of Foot. He lost an eye in the storming of Louisburg, Nova Scotia (1758), was one of the few officers surviving with Washington from Braddock's defeat (1755), and scaled the Heights of Abraham with Wolfe (1759). Converted under the preaching of John Wesley in 1765 he united with the Methodists and began preaching. Soon after, when the John Street Church was erected in New York City, in 1768, he was one of the chief contributors. In 1772–73 he visited England to secure aid for the struggling churches, and preached in England and Ireland. Returning to England at the breaking out of the Revolution, he settled at Portland, near Bristol, but preached wherever opportunity offered. He labored among the French prisoners at Winchester in 1776–82, and also among the sailors of Portsmouth. He is buried in Portland Chapel, which he helped to build.

WEBB, THOMAS EBENEZER (1821–1903). A British philosophical scholar, born at Pontscatho, Cornwall, and educated at Kingswood College, Sheffield, and at Trinity College, Dublin. He became professor of moral philosophy in the University of Dublin in 1857, regius professor of laws in 1867, and public orator in 1879. He withdrew from academic life in 1887, and thenceforth until his death was county court judge for Donegal. He published *The Intellectualism of Locke* (1857); *The Veil of Isis* (1885); *The Irish Land Question* (1886); *The Mystery of William Shakespeare: a Summary of Evidence* (1902).

WEBB CITY. A city in Jasper Co., Mo., 5 miles northeast of Joplin, on the Missouri Pacific and the St. Louis and San Francisco railroads (Map: Missouri, B 4). It is chiefly important as a mining centre, being situated in the lead and zinc district of southwest Missouri. There are more than 200 mining plants in operation in the city and vicinity. Other establishments include a large foundry, machine shops, ironworks, a flour mill, etc. Pop., 1900, 9201; 1910, 11,817; 1915 (U. S. est.), 13,560.

WEBBE, wĕb, WILLIAM. An English author, who seems to have been active between 1568 and 1591. He was educated at St. John's College, Cambridge, where he made the acquaintance of Gabriel Harvey and Edmund Spenser, and graduated B.A. in 1573. About 10 years later he became a private tutor in the household of Edward Sulyard of Flemyngs in Essex. There he composed *A Discourse of English Poetrie* (1586; reissued in E. A. Arber's *English Reprints*, London, 1870). The work is of interest for the light it throws upon the poets of the author's day, and upon contemporary literature and canons of criticism. To it are appended the first two eclogues of Vergil in hexameter verse. Webbe was of the school which wished to abolish rhyme and import classical metres into English verse.

WEB'BER, CHARLES WILKINS (1819–56). An American journalist and explorer, born in Russellville, Ky. He was one of the Texan Rangers and saw much of the wild frontier life. Afterward he studied medicine and then theology, but abandoned both professions and became connected with the *New World*, the *Democratic Review*, and the *Sunday Despatch* in New York City. He organized an expedition to the Colorado and Gila rivers in 1849. In 1855 he went to Central America. He was killed in Nicaragua, while a member of the filibustering party commanded by William Walker (q.v.). He wrote *Old Hicks, the Guide, or Adventures in the Comanche Country in Search of a Gold*

Mine (1848), *The Gold Mines of the Gila* (1849), *Tales of the Southern Border* (1852), and *Shot in the Eye* and *Adventures with the Texan Rifle Rangers* (1853).

WEBBER, HERBERT JOHN (1865–). An American plant physiologist, born at Lawton, Mich. In 1889 he graduated from the University of Nebraska. For the United States Department of Agriculture he investigated orange diseases in Florida (1893–97) and from 1889 to 1907 had charge of the department's plant-breeding investigations. He served as professor of experimental plant biology at Cornell (1907–08), where subsequently he was acting director (1909–10) and professor of plant breeding (1910–12) in the New York State College of Agriculture. In 1912 he went to the University of California to be director of the Citrus Experiment Station, dean of the Graduate School of Tropical Agriculture, and professor of plant breeding.

WEBER, vā'bĕr, ALBRECHT (1825–1901). A German Orientalist, born at Breslau. He studied at the universities of Breslau, Bonn, and Berlin, 1842–45, visited England and France where he studied under Burnouf in 1846, returned to Germany and was privatdocent at the University of Berlin, 1848–56. In 1856 he became assistant professor and in 1867 professor of Indian languages and literature, holding this position until his death. Among his works the most important are his edition of the *White Yajur Veda* (1849–59); *Indische Studien* (18 vols., 1850–98); *Indische Litteraturgeschichte* (1852; 2d ed., 1876); *Indische Skizzen* (1857); *Verzeichnis der Berliner Sanskrithandschriften* (2 vols., 1853–92); a translation of Kalidasa's drama *Mālavikā und Agnimitra* (1856); an edition of Hala's *Saptaśataka* (1881); *Indische Streifen* (3 vols., 1868–79); contributions, especially from Vedic literature, to the *Sanskrit-Wörterbuch* of Böhtlingk (q.v.) and Roth (q.v.); and numerous briefer articles in Oriental periodicals. Consult R. Pischel's memorial address in the *Proceedings of the Royal Prussian Academy of Sciences* (Berlin, 1903).

WEBER, E(MIL) ALFRED (1835–1914). A German philosopher, born at Strassburg. He studied at Berlin, Halle, Jena, and Tübingen, was assistant professor of philosophy at the Protestant Seminary at Strassburg (1863–72), and from 1872 professor in the Kaiser Wilhelm University of the same city. Weber published: *Examen critique de la philosophie réligieuse de Schilling* (1860); *Introduction historique à la philosophie hégélienne* (1866); *Histoire de la philosophie européenne* (1872; 7th ed., 1905; Eng. trans. by Frank Thilly, 1896); *Wille zum Leben oder Wille zum Guten?* (1882); *Die Religion als Wille zum ewigen Leben* (1888); *Von der Schulbank zum Lehrstuhl* (1894); *Aegri Somnia* (1900).

WEBER, ERNST HEINRICH (1795–1878). A German physiologist and anatomist, born at Wittenberg. He studied medicine at Wittenberg and Leipzig, and was appointed professor of comparative anatomy at Leipzig in 1818, professor of human anatomy in 1821, and, in addition, professor of physiology in 1840. His principal works are *Anatomia Comparata Nervi Sympathici* (1817); *De Aure et Auditu Hominis et Animalium* (1820); *Wellenlehre* (with his brother Wilhelm, 1825); *Zusätze zur Lehre vom Bau und von der Verrichtung der Geschlechtsorgane* (1846); "Der Tastsinn und das Gemeingefühl," in Wagner's *Handwörterbuch der Physiologie* (vol. iii, pt. ii, 1846; also published separately, 1851); and an important collection of shorter essays and monographs, entitled *Annotationes Anatomicæ et Physiologicæ* (1851). Weber is well known for his discoveries in anatomy, notably that of the existence of a rudimentary uterus in male mammals, but his greater fame rests upon his pioneer work in the exploration of the sense organs. His work upon the ear and upon the cutaneous senses—pressure, temperature, and what was then called the space sense—gave the deciding impulse to the introduction of the experimental movement into psychology. The important generalization which bears his name (see WEBER'S LAW) was the first valid generalization in psychophysics.

WEBER, GEORG (1808–88). A German historian, born at Bergzabern, in the Rhenish Palatinate. He studied at Erlangen, in 1839 became a teacher in one of the higher public schools of Heidelberg, and from 1848 to 1872 was its director. Among Weber's historical publications may be mentioned *Geschichte der englischen Reformation* (1845–53); *Weltgeschichte in übersichtlicher Darstellung* (1866; 21st ed., 1903); *Geschichte des Volkes Israel* (with Holtzmann, 1867); and *Allgemeine Weltgeschichte für die gebildeten Stände* (1857–80).

WEBER, wĕb'ĕr, JOSEPH M. (1867–). An American comedian, born in New York City. He began his stage career in 1877 in company with Lewis M. Fields (Lew Fields), with whom he formed the theatrical firm of Weber and Fields in 1885. Besides several other enterprises this firm managed the Broadway Music Hall from 1895 to 1904. Thereafter Weber was proprietor and manager of Weber's Theatre, New York. He was one of the best-known comedians of his day, especially clever in burlesques of current plays.

WEBER, vā'bĕr, KARL JULIUS (1767–1832). A German writer, born in Langenburg in Württemberg. He received his education at Erlangen and Göttingen, and after some time passed in Switzerland became, in 1792, private secretary to the Count of Erbach-Schönberg, whom he left in 1799 to accept the post of government councilor at König in Odenwald. Until 1804 he filled various administrative offices, retired then to private life, but from 1820 to 1824 was a member of the popular chamber of the Württemberg Estates. Weber is best known for his writings, in which he displays a fresh, original spirit, fine powers of observation, and a talent for witty satire. He was largely influenced by the humanistic teachings of the French literature and philosophy, but his reading was wider than France and his sympathies were cosmopolitan. The most celebrated of his works is *Demokritos, oder hinterlassene Papiere eines lachenden Philosophen* (1832–40), which is still very popular in Germany. He also wrote *Möncherei* (1818–20), more clever than reliable; *Das Ritterwesen* (1822–24); and *Deutschland, oder Briefe eines in Deutschland reisenden Deutschen* (1826–28). His collected works in 30 vols. were published in 1834–45.

WEBER, KARL MARIA VON (1786–1826). A famous German composer, born at Eutin, Oldenburg, Dec. 18, 1786. His musical training began at a very early age. His father, a shiftless musician, was anxious to make him a musical prodigy like Mozart and exhibit him for profit. Up to 1800 he received lessons from

his step-brother Fritz; J. P. Heuschkel at Hildburghausen, who grounded him thoroughly in piano playing; Michael Haydn at Salzburg; and at Munich, from Valesi in singing, and Kalcher, under whose direction he composed his first opera, *Die Macht der Liebe und des Weines*, the score of which, with other youthful compositions, was accidentally burned. At Freiberg in Saxony Weber produced in November, 1800, an opera, *Das Waldmädchen*, which failed, however, of lasting success there or elsewhere. The impulse to the composing of operas so early in his career came from his association with stage life through his father's wandering troupe. At Salzburg, where the family was again in 1801, his third opera, *Peter Schmoll und seine Freunde*, was privately heard at the house of his teacher, Michael Haydn; subsequently it was given at Augsburg. Important for Weber was his association as pupil and friend with Abbé Vogler at Vienna in 1803. In 1804, through Vogler's influence, he was appointed kapellmeister at Breslau. In 1806 he accepted the post of private secretary to Duke Louis of Württemberg. At Stuttgart, in 1810, preparations for the production of his opera *Silvana* were interrupted by his arrest at rehearsal. His father was charged with having misappropriated money. To shield him, Karl Maria took the disgrace upon himself, and both were banished. He went to Mannheim and Darmstadt and completed his comic opera *Abu Hassan* (1810). Weber had no important appointment until 1813, when he was called to Prague as conductor of the Landständisches Theatre. Among the singers he engaged was Caroline Brandt, whom he had heard at a performance of his *Silvana* in Frankfort and with whom he now fell in love. Upon their marriage (1817) Caroline, though in her prime, left the stage and devoted her life to him. Her influence on Weber was beneficial in the highest degree. In 1816 Weber, owing to the mark he had made in Prague, was called to Dresden as conductor of the opera. His work here as conductor was of the highest importance to the cause of German opera, notwithstanding that he often was obliged to overcome the prejudices of the King and the intrigues of the Italian party, headed by Morlacchi, the conductor at the Italian opera.

A chance discovery of Apel's *Gespensterbuch* in Dresden led him to take up the subject of the *Freischütz*, and Friedrich Kind wrote a libretto for him. The composer worked three years on the score, though not uninterruptedly, since his *Invitation à la valse* (dedicated to his wife) and other minor works, besides his *Jubilee Mass* and *Preciosa*, were written during this period. *Der Freischütz* was the first musical work brought out at the new Schauspielhaus, Berlin, where it was produced under Weber's direction, June 18, 1821, and achieved such a triumph as rarely has fallen to any stage work. Throughout Germany its success was equally great, and in London it was performed at three theatres simultaneously. His *Euryanthe*, produced in Vienna in 1823, was less successful there, but was received with acclamation in Dresden and Leipzig and especially in Berlin. But consumption began to make inroads upon his strength, and it was with a desperate desire to provide for his family that he accepted Charles Kemble's offer of £1000 to compose *Oberon* and direct its production in London. *Oberon* was produced at Covent Garden, April 12, 1826, and was received with unbounded enthusiasm. Weber survived only a few weeks, dying June 5, 1826. In 1844 his body was removed from Moorfield's Chapel to Dresden, where Wagner, who had arranged for the occasion a dirge on themes from *Euryanthe*, also pronounced a funeral oration.

Weber's *Freischütz* struck a national note, and through it he became the founder of the Romantic school of German opera. His influence on Wagner was very marked. The finale of the first act and the march in the second act of *Tannhäuser*, and the first finale in *Lohengrin*, besides minor passages in both these works, show unmistakably the influence of Weber in structure. Wagner's admiration for Weber was unbounded. Weber's *Leyer und Schwert* are among the most spirited German patriotic songs, and several of his piano works, notably the *Invitation à la valse*, the E flat major *Polonaise*, and the *Concertstück* for piano and orchestra, are brilliantly effective. Weber's complete literary works were edited by Georg Kaiser (Berlin, 1908).

Consult: the standard biography of Weber by his son, Max Maria von Weber, *K. M. von Weber, ein Lebensbild* (3 vols., Leipzig, 1864–66; new ed., 1912); also A. Reissmann, *Karl Maria von Weber* (Berlin, 1882); J. Benedict, *Weber* (London, 1882); H. Gehrmann, *Weber* (Berlin, 1899); G. Servières, *Weber* (Paris, 1906).

WEBER, Max Maria von (1822–81). A German civil engineer, son of Karl Maria von Weber. He was born in Dresden and received his early training in the schools of that city. Part of his experience was gained under Brunel and Stephenson in England. In 1850 he entered the civil service of his native Kingdom. In 1870 he went to Vienna, where he did much towards the extension of Austrian railways. In 1878 he was called in a similar capacity to Berlin. Outside of his official duties Weber found time for considerable writing, in the line of general literature as well as on technical matters. Among his works may be cited: *Schule des Eisenbahnwesens* (1857; 4th ed., by R. Koch, 1885); *Karl Maria von Weber: ein Lebensbild* (3 vols., 1864–66); *Die Praxis des Baues und Betriebs der Sekundärbahnen* (1873); *Nationalität und Eisenbahnpolitik* (1876); and the posthumous *Vom rollenden Flügelrad* (published by M. Jähns, with biography, 1882).

WEBER, Theodor (1836–1906). A German Old Catholic bishop. He was born at Zülpich, studied at Bonn, Munich, and Breslau, and became a priest in 1860. He was made professor of philosophy at Breslau in 1872. He was active in the Old Catholic movement from its beginning, and in 1890 removed to Bonn and was appointed vicar general by Bishop Reinkens. Five years later he was consecrated assistant bishop, and on Reinkens's death in 1896 he succeeded him as Bishop. He wrote: *Kants Dualismus von Geist und Natur* (1866); *Die Geschichte der neuern Philosophie und die Metaphysik* (3 parts, 1873); *Staat und Kirche nach der Zeichnung und Absicht des Ultramontanismus* (1873; 2d ed., 1875); *Metaphysik—Eine wissenschaftliche Begründung der Ontologie des positiven Christentums* (2 vols., 1888–91).

WEBER, Wilhelm (1804–91). A German physicist. He was born at Wittenberg and was educated at Halle. In 1825, in association with his brother, Ernst Heinrich Weber, he published

Die Wellenlehre. He became assistant professor of physics at Halle in 1827, and professor at Göttingen in 1831. He was one of the seven professors of Göttingen who were removed in 1837 for having protested against the violation of the constitution. He held the chair of physics at Leipzig, 1843–49, when he was restored to his former position at Göttingen. While living in that city he became acquainted with Gauss, and in 1833 they jointly devised an electromagnetic telegraph. They also founded the Magnetic Union and made many observations on terrestrial magnetism. An important achievement of Weber's is the introduction of the absolute system of electrical units modeled on the work of Gauss, who first devised such a system of units in his experiments in magnetism. Weber determined the value of the practical units in absolute measure and at the International Electrical Congress held at Paris in 1881 his system with certain modifications was adopted and the volt, ampere, coulomb, and farad were defined. Weber's works were published by the Göttingen Academy of Science in 1892, and his more important papers on absolute measurement of current and resistance were republished at Leipzig in 1904 as *Fünf Abhandlungen über . . . Strom- und Widerstandsmessung.* A biographical sketch entitled *Wilhelm Weber*, by Heinrich Weber, was published at Berlin in 1893.

WEBER'S (vā'bĕrz) **LAW.** In psychology, the formula expressing the relation of sensation to intensity of stimulus. In 1834 E. H. Weber proposed the theorem that the ratio of the increment of stimulus necessary to give a noticeably different sensation to the original stimulus is constant, or, as he expressed it, $\frac{V - U}{U} = C$, where V is the comparison stimulus, U the standard stimulus, and C a constant. The principle may be briefly termed that of the constancy of the relative difference limen (see LIMEN). It can be more explicitly stated in other forms, e.g., (*a*) if sensations increase in intensity by equal amounts, their stimuli increase by relatively equal amounts; (*b*) the difference which is relatively the same for stimulus is absolutely the same for sensation; or (*c*) the intensity of the stimulus increases in geometrical ratio as the intensity of the apperceived sensation increases in arithmetical ratio. The validity of this theorem was confirmed by Fechner by the use of various psychophysical methods (Weber had used that of minimal changes; see PSYCHOPHYSICS); he also extended its range to other sense departments than those investigated by Weber, and gave it the name Weber's law. Since Fechner's time the investigation of the applicability of the law has been carried on by many experimenters, and its significance is attested by its prominence in the literature of psychophysics. Wundt gives a résumé of its applicability as follows: The law has its most satisfactory application and its widest range in noise intensities; it has a less extended application in the modalities of vision, pressure, movement, taste, and smell; its validity in temperature and organic sensation is yet uncertain. Under certain theoretical conditions the law holds also for intensity of feeling (affection); in practice, however, other laws of feeling cut across it. It will be noticed that the range of applicability of the law is restricted to intensities. In the early days of psychophysics the law was supposed to hold not only for intensity but also for relations and qualities; it has now become a generalized law for intensity of sensation just as, e.g., the law of adaptation is a law of visual quality. In all modalities of sensation there are variations from the law at small and at great intensities. For quantitative results, see INTENSITY OF SENSATION.

When a stimulus acts upon the organism and its intensity is consciously noted, four factors may be distinguished, viz., stimulus, excitation, sensation, and apprehension or apperception of the sensation. The facts of Weber's law show that somewhere in this series of steps there is an inertia or lag. Accordingly, in the formulation of a theory of intensity, it is possible to assign the position of the discrepancy to any one of three places—between stimulus and excitation, between excitation and sensation, or between sensation and apperception; these interpretations furnish respectively the physiological, psychophysical, and psychological interpretations of Weber's law.

(1) The psychophysical view was historically first. Fechner held that the logarithmic relation which characterizes the law prevails not between physical processes themselves, but between physical and psychical processes. We have no access to the final term of the physical series, the cortex, and hence we are compelled to state the logarithmic relation in terms of stimulus and sensation, i.e., s (sensation) $= C$ log. r (stimulus); but we have reason to suppose that, except at the upper and lower limits of intensity, the cortical excitation is directly proportional to the intensity of the stimulus, and hence we can pass from external to internal psychophysics, and state the relation as $s = C$ log. E (excitation).

(2) The physiological formulation is that of G. E. Müller, who considers the sensation to be directly proportional to its cortical excitation, while the inertia is traceable to the behavior of nerves under excitation, to loss of energy in transmission, etc. The formula is thus $s = E = C$ log. r.

(3) The psychological interpretation has taken three forms. (*a*) Wundt says that there are instances (method of mean gradations) in which sensation is directly proportional to its stimulus, and a single instance of this sort is enough to controvert the physiological interpretation. For Wundt, Weber's law is only a special case of the more general psychological principle of relativity. Intensities are always judged relatively; we estimate the intensity of a sensation always with reference to some other intensity. This comparison of intensities is a matter of apperception. (*b*) Ziehen replaces apperception by association. A certain number of increments of intensity are added together till finally the verbal judgment, "greater," results by a process of association. If the original stimulus be large, it takes a relatively greater increment to call forth the judgment. (*c*) Meinong contends that too much emphasis has been put upon "just noticeable differences"; such differences may not be equally great or noticeable. We must distinguish between difference and differentness or diversity. In an arithmetical series one obtains an expression of the former category, in a geometrical series an expression of the latter. The mind takes note of diversity, not of difference; it notes not that an intensity difference of 2 less 1 equals one of 101 less 100, but rather that the relation of 2 to 1 is like that of 200 to 100.

WEB'STER. A town, including several villages, in Worcester Co., Mass., 16 miles south by west of Worcester, on the French River, and on the New York, New Haven, and Hartford and the Boston and Albany railroads (Map: Massachusetts, D 4). It has a public library and a beautiful 1200-acre lake. Woolen goods are extensively manufactured and there are other important industrial establishments, including print works, shoe factories, yarn mills, cotton mills, etc. Pop., 1900, 8804; 1910, 11,509; 1915 (State census), 12,565.

WEBSTER, ARTHUR GORDON (1863–). An American physicist, born at Brookline, Mass., and educated at Harvard and at Berlin, Paris, and Stockholm. In 1895 he was awarded the Thomson prize (Paris) of 5000 francs for experimental research on the period of electrical oscillations. He became professor of physics in 1900 at Clark University, where he had taught since 1890. In 1903–04 he was president of the American Physical Society, and in 1915 was appointed to the Naval Consulting Board. He came to be recognized as a leading authority on sound in the United States, inventing several instruments in this field. Besides numerous papers on physics, he wrote: *A Mathematical Treatise on the Theory of Electricity and Magnetism* (1897); *Dynamics of Particles of Rigid, Elastic, and Fluid Bodies* (1903); *Harrison Lectures on Sound, University of Pennsylvania* (1911).

WEBSTER, BENJAMIN NOTTINGHAM (1797–1882). An English actor, manager, and playwright. He was born at Bath; made his début at Warwick, and after playing in the provinces for a time appeared in London in 1819. In 1820 he became a member of the company at Drury Lane; in 1829 of that at the Haymarket, which he managed from 1837 till 1853. He became lessee of the Adelphi Theatre in 1844 and controlled it till his retirement in 1874. As an actor he created many rôles, his best being Triplet in *Masks and Faces* (Haymarket, 1852), Penn Holder in *One Touch of Nature*, written by himself (Adelphi, August, 1859), and Robert Landry in *The Dead Heart* (Adelphi, November, 1859). Among his plays were adaptations of the *Cricket on the Hearth* and the *Bird of Passage*. Consult: Scott, *The Drama of Yesterday and To-Day* (London, 1899); Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (New York, 1886).

WEBSTER, DANIEL (1782–1852). An American statesman, orator, and constitutional lawyer. He was born in Salisbury (now Franklin), N. H., Jan. 18, 1782, the son of Ebenezer Webster, who had been a Revolutionary soldier. He graduated from Dartmouth College in 1801, and then studied law, first at Salisbury and later in the office of Christopher Gore (q.v.) in Boston. In 1805 he was admitted to the New Hampshire bar, from 1807 practicing at Portsmouth, where he soon acquired distinction. Webster was, in 1812, elected by the party opposed to the war with England to a seat in Congress and was reelected in 1814. While a member of the important Committee on Foreign Relations, he spoke ably against the embargo and in favor of strengthening the navy, on the currency, the bank, and the tariff. In 1816 Webster removed to Boston, and for nearly seven years devoted himself to the practice of law. He soon rose to the position of one of the foremost advocates of the country and appeared before the United States Supreme Court in several famous constitutional cases, among them the Dartmouth College Case (q.v.); McCulloch *v.* Maryland (4 Wheaton 316), in which he argued successfully against the right of a State to tax a branch bank of the United States; and Gibbons *v.* Ogden (9 Wheaton 1), which established the complete control of Congress over interstate commerce. In 1820 he aided greatly in the revision of the constitution of Massachusetts. In the same year he delivered the oration at Plymouth on the second centennial of the landing of the Pilgrims, in 1825 an oration at the laying of the corner stone of the Bunker Hill Monument, and in 1826 a eulogy on Adams and Jefferson—three addresses which established his fame as one of the greatest of orators.

In the meantime, in 1822, Webster had been elected to Congress from the Boston district, and was twice reelected by a practically unanimous vote. As chairman of the Judiciary Committee he was instrumental in securing a codification of the criminal jurisprudence of the United States. He made notable speeches on the Greek Revolution and in opposition to the protective tariff measure of 1824. In 1827 he was elected to the United States Senate. He now abandoned his opposition to protective tariffs and became a supporter of the measure of 1828 known as the "tariff of abominations." In 1830 his fame as an orator reached its culmination in his reply to the speech of Robert Y. Hayne (q.v.), Senator from South Carolina, on the nature of the Union and the right of nullification. In this epoch-making oration Webster successfully combated the theory of nullification and ably vindicated the nationalist view of the Union. His argument was later supplemented and reënforced in debate with Calhoun (q.v.) on the Force Bill (see NULLIFICATION). In the controversy over the renewal of the charter of the United States Bank, Webster advocated renewal and opposed President Jackson's financial policy in general (see BANK, BANKING). Many of the principles of sound finance, developed by his speeches at this time, have been incorporated in the Federal Reserve System (see RESERVE BANK, FEDERAL). Upon the organization of the Whig party, Webster became one of its leaders, and in 1836 received the electoral vote of Massachusetts for President. Again in 1840 the Whigs failed to nominate either one or the other of their greatest statesmen, Webster or Clay. They offered Webster the vice presidency but he refused. Upon the election of Harrison, however, Webster was appointed Secretary of State, a position which he retained under Tyler. In this capacity

he managed, with tact, the cases growing out of the McLeod and *Creole* (q.v.) affairs and brought to a successful conclusion the negotiations with Lord Ashburton chiefly for the settlement of the northeast boundary dispute with Great Britain (see WEBSTER-ASHBURTON TREATY). He now retired from the cabinet, largely on account of President Tyler's break with the Whigs, declined a reëlection to the Senate, and resumed his law practice in Boston.

In 1844 he was again suggested for the presidency, but his following was small, and in the succeeding year he reëntered the Senate as the successor of Rufus Choate, in which capacity he opposed the annexation of Texas and the war with Mexico. Webster greatly desired the Whig nomination for the presidency in 1848, and was sorely disappointed at the nomination of Taylor, pronouncing it "one not fit to be made." He at first declined to support Taylor's candidacy, but later ably defended the Whig administration. His last years in the Senate were devoted to efforts to preserve the Union and maintain peace between the North and the South by means of compromise. His last great speech and one of the most notable of his life was that delivered in the Senate, March 7, 1850, on the Compromise Measures of 1850, in which he vindicated his own consistency in the matter of the extension of slavery, rebuked the North for violating the Fugitive Slave Law, and advocated concessions to the South. The speech aroused indignation at the North, where it was said that he was truckling to the South in order to gain support in his candidacy for President. Upon the succession of Fillmore to the presidency in 1850, Webster became Secretary of State. During this second tenure of the office he carried on a memorable correspondence with Chevalier Hülsemann, the Austrian Minister, boldly championing the right of the United States to recognize the new Hungarian Republic and its head, Kossuth (q.v.), and to sympathize with the development of "responsible and popular government in any part of the world." Again in 1852 he was disappointed in not receiving the Whig nomination for the presidency, refused to support the candidacy of General Scott, and took no part in the campaign. He returned to his home at Marshfield, Mass., in September, and there died on October 24.

Hardly in the history of the country has there been a more general expression of sorrow; the mourning can only be compared with that which followed the deaths of Washington and Lincoln. Hallam, the historian, who met Webster when he was in London, thus summarizes his character: "Mr. Webster approaches as nearly to the true ideal of a Republican Senator as any man I have ever seen in the course of my life; worthy of Rome or Venice rather than of our noisy and wrangling generation." In 1903 a collected edition of Webster's works in eighteen volumes was published in Boston as *Webster's Writings and Speeches*. This contains all the matter originally published in six volumes (1856) with memoir by Edward Everett, his *Private Correspondence* (ed. by his son Fletcher Webster in 1857), and many speeches and letters collected for the first time. Biographies of Webster have been written by George Ticknor Curtis (2 vols., Boston, 1870); H. C. Lodge (ib., 1883); H. E. Scudder (ib., 1882); N. Hapgood (ib., 1889); S. W. McCall (ib., 1902); J. B. McMaster (New York, 1902); E. P. Wheeler (ib., 1905); W. C. Wilkinson (ib., 1911); S. G. Fisher (Philadelphia, 1911); F. A. Ogg (ib., 1914). See, passim, UNITED STATES, *History*.

WEBSTER, HERMAN ARMOUR (1878–). An American painter and etcher. He was born in New York and studied under Laurens in Paris, where he settled. His etchings, which show the influence of Meryon, are especially notable, and usually present odd and unknown spots of old French towns rendered with an individual and poetic interpretation. They are represented in the permanent collections of the Luxembourg Museum (Paris), South Kensington Museum (London), the Congressional Library at Washington, the Art Institute of Chicago, the Boston Museum, the Darmstadt Museum, and elsewhere. He exhibited at the Paris Salon and the Royal Academy, London, and became a member of the Royal Society of Painter-Etchers and the Société Nationale des Beaux-Arts, Paris. In 1915 he was awarded a gold medal at the Panama-Pacific Exposition, San Francisco.

WEBSTER, HENRY KITCHELL (1875–). An American novelist, born in Evanston, Ill., and educated at Hamilton College, from which institution he graduated in 1897. For a year he was instructor in rhetoric in Union College. He collaborated with Samuel Merwin in *The Short Line War* (1899), *Calumet K* (1901), and *Comrade John* (1907). Alone he wrote: *The Story of a Corner in Land* (1900); *Roger Drake, Captain of Industry* (1903); *The Duke of Cameron Avenue* (1904); *A King in Khaki* (1909); *The Sky Man* (1910); *The Ghost Girl* (1913); *The Butterfly* (1914); and *Real Adventure* (1916).

WEBSTER, (ALICE) JEAN (1876–1916). An American author. She was born at Fredonia, N. Y., and graduated from Vassar in 1901. For some years she lived in Italy, and in 1906–07 she made a trip around the world. Miss Webster was a niece of Mark Twain. In 1915 she was married to Glenn Ford McKinney. Besides short stories contributed to magazines, she wrote: *When Patty Went to College* (1903); *The Wheat Princess* (1905); *Jerry Junior* (1907); *The Four-Pools Mystery* (1908); *Much Ado about Peter* (1909); *Just Patty* (1911); *Daddy Long-Legs* (1912; new ed., 1915); *Dear Enemy* (1915). *Daddy Long-Legs*, by which she became best known, was dramatized by her and produced in New York in 1914.

WEBSTER, JOHN (c.1580–c.1624). One of the greatest of English dramatists, best known for his tragedy *The Duchess of Malfi*. Of his life little is known. As early as about 1601 he began to write plays, collaborating with the group which included Drayton, Munday, and others. His alterations to Marston's play of *The Malcontent* appeared in 1604. With Dekker he produced the two comedies *Westward Hoe* and *Northward Hoe*, brought out in the winter of 1604–05, and printed in 1607. Much of his early work is irrecoverably mingled with that of inferior men. His own powers were first fully revealed in the tragedy of *The White Devil, or Vittoria Corombona*, which was printed in 1612, having been acted some time before. This is one of his masterpieces. The later *Appius and Virginia*, a tragedy based upon the familar Roman story, was well received, but is commonplace. The tragi-comedy of *The Devil's Law*

WEBSTER, HENRY KITCHELL (1875–). An American novelist, born in Evanston, Ill., and educated at Hamilton College, from which institution he graduated in 1897. For a year he was instructor in rhetoric in Union College. He collaborated with Samuel Merwin in *The Short Line War* (1899), *Calumet K* (1901), and *Comrade John* (1907). Alone he wrote: *The Story of a Corner in Land* (1900); *Roger Drake, Captain of Industry* (1903); *The Duke of Cameron Avenue* (1904); *A King in Khaki* (1909); *The Sky Man* (1910); *The Ghost Girl* (1913); *The Butterfly* (1914); and *Real Adventure* (1916).

WEBSTER, (ALICE) JEAN (1876–1916). An American author. She was born at Fredonia, N. Y., and graduated from Vassar in 1901. For some years she lived in Italy, and in 1906–07 she made a trip around the world. Miss Webster was a niece of Mark Twain. In 1915 she was married to Glenn Ford McKinney. Besides short stories contributed to magazines, she wrote: *When Patty Went to College* (1903); *The Wheat Princess* (1905); *Jerry Junior* (1907); *The Four-Pools Mystery* (1908); *Much Ado about Peter* (1909); *Just Patty* (1911); *Daddy Long-Legs* (1912; new ed., 1915); *Dear Enemy* (1915). *Daddy Long-Legs*, by which she became best known, was dramatized by her and produced in New York in 1914.

WEBSTER, JOHN (c.1580–c.1624). One of the greatest of English dramatists, best known for his tragedy *The Duchess of Malfi*. Of his life little is known. As early as about 1601 he began to write plays, collaborating with the group which included Drayton, Munday, and others. His alterations to Marston's play of *The Malcontent* appeared in 1604. With Dekker he produced the two comedies *Westward Hoe* and *Northward Hoe*, brought out in the winter of 1604–05, and printed in 1607. Much of his early work is irrecoverably mingled with that of inferior men. His own powers were first fully revealed in the tragedy of *The White Devil, or Vittoria Corombona*, which was printed in 1612, having been acted some time before. This is one of his masterpieces. The later *Appius and Virginia*, a tragedy based upon the familar Roman story, was well received, but is commonplace. The tragi-comedy of *The Devil's Law*

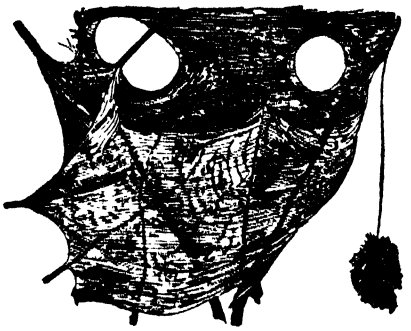
Case is in parts excessively coarse, and is inferior in construction. In 1623 was first printed *The Duchess of Malfi*, which had been played in 1616. The accumulation of horrors which gather about the end of the unhappy lady of Amalfi produces an intensity of impression that amply justifies Charles Lamb's well-known comment: "To move a horror skillfully, to touch a soul to the quick, . . . and then step in with mortal instruments to take its last forfeit; this only a Webster can do." Swinburne unhesitatingly places Webster next to Shakespeare among English dramatists. Gosse gives him a slightly lower place. In 1624 Webster wrote a Lord Mayor's pageant. He has been identified, doubtless erroneously, with a man of the same name who afterward wrote works of a quite different character, but this is the latest date that can be positively given in his life. His death has been variously set, from 1625 to 1652. Consult: Alexander Dyce, ed., *The Works of John Webster, now First Collected, with Some Account of the Author and Notes* (London, 1830; new ed., rev., ib., 1859); William Hazlitt, ed., *The Dramatic Works of John Webster*, with an introduction (ib., 1857); J. A. Symonds, ed., *The Best Plays of Webster and Tourneur, with an Introduction and Notes*, in the "Mermaid Series" (London, 1888); Edmund Gosse, *Seventeenth Century Studies* (ib., 1883); A. C. Swinburne, *Studies in Prose and Poetry* (ib., 1894); E. E. Stoll, *John Webster: Periods of his Work as Determined by his Relations to the Drama of the Day* (Cambridge, Mass., 1905); A. C. Swinburne, "John Webster," in *Age of Shakespeare* (New York, 1908).

WEBSTER, Noah (1758–1843). An American lexicographer, born in Hartford, Conn. He entered Yale in 1774, served under his father, a captain of militia, in 1777, and then returned to college and graduated in 1778. From 1779 to 1781 he taught school in Hartford and studied law, but receiving no encouragement to practice, opened, in 1782, a classical school at Goshen, N. Y. In 1783 he returned to Hartford and published *A Grammatical Institute of the English Language* (1783–85), the first part of which was popularly known as Webster's Spelling Book. In 1889 it was estimated that more than 62,000,000 copies of the Speller had been printed and sold. He also issued Governor Winthrop's *Journal;* contributed in 1783 to *The Connecticut Courant* a series of papers signed Honorius in defense of the soldiers' pay bill; published in 1785 *Sketches of American Policy*, advocating the formation of a new constitution, and in 1786 traveled in the South to procure the enactment of State copyright laws. In 1787 he became superintendent of an Episcopal academy in Philadelphia, and when the Constitutional Convention closed he published a pamphlet entitled *Examination of the Leading Principles of the Federal Constitution.* In December, 1787, he established in New York *The American Magazine*, but discontinued it after a year and returned to Hartford in 1789. After having practiced as a lawyer he returned to New York in 1793, where he started a daily newspaper, *The Minerva* (afterward *The Commercial Advertiser*), and a semi-weekly edition of *The Herald* (afterward *The New York Spectator*) for the support of the national administration. In 1795 he wrote for *The Minerva* a series of able articles under the signature of Curtius in defense of Jay's treaty with England, concluded the previous year. In 1798 he removed to New Haven, and published *A Brief History of Epidemics and Pestilential Diseases* (2 vols., 1799); *Historical Notices of the Origin and State of Banking Institutions and Insurance Offices* (1802); *Rights of Neutral Nations in Time of War* (1802); *A Compendious Dictionary* (1806); and *A Philosophical and Practical Grammar of the English Language* (1807); and began the preparation of his *American Dictionary of the English Language.* After devoting 10 years to the study of the English language he began his dictionary anew, spent almost the entire year 1824 in Paris and Cambridge, England, and returned to America in 1825 to complete his great work, the first edition of which was published in two volumes in 1828. It contained 12,000 more words and about 40,000 more definitions than had appeared in any English dictionary previous thereto. Webster issued a second edition of his great work in 1840, and completed an appendix only a short time before his death in 1843. Before the title of the dictionary had been changed to *Webster's International* in 1890, the work had already been revised by C. A. Goodrich in 1847 and by Noah Porter in 1864.

From 1812 to 1822 Webster resided at Amherst, Mass., where he aided in founding Amherst College. He was for several years president of its board of trustees, and also represented Amherst in the State Legislature. He had previously represented New Haven in the Connecticut Legislature and had been a judge of one of the State courts. He returned to New Haven in 1822, where he died, May 28, 1843. Among Webster's works were: *Dissertations on the English Language* (1789); *The Revolution in France* (1794); *Letters to Dr. Priestley* (1800); *Origin, History, and Connection of the Languages of Western Asia and of Europe* (1807); *Letters to a Young Gentleman Commencing his Education* (1823); *Manual of Useful Studies* (1832); *History of the United States* (rev. ed., 1838); and *A Collection of Papers on Political, Literary, and Moral Subjects* (1843). His *Synopsis of Words in Twenty Languages*, written about 1817, has never been published. See the memoir by Goodrich prefixed to editions of the dictionary (last ed., 1890); Scudder, *Noah Webster* (Boston, 1882); and Mrs. E. E. Ford, *Notes on the Life of Noah Webster*, edited by E. E. Ford Skeel (2 vols., New York, 1912).

WEBSTER, Pelatiah (1725–95). An American publicist, born at Lebanon, Conn. He graduated at Yale in 1746, studied theology and preached in 1748–49, and amassed a fortune in business in Philadelphia. An active patriot during the Revolution, he later used his influence for the formation of the Federal union. Some, especially Hannis Taylor (q.v.), have claimed that the plan of the United States Constitution was his. Webster published: *Dissertation on the Political Union and Constitution of the Thirteen United States of North America* (1783); *Essays on Free Trade and Finance* (1785); *An Essay on Credit* (1786); *Political Essays on the Nature and Operation of Money, Public Finances, and Other Subjects* (1791). Consult Hannis Taylor, *Memorial* (to Congress) *on Behalf of the Architect of our Federal Constitution* (Washington, 1908); Max Farrand, *The Framing of the Constitution of the United States* (New Haven, 1913).

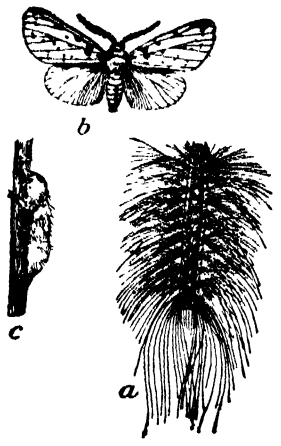
WEBSTER, Sir Richard Everard, first Viscount Alverstone (1842–1915). An English



jurist. He was educated at Trinity College, Cambridge, was called to the bar in 1868, and became queen's counsel in 1878. As a Conservative he represented the Isle of Wight in Parliament from 1885 to 1900, and was Attorney-General in 1885–86, 1886–92, and 1895–1900. In 1900 he was made Master of the Rolls, and in the same year he was appointed Lord Chief Justice, taking the title of Baron Alverstone. In 1903 he served as one of the three British members of the Alaskan Boundary Commission and his vote favored the claims of the United States as against those of Canada (see ALASKA, *History*). Upon retiring in 1913 he was created Viscount. He represented England before the Venezuelan Commission, in 1893 was associated with Sir Charles Russell in the Bering Sea Arbitration case, and also appeared on behalf of the *Times* before the Parnell Commission. He published *Recollections of Bar and Bench* (1914).

WEBSTER-ASHBURTON TREATY, commonly called the ASHBURTON TREATY. A name given to the treaty concluded at Washington between the United States and Great Britain in 1842. In 1838–39 the dispute over the northeastern boundary had almost brought on a war between the two countries, but a conflict had been averted by a temporary arrangement which provided for joint occupation of the territory in dispute by both parties. In an attempt to arrive at a permanent settlement of this and other points at issue, Great Britain in 1841 sent Lord Ashburton to Washington, where, after some months spent in negotiations with Daniel Webster, then Secretary of State, the two at length, on Aug. 9, 1842, signed an agreement, which was afterward ratified by both governments. The treaty provided for the free navigation of the St. John's River by both nations; gave about seven-twelfths of the 12,000 square miles of territory in dispute, as well as Rouses Point, N. Y., and some other doubtful territory in New Hampshire, to the United States; and contained a stipulation that, in consideration of the losses sustained by Maine and Massachusetts, the Federal government should pay these States the sum of $300,000. The treaty further provided for the mutual extradition of criminals, and contained a cruising-convention clause, which bound each nation to keep a squadron off the coast of Africa for the suppression of the slave trade. Other questions, such as the Oregon boundary, the *Caroline* affair, and the *Creole* case, were passed over in silence. A curious feature of the negotiations leading up to the treaty was that each nation secretly had in its possession a map that was unfavorable to its own claims. The Americans withheld one that had recently been discovered in the Paris archives and that was mistakenly supposed to have been marked by Franklin in 1782; the British withheld one made by Oswald, one of the commissioners who had negotiated the peace which had given the United States its independence. Later each government made use of the unfavorable map in its possessions to convince its people that it had secured a good bargain. The text of the treaty is given in William Macdonald, *Select Documents Illustrative of the History of the United States, 1776–1861* (New York, 1898). Consult G. T. Curtis, *Life of Daniel Webster* (2 vols., New York, 1870), and J. W. Foster, *A Century of American Diplomacy* (Boston, 1900). See NORTHEAST BOUNDARY DISPUTE.

WEBSTER CITY. A city and the county seat of Hamilton Co., Iowa, 72 miles north by west of Des Moines, on Boone River, and on the Illinois Central, the Chicago and Northwestern, and the Crooked Creek railroads (Map: Iowa, D 2). It has the Kendal Young Library, the Mercy Hospital, city and county parks, and a courthouse. There are shops of the Crooked Creek Railroad, and manufactories of sewer pipe, skates, sieves, troughs, canned goods, rugs, cigars, bricks and tiles, brooms, iron products, stock food, and felt shoes. The city manager plan of government was adopted in 1915. Pop., 1900, 4613; 1910, 5208.



WEBSTER GROVES. A city in St. Louis Co., Mo., 9 miles southwest of St. Louis, on the Missouri Pacific and the St. Louis and San Francisco railroads. It is a residential suburb of St. Louis, and contains a Masonic home, Kendrick Seminary, Loretto Academy, and a public library. Pop., 1900, 1895; 1910, 7080.

WEBWORM (*web*, AS. *web*, OHG. *weppi*, dial. Ger. *Webb*, Ger. *Gewebe*, web, from AS. *wefan*, OHG. *weban*, Ger. *weben*, to weave + *worm*). Any one of several lepidopterous larvæ

WEB OF FALL WEBWORM.
With one of the suspended caterpillars.

which spin webs, and live gregariously in large colonies or occupy single webs. The commonest is the fall webworm, the larva of *Hyphantria textor*. The adult is a rather small, pure white moth, sometimes spotted with black. It lays its eggs in clusters of 4 to 500 upon the leaves of trees. The caterpillars on hatching live together, each colony spinning a web which grows with the growth of the larvæ, and may include all the leaves of a limb. It with the forest tent caterpillar and gypsy moth is one of the worst enemies of the forests in the United States. Upon reaching full growth the larvæ leave the web and crawl down the trunk to spin their cocoons. There are two generations each year, and the insect hibernates in the pupal condition. When numerous it is abundantly parasitized, many ichneumon flies and chalcis flies laying eggs in the growing caterpillars. Burning the webs at nightfall or in dark weather, when the caterpillars are close together, is often practiced, a torch being used. Compare TENT CATERPILLAR.

FALL WEBWORM
a, caterpillar of *Hyphantria cunea*; *b*, spotted form of moth; *c*, cocoon.

The sugar-beet webworm is the green and black striped larva of a pyralid moth (*Loxostege sticticalis*). It feeds upon the leaves of the sugar beet, transforming to a pupa in May after passing the winter underground in a long silken tube. The imported cabbage webworm is the larva of another pyralid moth (*Hellula undalis*), which occurs throughout the Gulf region in the United States, and which is also found in the Mediterranean, Ethiopian, and Oriental regions. The moths lay their eggs in small batches on the leaves, upon the under sides of which the larvæ feed, concealing themselves with a silken web to which their excrement is attached. There are two generations each year. Cabbages and turnips are the favorite food, but radishes and beets are also attacked. An early trap crop of collards or radishes is recommended to be planted and sprayed with an arsenical poison.

WECHIKHIT, wĕch'ĭ-kĭt. See YOKUTS.

WECKERLIN, vĕk'ĕr-lĕn'; *Fr. pron.* vĕ'kâr'-lăN', JEAN BAPTISTE THÉODORE (1821–1910). A French musician, born at Gebweiler, Alsace. In 1844 he began his musical career, studying singing with Ponchard and composition with Halévy at the Paris Conservatory. In 1847 he brought out his heroic symphony *Roland*. In 1869 he was appointed assistant librarian to the Conservatory. In 1876 he became Félicien David's successor as librarian at the Conservatory and published in 1885 a biographical catalogue. Later he became librarian of the Société des Compositeurs. He retired in 1909, and died the following year in his native town. Among his works are: an oratorio, *Le jugement dernier;* the cantatas, *L'Aurore* and *Paix, charité, grandeur* (1886); the ode-symphonie, *Les poèmes de la mer*, for solo, chorus, and orchestra (1860); *L'Inde* (1873); and *La fête d'Alexandre*, in the same year. His *Histoire de l'instrumentation depuis le seizième siècle jusqu'à l'époque actuelle* won the gold medal of the Académie in 1875.

WECKHERLIN, vĕk'hĕr-lĕn, GEORG RUDOLPH (1584–1653). A German poet. He was born at Stuttgart, studied jurisprudence at the University of Tübingen, and entered the diplomatic service of Württemberg. After serving as secretary to Duke John Frederick (1614–c.1620) he removed to England, where he served (1624–41) as an Undersecretary of State. At the outbreak of the Civil War he chose the side of Parliament and from 1644 to 1649 held the position of secretary for foreign tongues. Upon his retirement he was succeeded by John Milton, and in 1652 was appointed assistant to the latter, but continued in office only a few months and died in London the following year. Weckherlin's German poems are for the most part imitated from the works of the French Pleiade, especially from Ronsard, or from English writers like Samuel Daniel. He ranks as foremost of the poets before Opitz who tried to introduce Renaissance forms and feelings into German verse. His lyrics are poetic in tone, though some may be considered hard and unwieldy in form. His chief English poems are "Triumphal Shows Set Forth Lately at Stuttgart" (1616) and "Panegyricke to Lord Hay, Viscount of Doncaster" (1619). His collected poems were edited by H. Fischer (Stuttgart, 1893–95). Consult: Fischer, as above; Cong, *Nachrichten von dem Leben und den Schriften R. Weckherlins* (Ludwigsburg, 1803); Höpfner, *Weckherlins Oden und Gesänge* (Berlin, 1865); and Bohn, *Englands Einfluss auf Weckherlin* (Göttingen, 1893).

WECKLEIN, vĕk'līn, NIKOLAUS (1843–). A German classical scholar, born at Gänheim. He studied at Würzburg, Munich, and Berlin, taught in Gymnasia in Munich, Bamberg, and Passau, and from 1886 again at Munich. His publications include numerous excellent annotated editions of plays of Æschylus, Sophocles, and Euripides: *Ars Sophoclis Emendandi* (1869); *Curæ Epigraphicæ* (1869); *Studien zu Aeschylos* (1872); *Studien zu Euripides* (1874); *Curæ Criticæ* (1877); *Beiträge zur Kritik des Euripides* (1895); *Studien zu Ilias* (1905).

WED'DERBURN, ALEXANDER. See ROSSLYN, first EARL OF.

WEDDERBURN, JAMES (?1495–1553). A Scottish poet. He was born in Dundee, studied at St. Andrews University, and became a merchant. He was active in the Scottish Reformation, and in 1539 fled to France to escape prosecution as a heretic, and died there. With his brothers, John (?1500–56) and Robert (?1510–56), he wrote a work entitled *Ane Compendious Buike of Godly and Spirituall Sangs with Augmentation of sundrie gude and godlie Ballates not contenit in the first Editioun*, which appeared in 1567. The first edition referred to is unknown and it is thought that the poems may have originally appeared in broad sheets. The *Complaynt of Scotland* (1548), said to be the only classic work in old Scottish prose, has been attributed to one of the Wedderburns. The *Compendious Book* has been edited by David Laing (Edinburgh, 1868), and by Mitchell (ib., 1897); consult also the latter's *The Wedderburns and Their Work* (London, 1867).

WEDDING ANNIVERSARIES. The names given to the several anniversaries of a marriage are said to be of quite ancient origin, and arose from the gift which was regarded as the most suitable offering from the husband to the wife. The names commonly given to such anniversaries are for the first, paper; second, straw; third, candy; fourth, leather; fifth, wooden; seventh, floral; tenth, tin; twelfth, linen; fifteenth, crystal; twentieth, china; twenty-fifth, silver; thirtieth, pearl; thirty-fifth, coral; fortieth, emerald; forty-fifth, ruby; fiftieth, golden; seventy-fifth, diamond. The diamond wedding is often celebrated at the sixtieth anniversary. Those most frequently celebrated are the paper, wooden, tin, crystal, silver, and golden.

WEDEKIND, vā'de-kĭnt, EDGAR L. WALDEMAR OTTO (1870–). A German chemist. He was born in Altona, Prussia, and studied chemistry at Tübingen and at Munich (Ph.D., 1901). After some years of experience in teaching he was appointed professor of chemistry at Tübingen. In 1909 he was called to the chair of inorganic and physical chemistry, with directorship of the department of inorganic chemistry, in the University of Strassburg. His many researches gained for him important recognition and he received an award of 1000 marks from the Royal Prussian Academy of Sciences for his studies in magneto-chemistry. His larger works include: *Zur Stereochemie des fünfwertigen Stickstoffs* (2d ed., 1907); *Lehrbuch der heterocyclischen Verbindungen* (1901); *Stereochemie* (2d ed., 1914); *Organische Chemie* (1910); *Magnetochemie* (1911).

WEDEKIND, FRANK (1864–). A German dramatist. He was born at Hanover, the son of a well-to-do physician and of an actress,

who met in California. Despite literary ambitions, he was compelled to study law at Munich and Zurich, where in his Bohemian life he met Hartleben, the two Hauptmanns, and other notables. In Munich, Paris, and London he soon ran through his inherited competence. Upon his return to Munich he was given a place on the staff of *Simplicissimus* by Langen. Heine successfully produced his plays *Der Erdgeist* (1895; Eng. trans., *Erdgeist*, 1915), *Der Kammersänger* (1899), and *Der Liebestrank* (1899) in Leipzig. Lèse-majesté caused Wedekind's flight to Paris, whence, however, he soon returned to serve out his sentence in Königstein. Next he went on the stage in Berlin, mostly in his own plays, with no great success. In 1906 he married the actress Tilly Niemann, and in 1908 returned to Munich. Greatly influenced by Ibsen, Strindberg, and Shaw, Wedekind equals his teachers in ability to depict depravity of many kinds, mostly sexual, but he approaches these other dramatists neither in technique nor in style. A broad bitter line of pessimistic satire and cynicism runs through his works. Although he is obviously talented and apparently in earnest, most of his works are classed by his critics as unpleasant and sometimes disgusting caricatures of the seamy side of life viewed by a morbid mind. Among other dramatic works than those mentioned are: *Frühlings Erwachen* (1891; 20th ed., 1908; Eng. trans., *Awakening of Spring*, 4th ed., 1915); *So ist das Leben* (1902; Eng. trans., *Such is Life*, 1912); *Die Büchse der Pandora* (1904; new revised ed., 1906), a continuation of *Der Erdgeist; Der Marquis von Keith* (1904); *Hidallah* (1904); *Totentanz* (1906); *Musik* (1907); *Der Stein der Weisen* (1909); *Mit allen Hunden gehetzt* (1910); *Franziska* (1912); *Leidenschaften* (1913); *Simson oder Scham der Eifersucht* (1914). His collected works appeared in six vols. (1913). Consult H. B. Samuel, *Modernities* (London, 1913); J. G. Huneker, *Ivory, Apes, and Peacocks* (New York, 1915).

WEDGE (AS. *wecg*, OHG. *weggi*, Ger. *Wecke*, *Weck*, 'wedge-shaped loaf'). The wedge is in principle a modification of the inclined plane. A force is applied by pressure, or more generally by percussion to the back, thus driving the edge forward. The wedge is employed for such purposes as the splitting of wood, the fastening firmly of the handle of an axe, the raising of a ship in a dry dock, or for launching, etc. The investigation on statical principles of the mechanical advantage of the wedge is extremely unsatisfactory, the enormous friction on the sides of the wedge being generally neglected; the theoretical result thus incorrectly arrived at is that the force applied at the back ÷ the resistance = ½ width of back of wedge ÷ length of side. In the application of the wedge to the splitting of wood in the direction of the fibres, the split generally extends some distance in advance of the edge of the wedge, and the action of the latter is then a combination of the action of the wedge with that of the lever; in fact, this compound action is found more or less in all applications of the wedge as a cutting or splitting weapon, and tends further to complicate the statical investigation of its mechanical properties.

WEDGE-TAILED EAGLE. See EAGLE.

WEDGWOOD. The name given to various kinds of pottery and stoneware invented by Josiah Wedgwood (q.v.) of Staffordshire, England. A cream-colored ware was made in the English potteries as early as 1725, which had been improved by Aaron Wedgwood and Enoch Booth, of Tunstall, and afterward by a firm of skillful potters named Warburton. It finally fell into the hands of Josiah Wedgwood, through whom it became the recipient of the enameler's best art, and was considered worthy of the tables of the royalty. Black ware had been made in England from time immemorial, but Wedgwood's improvement, known as *basaltes*, was so marvelous as to amount to a creation. Wedgwood was assisted by John Flaxman, who modeled the most characteristic designs. The ware consisted of tinted bodies of blue, sage green, and various colors, on which small cameo reliefs in white or tinted paste were applied while they were soft, and were then fired. The figures are very beautiful and classical and the microscopic delicacy of the detail is astonishing. Towards the end of the eighteenth century many imitations of the Wedgwood wares were made by different English manufacturers and they were copied at Sèvres, but with French designs. The famous Barberini or Portland vase (q.v.), reproduced from the original antique, is probably the most famous example of Wedgwood jasper. Consult: Eliza Meteyard, *The Wedgwood Handbook: a Manual for Collectors* (London, 1875); *Old Wedgwood and Old Wedgwood Ware*, published by the Birmingham Museum and Art Gallery (ib., 1885); Samuel Smiles, *Josiah Wedgwood, F.R.S.* (New York, 1895). See POTTERY; STONEWARE.

WEDGWOOD, HENSLEIGH (1803–91). An English philologist, grandson of Josiah Wedgwood. He was born at Gunville, in Dorset, and was educated at Rugby School and Cambridge University. He is best known for his work in philology. He was one of the original members of the English Philological Society, and, in spite of his imperfect preparation, a scholar of wide learning and much natural balance. He published: *The Principles of Geometrical Demonstration* (1844); *On the Development of the Understanding* (1848); *A Dictionary of English Etymology* (1857); *Contested Etymologies* (1882). His dictionary, which attracted much attention when it was published, is not now valued. Towards the close of his life he became a convinced spiritualist.

WEDGWOOD, JOSIAH (1730–1795). The most celebrated of English potters. He was born in Staffordshire of a family of potters, established there since the seventeenth century. His school career closed with his ninth year, and he worked at the potter's trade as apprentice to his brother, then independently until his association with Thomas Whieldon, of Fenton, a prominent potter. In 1759 he opened works of his own in Burslem, himself supplying the models and mixing the clay for his workmen. His interest turned especially to the Greek or Etruscan vases, from which he copied his designs for his famous Wedgwood wares (see WEDGWOOD). In partnership with Thomas Bentley, of Liverpool, he opened, in 1769, very extensive potteries at Etruria (Staffordshire), a village he had built for his workmen. After the death of Bentley Wedgwood became sole owner of the establishment. He took some part in public life, being a successful advocate of road improvement and canal extension in the pottery district. He published valuable pamphlets on pottery, was elected a fellow of the Royal So-

ciety in 1783, and of the Society of Antiquaries in 1786.—A descendant, JOSIAH CLEMENT WEDGWOOD (born 1872), became known as a leader in the single tax movement and as a writer on this subject and on the Wedgwood family and pottery. Consult: Eliza Meteyard, *Life of Wedgwood from his Private Correspondence and Family Papers* (2 vols., London, 1865–66); id., *Group of Englishmen, 1795–1815* (ib., 1871); Sir A. H. Church, *Josiah Wedgwood: Master Potter* (new ed., New York, 1903); K. E. Farrar, ed., *Letters of Josiah Wedgwood* (2 vols., London, 1903; supplementary vol., ib., 1906), for private circulation; J. C. Wedgwood, *A History of the Wedgwood Family* (New York, 1909); Julia Wedgwood, *Personal Life of Josiah Wedgwood* (rev. and ed. by C. H. Herford, ib., 1915); also Henrietta Litchfield, ed., *Emma Darwin: A Century of Family Letters* (2 vols., London, 1915).

WEDGWOOD, THOMAS (1771–1805). An English physicist and philanthropist, son of Josiah Wedgwood. He was born at Etruria Hall, Staffordshire, and was educated at home with the exception of a few terms at Edinburgh University. It is said that Wedgwood was the first photographer, as he was the first to discover that a silhouette of any object might be obtained when its shadow was thrown on a surface moistened with nitrate of silver. He did not, however, discover any way of fixing the images, and so was obliged to keep them in the dark. When his father died, leaving considerable property, the son aided several men, among whom was Samuel Taylor Coleridge, the poet. Consult R. B. Litchfield, *Tom Wedgwood the First Photographer* (London, 1903).

WED'MORE, SIR FREDERICK (1844–). An English art critic and miscellaneous writer, born at Clifton. He was educated at Lausanne and Paris. At 19 he took up journalism at Bristol, and afterward settled in London, where he became art critic of the *Standard*. In 1885 he visited the United States to deliver art lectures at Harvard and Johns Hopkins universities. In 1912 he was knighted. Among his many books on art are: *Studies in English Art* (two series, 1876, 1880); *Masters of Genre Painting* (1877); *Etching in England* (1895); *Fine Prints* (1896); *On Books and Art* (1899); *Turner and Ruskin* (1900); *Some of the Moderns* (1909); *Etchings* (1911); *Painters and Painting* (1913). He is known also for short stories and other imaginative pieces in *Pastorals of France* (1877), *Renunciations* (1893), *English Episodes* (1894), and *Orgeas and Miradou* (1896); and for a novel, *Collapse of the Penitent* (1900). In addition, he contributed a life of Balzac to the "Great Writers Series" (1890) and published his reminiscences, social and literary, as *Memoires* (1912).

WEDMORE, PEACE OF. See CHIPPENHAM.

WEDNESBURY, wĕnz'bĕr-ĭ. A municipal borough in Staffordshire, England, near the source of the Tame, 7½ miles northwest of Birmingham (Map: England, D 4). Its chief industry is the manufacture of heavy iron and steel goods. The city is named after the Saxon god Woden. The site of the ancient temple dedicated to pagan worship is occupied by a fine Perpendicular church. Pop., 1901, 26,544; 1911, 28,108.

WEED (AS. *wīod, wēod*, of uncertain origin). A plant which grows wild in cultivated grounds, choking crops and exhausting the soil. Annual and biennial weeds, such as charlock, pigweed, burdock, and melilot, may be destroyed by clean cultivation, as may also perennial weeds, such as couch grass, Canada thistle, ox-eye daisy, and sorrel, but by persistent fighting. For this purpose crops which require much cultivation are advantageously planted, and recourse may be made to summer fallowing in fields and frequent weeding in gardens. Thistles and other large weeds are frequently pulled in grain fields before the ripening of the crop, and, to prevent their seeding, they are cut in pastures. Sedges and rushes in damp grounds disappear on thorough draining. Leafy crops, which thickly cover the soil, prevent growth of weeds by the exclusion of air and light. Weeds which appear in fallow grounds serve as green manure when they are plowed under. Some weeds while young can be destroyed in growing grain without injury to the crop by spraying the fields with a solution of copper sulphate or iron sulphate. (See HERBICIDE.) Most weeds are introduced by sowing impure seed. Clover and grass seeds are especially liable to contain weed seeds. See SEED TESTING.

WEED, CLARENCE MOORES (1864–). An American zoölogist, born at Toledo, Ohio. He was educated at the Michigan Agricultural College and at Ohio State University (Ph.D., 1890). He was entomologist and botanist at the Ohio Experiment Station (1888–91), professor of zoölogy and entomology at the New Hampshire College of Agriculture (1891–1904), and thereafter instructor in nature study at the State Normal School at Lowell, Mass. Among his publications are *Insects and Insecticides* (1891); *Fungi and Fungicides* (1894); *Life Histories of American Insects* (1897); *Birds in their Relation to Man* (1903; 2d ed., rev., 1916), with N. Dearborn; *Farm Friends and Farm Foes* (1910); *Seeing Nature First* (1913).

WEED, THURLOW (1797–1882). An American journalist and political leader, born at Cairo, Greene Co., N. Y., Nov. 15, 1797. At the age of 14 years he was an apprentice in a printing office at Onondaga Hollow, N. Y.; and in the War of 1812 he served for a time as a volunteer on the northern frontier. In 1815 he went to New York City, and after a brief career in printing establishments there he engaged in several journalistic ventures in western New York, founding successively the *Agriculturist* at Norwich and the *Onondaga County Republican* at Manlius, N. Y. He became editor of the Rochester daily *Telegraph* in 1822, of which three years later he also became the proprietor. In 1826 he retired from the management of this paper and established the *Anti-Masonic Enquirer*, and became prominently identified with the Anti-Masonic party. He was for several years a member of the State Legislature, where he was noted for his remarkable adroitness as a political manager. In 1830 Weed removed to Albany and established the Albany *Evening Journal*, an anti-Jackson organ, which he edited with singular ability for 33 years, almost immediately attracting attention by his vigorous attacks upon the Albany Regency (q.v.). He had a wide acquaintance with public men, and for many years his influence in political affairs, first as a Whig and later as a Republican, was in some respects unsurpassed by that of any man in the country. Declining to accept any offices for himself except the profitable one of State printer, he dictated the nomination and appointment of others. It was owing to his management more than to that of any other man that Harrison and Taylor

were nominated for the presidency in 1840 and 1848 respectively, while he took a leading part in bringing about the nomination of Clay in 1844, of Scott in 1852, and of Frémont in 1856. Throughout his long career he was an intimate friend of Seward, and for a long time was an influential member of the powerful "political firm of Seward, Weed, and Greeley," which controlled the politics of New York State. During the Civil War he spent some months in Europe as a member of a commission charged with securing the neutrality of foreign governments. For a brief period after the war he served on the editorial staff of the New York *Times*, and in 1867–78 was editor of the *Commercial Advertiser*. In 1866 he published *Letters from Europe and the West Indies*. He died in New York City, Nov. 22, 1882. His *Autobiography*, a useful contribution to the historical and political literature of the country, was published in 1884 (Boston), and a *Memoir* by Barnes (Boston, 1884). Consult De A. S. Alexander, *Political History of the State of New York* (New York, 1906).

WEED, WALTER HARVEY (1862–). An American geologist, born in St. Louis. He graduated at the Columbia School of Mines in 1883, became a geologist on the United States Geological Survey in the same year, and in 1883–89 was engaged on the geological survey of Yellowstone Park. From 1889 to 1898 he was engaged in the geological exploration of Montana, and subsequently devoted his attention chiefly to the study of economic geology, particularly of ore deposits. His publications include: *Glaciation of Yellowstone Valley* (1893); *Secondary Enrichment of Mineral Veins* (1899); *Copper Mines of the World* (1907); *Ore Deposits* (1905), a translation from the German of Richard Beck, and many bulletins of the Survey.

WEE'DEN, WILLIAM BABCOCK (1834–1912). An American economist and historian. He was born at Bristol, R. I., and was educated at Brown University. In 1851 he entered upon the business of woolen manufacture at Providence. He served in the Civil War in 1861–62, resigning as captain. He then returned to his business. He is well known for his publications in economic history: *Morality of Prohibitory Liquor Laws* (1875); *Social Law of Labor* (1882); *Economic and Social History of New England* (1890); *War Government, Federal and State* (1906); *Early Rhode Island, a Social History of the People* (1910).

WEEK (AS. *wucu, wicu*, OHG. *wohha, wchha*, Ger. *Woche*, week). A subdivision of the month, usually consisting of seven days. Its origin is somewhat obscure, although it may be based on the moon's phases, which are approximately seven days apart—each quarter of the lunar month exceeding the seven-day week only by three-eighths of a day. Such was the basis of the Chinese and of the ancient Peruvian week. If, however, the week of seven days came first from Babylonia, as seems most probable, the number seven may be derived from the sun and moon with the five planets, in the order Ninib (Saturn), Marduk (Jupiter), Nergal (Mars), Shamash (Sun), Ishtar (Venus), Nabu (Mercury), and Sin (Moon). With this astronomical basis the influence of the widespread belief in the sacred prime number seven probably cooperated. Furthermore, in Babylonia every seventh day of the month was an evil day, on which certain things were taboo and certain offerings were incumbent. The names of the intervening days are unknown, and the date and frequency of celebration of the day *shabattu*, devoted to the "contentment of the heart (of the gods)," are also uncertain. Among the Jews, on the other hand, the week of seven days prevailed from earliest times. There is here no trace of planetary influence. The names of the Hebrew days of the week are unknown, although from the analogy of the New Testament and Rabbinical usage they would seem to have been numbered from the Sabbath, so that "four after the Sabbath" would be Wednesday. Like the Semites, the Egyptians had a week of seven days, and these were named according to the seven planets. Over each hour of the Egyptian day a planet presided, in the order of its distance from the earth according to the geocentric system, thus giving the succession Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon. If then Saturn presides over the first hour of the first day (Saturday), the twenty-fifth hour will fall to the sun, the forty-ninth hour to the moon, and so for the rest. From Alexandria this week with its system of nomenclature came to the Greeks and Romans. The Greeks had previously divided each month into three decades, while the Romans had had eight-day periods, the eight days or *nundinæ* being primarily market days and based on the changes of the moon. The week of seven days was not officially adopted, however, until the time of Constantine. In Greece the week had been introduced by Greek-speaking Jews from Alexandria, in Rome by Chaldæan astrologers about the beginning of our era. From Rome this system spread to the Teutonic and Celtic peoples conquered by the Latins, and the names of the days of the week were translated, so that the *Dies Jovis* (French *jeudi*, Italian *giovedì*), day of Jupiter, became the Icelandic *þorsdagr*, day of Thor, the English Thursday. From the Greeks the week was imported to India, along with much other astronomical science, so that, since Brihaspati is the Sanskrit name for the planet Jupiter, *Bṛhaspativāra* corresponds to Thursday. In India, however, the week is of little importance. Among the Iranians the month of 30 days was divided into quasi weeks of 7, 7, 8, and 8 days each, although no special sanctity attached to the dividing days. The Islamitic peoples borrowed the week from the Jews, and like them number the days, as do also the Greeks, Slavs, Finns, and as did the French revolutionists, instead of naming them like the Latins (except the Portuguese, who retain the ecclesiastical enumeration, as *quinta feria*, "fifth day, Thursday"), Teutons, Celts, and Albanians. In the French Revolutionary calendar, officially decreed Oct. 3, 1793, and suppressed Dec. 31, 1805, the months, of 30 days each, were divided into three decades each, the tenth day of each decade being a holiday. Consult: Ludwig Ideler, *Handbuch der mathematischen und technischen Chronologie* (2d ed., 2 vols., Breslau, 1883); E. R. Roesler, *Ueber die Namen der Wochentage* (Vienna, 1865); Otto Schrader, *Reallexikon der indogermanischen Altertumskunde* (Strassburg, 1901).

WEEK, HOLY. See HOLY WEEK.

WEEK OF PRAYER. See PRAYER, WEEK OF.

WEEKS, FEAST OF. A name commonly given among the Jews to the second of their great festivals, from its being the culminating point of the seven weeks after the Passover, the same idea being expressed by the Greek word Pentecost (fifty). Its observance was connected with

the supplication for divine blessing on the harvest, and the day was in later times supposed to commemorate the giving of the law on Mount Sinai. When the day of Pentecost became one of the earliest of the Christian festivals, an analogy was easily traced between this event and the formal organization of the Christian Church on that day.

WEEKS, EDWIN LORD (1849–1903). An American painter. He was born in Boston and lived in Paris, where he studied under Gérôme and Bonnat. Early in his career he began a series of journeys to Egypt and Asia which led him to take the subjects of most of his paintings from the Orient. He received the grand diploma of honor at Berlin in 1891, and a special medal and prize at the Empire of India Exhibition in London (1896) and was made Chevalier of the Legion of Honor of France in 1896, and officer of the Order of St. Michael of Bavaria in 1898. His work, which shows accuracy of observation and detail, is well represented in the Corcoran Gallery, Washington, the Academy of Fine Arts, Philadelphia, the Metropolitan Museum, New York, and the Brooklyn Institute Museum. Weeks published two books on his travels.

WEEKS, JOHN WINGATE (1860–). An American banker and legislator, born at Lancaster, N. H. In 1881 he graduated from the United States Naval Academy and for two years was a midshipman. After acting as land commissioner in Florida for the Southern Railroad (1886–88) he became a member of the banking house of Hornblower & Weeks of Boston, Mass. A Republican, he served as mayor of Newton (1903–04) and as Representative in Congress (1905–13). In the House he became known as a legislator possessing great talent for details and ability in finance. In 1912 he was elected to the United States Senate. There he took a prominent part in the debate concerning the Glass-Owen Currency Act and the other important finance measures. In 1914–15 he was mentioned in connection with the Republican nomination for the presidency.

WEEKS, RAYMOND (1863–). An American philologist and phonetician, born at Tabor, Iowa. He graduated from Harvard in 1890, from 1893 to 1895 as traveling fellow studied at Paris and Berlin, and then became professor of Romance languages at the University of Missouri. In 1897 he took his Ph.D. at Harvard. He accepted a call to the University of Illinois in 1908 and in 1909 to Columbia. He wrote numerous articles on Old French literature, invented several instruments for use in the development of the study of phonetics, and was assistant editor on the *New Standard Dictionary* (1913). His works include: *Origin of the Covenant Vivien* (1902); *La Chevalerie Vivien*, facsimile edition (1909); *The N. E. A. Phonetic Alphabet* (1912), with J. W. Bright and C. H. Grandgent; and occasional poems and short stories. In 1910 he founded, in collaboration with H. A. Todd (q.v.) and other scholars, the *Romanic Review*, and he became general editor of the "Oxford French Series."

WEEMS, MASON LOCKE (c.1760–1825). An American preacher and writer, the author of a famous biography of George Washington. He was a native of Maryland, was educated for the Anglican ministry in London, and in 1784, there being no bishop of the Church of England in America, applied, but without success, to various bishops in England for admission to holy orders. An account of his difficulties in this respect may be found in McMaster's *History of the People of the United States*, vol. i (New York, 1900). The incident was an important factor in the establishment in the United States of the Protestant Episcopal church, distinct in organization from the Church of England. After Weems's return he preached at various places, though he seems never to have had a regular rectorship, and about 1790 he became a book agent for Matthew Carey (q.v.). Weems is remembered chiefly for his *Life of Washington*, one of the most popular books ever published in America. It first appeared in 1800 and in 1891 had gone through more than 70 editions. The fifth edition (1806) contained such anecdotes as that of the hatchet and cherry tree, now generally discredited. Weems wrote several other works, none of them important.

WEENIX, vā'nĭks, JAN (1640–1719). A Dutch animal and still-life painter, born in Amsterdam. He was the son and pupil of Jan Baptiste Weenix (1621–60), and his first pictures of subjects in the Roman Campagna and seaports are in the manner of his father. Under the influence of his uncle, Hondecoeter, he became a painter of hunting scenes and dead game. He is especially celebrated for his painting of dead hares, but his pictures often contain birds and sumptuous vases, with landscape backgrounds. From 1702 to 1712 he was court painter to the Elector at Düsseldorf, for whom he decorated the Castle of Bensberg with paintings of this character, most of which are now in the Munich Gallery and at Schleissheim. Nearly all the chief galleries of Europe and America possess his pictures, which are characterized by truthfulness, decorative arrangement, delicate brush work, and good color.

WEEPING PHILOSOPHER, THE. An appellation occasionally given to the Greek philosopher Heraclitus.

WEEPING TREE. Any one of several kinds of trees upon which leaf hoppers (especially *Proconia undata*) and their kin congregate, usually in the early summer, and copiously discharge honeydew (q.v.).

WEERTS, vârt, JEAN JOSEPH (1847–). A French decorative, historical, and portrait painter. He was born at Roubaix and studied at the Ecole des Beaux Arts under Cabanel. Among his best-known paintings, which are interesting, but hard and somewhat theatrical, are "The Death of Joseph Bara" (Luxembourg), "Exorcism in the Middle Ages" (Bordeaux Museum), "Assassination of Marat" (Evreux Museum), and "The Eternal Moment" (Petit Palais, Paris). He helped to decorate the grand gallery of the Court of Honor and the chapel of the Sorbonne, also the Hôtel de la Monnaie and the Hôtel de Ville, Paris, and the Hôtel de Ville at Limoges. His official portraits include those of Henri Brisson, Robert Fleury, and Alfred Roll. He became an officer of the Legion of Honor.

WEEVER (variant of *weaver*), or STINGFISH. A fish of the genus *Trachinus*, of the spiny-rayed fishes of the family Trachinidæ, interesting because of the sharp dorsal and opercular spine by which these fishes can inflict an unpleasant wound. Two species inhabit the sandy bottoms of the European coasts, both excellent for the table. There is no evidence that their sting is poisonous.

WEEVER, JOHN (1576–1632). An English poet and antiquary. He was born in Lancashire and was educated as a sizar at Queens' College,

Cambridge. In 1599 he published *Epigrammes in the Oldest Cut and Newest Fashion*, worthless, except that the references to Shakespeare, Daniel, Drayton, Ben Jonson, Marston, Middleton, and others throw light on contemporary opinion of those poets. In 1601 Weever published *The Mirror of Martyrs*, which relates to Sir John Oldcastle and enables us to date *Julius Cæsar*. His antiquarian researches were of value despite occasional inaccuracies. Consult Fuller, *History of the Worthies of England* (ed., Nuttall, London, 1840).

WEEVIL (AS. *wifel*, Ger. *Wiebel*, weevil; connected with AS. *wefan*, OHG. *weban*, Ger. *weben*, to weave). A name applied to many of the snout beetles of the suborder or series Rhynchophora, and to species of the family Bruchidæ of the series Phytophaga. The heads of the beetles of the former group, which it is said includes 25,000 species, are prolonged into a beak which in some species exceeds the length of the body. The jaws are at the tip of the snout, by means of which holes are drilled, and in some species the eggs pushed into place. According to Sharp only four families of snout beetles can be accepted with certainty. Other authors subdivide the order into more than twice as many families. The commoner North American species belong to Otiorhynchidæ, Curculionidæ, Calandridæ, and Scolytidæ, the first including over 100 North American species, commonly known as scarred snout beetles because the appendage borne on the mandible of the pupa, or even of the young adult, later falls and leaves a scar. *Aramigus fulleri*, which is destructive to roses (see ROSE INSECTS), belongs to this family. *Epicærus imbricatus* (see IMBRICATED SNOUT BEETLE) is destructive to trees, shrubs, fruits, and vegetables. Certain weevils of the Rhynchitidæ, which in the larval stage roll the leaves of plants, are the only true leaf rollers (q.v.) among the beetles. The family Curculionidæ includes more than 20,000 species, among which are some of the most destructive of beetles. In this family the mandible is not scarred. The antennæ are frequently elbowed. The maggot-like larvæ are especially injurious to fruits, seeds, and nuts. Two species (*Balaninus quercus* and *Balaninus rectus*) breed in acorns, *Balaninus nasicus* in hickory nuts, and *Balaninus caryatrypes* in chestnuts. *Conotrachelus nenuphar* is the cause of wormy plums and cherries. See PLUM INSECTS.

To this group belong certain destructive species of the genus *Anthonomus*. The strawberry weevil (*Anthonomus signatus*) destroys the buds of strawberry. (See STRAWBERRY INSECTS.) The most destructive, perhaps, of the whole series, is the sharpshooter, picudo, an insect most widely known as the Mexican cotton-boll weevil (*Anthonomus grandis*), one of the largest species of its genus. This insect, whose normal habitat is Central America and the West Indies, and whose ravages stopped the cultivation of cotton in the Monclova district of the State of Coahuila, Mexico, in 1863, appeared near Matamoros about 1888, spread across the river to Brownsville, Texas, and at the close of 1902 ranged over practically all of the best cotton-growing region of Texas, where in 1901 and 1902 its ravages were estimated at about $10,000,000. The adult insect is a small, long-snouted grayish weevil less than one-quarter of an inch long. Throughout the season it punctures and lays its eggs in the squares and bolls. The larva is a fat, white maggot about three-eighths of an inch long when full grown. It lives upon the internal tissues of buds and bolls. When the square is attacked it usually drops, but most of the damaged bolls remain upon the plant and become stunted or dwarfed except late in the season, when they either dry or rot. The larva pupates within the boll, which may contain several larvæ. The adult weevils hibernate in grass, in late cornstalks, in old bolls on the cotton plants, and in piles of seed about the cotton gins. They appear when the cotton blossoms, or earlier, and feed on young twigs and leaves. There are four or more generations each summer, the larvæ being found as late as December. No food plant other than cotton is known. The infestation of a field is evident from the falling blossoms. The Department of Agriculture recommends as the best remedies early planting, thorough cultivation, the planting of wide rows in order to admit the sun, and the destruction of the plants by fall plowing and fire in the autumn.

The rice weevil (*Calandra oryzæ*) is economically a very important beetle, which infests stored rice. (See RICE INSECTS.) *Calandra palmarum* or *Rhyncophorus palmarum* is the palm weevil, and does great damage to cocoa palms. Its larvæ are roasted and eaten by the natives of tropical America. (See GRUGRU.) To this group belong the bill bugs of the genus *Sphenophorus*, whose larvæ live on the roots of corn and other grains and grasses. One species (*Sphenophorus obscurus*) infests sugar cane in the Pacific Islands. The Scolytidæ are the bark or engraver beetles, which burrow between the bark and wood of trees, or even in the wood, leaving visible tunnels. When numerous they kill trees or else greatly damage the wood for commercial purposes. See BARK BEETLE; AMBROSIA BEETLES.

The Bruchidæ, of which there are about 800 species, are not snout beetles, although they are commonly called weevils. They are small, usually dull-colored stout beetles. The legless larvæ are fat maggots which live in the seeds of plants, mainly of the family Leguminosæ. One species (*Bruchus pisi*), which is the largest pea and bean feeding weevil found in North America, has caused the abandonment of pea cultivation in some sections of the United States. Since it does not thrive in cold countries, Canadian peas find a ready market in the United States. The eggs are laid on the very young pea pod. The larvæ, on hatching, bore through the pod and into the pea, from which the beetle emerges in the spring. *Bruchus obtectus*, a very formidable enemy of bean culture, not only breeds in the young pod, but also in stored beans. Infested beans will float in water; they should not be planted.

Certain other beetles inhabiting flour (e.g. *Silvanus surinamensis* of the family Cucujidæ, *Tribolium confusum* of the family Tenebrionidæ, and *Trogosita mauritanica* of the family Trogositidæ) and stored grain have erroneously been called weevils. Even a lepidopterous insect, the Angoumois grain moth (*Sitotraga cerealella*), is known in the southern United States as the fly weevil. See BEAN WEEVIL; GRAIN INSECTS.

WEFA, ABUL. See MOHAMMED BEN MOHAMMED BEN YAHAYA.

WEGELIUS, vā-gā'lī-ụs, MARTIN (1846–1906). A Finnish composer, born at Helsingfors. After the completion of his university studies he went to Vienna in 1870. The following year he studied with Richter and Paul in Leipzig. He began his career as chorus master at the opera in Helsingfors. After further study in Leipzig (1877–78) he was appointed conductor of the Finnish Opera at Helsingfors and director of the Conservatory. As a composer, and still more as a teacher, he exerted a marked influence upon the younger Finnish composers, among whom Sibelius, Järnefelt, Melartin, and Palmgren were his personal pupils. Wegelius' compositions include an overture, *Daniel Hjort;* a *Rondo quasi fantasia* for piano and orchestra; several cantatas; piano works; songs. See FINNISH MUSIC.

WEGENER, vā'gen-ẽr, GEORG (1863–). A German traveler and writer, born in Brandenburg. He studied at Heidelberg, Leipzig, Berlin, and Marburg, and after 1892 traveled in all parts of the world. In 1910–11 he accompanied the Crown Prince on an Asiatic journey. His publications include: *Herbsttage in Andalusien* (1895; 4th ed., 1908); *Zum ewigen Eise* (1896; 2d ed., 1897); *Der Südpol* (1897); *Deutsche Ostseeküste* (1900); *Zur Kriegszeit durch China 1900–01* (1st and 2d ed., 1902); *Deutschland im Stillen Ocean* (1903); *Tibet und die englische Expedition* (1904); *Reisen im Westindischen Mittelmeer* (1904); *Reisen* (3 vols., 1905–08); *Der deutsche Kolonialreich* (2 vols., 1910), with others; *Madeleine* (1910); *Reisehandbuch Indien* (1913).

WEGG, SILAS. A wooden-legged rascal, in Dickens's *Our Mutual Friend.*

WEGSCHEIDER, vāk'shī-dẽr, JULIUS AUGUST LUDWIG (1771–1849). A German theologian. He was born at Kübbelingen, Brunswick, studied at Helmstedt, and became professor at Rinteln in Hesse in 1806 and at Halle in 1810. His *Institutiones Theologiæ Christianæ Dogmaticæ* (1815; 8th ed., 1844) was considered the standard exposition of German rationalism.

WEHNER, ARTHUR ADOLF, COUNT VON POSADOWSKY-. See POSADOWSKY-WEHNER, A. A., COUNT VON.

WEIDNER, wīd'nẽr, REVERE FRANKLIN (1851–1915). An American Lutheran theologian, born at Centre Valley, Pa. He graduated at Muhlenberg College in 1869, and at the Lutheran Theological Seminary, Philadelphia, in 1873. From 1882 till 1891 he was professor in Augustana Theological Seminary (Rock Island, Ill.), and from 1891 till his death was president of and a professor in the Chicago Lutheran Theological Seminary. His publications include: *Theological Encyclopedia* (3 vols., 1885–91); *Biblical Theology of the Old Testament* (1886); *Introduction to Dogmatic Theology* (1888); *Biblical Theology of the New Testament* (1891); and various doctrinal works.

WEIERSTRASS, vī'ẽr-shträs, KARL (1815–97). A German mathematician, born at Ostenfelde, in Westphalia. In 1834 he went to Bonn for the purpose of studying law and finance, but four years later he took up the study of mathematics at Münster. In 1842 he became a teacher in the Gymnasium at Münster, and in 1848 was appointed to a similar position at Braunsberg. In 1856 he became instructor in the Industrial Institute at Berlin, and in 1864 professor of mathematics at the university in that city. His works relate chiefly to Abelian integrals and differential equations, and to the general theory of functions, the modern treatment of which he may be said to have introduced. His *Abhandlungen aus der Funktionenlehre* was published in Berlin in 1886. His other works, including *Zur Theorie der Abel'schen Integrale* (1849), *Formeln u. s. w. der elliptischen Funktionen* (ed. by Schwarz, 1885), and his numerous memoirs, appear in his *Mathematische Werke,* published under the patronage of the Prussian Academy of Sciences (Berlin, 1894–1903). He also edited Jacobi's (1881–91) and Steiner's (1881–82) works.

WEIGALL, wī'gạl, ARTHUR EDWARD PEARSE BROME (1880–). An English Egyptologist. He studied at Wellington College and for a short time at New College, Oxford. At 18 he took up archæological work, and in 1901–02 served as an assistant to Flinders Petrie at Abydos. He worked at Saqqara (1902–04); excavated the mortuary temple of Thothmes III at Thebes (1905); investigated the condition of the antiquities in Nubia (1906–07); explored the eastern desert and, in 1908, Wady Hammamat, Kassair, and other places. From 1907 to 1912 Weigall was also occupied with excavating and preserving the tombs of the nobles of Thebes. He published: *A Report on the Antiquities of Lower Nubia* (1907); *A Catalogue of the Weights and Balances of the Cairo Museum* (1908); *Travels in the Upper Egyptian Deserts* (1909); *A Guide to the Antiquities of Upper Egypt* (1910); *The Life of Akhuaton, Pharaoh of Egypt* (1910); *The Treasury of Ancient Egypt* (1911); *History of Events in Egypt from 1798 to 1914* (1915).

WEIGAND, vī'gänt, GUSTAV (1860–). A German philologist, born at Duisburg. He studied in 1884 at Leipzig, where, after traveling in France and Italy, he became a lecturer (1891) and assistant professor (1897). Among his more important works are: *Die Sprache der Olympo-Walachen* (1888); *Vlacho-Meglen* (1892); *Die Aromunen* (2 vols., 1894–95); *Der Banater Dialekt* (1896); *Körösch und Marosch Dialekte* (1897); *Linguistischer Atlas des dakorumänischen Sprachgebietes* (1898–1907); *Praktische Grammatik der rumänischen Sprache* (1903); *Die Dialekte der Bukowina und Bessarabiens* (1904); *Bulgarische Grammatik* (1907); *Albanesische Grammatik im südgegischen Dialekt* (1913); *Bulgarisch-deutsches Wörterbuch* (1913); *Albanisch-deutsches und deutsch-albanisches Wörterbuch* (1914).

WEIGEL, vī'gel, VALENTIN (1533–88). A German mystic. He was born at Grossenhain, near Dresden; studied at Leipzig and at Wittenberg, and from 1567 to his death was preacher at Zschopau, near Chemnitz. He emphasized the necessity of internal unction and illumination. His main thesis as a psychologist was that knowledge does not come from without, but from the eye of the cognitive subject. In cosmology he stands near Paracelsus. Of his writings only an unimportant funeral sermon appeared before his death. His productions were published from 1604 to 1618 in various places, and Weigelianism became widely spread. His opponents represented him as a dangerous revolutionary, who aimed at the overthrow of all political and social order. Weigel's most prominent writings are: *Libellus de Vita Beata*

(1609); *Ein schön Gebetbüchlein* (1612); *Philosophia Theologica* (1614); *Principal und Haupttractat von der Gelassenheit* (1618); *Soli Deo Gloria* (1618). Consult: Opel, *Valentin Weigel* (Leipzig, 1864); Pünjer, *History of Christian Philosophy of Religion* (Edinburgh, 1887); and Israel, *M. Valentin Weigels Leben und Schriften* (Zschopau, 1888).

WEIGELA, wī-gē'lȧ (Neo-Lat., named in honor of Christian Ehrenfried von Weigel, a Swedish physician of the early nineteenth century). A common name for certain species of Diervilla, one of which (*Diervilla florida*) was introduced into cultivation from China as *Weigela rosea*. There are two American species known as bush honeysuckle. The northern species, *Diervilla lonicera*, is common in the middle and northern States, extending to Hudson Bay and to the Rocky Mountains. It grows from 1 to 4 feet high, bears oblong-ovate petioled leaves, and pale-yellow axillary flowers, usually three on a stalk. The southern species, *Diervilla sessilifolia*, grows along the southern Alleghanies, and has sessile leaves. The foreign species, all of which are Asiatic, number only 6 or 8, but the colors of the flowers vary from white to deep rose. Among the best known are *Diervilla japonica* and *Diervilla coracensis*. All are grown in the United States, but require winter protection in the North.

WEIGHING MACHINE. A contrivance for ascertaining the weight of objects. The most common form of weighing machine is the platform scale, in which a small known weight at one end of multiplying beams is made to balance a heavy unknown weight at the other end. The principle of the unequal beam balance is simply the principle of the lever (see LEVER; BALANCE), and as applied to scales it may be illustrated by the accompanying diagram. Here we have the beam hinged at *l* and *m* and attached by a rod *no* to the scale beam *oq*. At *rjks* is a U-shaped lever hinged to fixed pivots at *j* and *k* and to the lever *lmn* at *r* and *s*. If now we let the broken lines *a*, *b*, *c*, *d* represent a stiff platform, which is carried on the two levers by means of standards at *c*, *f*, *g*, and *h*, we have represented all the principal operating parts of the ordinary platform scale. To understand the mode of operation, assume that a load is placed upon the platform *a*, *b*, *c*, *d*. This load is conveyed to the system of levers by the standards *c*, *f*, *g*, and *h*, and depresses them so that they exert a pull downward on the rod *no* and the short arm of the lever *op*. This pull is balanced by sliding the weight *w* along the lever or scale beam *oq*, which is so graduated into pounds and fractions that the weight of the article on the platform is read at a glance. It is now plain that we have only to vary the number of levers and relative lengths of the arms of these levers to secure almost any multiplication of the weight that we please. In ordinary platform scales a weight *w* of 1 pound balances a load of 100 pounds on the platform. But this ratio is increased to 1 to 500 or to 1 to 1000 in scales for weighing loaded wagons and cars. The arrangement of levers shown in the accompanying diagram is a common one, but there are many others in use, each of which is adapted to some particular application or use.

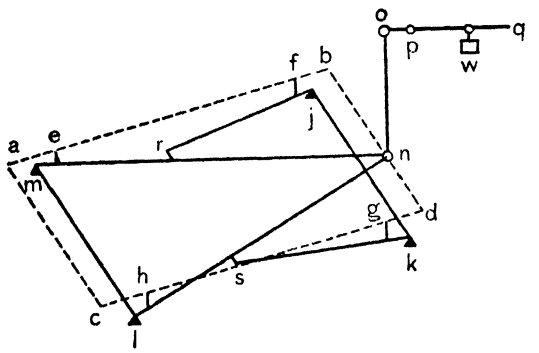

DIAGRAM OF PLATFORM SCALE.

Some scales work automatically, taking material from a large hopper, weighing out a certain amount and discharging it and then repeating the operation. Such contrivances are used for bagging sugar, coffee, etc., and for weighing grain or coal in or out of bin or elevator. Scales are built which have a capacity for weighing very heavy loads; examples of these are railway car and locomotive scales, cattle scales with a capacity of weighing from 20 to 200 head of cattle, and grain scales of 500 bushels capacity and more. Besides scales operating on the principle of the balance, there are weighing machines which operate by compressing a coiled spring or by twisting a bar of metal. The spring scale is a very common device, and in the form of a dynamometer for registering the pull of locomotives is made with very large capacities. For the most part, however, spring scales are of small capacity. They are not as reliable as balance scales. Consult *The Scale Journal* (Chicago, monthly) for discussion of new types as well as practice and theory of weighing machines. See SPRING BALANCE.

WEIGHT. See MATTER.

WEIGHTS, ATOMIC. See ATOMIC WEIGHTS.

WEIGHTS, MOLECULAR. See MOLECULES—MOLECULAR WEIGHTS.

WEIGHTS AND MEASURES. Standards of magnitude, weight, and value are essential for commercial and scientific purposes, and the facility with which national and international intercourse is carried on depends largely upon the uniformity of these standards. Naturally the units of measure adopted by primitive peoples were varied and imperfect, but as civilization advanced, trade increased, science developed, and more accurate standards became necessary. Their selection, whether by government action or common consent, was left almost to chance, so that they have differed from nation to nation, from county to county, from town to town, and even from one trade or guild to another. The last two centuries, however, have witnessed a great advance in favor of uniformity. England, the United States, France, and several other nations have established uniformity in their respective territories, and most of the leading nations have adopted the metric system. The same advantage accruing from uniformity for one or several countries would evidently obtain if a universal system were adopted by the whole world.

The setting up of a system of measures is fraught with many difficulties. The selection, determination, construction, and copying of the standard furnish peculiar problems. The chief considerations affecting the selection of a standard are its relation to a recognized physical constant and the relative ease with which these standards may be determined. In the case of the unit of length, two constants have been favored, a fractional part of a terrestrial merid-

urna = 1 amphora = 26.26 liters = 28.9 quarts. For dry materials, 192 cyathus = 128 acetabulum = 64 quartarius = 32 hemina = 16 sextarius = 2 semodius = 1 modius = 8.754 liters = 9.62 quarts. The Roman unit of weight, the pound, was subdivided duodecimally with special names as semis ½, bes ⅔, etc., into 12 unciæ each equal to 4 sicilici = 24 scripula = 48 oboli = 144 siliquæ = 27.29 grams = 1.09 ounces.

Passing over the details of mediæval European units, it appears that in England, up to 1400, an old building foot existed, about 13.22 inches, and the mile = 79,200 inches, subdivided into 10 furlongs (100 chains) or 1000 fathoms. This fathom is half the Belgian pertica or perch, equals two yards or six feet. Unfortunately, this system was legally suppressed and gradually driven out in favor of the foot of 12 inches, which had been legally enforced as early as the tenth century. The league is a Gallic unit, and lasted in Wales (= 1.56 miles) till the seventeenth century.

Prior to 950 A.D. the Saxon standards were kept at Winchester, where copies were compared and stamped. The measure at Winchester shall be the standard, was the decree of King Edgar. Under the Normans the standards were transferred to Westminster and placed in the care of the chamberlains of the exchequer, but their dimensions were not changed. These came later to be known as The Standards of the Exchequer. In 1224 the rule is laid down that: 3 barleycorns = 1 inch; 12 inches = 1 foot; 3 feet = 1 ell (*ulna*); 5½ ulnæ = 1 perch; 40 perches long and 4 in breadth = 1 acre. The barleycorns are to be dry, laid end to end, and taken from the middle of the ear. Under Henry VI, Richard II, and Anne an extra inch or thumb's breadth was added to the yard for stretching, of cloth. Richard II decreed uniformity for the Kingdom except in Lancaster, which always had larger measures.

A yard of Henry VII, dated 1490, and one of Elizabeth, 1588, are undoubtedly the oldest British standards of length, and they differ only about one hundredth of an inch from the present Imperial British yard. Still extant are also the Guildhall yard of 1660, Rowley's Tower standard of 1720, etc. In 1742 the Royal Society had an accurate yard made, called Graham's yard. A committee of Parliament in 1758 had two very accurate yards made by John Bird, who made another in 1760. These were 39.73 inches long and near each end was inserted a gold plug upon which the mark was made; they were of brass rods a trifle over an inch square in cross section.

In 1797 Sir George Shuckburgh Evelyn first used a comparator by Troughton for the accurate comparison of standards. The results obtained by him are as follows:

	Year	Inches
Henry VII standard	1490	35.924
Elizabeth standard	1588	36.015
Guildhall standard	1660	36.032
Clockmaker's Co. standard	1671	35.972
Graham's scale, by Sisson	1742	36.0013
Graham's scale, by Sisson in the Exchequer		35.9933
General Roy's scale, by Bird	1745–60	36.00036
Mr. Aubert's scale, by Bird	1745–60	35.99880
Royal Society's scale, by Bird	1745–60	35.99955
Bird's Parliamentary standard	1758	36.00023
Bird's Parliamentary standard	1760	36.00002

The Clerk of the House of Commons took charge of the Bird standards until they were finally adopted by Parliament under George IV on June 17, 1824, after another exhaustive investigation by Capt. Henry Kater. The legalization went into effect Jan. 1, 1826. The Act made elaborate provision for the restoration of this standard yard from its relation to the seconds pendulum, but when the Houses of Parliament burned down in 1834, destroying these standards, a royal commission decided against the recovery of the standard from the pendulum, and proceeded to derive a new standard from the extant standards. This new standard was adopted June 30, 1855. In 1870 it was recommended that mural fixed standards be established in populous towns for easy public comparison. Bronze blocks were inserted in the granite on the north side of Trafalgar Square, London, every 10 feet to 100, and for the chain of 66 feet, and these standards were legalized in June, 1876, by Act of the Council. Frequent committees have recommended to Parliament the adoption of the metric system, but with no success as yet. England and America will probably be forced to adopt the metric system for purposes of foreign trade, making the move at nearly the same time; neither alone can get along without it if the other takes it.

Early in the thirteenth century it was enacted under Henry III that there should be uniformity in the weights and measures throughout the realm, and a little later it was determined that measures of capacity should be based upon weights. Soon afterwards weights were established upon the weight of grains of wheat, as follows: 32 wheat grains = 1 penny (pennyweight); 20 pence = 1 ounce; 12 ounces = 1 pound; 8 pounds = 1 gallon; 8 gallons = 1 London bushel; 8 bushels = 1 quarter. This was known as the Tower pound and was in use until the middle of the fifteenth century.

As early as the thirteenth century, the gallon appears as eight pounds of wine, and the bushel as eight gallons; also in 1452 the gallon was defined as eight troy pounds of wheat, which in Elizabeth's time had become eight pounds avoirdupois. A statute of 1689 defines the wine gallon as 231 cubic inches, a unit still legal in the United States. The Imperial gallon of Great Britain contains 277.274 cubic inches and is used for the measurement of all liquid and dry substances. The Imperial British bushel contains 2218.192 cubic inches, and the Winchester bushel, the legal standard of the United States, contains 2150.42 cubic inches.

In England as well as elsewhere in Europe two pound units have prevailed from mediæval times, a light pound for weighing articles of high value and a heavy pound for weighing articles of low value. Many of the lighter pounds used in the Latin States are variations of the old Roman standards, others are of Saxon origin, and still others of more recent date. The Italian pounds have varied from 300 to 350 grams, the average being about the weight of the old Roman pound of 325.8 grams. The Spanish, Portuguese, and Prussian light pounds have varied from 459 to 470 grams. The English light pound is the troy pound of 12 ounces, named from the city of Troyes, and declared a legal standard by Great Britain (1497) for weighing gold, silver, silk, and other valuable commodities. The troy pound of Elizabeth (1588) served as a standard for such articles until 1824 (still legal in the United

States), and the Imperial standard troy pound (1758) was the only legal standard in Great Britain until 1856. The present standard troy pound is defined as 5760 grains, the troy pound used in the United States.

Of the heavy or so-called commercial pounds there have likewise been a great number. Their range is practically from 15 to 24 ounces, but heavy pounds of 28 and 36 ounces are said to have been used in Milan and Valencia. The standards of France, Germany, Denmark, and Holland range mostly from 488 to 500 grams. The avoirdupois pound was recognized as a standard in England during the reign of Edward III, and the Elizabethan standard (1588) of 7002 grains was derived from that of Edward. The Imperial pound avoirdupois of 7000 grains has been the English standard since 1856 and is generally copied by the United States. At the time it was legalized it was provided that in case the standards were destroyed they were to be recovered by the fact that 1 cubic inch of water at 62° F. and a barometric pressure of 30 inches of mercury, against brass weights in air, weighs 252.458 grains. When this standard perished in 1834 with the yard, it was not recovered by this method, but from other standards.

The development of the standards of France was essentially similar to that in other countries, except that the Revolution at the close of the eighteenth century precipitated the new conditions and resulted in the metric system (q.v.).

In the early colonial days in America the standards of the colonists were naturally those of the mother country, and in most cases copies of the home standards were brought over and intrusted to the care of special officers of the Commonwealth. In the English colonies it was usually the yard of 1588 that was employed. At the time of the Revolution the new country naturally continued with its existing English standards, and although the Constitution empowered Congress to fix the standard of weights and measures, nothing was done for a very long time. Thomas Jefferson in 1790, at the suggestion of Washington, brought in to Congress a proposition for a decimal system based upon a natural standard. He was not satisfied with proposed standards and urged the establishment of the Leslie pendulum, a straight bar vibrating mean seconds when suspended at one end = 38.72368 inches.

In 1813 the Coast Survey imported a Troughton scale of 82 inches similar to the one used by Shuckburgh, and Superintendent Hassler made a very complete investigation of this as well as all the other standards which he could get, and finally recommended that the distance from the 27th to the 63d mark on the Troughton scale be adopted as the yard, at 62° F. This was adopted by the Treasury Department. In 1817 Hassler compared this American yard with the meter and toise, with the following result: 1 meter = 39.38024749 inches and 1 toise = 76.74 + inches.

On March 3, 1817, the Senate called upon the Secretary of State for an elaborate report relative to weights and measures of the United States and other countries. John Quincy Adams presented a very complete and exhaustive report, but practically advised that nothing be done at that time. The appendices of this report are very rich in early legal enactments. The matter was taken up again by the Senate in 1830, and again Mr. Hassler undertook a complete investigation of the standards. The Troughton scale of 1813 was taken as the standard, with the following results:

	Inches
The old Exchequer yard of 1820	35.987497
The old Exchequer ell of 1820	45.026101
Latter reduced to yard	36.020881
Copy of Exchequer yard, by Jones	35.9990285
Copy of Exchequer ell, by Jones	45.0389644
Reduced to yard	36.031171
Brass yard of Jones	35.993835
Brass ell of Jones	45.03343
Brass ell reduced to yard	36.026744
Troughton yard, mean of 52-inch scale	36.0003465
The scale of the University of Virginia	35.9952318
Iron yard of the Engineering Department	35.998776
The New York brass yard	36.01545

Gallatin in 1821 brought over to America a standard platinum meter and kilogram. In 1827 he brought a troy pound of brass which was made the standard of mass in 1828 and has been the Mint standard ever since. The Treasury Department in 1830 adopted 231 cubic inches as the gallon and 2150.42 cubic inches as the bushel.

In 1856 the English government sent to the United States two certified copies of the standard of length, and these are now known as bronze standard No. 11 and Low Moor iron standard No. 57. In the same year, in order to encourage uniformity among the States, the Treasury Department sent to the Governor of each State a set of weights and measures complete. On July 28, 1866, the metric system of weights and measures was legalized by Act of Congress. In 1875 the United States joined with a number of others in the establishment of the International Bureau of Weights and Measures at Paris, and as a result thereof received in 1889 Standard International Meters No. 21 and No. 27 and International Standard Kilograms No. 4 and No. 20. These are made of an alloy of platinum with 10 per cent of iridium. April 5, 1893, the Treasury Department adopted meter No. 27 and kilogram No. 20 as the standards of the country, and since that time all measures are standardized against these, following the law of 1866 which defined the ratio of the yard to the meter as 3600 to 3937, and the ratio of the pound to the kilogram as 1 to 2.2046. See STANDARDS, UNITED STATES NATIONAL BUREAU OF.

False Weights and Measures. The necessity for prescribing and establishing a uniform system of weights and measures was early recognized by the English law. Before the Conquest there were Anglo-Saxon laws regulating the sizes of measures used in market places, and since then Parliament has enacted many statutes upon the subject, the present English law being incorporated in the Weights and Measures Act. In the United States the power of regulating weights and measures was vested in Congress, but as that body has not attempted to exercise its authority, except in regard to standards for the collection of customs and internal revenue, the several States have been obliged to fix their own standards and prescribe penalties for the violation of their statutory provisions on this subject. Inspectors are usually appointed with power to visit places of business where either weights or measures are used, in order to detect and prosecute violations of the law. Besides forfeiture of the false instruments, a penalty of fine or imprisonment is usually imposed upon the offender. Such laws have been held to be a legitimate exercise of the police power.

S. SYSTEM.

The following tables include the chief units of extension, volume, and weight in use in the United States and in Great Britain, together with the ratios of the various units of the same class. There are various local divergencies from these usages, and in many trades and for special purposes, other units and systems of measures, based more or less on the Anglo-Saxon measures, are employed. In the United States, State legislation and commercial usage define the weights and measures of trade rather than strict adherence to a single national scheme. Thus, in different States, a bushel may be defined as the weight of a certain agricultural product or other commodity only approximate to the volume of a United States bushel. In different States legislation differs as to whether commodities should be sold by weight or by volume, and often the exact form of measure is prescribed for a single commodity. In some States the gallon for milk is not the United States legal gallon, but a larger or ale gallon, while in others the long and short ton are indicated for specific uses. Nevertheless, the general system of weights and measures as used in the United States is based upon the following tables. For the special usage in various States and Territories see *Laws Concerning Weights and Measures of the United States*, compiled by the United States Bureau of Standards, Washington, D. C., 1904.

LONG MEASURE. UNITED STATES AND BRITISH

12	inches	1 ft. = 0.30480 meter
3	feet	1 yd. = 36 in. = 0.914402 meter
5½	yards	1 rod, pole, or perch = 16½ ft. = 198 in.
40	rods	1 furlong = 220 yds. = 660 ft.
8	furlongs	1 statute or land mile = 320 rods = 1760 yds. = 5280 ft. = 63,360 in.
3	miles	1 league = 24 furlongs = 960 rods = 5280 yds. = 15,840 ft.

Gunter's chain formerly used in surveying contained 100 links of 7.92 inches and was 66 feet or 4 rods in length.

SQUARE OR LAND MEASURE. UNITED STATES AND BRITISH

144	sq. in.	1 sq. ft. (100 sq. ft. = 1 square)
9	sq. ft.	1 sq. yd. = 1296 sq. in.
30¼	sq. yds.	1 sq. rod = 272¼ sq. ft.
40	sq. rods	1 rood = 1210 sq. yds. = 10,890 sq. ft.
4	roods	1 acre = 160 sq. rods = 4840 sq. yds. = 43,560 sq. ft.
640	acres	1 sq. mile or 1 section = 27,878,400 sq. ft. = 3,097,600 sq. yds.

One acre contains 10 square Gunter's chains.

CUBIC OR SOLID MEASURE. UNITED STATES AND BRITISH

1728 cubic inches	1 cubic or solid foot
27 cubic feet	1 cubic or solid yard
128 cubic feet	1 cord

LIQUID MEASURE. UNITED STATES ONLY

4 gills	1 pt. = 28.875 cu. in.
2 pints	1 qt. = 57.750 cu. in. = 8 gills
4 quarts	1 gallon = 231 cu. in. = 8 pts. = 32 gills
63 gallons	1 hogshead
2 hogsheads	1 pipe or butt
2 pipes	1 tun

British Imperial gallon is 277.274 cubic inches.

DRY MEASURE. UNITED STATES ONLY

	Edge of a cube of equal capacity
2 pts. = 1 qt. = 67.2006 cu. in. = 1.16365 liquid qts.	4.066 in.
4 qts. = 1 gallon = 8 pts. = 268.8025 cu. in. = 1.16365 liquid gallons	6.454 in.
2 gallons = 1 peck = 16 pts. = 8 qts. = 537.6050 cu. in.	8.131 in.
4 pecks = 1 struck bushel = 64 pts. = 32 qts. = 8 gallons = 2150.4200 cu. in.	12.908 in.

British bushel is 2218.192 cubic inches.

AVOIRDUPOIS OR COMMERCIAL WEIGHT. UNITED STATES AND BRITISH

27.34375	grains	1 dram
16	drams	1 ounce = 437½ grains
16	ounces	1 lb. = 256 drams = 7000 grains
28	pounds	1 quarter = 448 ounces
4	quarters	1 hundredweight = 112 lbs.
20	hundredweights	1 (long) ton = 80 quarters = 2240 lbs.

The short ton of 2000 pounds is largely used in the United States.

TROY WEIGHT. UNITED STATES AND BRITISH

24 grains	1 pennyweight (dwt.)
20 pennyweights	1 ounce = 480 grains
12 ounces	1 lb. = 240 dwts. = 5760 grains

APOTHECARIES' WEIGHT

20 grains or minims	1 scruple
3 scruples	1 drachm = 60 grains
8 drachms	1 ounce = 24 scruples = 480 grains
12 ounces	1 pound = 96 drachms = 288 scruples = 5760 grains

APOTHECARIES' FLUID MEASURE

60 minims	1 fluid drachm (f ℥)
89 drachms	1 fluid ounce (f ℥)
16 fluid ounces	1 pint (O)
8 pints	1 gallon (Cong.)

CIRCULAR OR ANGULAR MEASURE

60 seconds	1 minute (1′)
60 minutes	1 degree (1°)
90 degrees	1 right angle
360 degrees	1 circumference

1 radian or unit of circular measure is the angle subtended at the centre of a circle by an arc equal to the radius and is equal to 57.29577 degrees.

WEIGL, vī'g'l, JOSEPH (1766–1846). An Austrian composer, born at Eisenstadt, Hungary. He studied with Albrechtsberger and Salieri, and when but 16 years of age wrote an opera, *Die unnütze Vorsicht*. His first opera produced, however, was *Il pazzo per forza*, which appeared in 1788 and was very successful. Encouraged by this, he brought out—between that year and 1825—30 more operas, both Italian and German, besides a number of ballets. He also wrote two oratorios and many German and Italian cantatas. Upon the death of Salieri, in 1825, he received

the position of second court conductor and devoted his entire time to masses, offertories, and graduals. His opera *Die Schweizer Familie*, produced at Vienna in 1809, became exceedingly popular.

WEIHAIWEI, wā'hī'wā'. A port on the north coast of the promontory of Shantung, China, about 40 miles east of Chifu (q.v.), and about the same distance west of Yung-ching-hien, near the extreme end of the promontory (Map: China, M 4). It is situated on a moderately large bay with a small island in its mouth which protects the harbor from all sides except one. It was fortified by the Chinese in 1883–85, was made a naval station, and an arsenal was established. In 1895 the Japanese captured it from the landward side. It was evacuated in 1898, and shortly thereafter leased by Great Britain to be held by her so long as Russia should hold Port Arthur, on the opposite coast. In 1905 when Japan took over the lease of Port Arthur the British lease was made to run as long as the Japanese occupied Port Arthur. With the concession went a strip of land 10 miles wide, lying east of 121° 40′ E., and covering an area of about 285 square miles. Pop., about 150,000, all under British rule. Only Chinese and British war vessels may enter the harbor.

WEIL, vīl, GUSTAV (1808–89). A German Semitic scholar. He was born at Sulzburg, Baden, studied at Heidelberg and Paris, and, after a five years' residence in the East, became connected with the library at Heidelberg. He was made professor of Oriental languages in the university in 1848. His more important publications include: *Die poetische Litteratur der Araber* (1837); the translation of the *Thousand and One Nights* (1837–41; 3d ed., 1866); *Mohammed der Prophet* (1843); *Historisch-kritische Einleitung in den Koran* (1844); *Geschichte der Chalifen* (1846–51); *Geschichte des Abbassidenchalifats in Aegypten* (1860–62); *Das Leben Mohammeds nach Mohammed Ibn Ishak bearbeitet von Abd el Malik Ibn Hischam* (1864); *Geschichte der islamitischen Völker von Mohammed bis zur Zeit des Sultans Selim* (1866).

WEIL, HENRI (1818–1909). A French classical scholar, born at Frankfort-on-the-Main, Germany. He studied at Bonn, Berlin, and Leipzig, and in 1847 was an associate professor at Paris, whence he was called two years later to Besançon. In 1876 he went to Paris as professor of Greek at the Ecole Normale Supérieure and the Ecole des Hautes-Etudes. He resigned both positions in 1891. Among his works are: *De l'ordre des mots dans les langues anciennes, comparées aux langues modernes* (1844; 3d ed., 1879; Eng. trans. by C. W. Super, 1887), his masterpiece; and editions of *Æschylus*, with a Latin commentary (2 vols., 1861–67; 2d ed., 1884); seven tragedies of *Euripides*, with a French commentary (1868; 2d ed., 1879); *Les harangues de Démosthène* (1873; 2d ed., 1881); *Les plaidoyers politiques de Démosthène* (1877–86); *Etudes sur le drame antique* (1897); *Etudes de littérature et de rhythmique grecques* (1902).

WEIMAR, vī'mär. The capital of the Grand Duchy of Saxe-Weimar, Germany, situated 50 miles west-southwest of Leipzig (Map: Germany, D 3). The quaint old town lies in agreeable surroundings on the Ilm. The Stadtkirche, dating from 1488, rises in the middle of Weimar. It contains Cranach the Elder's valuable "Crucifixion," in which are to be discerned the faces of Luther and Melanchthon.

On the east side of the town looms the grand ducal palace, an interesting edifice, begun in 1790, and constructed under Goethe's supervision. Near the palace is the modern building completed in 1896, and devoted to the preservation of the precious and extensive Goethe and Schiller archives. South of the palace is the fine library, with over 287,000 volumes and more than 8000 maps. Southwest of the palace, in the market place, rises the striking Gothic town hall, with the remarkable house of the two Cranachs close at hand. Not far distant is the Schiller house, owned by the municipality since 1847. In front of the court theatre, which bears such high repute, is the great bronze Goethe-Schiller monument, by Rietschel. It was unveiled in 1857. Towards the southern part of the town is the famous Goethe home, where the poet lived. It is open to the public as the Goethe National Museum. In the cemetery on the southern edge of Weimar are buried Goethe and Schiller. To the east lies the beautiful park through which the Ilm flows. Weimar has among its many public and special schools a good art school, dating from 1860. With it are connected several names prominent in the German art world. The valuable new museum is housed in a striking yellow and red stone Renaissance structure. The finest of the contents is the cycle of frescoes by Preller on subjects from the *Odyssey*. There are also a natural history museum, with ethnological and antiquarian collections, the Liszt museum, a geographical institute, large orphanages, etc. Weimar has manufactures of iron, wood, straw, cloth, leather, and stoves, and is an important seat of the book trade. Pop., 1900, 28,509; 1910, 34,581, nearly all Protestants. Weimar dates from the ninth century. It passed to the Ernestine line of Saxony about 1500. Owing to the enlightened patronage of Duke Charles Augustus (q.v.), it is famous for literary associations pertaining to the classic epoch of German literature. Goethe resided here more than 50 years of his life; Schiller, Wieland, Herder, and Liszt also lived here; and it was for decades the German Athens and the resort of those famed or interested in letters.

WEINBERGE, vīn'bĕr-ge, or KÖNIGLICHE WEINBERGE. The former capital of a district in Bohemia, Austria, on the Moldau River, near Prague, of which it is an important suburb. It is now incorporated with its larger neighbor.

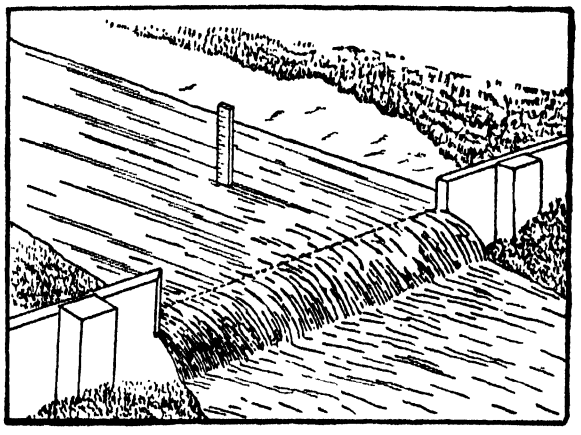
WEINEL, vī'nel, HEINRICH (1874–). A German Protestant theologian, born at Vonhausen, Hesse. He was educated at the universities of Berlin and Giessen (Ph.D., 1898), and at the theological seminary at Friedberg, Hesse. In 1904 he accepted the chair of New Testament exegesis at Jena. His publications include: *Jesus im 19. Jahrhundert* (1903; 3d rev. ed., 1914; Eng. trans., *Jesus in the Nineteenth Century*, 1914); *Paulus, der Mensch und sein Werk* (1904; Eng. trans., *St. Paul, the Man and His Work*, 1906); *Die Gleichnisse Jesu* (1904; 3d ed., 1910); *Ibsen, Björnson, Nietzsche, Individualismus und Christentum* (1908); *Biblische Theologie des Neuen Testaments: Die Religion Jesu und des Urchristentums* (1911; 2d ed., 1913).

WEINGARTNER, vīn'gärt'nĕr, FELIX (1863–). An Austrian musical conductor, born at Zara, Dalmatia. He studied for two years at the Leipzig Conservatory, where he won the Mozart Prize, made a short stay with Liszt at

Weimar, and in 1884 produced his opera *Sakuntala* there. He was conductor of the theatres at Königsberg, Danzig, and Hamburg and for two years at Mannheim. In 1891 he was appointed kapellmeister at the Berlin Court Opera, and also of the Royal Symphony concerts. In 1898 he settled at Munich as conductor of the Kaim orchestra, but resigned in 1904. In 1908 he succeeded Mahler as director of the Vienna Opera and conductor of the Symphony concerts, remaining, however, for only two years. From 1912 to 1914 he was first conductor at the Stadttheater in Hamburg, and thereafter was general musical director at Darmstadt and director of the conservatory. He visited the United States for the first time in 1906 as guest conductor of the New York Philharmonic Society. During the seasons 1912–14 he conducted the Wagner performances of the Boston Opera Company. As a conductor he ranks among the world's greatest interpreters, but as a composer he falls short of his lofty aims because of lack of genuine inspiration. His works include the operas *Sakuntala* (1884); *Malawika* (1886); *Genesius* (1893); *Orestes*, a trilogy after Æschylus: 1, *Agamemnon*, 2, *Das Totenopfer*, 3, *Die Erinyen* (1902); *Frühlingsmärchenspiel* (1908); *Kain und Abel* (1914); *Dame Kobold* (1916); three symphonies (G, E flat, E); two symphonic poems, *König Lear* and *Die Gefilde der Seligen;* considerable chamber music; choral works; songs; piano pieces. Among his literary works the following are of more than passing value: *Die Lehre von der Wiedergeburt und das musikalische Drama* (1895); *Ueber das Dirigieren* (1895; 4th ed., 1913); *Bayreuth, 1876–96* (1896); *Die Symphonie nach Beethoven* (1897; Eng. trans., *Post Beethoven Symphonists*, 1906). Together with Charles Malherbe he became editor of the monumental edition of Berlioz's works published by Breitkopf and Härtel, and also one of the editors of the same firm's complete edition of Haydn. Consult P. Raabe, *Felix Weingartner als schaffender Künstler* (Berlin, 1908); J. C. Lusztig, *Felix Weingartner, Persönlichkeiten* (ib., 1908).

WEINHEIM, vīn'hīm. A town in the Grand Duchy of Baden, Germany, 11 miles northeast of Mannheim (Map: Germany, C 4). It is a popular health resort and tourist centre. Leather, machinery, weapons, dyestuffs, chairs, and soap are manufactured. Pop., 1900, 11,168; 1910, 14,170.

WEINHOLD, vīn'hōlt, KARL (1823–1901). A German philologist and student of Germanic culture. He was born at Reichenbach, in Silesia, and studied at Breslau and Berlin. He became privatdocent at Halle in 1847, removed to Breslau in 1849, and became professor of German language and literature at Cracow in the following year, at Gratz in 1851, at Kiel in 1861, at Breslau in 1876, and at Berlin in 1889. His services to Germanic grammar and anthropology are valuable. The more important of his publications include: *Die deutschen Frauen im Mittelalter* (1851; 3d ed., 1897); *Altnordisches Leben* (1856); *Die Riesen des germanischen Mythus* (1859); *Die Heidnische Totenbestattung in Deutschland* (1859); *Alemannische Grammatik* (1863); *Bayrische Grammatik* (1867); editions of the Old High German *Isidorfragment* (1847), of the *Pilatusfragment* (1877) of Lampricht's *St. Francisken Leben und Tochter Syon* (1880); and of Lenz's dramatic remains; *Mittelhochdeutsche Grammatik* (1877; 2d ed., 1883); *Mittelhochdeutsches Lesebuch* (1850; 4th ed., 1891); *Verbreitung und Herkunft der Deutschen in Schlesien* (1887); *Ueber den Mythus vom Wanenkrieg* (1890); *Zur Geschichte des heidnischen Ritus* (1896); *Mystische Neunzahl* (1897); *Die Verehrung der Quellen in Deutschland* (1898). He was editor of *Germanistische Abhandlungen* in 1882–91, and in the latter year founded and edited the *Zeitschrift des Vereins für Volkskunde*. Consult K. W. Vogt, article in the *Zeitschrift für deutsche Philologie*, vol. 34 (Halle, 1902).



WEINMAN, wīn'man, ADOLPH ALEXANDER (1870–). An American sculptor. He was born in Karlsruhe, Germany, and at 10 came to New York, where he studied at the Art Students' League under Saint-Gaudens and at Cooper Union. His work, which is original in conception and shows clever and facile modeling, is well represented in the General Macomb monument (1908) at Detroit, Mich., the two Lincoln memorials at Hodgenville, Ky., and Madison, Wis., the "Indian Head" in the Brooklyn Institute Museum, and a seated statuette of Lincoln in the Metropolitan Museum, New York. Weinman was elected to the National Academy (1911), the National Sculpture Society, the New York Architectural League (1902), and the National Institute of Arts and Letters. In 1915 he was a member of the International Jury of Awards at the Panama-Pacific Exposition, San Francisco, where he exhibited 27 pieces, including portrait busts and plaques and medals.

WEIPERT, vī'pērt. A town in the Austrian Crownland of Bohemia, on the slope of the Harz Mountains, near the Saxon frontier, 68 miles northwest of Prague. The manufactures include firearms, silks, laces, and paper. Pop., 1900, 10,037; 1910, 10,972.

WEIR (AS. *wer*, Ger. *Wehr*, weir, dam, dike; connected with AS. *werian*, OHG. *werjan*, Ger. *wehren*, to guard, protect). A barrier or dam thrown across a stream to facilitate the measurement of its flow, to raise its level, or to direct the water for any useful or ornamental purpose. The word is also used to denote several varieties of fish traps. (See FISHERIES.) In the United States the term is but little employed except for measuring weirs and waste weirs or spillways; but in Great Britain, Egypt, India, and Australia it is quite commonly applied to such dams as have water flowing over their tops, either continuously or in floods. For ordinary dams for waste weirs or spillways, see DAMS AND RESERVOIRS.

Measuring Weirs are generally restricted to gauging the flow of comparatively small natural streams, sewers, and the like, and to serve as checks on other methods of measuring flows, such as meters, or the displacement of pumps. There is an increasing use of weirs in steam-power plants—in feed-water heaters to measure the water furnished the boilers. As a rule field weirs are temporary structures and therefore are more commonly built of wood. Sometimes metal is employed, but such is rarely the case, except for the crest of the weir. Ordinary flow dams may be used as weirs, either by changing their crests to make them conform to the accepted types, or by making allowances in computations. The standard measuring weir has a perfectly horizontal knife-edge, with vertical ends, and its back, or upstream face, a vertical plane surface. This is known as a sharp-crested rectangular weir. If the ends of the weir proper

do not extend the full width of the stream, allowance must be made for what are called end contractions. When the two ends of the weir are inclined to the crest the weir is known as trapezoidal. If two such inclined ends join in a common point, so there is no horizontal crest, the weir is called triangular. In determining the

TYPICAL TEMPORARY WEIR ON SMALL STREAM.

flow of water over weirs the observer merely determines the depth of the water on the weir, taking care that the measurement is made far enough above the weir to avoid the curved surface which is formed as the water pitches over. The readings are taken at sufficient intervals to include all marked variations in the depth of the water, or automatic recording gauges may be employed. The actual volumes are finally determined from the tables giving the discharge for various lengths of overflow, depths on the weir, and the character of the weir. The accepted formula for a simple weir with end contractions is: $Q = 3.33(L - 0.2H)H^{\frac{3}{2}}$, where Q = flow in cubic feet per second, L is length of weir in feet, and H is height of water over crest, in feet. See IRRIGATION.

Consult: Turneaure and Russell, *Water Supply Engineering* (New York, 1901); Mansfield Merriman, *Hydraulics* (ib., 1905), and papers in *Transactions American Society of Civil Engineers* (ib., March and May, 1900); also engineering periodicals.

WEIR, J(ULIAN) ALDEN (1852–). An American portrait, genre, and landscape painter and etcher. He was born at West Point, N. Y., and received his first instruction from his father, Robert Walter Weir (q.v.). He then studied at the National Academy of Design, New York, and at the Beaux-Arts, Paris, under Gérôme (1873–76) but was more influenced by the Impressionists. After his return to America he was one of the founders of the Society of American Artists (1877), and at one time its president, but seceded as one of the "Ten American Artists" in 1898. He was elected a member of the National Academy in 1886, and its president in 1915, succeeding John W. Alexander. He was chosen a member of the American Academy of Arts and Letters and received numerous important prizes, including gold medals at St. Louis (1904), National Academy of Design, New York (1906), the Corcoran Art Gallery, Washington (1914), and was hors concours, San Francisco, in 1915. Weir's work, rightly classed as impressionistic, is characterized by a skillful and original handling of delicate color, and a harmonious arrangement of masses. He combines much refinement of feeling with an able and sure technique. Examples of his paintings are to be found in most public collections in America, including the Metropolitan Museum, New York, the Art Institute, Chicago, the Albright Art Gallery, Buffalo, the National and Corcoran galleries, Washington, and the Pennsylvania Academy of Fine Arts, Philadelphia. In the Luxembourg Museum, Paris, is his "Portrait of a Young Girl."

WEIR, JOHN FERGUSON (1841–). An American painter and sculptor, the son of Robert Walter Weir (q.v.). He was born at West Point, N. Y., and studied with his father and at the National Academy, New York. In 1861 he opened a studio in New York and he became a member of the National Academy in 1866. In 1868 he studied abroad. After his return he served as director of the School of Fine Arts at Yale University (1869–1913). Among his best-known paintings are "The Gun Foundry" (1867); "Forging the Shaft" (1868, Metropolitan Museum, New York); "Tapping the Furnace"; and various portraits, including those of Admiral Farragut, President Dwight of Yale, and Wells Williams. His statues of President Woolsey and the elder Professor Silliman are at Yale University; he also designed the public fountain on New Haven Green. Among his writings are *John Trumbull and his Works* (1902); and *Human Destiny in the Light of Revelation* (1903).

WEIR, ROBERT WALTER (1803–89). An American historical and genre painter. He was born in New Rochelle, N. Y., and studied under Jarvis in New York City, from 1824 to 1828 under Benvenuti at Florence, and in Rome. He was elected to the National Academy in 1829, and in 1832 was appointed professor of drawing at the United States Military Academy at West Point, a post which he held for 42 years. Weir was among the first American painters to devote himself to historical subjects. Among his paintings are the "Embarkment of the Pilgrims" (1845), in the rotunda of the Capitol at Washington; the "Landing of Hendrik Hudson" (1842); the "Church of the Holy Innocents" (1847, Corcoran Gallery, Washington); and "Columbus Before the Council of Salamanca" (1884). His finest production is probably the large allegorical work, "Peace and War," executed for the chapel at West Point. He also designed the stained-glass windows of Trinity Chapel and Calvary Church, New York City. Some good portraits by him are at West Point. For his sons, see WEIR, J. A., and WEIR, J. F.

WEISBACH, vīs'bäĸ, JULIUS (1806–71). A German mathematician and mining engineer, born near Annaberg. He studied at Freiberg, Göttingen, and Vienna, and became professor in the school of mines at Freiberg (1833). He is principally known for his work in hydraulics and mechanics, his introduction and development of the surveying of mines, and the extension of axonometry. He wrote: *Handbuch der Bergmaschinenmechanik* (1836); *Experimentalhydraulik* (1855); *Lehrbuch der Ingenieur- und Maschinenmechanik* (1845–60, and subsequent editions); *Der Ingenieur* (1848; 7th ed. by Reuleaux, 1896); *Die neue Markscheidekunst* (1851–59); *Anleitung zum axonometrischen Zeichnen* (1857).

WEISER. A city and the county seat of Washington Co., Idaho, 82 miles northwest of Boise, on the Pacific and Idaho Northern, and the Oregon Short Line railroads (Map: Idaho,

B 5). It is the seat of the Intermountain Institute. The leading industries are mining, stock raising, and flour milling. Pop., 1900, 1364; 1910, 2600.

WEISHAUPT, vīs'houpt, ADAM (1748–1830). A German mystic and religious leader. He was born at Ingolstadt, studied law in his native city, and after 1772 was professor of canon law in the university there. In 1776 he declared himself an open enemy of the Jesuits, whose pupil he had been, and on May 1 of that year founded the Order of the Illuminati, or, as it was at first called, *Gesellschaft der Perfectabilisten*, the members of which were entirely subservient to their superiors, though theoretically vowed to the propagation of liberty. Weishaupt attracted great numbers of young men, especially those of good family, by his teaching, and made Ingolstadt a cosmopolitan centre till 1785, when his lecture hall was burned by his enemies. He then removed to Gotha, where he died. Among his writings were the following: *Apologie der Illuminaten* (1786); *Geschichte der Verfolgung der Illuminaten* (1786); *Das verbesserte System der Illuminaten* (1787; 3d ed., 1818). See ILLUMINATI.

WEISMANN, AUGUST (1834–1914). A German zoölogist, born Jan. 17, 1834, at Frankfort-on-the-Main. He studied medicine at Göttingen, was clinical assistant at Rostock for three years and then began to practice medicine at Frankfort. In 1861–62 he was private physician to Archduke Stephen of Austria. In 1863 he studied zoölogy as a student of Leuckart at Giessen, and from that year was identified with the University of Freiberg, where he was professor of zoölogy from 1871 till his retirement in 1912. He died at Berlin Nov. 6, 1914. Weismann's zoölogical investigations, especially those dealing with the embryology of insects and crustaceans, were of the greatest importance. Failing eyesight made it necessary for him to abandon microscopic work from 1864 to 1874, and again after 1884, and while for a part of this time he carried out his investigations with the aid of his wife and his assistants, he was eventually obliged to give it up entirely. His attention now turned to some philosophical phases of zoölogy, and in this field he did the epoch-making work upon which his scientific reputation mainly rests. The *Origin of Species* came to his attention in 1861 and he at once accepted the evolution theory and was one of the first scientific men in Germany publicly to defend it.

Although Jäger first (1876) proposed the term "continuity of the germ plasm," Weismann greatly expanded the idea, and added many new and original suggestions, establishing the present theory that heredity (q.v.) has a physical basis. He was also led to deny what is known as use inheritance (q.v.), or the Lamarckian doctrine that characters acquired during the lifetime of an animal may be transmitted to its posterity. Subsequently he proposed a theory of germinal selection. Weismann was an admirable investigator, a strong thinker, and the leader of the Neo-Darwinian or Weismannian school of evolutionists. His theories, which are bold, original, and suggestive, have been criticized as superscientific speculations and assumptions, especially that related to the architecture or mechanical arrangement of his hypothetical elements or determinants of the germ plasm (q.v.), but it is recognized that he was a powerful agent in placing modern biological studies on a higher plane, and in rendering the theory of descent of practical value in psychological and philosophical studies (see WEISMANNISM). His principal works are: *Die Entwickelung der Dipteren* (1864); *Studien zur Descendenztheorie* (2 vols., 1875–76; Eng. trans., *Studies in the Theory of Descent*, 1882); *Beiträge zur Naturgeschichte der Daphnoiden* (1876–79); *Ueber die Zahl der Richtungskörper und über ihre Bedeutung auf die Vererbung* (1887); *Essays upon Heredity and Kindred Biological Problems* (2 vols., 1889–92); *Amphimixis oder die Vermischung der Individuen* (1891); *Aufsätze über Vererbung* (1892); *Das Keimplasma* (1892; Eng. trans., *The Germ-Plasm, A Theory of Heredity*, 1893); "The All-Sufficiency of Natural Selection," in *Contemporary Review*, in February, March, and May, 1893; *The Effect of External Influences upon Development* (1894), Romanes Lecture at Oxford; *Neue Gedanken zur Vererbungsfrage: Eine Antwort an Herbert Spencer* (1895); "New Experiments on the Seasonal Dimorphism of Lepidoptera," in *Entomologist* (January–August, 1896); *Ueber Germinalselektion* (1896); *Vorträge über Descendenztheorie* (1902; 3d ed., 1913; Eng. trans., *The Evolution Theory*, 2 vols., 1905).

WEISMANNISM. The essence of the doctrines which were taught by August Weismann, and which differ from the more moderate views of Darwin, Romanes, and others, is the all-sufficiency of natural selection; the sweeping denial that use inheritance (q.v.) operates at all; the view that variation is mainly due to sexual reproduction, or amphimixis; and the elaborate and complicated relations of the ultimate elements or determinants (biophores) of the germ plasm. He thus states his theory as to the nature of the nuclear substance: "The germ plasm, or hereditary substance of the Metazoa and Metaphyta, therefore, consists of a larger or smaller number of idants, which in turn are composed of ids; each id has a definite and special architecture, as it is composed of determinants, each of which plays a perfectly definite part in development" (*The Germ-Plasm*, p. 453). He admits that the primary cause of variation is always the effect of external influences, but when these changes of conditions only affect the body in general their effects are limited to the simple life of the individual, and are not transmitted by heredity; but when they occur in the germ plasm they are transmitted to the next generation, and cause corresponding hereditary variations in the body. The opponents of this view hold that whatever external changes affect the body in general must necessarily affect the reproductive cells and the chromosomes of the nucleus of such cells. Indeed, the Weismannians treat the germ plasm as if it were a parasite, getting shelter and food from the body containing it.

In maintaining the all-sufficiency of natural selection Weismann argues that external influences act only as stimuli by which latent powers in the germ are called forth. Hence the changes in external conditions which appear to determine characters are not in any sense a true *causa efficiens*, but merely a necessary condition for the appearance of that which is inherent in the organism at some stage of development. His critics assert that in taking such extreme ground as this he overlooks the thoroughgoing effects of past geological changes, and their persistent effects as seen in the different lines of develop-

ment of series of extinct animals. Weismannism, they say, also overlooks the fact that in the beginning natural selection had no materials to operate with, the earliest types having been originated by the action of the primary factors of organic evolution. Accounting for the disappearance of a typical organ, Weismann says it is "always due to variations of the primary constituents of the germ," whereas Darwin and Lamarck attribute the loss of or reduction in the number of digits or other parts to simple disuse.

Another phase of Weismannism is the principle of intraselection. Taking the hint from Roux's principle of selection, or the struggle for existence between the parts of the organism, Weismann has greatly extended it, claiming that the selective process must take place not only in cells and tissues, but also in the smallest conceivable particles of the germ plasm, which he calls biophores. This process he calls intraselection. Here as elsewhere his opponents argue that Weismann minimizes, or sets aside even in the case of plants, the effects of the action of the primary factors, such as gravity, light, heat, moisture, and chemical stimuli, and asserts that all the various adaptations of the parts of plants "must likewise be referred to the process of intraselection." In the same manner Weismann, in the words of a friendly critic, driven back from acquired characters as a cause of phylogenetic variation, came to regard the mingling of germ characters in amphimixis as the source of all variation, though he does allow that in the lowest organisms variation is due to the direct influence of changes in the environment.

Although Weismann struck a deathblow at the ancient preformation theory, his speculations have led him and his followers to a modern phase of preformation. He denies that epigenetic development exists, and claims that individual development (ontogenesis) "can be explained only by evolution, and not by epigenesis." In his view the germ "is an exceedingly complicated living being, a microcosm in the truest sense, in which every independently variable part that ever appears throughout the whole life is represented by a living particle." (Hertwig.) It should be said that Weismann from time to time modified his views, especially in proposing his theory of germinal selection, which admits that the environment may produce permanent modifications of the germ plasm, but supposes that it does so through favoring or inhibiting the activity of distinct determinants.

Consult: J. G. Romanes, *An Examination of Weismannism* (Chicago, 1893); Oskar Hertwig, *The Biological Problem of To-day* (New York, 1894); and for more general treatment: E. B. Poulton, *Essays on Evolution* (Oxford, 1908); and various authors in *Darwin and Modern Science* (Cambridge, 1909); also references under WEISMANN.

WEISS, vās, ANDRÉ (1858–1914). A French international law scholar, born at Mulhouse. He became a doctor of law in 1880. He taught at the University of Paris, was a member of various commissions, contributed to numerous reviews, and was made a Knight of the Legion of Honor. He became a member of the Academy of Moral and Political Sciences in 1914. His works, clear in exposition and monumental in scope, include: *Etude sur les conditions de l'extradition* (1880); *Traité élémentaire de droit international privé* (1885); *Traité théorique et pratique de droit international privé* (1892–98; 2d ed., 1907–13); *Le droit civil et la législation comparée* (1900); *Manuel de droit international privé* (1905); *Le code civil et le conflit des lois* (1906).

WEISS, vīs, BERNHARD (1827–). A German theologian. He was born at Königsberg, and studied there and at Halle and Berlin. In 1857 he became professor at Königsberg, in 1863 at Kiel, and in 1877 at Berlin. He took a deep interest in the Inner Mission (q.v.), and held positions at Berlin as official adviser concerning matters of religious education. His publications include: *Lehrbuch der biblischen Theologie des Neuen Testaments* (1868; 7th ed., 1903; Eng. trans., 1882–83); *Leben Jesu* (1882; 4th ed., 1902; Eng. trans., 1883–84); *Einleitung in das Neue Testament* (1886; 3d ed., 1897; Eng. trans., 1889); *Das Neue Testament* (4 parts, 1894–1900; 2d ed., 1902–05); *Die Religion des Neuen Testaments* (1903; 2d ed., 1908); *Die Quellen des Lukasevangeliums* (1907); *Paulus und seine Gemeinden* (1914). For the new edition of Meyer's commentary he prepared the volumes on the Gospels of Matthew and John, the Epistles to the Romans, Timothy, Titus, and the Hebrews, and the Epistles of John, and with his son, Johannes Weiss, that upon the Gospels of Mark and Luke.

WEISS, wīs, JOHN (1818–79). An American author and clergyman, born in Boston. He graduated at Harvard in 1837 and at the Harvard Divinity School in 1843. He then preached at Watertown and New Bedford, Mass., till failing health compelled him to devote several years to travel. In 1859 he returned to Watertown, where he remained till 1870 in charge of the Unitarian church. He was a zealous Abolitionist, a transcendentalist in philosophy, an advocate of woman's rights, and a champion of rationalism in religion. His publications included a *Life and Correspondence of Theodore Parker* (1864), *American Religion* (1871), and a translation of Schiller's *Philosophical and Æsthetic Letters and Essays* (1845).

WEISSE, vī'se, CHRISTIAN FELIX (1726–1804). A German poet. He was born at Annaberg, in Saxony, and was educated at the University of Leipzig. In 1761 he became receiver of taxes in Leipzig. He tried imitations of Shakespeare, such as *Richard III* (1759) and *Romeo und Julia* (1767); but failing in these, he turned to light pastoral dramas and operettas, such as *Die Liebe auf dem Lande* (1768) and *Die Jagd* (1770), very popular in their day. He also wrote many lyrics and books for children, as his *Kinderfreund* (24 vols., 1776–82), still well known. Consult Minor, *Christian Felix Weisse und seine Beziehungen zur deutschen Litteratur* (Innsbruck, 1880).

WEISSE, CHRISTIAN HERMANN (1801–66). A German philosopher. He was born at Leipzig. After taking his degree from the university in his native city in 1823 he taught there till 1837, when he retired to his estate near the city; but he was recalled to academic activity in 1846 by an appointment as professor. Weisse was with Fichte one of the founders of the system of speculative theism which opposed the pantheistic idealism of Hegel. His most important writings were: *System der Aesthetik als Wissenschaft von der Idee der Schönheit* (2 vols., 1830); *Die Idee der Gottheit* (1833); *Grundzuge der Metaphysik* (1835); *Kritik und Erläuterung des Goetheschen Faust* (1837); *Die Christologie Luthers* (1852); *Philosophische*

Dogmatik oder Philosophie des Christenthums (3 vols., 1855–62); *Psychologie und Unsterblichkeitslehre* (1869). Consult Seydel, *Christian Hermann Weisse* (Leipzig, 1866).

WEISSE, wīs, FANEUIL DUNKIN (1842–1915). An American surgeon, born at Watertown, Mass. He graduated in 1864 from University Medical College, New York, where between 1865 and 1888 he was successively clinical professor of dermatology, professor of surgical pathology, and professor of practical and surgical anatomy. From 1865 to 1875 he was also professor of surgical pathology of the New York College of Veterinary Surgeons, and after helping to found the New York College of Dentistry (1865), was there professor of anatomy, surgical pathology, and oral surgery till his death, and from 1897 also dean. He published *Practical Human Anatomy* (1886) and many medical articles.

WEISSENBURG, vīs'en-bụrk. A town of Lower Alsace, on the Lauter River, about 20 miles west of Karlsruhe (Map: Germany, B 4). It has manufactories of stockings, paper, leather, and matches. Pop., 1900, 6294. It is noted as the scene of the first important battle of the Franco-German War, Aug. 4, 1870, in which the French under Douay were defeated by the advance guard of the German army under the Crown Prince of Prussia. The lines of Weissenburg were fortifications extending from Weissenburg along the right bank of the Lauter for a distance of about 13 miles to its confluence with the Rhine. They were built in 1706 and played an important part in the war of the Austrian Succession and in the wars of the French Revolution. Their demolition was begun in 1873.

WEISSENFELS, vī'sen-fĕls. A town in Saxony, Prussia, 23 miles southwest of Leipzig on the Saale (Map: Germany, E 3). The old Augustusberg Palace is now an important military school. It has important industries, including the manufacture of shoes, paper, nails and chains, machinery, sugar, electrical appliances, and organs. Pop., 1900, 28,201; 1910, 33,581.

WEITENKAMPF, wī'ten-kămpf, FRANK (1866–). An American authority on engraving and library official. He was born in New York, where he studied for two years at the Art Students' League. He was placed in charge of the department of art and prints of the New York Public Library, which became widely known through the interesting print exhibitions he arranged. Weitenkampf gained recognition as one of the foremost authorities on engraving in the United States. In 1914 New York University gave him the degree of L.H.D. Among his publications are *How to Appreciate Prints* (4th ed., 1911), *American Graphic Art* (1912), and many contributions to periodicals. He also contributed to several encyclopædias, among them the NEW INTERNATIONAL.

WEITLING, vīt'lĭng, WILHELM (1808–71). A German Socialist, born in Magdeburg. He was a tailor by trade, but traveled through his native country preaching communism and other radical doctrines. After taking part in the revolutionary movement of 1848 he settled in America, which he had previously visited, and formed a Socialist society in New York City called the Arbeiterbund. He was identified with a Socialistic colony in Wisconsin, but lived in New York, where he had a clerkship. The ideal society of Weitling was to be fashioned on the old ethnic lines, a federation of the families of the world, with leaders chosen by acclamation, who should divide the products of labor, giving to every one a fixed share. He wrote *Die Menschheit wie sie ist und sein soll* (1838), *Garantien der Harmonie und Freiheit* (1842), and *Das Evangelium eines armen Sünders.*

WEITSPEC, wīts'pĕk. See YUBOK.

WEITZEL, vīt'sel, GODFREY (1835–84). An American soldier, born in Cincinnati, Ohio. He graduated at West Point in 1855, and was assigned to the corps of engineers. In April, 1861, on the outbreak of the Civil War, he was sent to aid in the defense of Fort Pickens, Fla. In February, 1862, he became chief engineer on the staff of General Butler, with whom he was stationed for some time at New Orleans. In August, 1862, he was promoted brigadier general of volunteers, and from October, 1862, to April, 1863, he commanded in the Lafourche campaign. In April and May, 1863, he commanded General Banks's advance guard, and later a division at the siege of Port Hudson, where his gallantry earned him the brevet of lieutenant colonel in the regular army. During May, 1864, he commanded a division before Richmond, was then appointed chief engineer of the Army of the James, and constructed fortifications. He was second in command of the first Fort Fisher expedition, and later commanded all the troops north of the Appomattox River. On April 3, 1865, he entered Richmond. On March 13, 1865, he was brevetted brigadier general and major general in the regular army, and soon afterward was assigned to the command of the Rio Grande district in Texas. On March 1, 1866, he was mustered out and was commissioned major of engineers. From that time he was employed in the construction of fortifications and in river and harbor improvements. He was promoted to the rank of lieutenant colonel of engineers in 1882.

WEIZSÄCKER, vīts'ĕk-ĕr, KARL (1822–99). A German theologian. He was born at Oehringen, Württemberg, and studied theology at Tübingen and Berlin. In 1851 he became court preacher at Stuttgart, and in 1859 was appointed superior consistorial counselor there. In 1861 he was called to the chair of theology at Tübingen and in 1894 he became a councilor of state. His publications include *Untersuchungen über die evangelische Geschichte* (1864; 2d ed., 1901); *Das apostolische Zeitalter der christlichen Kirche* (1886; 3d ed., 1901; Eng. trans., *Apostolic Age of the Christian Church*, 2 vols., 1894–95); and a translation of the New Testament (10th ed., 1912). He was also editor of the *Jahrbücher für deutsche Theologie* from 1856 to 1878. Weizsäcker was one of the most distinguished German theologians of his day.

WE'JACK. See FISHER.

WEKA, wā'kä *or* wē'kà. A native (Maori) name for the peculiar New Zealand rails of the genus *Ocydromus*, which, although provided with wings, are unable to make any effective use of them, on account of the wide-angled relation between the scapula and coracoid. They are brown, rail-like birds; one species frequents the seashore and feeds on shellfish and the like found among the kelp. These birds are rapidly disappearing, but are still quite numerous in places. Consult Buller, *Birds of New Zealand* (2d ed., (London, 1888). See EXTINCT ANIMALS, *Liability of Insular Faunas to Destruction;* FLIGHTLESS BIRDS; and Plate of RAILS, ETC.

WEKERLE, vā'kĕr-le, ALEXANDER (1848–). An Hungarian political leader, born at Moor, in the county of Stuhlweissenburg. After pursuing the study of law he received a post in the Ministry of Finance in 1870, holding at the same time the position of privatdocent in financial and administrative law at the University of Budapest. He became Ministerial Councilor in 1884 and two years later was made Under-Secretary of State in the Ministry of Finance, and was elected to the Lower House of the Diet. In 1889 he was summoned by Koloman Tisza to the office of Minister of Finance, to the duties of which he devoted himself with such success that in the following year he was able to submit to the national legislature a budget minus the classic deficit. This he was enabled to effect through a skillful reconversion of the public debt. He also dealt successfully with the problems of excise, government monopolies, and the regulation of the coinage. In November, 1892, he succeeded Szapáry as president of the Ministerial Council and made the chief feature of his programme the enactments of legislation looking toward the establishment of a more liberal régime in religious affairs. Laws providing, among other things, for the recognition of the Jewish religion, making civil marriage compulsory, and leaving the religious education of children of mixed marriages to the parents' decision were passed by large majorities in the Lower House, but failed in the Table of Magnates. After a struggle, the Magnates were compelled to give assent to most of the ministerial programme. Recognition of the Jewish faith was refused. Despite his victory, Wekerle found his position untenable, and resigned in 1894, and was succeeded by Bánffy (q.v.). From 1897 to 1906 he was president of the Hungarian Court of Administration. After more than a year of crisis precipitated by the refusal of the Independence party to take office, Wekerle was Premier and Minister of Finance in a compromise cabinet in 1906–10. See HUNGARY.

WELBY, wĕl'bĭ, REGINALD EARLE, first BARON (1832–1915). A British financial expert, born at Hareston, County Leicester. He was educated at Eton, and at Trinity College, Cambridge. Entering the Treasury in 1856, he became Assistant Financial Secretary of the Treasury in 1880, and Auditor of the Civil List in 1881, and was Permanent Secretary of the Treasury in 1885–94. In the latter year he was elevated to the peerage.

WELCH, ASHBEL (1809–82). An American civil engineer. He was born in Nelson, Madison Co., N. Y. In 1835 he became chief engineer of the Delaware and Raritan Canal. During the 39 years that he had charge of this important waterway and the railroads laid in connection with it, he devised for the New York and Philadelphia Railway a system of safety signaling (1865), doubled the capacity of the canal locks by fitting them with steam (1868), built the Chesapeake and Delaware Canal, and was elected to the presidency of the United Railroads and Canals of New Jersey (1867). After the acquisition of this system by the Pennsylvania Railroad (1871) he became consulting engineer to many important enterprises. In 1882 he served as president of the American Society of Civil Engineers.

WELCH, HERBERT (1862–). An American Methodist Episcopal clergyman and educator, born in New York City. He graduated from Wesleyan University in 1887 and from Drew Theological Seminary in 1890, and in 1902–03 studied at Oxford. He entered the ministry of the Methodist Episcopal church in 1890, joining the New York Conference. In 1905 he became president of Ohio Wesleyan University. From 1897 to 1912 he was president of the Methodist Federation for Social Service and thereafter its vice president; after 1908 he was a member of the University Senate of his denomination; and he held various other offices. In 1916 he was elected Bishop and was assigned to Seoul, Korea. He edited *Selections from the Writings of John Wesley* (1901); *The New Age and its Creed* (1906).

WELCH, WILLIAM HENRY (1850–). An American pathologist, born at Norfolk, Conn. He graduated from Yale in 1870 and from the College of Physicians and Surgeons, New York, in 1875. Afterward he studied pathology at Strassburg, Leipzig, Breslau, and Berlin. From 1879 to 1884 he was professor of pathological anatomy in Bellevue Hospital Medical College, New York. He was then called to Baltimore, where he became professor in Johns Hopkins University and pathologist to the Johns Hopkins Hospital, being also dean of the medical school from 1893 to 1898. He became eminent as an authority in bacteriology and pathology. In 1901 he was elected president of the Board of Directors of the Rockefeller Institute for Medical Research in New York, and in 1906 trustee of the Carnegie Institution of Washington. He was president of the Congress of American Physicians (1897), the Association of American Physicians (1901), the American Association for the Advancement of Science (1906–07), the American Medical Association (1910–11), and the National Academy of Sciences (for the term 1913–19). Welch published: *General Pathology of Fever*, which has been a standard textbook since its publication in 1888; *Biology of Bacteria* (1894); *Infection and Immunity* (1894); *Bacteriology of Surgical Infection* (1895); but many of his writings are incorporated in compilations, e.g., in Flint's *Practice of Medicine* (5th and 6th eds.), in Pepper's *System of Medicine*, in Dennis's *System of Surgery*, in Allbut's *System of Medicine*, and in *A Textbook of Medicine by American Teachers*. He also contributed to medical journals numerous papers on pathological and bacteriological subjects.

WELCKER, vĕl'kĕr, FRIEDRICH GOTTLIEB (1784–1868). A German classical archæologist and philologist. He was born at Grünberg, in Hesse-Darmstadt; studied at Giessen; was appointed teacher at the Gymnasium there in 1803; and in the year 1806 went to Rome, where he remained two years as tutor in the family of Wilhelm von Humboldt, who became his warm friend. On his return from Italy, he was appointed to a professorship of ancient literature in Giessen. In 1814 he served in the War of Liberation. For political reasons he left Giessen, went the following year to Copenhagen, to edit the posthumous works of the Danish archæologist Zoëga, and accepted a chair at Göttingen in 1816. Thence he was called in 1819 to Bonn, where he remained until his death, though he resigned his chair in 1859. Welcker's studies covered a wide range, but his chief influence was exerted in the fields of Greek literature, art, and mythology. He belonged, like Böckh and his pupil K. O. Müller, to that school of German

philologists who took as their aim the complete reconstruction of the ancient life, in distinction from the school of G. Hermann, who were disposed to limit the field to the language and text of the Greek and Roman writers. Welcker was thoroughly imbued with the harmony of the whole Greek conception, whether expressed in art, literature, or religion, and it was to the presentation of this as a complete whole that he devoted his efforts. Among his editions of Greek texts are the collection of the fragments of Hipponax (1817), Theognis (1826), Philostratus (1825), and the *Theogony* of Hesiod (1865). Of his other works may be mentioned *Der epische Cyklus* (1835, 1849; reprinted 1865, 1882); *Die Æschyleische Trilogie Prometheus, und Nachtrag* (1824, 1826); *Die griechischen Tragödien mit Rücksicht auf den epischen Cyklus geordnet* (1839–41); *Griechische Götterlehre* (1857–62). Shorter essays were collected in *Alte Denkmäler* (1849–64) and *Kleine Schriften* (1844–67). Consult Kekulé, *Das Leben Friedrich Gottlieb Welckers* (Leipzig, 1880); J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

WELD (Dutch *wouw*, Swed., Dan. *vau*, Ger. *Wau*, weld; of unknown etymology), Woold, Dyer's Rocket, Dyer's Weed, or Yellow Weed (*Reseda luteola*). A plant of the family Resedaceæ and of the same genus as mignonette (q.v.), a native of waste places in many parts of Europe and introduced in some places in the eastern United States. It is cultivated to some extent for dyeing. For the greatest production of coloring matter the plant should be cut before the fruits show much development, otherwise the pigment diminishes. Though in part supplanted by chemical dyes, weld is still a valuable dyestuff. It serves equally for linen, woolen, and silk, dyeing with proper management all shades of yellow, and producing a bright and beautiful color. Large quantities of weld are exported from France. This plant is sometimes called wild woad, but should not be confused with woad, *Isatis tinctoria*, which yields a blue dye.

WELD, Angelina Emily (Grimké). See Grimké Sisters, The.

WELD, Isaac (1774–1856). An Irish topographical writer, born in Dublin, and educated in England. In 1795–97 he traveled through the United States and Canada, visiting not only the long-settled eastern seaboard, but also the still unbroken wildernesses of the West; and after his return to Europe published *Travels through the States of North America and the Provinces of Upper and Lower Canada during the Years 1795, 1796, and 1797* (1799). Several editions were issued, and translations were made into French, German, and Dutch. Among his other publications were a paper by which he sought to divert Irish emigration from the United States to Canada (1801); *Illustrations of the Scenery of Killarney and the Surrounding Country* (1807; 2d ed., 1812); and a *Statistical Survey of the County of Roscommon* (1838). Consult *The Dublin University Magazine*, vol. xlix (Dublin, 1857).

WELD, Theodore Dwight (1803–95). An American reformer and abolitionist, born at Hampton, Conn. In 1833 he entered the Lane Theological Seminary in Cincinnati, where, during the famous antislavery debate, he took the lead among the students by his eloquence. On the suppression of the antislavery society by the trustees of the seminary, he was one of the students who withdrew, and during the next three years he devoted himself to lecturing on slavery and its evils. In 1836, however, he lost his voice, and was thenceforth compelled to earn his living by his pen and by teaching school. He edited the publications of the American Antislavery Society, and in 1854 he opened a school at Perth Amboy, N. J., where he received boys and girls of both races. In 1864 he removed his school to Hyde Park, Mass., where he passed the remainder of his life. In 1838 he married Angelina Grimké. (See Grimké Sisters.) His publications include: *The Power of Congress over the District of Columbia* (1837); *The Bible against Slavery* (1837); *American Slavery as it is: or, the Testimony of a Thousand Witnesses* (1839), composed of extracts from southern papers; and *Slavery and the Internal Slave Trade in the United States* (1841).

WELDE, WELD, or **WELLS,** Thomas (c.1590–1662). A Puritan divine. He was born in England, and graduated at Cambridge in 1613. He was minister at Terling, Essex, in 1624–31, when he was deprived for nonconformity and went to America. He was the first pastor of the church at Roxbury, and opposed the religious views of Anne Hutchinson (q.v.) at her trial in 1637; he aided John Eliot and Richard Mather in the preparation of the *Bay Psalm Book* (q.v.). He went to England with Hugh Peters as agent for the colony (1641), but did not return; was pastor of a church at Gateshead (1649), but was ejected for nonconformity, 1662. He published *A Short Story of the Rise, Reign, and Ruin of the Antinomians, Familists, and Libertines that Infected the Churches of New England* (1644); and *A Further Discovery of that Generation . . . Called Quakers* (1654).

WELDING (from *weld*, variant of *well*, influenced, by Dan. *waelde*, to boil). The process of uniting two pieces of metal (such as iron, steel, or platinum) by heating them to a temperature at which they become sticky. Platinum can be welded by heating to a white heat and pressing or hammering the two surfaces together. To weld iron or steel, the metal is heated to about 1300° C. As the surfaces must be clean and free from oxide, sand or borax is used as a flux. There are several types of welds, such as butt weld where the surfaces merely come together, and lap weld where they overlap (as in pipes); also V weld where the two pieces fit into each other, and split weld where they form a step, as a carpenter joins two pieces of wood. As the welding temperature is so high the grain of the metal becomes very coarse and ought to be refined by hammering or by heat treatment if strength is required. Autogenous welding is done by actually melting the metal as in lead burning. In this way joints are made in aluminium, copper, cast iron, steel, etc.

In recent years a number of processes of welding have been developed. The Thermit process (see Alumino-Thermics) uses the heat developed in the reduction of oxide of iron by finely powdered aluminium. The oxyacetylene blowpipe is widely used for autogenous welding. There are two types of welding by the electric current: (1) resistance of the joint to the electric current as in spot welding, etc., and (2) arc welding, using a carbon electrode, as in joining fish plates to rails, patching breaks or filling up worn spots, by melting in metallic rods, and using a metallic electrode which melts off and

forms the weld metal. One form of electric-welding equipment, used in welding the tracks of street railways, consists of an air compressor and sand blast, by which the rails at the joints are thoroughly cleaned after removing the splice plates, and the welder, which is simply a large transformer with jaws that can be clamped upon the rail. By means of these jaws a bar of steel is clamped to the rail on each side with a pressure of about 1400 pounds. Current is then turned on and continued about two minutes. This heats the splice bars and rails sufficiently to cause the metals to flow and the bars and rails to unite firmly. Current is then turned off and the clamping pressure is increased to about 35 tons and continued until the joint cools. See OXYACETYLENE WELDING AND CUTTING.

Consult: L. A. Groth, *Welding and Cutting of Metals by Aid of Gases or Electricity* (2d ed., New York, 1913); R. N. Hart, *Welding: Theory, Practice, Apparatus, and Tests* (2d ed., ib., 1914); Granjon and Rosemberg, *A Practical Manual of Autogenous Welding*, English translation by D. Richardson (3d ed., London, 1915); Theodore Kautny, *Autogenous Welding and Cutting* (Eng. trans., New York, 1915).

WELDON, RICHARD CHAPMAN (1849–). A Canadian legal scholar and educator. He was born at Sussex, New Brunswick, graduated at Mount Allison University in 1866, at Yale (Ph.D.) in 1872, and studied at Heidelberg. He was professor of mathematics at Mount Allison University in 1875–83, and in 1883–1914 was professor of constitutional law and dean of the law faculty, Dalhousie University. In 1884 he was called to the bar. He was a Conservative member of the House of Commons in 1887–96.

WEL'DON, WALTER (1832–85). An English chemist, born at Loughborough, Leicestershire. He was for a time engaged in his father's manufacturing business. In 1860 he founded a monthly entitled *Weldon's Register of Facts and Occurrences Relating to Literature, the Sciences, and the Arts*, which continued for four years. Then began a scientific career the more remarkable as the inventor was without practical knowledge of chemistry when he took out the first patents for his manganese regeneration process. By the manganese process (patented in 1867, but not applied commercially till 1869) the price of bleaching powder was reduced £6 a ton, while paper, calico, etc., became much cheaper in consequence. He was president of the Society of Chemical Industry in 1883–84.

WELFARE WORK. The special efforts of an industrial or commercial establishment designed adequately to maintain and improve the physical condition of its employees. Contemporaneously with the introduction of more efficient management and operation in factories and workshops, efforts of this kind have increased in number and, under expert social workers, have widened greatly in scope. Recognizing that the physical well-being of employees has a direct influence upon the quality and quantity of the product turned out by them, industrial welfare work may not be entirely altruistic, and in its simplest form involves providing adequate ventilation and light and generally more hygienic surroundings for the workers. In addition, there may be provided rest and lounging rooms, gymnasiums, athletic fields, shower baths, and swimming pools. For the largest establishments, hospitals and dispensaries are usual, where even the most trifling injuries to employees may be treated; lunch counters or restaurants supplying wholesome meals at cost, and, in some cases, stores selling direct to employees without profit. Frequently, systematic and periodical physical examinations of employees are insisted on, and outside of the works, attention is devoted to their proper housing, along with providing an uncontaminated water supply and a sewage-disposal system. In not a few instances the surroundings of both homes and workshops have been beautified by landscape gardening, while lyceums, recreation centres, libraries, concerts, and other wholesome amusements are maintained, stimulated, or assisted by the management or owners.

WELHAVEN, vĕl'hä'ven, JOHAN SEBASTIAN CAMMERMEYER (1807–73). A Norwegian poet, born at Bergen, and educated at the University of Christiania. In 1825, while yet a student, he opposed himself to the patriotic but wild and tasteless first attempts of Henrik Wergeland to form a national literature. In 1832 he attacked the latter's poetry in a bitter book, *Henrik Wergelands Digtekunst og Polemik*, which raised a great storm and made Welhaven the champion of the cultivated and conservative classes. He followed this up by the publication of a cycle of satirical sonnets, *Norges Dæmring* (1834), and ultimately won over Wergeland as well as Norwegian writers generally to his literary standard. In 1840 he became lecturer and in 1846 professor of philosophy in the University of Christiania. Welhaven's poetry by its perfection of form and delicate feeling for nature holds a permanent place in Norwegian literature. He published volumes of poems in 1839, 1845, 1848, 1851, and 1860, as well as two literary studies, *Holberg* (1854) and *Ewald og de norske Digtere* (1863). His collected works were published in eight volumes in 1867–69. Consult: J. B. Halvorsen, *Norsk Fortfatterlexikon* (Christiania, 1885–1908); Jaeger, *Illusteret Norsk Literaturhistorie* (ib., 1896); Gerhard Gran, *Norges Dæmring* (ib., 1899); id., *Nordmænd i det 19de Aarhundrede* (3 vols., ib., 1914); Arne Löchen, *J. S. C. Welhavens Liv og Skrifter* (ib., 1900).

WELL. See ARTESIAN WELLS; WATER SUPPLY; WELL SINKING.

WELLAND, wĕl'and. A town and the county seat of Welland Co., Ontario, Canada, on Welland Canal (q.v.) and Welland River, 22 miles northwest of Buffalo, N. Y., and on the Michigan Central, Grand Trunk, Canadian Pacific, Pere Marquette, and other railways (Map: Ontario, F 8). There are two government docks and a turning basin. Pop., 1901, 1863; 1911, 5318.

WEL'LAND CANAL. An important Canadian ship canal, 27 miles long, between Lake Erie and Lake Ontario, begun in 1824 and completed in 1833. Its original dimensions were greatly enlarged until there was a depth of 14 feet. In 1913 a new and enlarged canal was started estimated to cost some $50,000,000 and entitled to rank as an engineering work with the Panama and New York State Barge canals. The new canal in the main follows the old line from Port Colbourne on Lake Erie to Allanburg, whence there is a new route to Lake Ontario. The new canal is 200 feet wide at the bottom and has a depth of 25 feet, which later can be increased to 30 feet, the depth provided in the locks which are arranged for vessels of as great length as 800 feet. Seven lift locks, each with a lift of 46½ feet, are required, and the flight of three locks at Thorold will have a lift of

139½ feet, or greater than that of the locks at Gatun. The locks will be double and will have swinging single-leaf gates. During the great war German agents plotted to destroy the Welland Canal, but were detected before any damage was done.

WEL'LER, SAM. A witty and faithful cockney engaged by Mr. Pickwick, at the opening of Dickens's *Pickwick Papers*, as a body servant. The character is modeled on a comic actor, Sam Vale, well known in London for his wit and repartee.

WELLES, wĕlz, GIDEON (1802–78). An American statesman. He was born in Glastonbury, Conn., and was a student for a time, without graduating, at Norwich University. He early entered politics and, as editor and part owner of the Hartford *Times* from 1826 to 1836, he exerted a powerful influence in his State in favor of the Democratic party. He was an enthusiastic adherent of Andrew Jackson, and was said to have been the first to advocate his election to the presidency. From 1827 to 1835 he was a member of the State Legislature, where he advocated the abolition of imprisonment for debt and opposed a proposed measure for excluding from the courts such witnesses as did not believe in "a future state of rewards and punishments." He was comptroller of the State in 1835 and again in 1842 and 1843, was postmaster at Hartford from 1835 to 1842, and from 1846 to 1849 was chief of the Bureau of Provisions and Clothing in the Navy Department. Joining the Republican party soon after its organization, he was a delegate to the National Convention at Chicago in 1860, and in 1861 became Secretary of the Navy in President Lincoln's cabinet. In this position, though utterly ignorant of navigation and ship construction, he evinced great executive ability, managing the navy with the greatest efficiency during the Civil War, and was besides a valuable adviser of the President on matters of general policy. Being reappointed by President Lincoln in 1865, he was retained by President Johnson, and served throughout the latter's administration. Subsequently, in 1872, he joined the Liberal Republicans, and in 1876, as an adherent of Samuel J. Tilden, took an active and somewhat acrimonious part in the Tilden-Hayes controversy. He published a volume entitled *Lincoln and Seward* (1874). *The Diary of Gideon Welles* (3 vols., 1911) is a most important source for the period of the Civil War.

WELLESLEY, wĕlz'lĭ. A town, including several villages, in Norfolk Co., Mass., 15 miles west of Boston, on the Boston and Albany Railroad (Map: Massachusetts, E 3). It is attractively situated and has well-shaded streets and many handsome residences. The chief feature of the town is Wellesley College (q.v.). There are also here Dana Hall, a school for girls, the Academy of the Assumption, and a large public library. Pop., 1900, 5072; 1910, 5413; 1915 (State census), 6439.

WELLESLEY, ARTHUR, first DUKE OF WELLINGTON. See WELLINGTON.

WELLESLEY, HENRY RICHARD CHARLES. See COWLEY, first EARL.

WELLESLEY, RICHARD COLLEY WELLESLEY, MARQUIS (1760–1842). A British administrator of India. He was the eldest son of Garret Wellesley, first Earl of Mornington, and brother of the Duke of Wellington. He was born at Dangan Castle, Ireland, and was educated at Harrow, Eton, and Christ Church, Oxford, but never took a degree, on account of his father's death in 1781, which compelled him to end his studies. In 1784 he entered the English House of Commons, and in 1793 became a member of the Board of Control of Indian Affairs. On the resignation of Lord Cornwallis in 1797 Wellesley was appointed Governor-General of India. He immediately concluded several treaties with the powerful native rulers, which assured either their alliance or neutrality in the impending struggle with France. In 1799 Mysore, the country of the hostile Tipu Sahib, son of Hyder Ali (q.v.), was invaded by a British force, and in a very short time the dreaded Sultan was overthrown. Wellesley now established several dependent principalities, a procedure which became for a long time the British policy in dealing with the native states. As a reward for his services he was created Marquis Wellesley in the Irish peerage. He extended British rule in many directions, and also paid much attention to the internal affairs of the British provinces. The Mahratta War of 1803–05 was marked by the victories of Arthur Wellesley, Lake, and others. The administration of the Marquis of Wellesley terminated in 1805. In 1809 he was sent as envoy to Spain, and in the same year he became Secretary of State for Foreign Affairs under Perceval. He acquitted himself well in the many important negotiations that required his attention. After Perceval's assassination in 1812 he tried to form an administration of his own, but in vain. Until 1821 Wellesley remained out of office, and was usually in opposition, believing that it would have been better to allow Napoleon to continue to rule, though with restricted power. In 1821 he accepted the position of Lord Lieutenant of Ireland, and was at first well received by all parties, but when he sought to reconcile Catholics and Protestants, he aroused the opposition of the Orangemen. He resigned in 1828, but held the same office again in 1833–34. He retired to private life, and died Sept. 26, 1842. He was one of the greatest colonial administrators Great Britain has ever had, and together with Dalhousie and Hastings firmly established the British power in India. Consult: Montgomery Martin, *Despatches, Minutes, and Correspondence of the Marquis Wellesley during his Administration in India* (5 vols., London, 1836); W. H. Hutton, *The Marquis Wellesley* (Oxford, 1893); *The Wellesley Papers*, by "The Editor of the Windham Papers" (2 vols., ib., 1914). See INDIA.

WELLESLEY COLLEGE. An institution for higher education of women, founded in 1875 at Wellesley, Mass., by Henry Fowle Durant. Students are admitted either by examination or by certificate from approved schools. Courses are largely elective and lead to the degree of B.A. and M.A. The college is a contributor to the American schools of classical study at Rome and Athens, to the Marine Biological Laboratory at Woods Hole, Mass., and to the Zoölogical Station at Naples. On May 12, 1914, the main building of the college was destroyed by fire. The attendance in 1915–16 was 1512. The force of instructors numbered 134, and the library contained 85,114 volumes in the same year. The endowment was $2,074,512, and the gross income (exclusive of dormitories) was $413,812.71. The dean in 1916 was Ellen F. Pendleton. Consult Florence Converse, *The Story of Wellesley* (Boston, 1915).

WELLESLEY PROVINCE. A province of Penang (q.v.), the most northerly of the British Straits Settlements (q.v.), on the west coast of the Malay Peninsula (Map: Burma, C 5). Area, 280 square miles; pop., 1911, 128,978. Tapioca, rice, sugar, and pepper are produced.

WELLHAUSEN, vĕl'hou-zen, JULIUS (1844–). A German Orientalist and biblical scholar. He was born at Hameln, and studied under Ewald at Göttingen. In 1872 he became professor of theology at Greifswald, but resigned in 1882, and became first privatdocent and then associate professor of Oriental languages in the philosophical faculty at Halle. In 1885 he was called as professor to Marburg and in 1892 to Göttingen; he retired from his chair in 1913. As an Old Testament scholar Wellhausen holds a unique position for his work in literary criticism and historical reconstruction. Through his writings he probably exercised a greater influence on his generation than any other biblical critic. Among his numerous publications are: *Text der Bücher Samuelis* (1871); *Pharisäer und Sadducäer* (1874); *Geschichte Israels* (1878), expanded into *Prolegomena zur Geschichte Israels* (1883; 6th ed., 1905; Eng. trans., *Sketch of the History of Israel and Judah*, 3d ed., 1891); *Israelitische und jüdische Geschichte* (1894; 7th ed., 1914); *Die Composition des Hexateuchs* (1885; 3d ed., 1899); *Die Kleinen Propheten* (1892; 3d ed., 1898); *The Book of Psalms*, in Haupt's *Sacred Books of the Old Testament* (1895; Eng. trans., 1898); and an edition of Bleek's *Einleitung in das Alte Testament* (6th ed., 1893). In the field of early Arabic literature and history he published: *Muhammed in Medina* (1882); *Lieder der Hudhailiten* (1884); *Reste arabischen Heidentums* (1887; 2d ed., 1897); *Medina vor dem Islam* (1889); *Prolegomena zur ältesten Geschichte des Islams* (1899); *Ein Gemeinwesen ohne Obrigkeit* (1900); *Die religiös-politischen Oppositionsparteien im alten Islam* (1901); *Das arabische Reich und sein Sturz* (1902). His later works, chiefly on New Testament literature, include: *Das Evangelium Marci* (1903); *Das Evangelium Matthäi* (1904); *Das Evangelium Lucä* (1904); *Einleitung in die drei ersten Evangelien* (1905; 2d ed., 1911); *Analyse der Offenbarung Johannis* (1907); *Evangelium Johannis* (1908). A complete bibliography is given by A. Rahlfs in *Studien zur semitischen Philologie und Religionsgeschichte Julius Wellhausen gewidmet* (Giessen, 1914).

WEL'LINGBOROUGH. A town in Northamptonshire, England, 10½ miles east-northeast of Northampton (Map: England, F 4). It has manufactures of boots and shoes, and there are iron-ore mines, blast furnaces, and chalybeate springs. Pop., 1901, 18,412; 1911, 19,753.

WEL'LINGTON. The capital of New Zealand, beautifully situated on a bay of Port Nicholson, an inlet of Cook's Strait, on the south coast of North Island (Map: New Zealand, N. I., B 8). The harbor is a fine expanse of water six miles long and five miles broad, and has excellent wharf accommodations. In 1913 the total volume of its trade, both imports and exports, amounted to $58,387,770. Since the removal of the seat of government hither from Auckland in 1865 the town has made rapid progress; it possesses a number of good public buildings, including a handsome structure for the use of the House of Representatives and the Legislative Council. The streets are generally spacious. Wellington has two cathedrals, together with numerous other denominational places of worship, Freemasons' Hall, a public library, fine botanical gardens, a public park, and extensive water works. Victoria College is affiliated with the University of New Zealand. The industrial establishments include flour and saw mills, tanneries, foundries, meat-preserving factories, soap and candle works, brick kilns, breweries, etc. Founded by Colonel Wakefield in 1840, Wellington was the first settlement of the New Zealand Company. Pop., 1911, 64,372, with suburbs, 70,729.

WELLINGTON. A city and the county seat of Sumner Co., Kans., 30 miles south of Wichita, on Slate Creek, and on the Chicago, Rock Island, and Pacific, and the Atchison, Topeka, and Santa Fe railroads (Map: Kansas, E 8). It is an important shipping centre for grain, live stock, and farm produce, and has large flouring mills, grain elevators, a broom factory, an ice plant, and railroad shops. There are extensive salt deposits. Wellington has a Carnegie library and fine city hall and courthouse buildings. The commission form of government has been adopted. Pop., 1900, 4245; 1910, 7034.

WELLINGTON, ARTHUR MELLEN (1847–95). An American civil engineer, born in Waltham, Mass. He graduated from the Boston Latin School at 16 and for three years was an articled student with John B. Henck, an engineer and author of *Henck's Field Book*. After about a year as assistant engineer in the construction of Prospect Park, Brooklyn, under F. L. Olmsted (q.v.), he began his railway engineering career in 1868 in charge of a locating party on the Blue Ridge Railroad, South Carolina. After various other railway engineering engagements he was chief assistant in the engineering department of the New York, Pennsylvania, and Ohio Railway in 1878–81, afterward held positions with the Mexican Central and the Mexican National railways. He became an editor of the *Railway Gazette* in 1884, and one of the chief editors and owners of the *Engineering News* in 1887. With the latter journal he continued until his death, serving also as consulting engineer for many enterprises, including the abolition of grade crossings at Buffalo, the improvement of railway terminals and erection of the Board of Trade building at Toronto, and the plans for the Boston subway. He published: *Computation of Railway Earthwork from Diagrams* (2 vols., 1874); *The Economic Theory of Railway Location* (1877 and 1887), which won him international recognition; *Car Builders' Dictionary* (1884); *Field Work of Railway Location and Laying Out of Works* (1889).

WELLINGTON, ARTHUR WELLESLEY, first DUKE OF (1769–1852). A British general and statesman. He was the fourth son of Garret Wellesley, first Earl of Mornington, and was born in 1769, probably on the 29th of April, at Dublin, though both the date and the place are doubtful. His education was begun at a private school at Chelsea, whence he was sent to Eton, where he remained until the death of his father in 1781. He was an unpromising boy, and his mother, deciding that her "ugly boy Arthur" was "fit food for powder and nothing else," sent him to a military academy at Angers, France, for one year. He entered the army in 1787, and rose rapidly, receiving his commission as colonel in 1796. At first he saw but little of military service, but in 1794–95 he served with conspicuous

gallantry in Holland against Pichegru. In 1796 Wellesley was ordered to India, and arrived at Calcutta with his regiment in the following year. His brother, the Earl of Mornington, afterward the Marquis of Wellesley, was named Governor-General, and landed at Calcutta in May, 1798. In August Wellesley was transferred to the Madras establishment. In 1799 the campaign of the English against Tippu Sahib, ruler of Mysore, was undertaken. Wellesley commanded the English left at Malavelly, but remained with the reserves when Seringapatam was stormed. Nevertheless he was named Governor of the conquered state, and until the beginning of 1803, save for brief intervals, was in control of both the military forces and the civil administration. In 1800 he pursued and defeated Dhundiah Waugh, a freebooter who had collected an army of 40,000 and was invading Mahratta territory. In the Mahratta War of 1803–05, Wellesley commanded the English forces in the south. After capturing the fortress of Ahmednagar, he unexpectedly found himself at Assaye in the presence of about 40,000 Mahratta troops with 100 guns, while he had only 4500 men and 17 guns, together with about 5000 auxiliary troops. He assumed the offensive, and by means of daring but hazardous movements won a complete victory (September 23). The battle of Argaum and the storming of Gawilgarh completed the discomfiture of the Mahratta chiefs. Wellesley received the thanks of Parliament and was made K.C.B. In 1805 he sailed for England.

During the three years from Wellesley's landing in England until his departure for Portugal he held various minor military offices. In 1806 he took his seat in Parliament for Rye. He was returned again in 1807, and in the same year was named Privy Councilor and Chief Secretary for Ireland, holding the latter office for two years. He distinguished himself in the expedition against Copenhagen in 1807, and in the following year was commissioned lieutenant general. In July, 1808, Wellesley sailed from Cork with the first English contingent destined to aid the Portuguese and Spanish in their revolt against Napoleon. It was intended that he should be fourth in command, the superior officers following with reënforcements. He landed at Mondego Bay and gained the victory of Vimeiro (August 21), which resulted in the Convention of Cintra, providing for the peaceful withdrawal of the French troops in English vessels from Lisbon. Wellesley was superseded on the day following the battle, and, finding his advice disregarded, retired to England. Both he and his two superiors were brought before a court of inquiry to justify the Convention of Cintra, which was unpopular in England. The English army, however, which had been under the command of Sir John Moore (q.v.), having been forced to embark at Corunna owing to the overwhelming numbers of the French, Wellesley was sent to Portugal with a new force, landing at Lisbon April 22, 1809.

Throughout the Peninsular campaigns Wellesley was hampered by the lack of supplies and men, and by the incompetence of his Spanish allies. He had, moreover, to cope with overwhelming numbers of the enemy. There were about 300,000 French soldiers in the Peninsula during the greater part of the time. The necessity of keeping down an insurgent population involved their wide dispersal, however, and gave Wellesley his opportunity to attack them in detail, relying on the badness of the Spanish roads to prevent their rapid concentration. On May 12, 1809, Wellesley drove Soult from Oporto, and on July 27–28 defeated an army nearly twice as large as his own under Victor at Talavera, not far from Madrid. But he had insufficient forces to maintain the position gained, and retreated to Portugal. For these victories he was made Baron Douro of Wellesley and Viscount Wellington of Talavera. Early in 1810 Napoleon sent 150,000 reënforcements into Spain, and formed an army of 80,000 under Masséna to drive the English into the sea. Wellington retired stubbornly before the superior forces of the enemy, devastating the country as he went, until he reached the lines of Torres Vedras (q.v.), barring the way to Lisbon. Masséna remained helpless before the English position from Oct. 12, 1810, to March 11, 1811, when scarcity of supplies forced him to retreat, stubbornly followed by Wellington. On April 5 Masséna recrossed the Portuguese frontier, having lost 30,000 men. This marks the turning point in the Peninsular War. Parliament no longer wavered in its support, and Napoleon was already withdrawing troops for the Russian campaign. Wellington captured the frontier fortresses of Ciudad Rodrigo (Jan. 19, 1812) and Badajoz (April 6), and the way was open into Spain. On July 22 he utterly defeated a superior force under Marmont at Salamanca, and entered Madrid amid great enthusiasm. The French completely abandoned southern Spain and gathered in such numbers that Wellington, after besieging Burgos in vain, retreated to Portugal. For this campaign he was made Marquis of Wellington. The campaigns of 1813 and 1814 were fought with the fortunes of Napoleon in full decline. On June 21, 1813, Wellington defeated King Joseph at Vitoria. The fortresses of San Sebastián and Pamplona fell into his hands and the French forces under Soult were driven across the Pyrenees. In 1814 Wellington was already in possession of Bordeaux, and after an engagement with Soult in April he was on the point of entering Toulouse when news of peace put an end to hostilities. For these closing campaigns Wellington was made Marquis of Douro and Duke of Wellington, and received a grant of £400,000. In July, 1814, he was sent as Ambassador Extraordinary to France, but in February, 1815, was transferred to the Congress of Vienna. Upon the return of Napoleon from Elba he was summoned to command the forces of the English and allies in Belgium, in coöperation with a Prussian army under Blücher. The battles of Ligny (q.v.) and Quatre Bras (q.v.) were followed on June 18, 1815, by the great battle of Waterloo (q.v.), which finally shattered the power of Napoleon. From 1815 to 1818 Wellington commanded the army of occupation in France.

On his return to England he was made master general of the ordnance, with a seat in the cabinet. He represented England in the Congress of Verona (1822), where he advocated the policy of noninterference in Spanish affairs. In 1826 he went to Russia to negotiate a treaty providing for the partial independence of Greece. He was an extreme Tory, contending for the political influence of wealth and the supremacy of the landed aristocracy. He distrusted and disliked popular movements and was inclined to regard them as the result of artificial and unscrupulous agitation. He advocated the supremacy of

the English settlers in Ireland, deprecated political concessions to the Irish people, and opposed Catholic emancipation and the reform of Parliament. He was a member of the cabinet until the retirement of Lord Liverpool, February, 1827, but he refused to serve during the short premiership of Canning. After the brief administration of Goderich, Wellington was Prime Minister from January, 1828, to November, 1830. His previous military career unfitted him in many ways for the office, and there was much dissension in the Ministry. In 1829 Wellington forced through Parliament the Catholic Emancipation Act, having become convinced that it was the only way to avert a war with the Irish nation. In 1830 he declined to consider proposals for the reform of parliamentary representation, and his Ministry was outvoted in the House of Commons. Wellington incurred intense unpopularity by his stubborn resistance to the Reform Bill in 1831–32. His house was mobbed and he was hooted in the streets. In the end he persuaded the Lords to give way in order to avert the creation of new peers. In 1834 he was elected chancellor of the University of Oxford. From December, 1834, to April, 1835, he was Secretary of State for Foreign Affairs under Peel. He took a less active part in subsequent political events, yet the prestige of his name was so great and his advice so prized that he was made a member of Peel's second cabinet without a portfolio (1841–46). In 1842 he was named commander in chief for life, a post which he had previously occupied for short periods. From 1845 to 1846 he was President of the Privy Council. In his last years he regained his popularity, and was the idol of the English nation. He died Sept. 14, 1852, and was buried in St. Paul's Cathedral.

Bibliography. *Wellington's Despatches, 1779–1815*, edited by John Gurwood (London, 1834–1839); *Supplementary Despatches*, edited by the second Duke of Wellington (15 vols., ib., 1858–1872); *Wellington's Despatches*, a new series also edited by the second Duke of Wellington (8 vols., ib., 1867–1880); George Hooper, *Wellington*, in "English Men of Action" series (New York, 1890); *Personal Reminiscences of the Duke of Wellington*, by Francis, the first Earl of Ellesmere (ib., 1903); Lewis Butler, *Wellington's Operations in the Peninsula* (2 vols., ib., 1904); W. O. Morris, *Wellington*, in "Heroes of the Nations" series (New York, 1904); C. W. Robinson, *Wellington's Campaigns* (2 vols., London, 1908); W. H. Fitchett, *The Great Duke* (2 vols., New York, 1911). See PENINSULAR WAR.

WELL'MAN, WALTER (1858–). An American journalist, explorer, and aëronaut, born at Mentor, Ohio. He received a common school education. In 1879 he founded the Cincinnati *Evening Post*, and after 1884 was the Washington correspondent successively of the Chicago *Herald* and the Chicago *Times-Herald*. In 1892 he attempted to locate the first landfall of Columbus, and built a monument on Watling Island, in the Bahamas, on the assumed spot. In 1894 he led an expedition to the Arctic regions to a point on the eighty-first degree of latitude, northeast of Spitzbergen. In 1898–99 he led another expedition to the Arctic regions, making Cape Tegetthoff in Franz Josef Land his base of operations, and spending the winter there. He established an outpost at Cape Heller, from which in the early spring of 1899 he started on a dash for the pole, but at the end of March, when the party had reached a point off the coast of Rudolf Land, near the eighty-second parallel, he was compelled by an accident to retreat. From 1906 to 1910 he devoted his energies wholly to aviation. In the three summers of 1906, 1907, and 1909, he made efforts to explore the unknown areas of the polar regions to the north of Spitzbergen, using Danes Island as his base. The first two attempts were wholly without results, but in 1909 his balloon traveled about 60 miles to the northeast before falling on the ice pack. In 1910, with five companions, he made a daring attempt to cross the Atlantic in the airship "America." After a hazardous voyage of 1000 miles or more, the balloon fell into the ocean about 375 miles from Cape Hatteras, where the aviators were rescued by a passing steamer.

WELLS. A city in Somersetshire, England, pleasantly situated at the foot of the Mendip Hills, 15 miles southwest of Bath (Map: England, D 5). The cathedral dates from the first half of the thirteenth century, and is for the most part in Early English; its west front, one of the noblest façades in the Kingdom, enriched with 300 statues, is Gothic. One of the most important of Wessex towns in Saxon times, Wells was created a see in 905. Pop., 1901, 4849; 1911, 4655.

WELLS, FROZEN. See FROZEN WELLS.

WELLS, BENJAMIN WILLIS (1856–). An American scholar and editor, born at Walpole, N. H. He graduated in 1877 at Harvard, and there took the degree of Ph.D. in 1880. Later he studied for a time at Berlin, held a fellowship at Johns Hopkins University, was an instructor in the Friends' School, Providence, R. I., from 1882 to 1887, and from 1891 to 1899 was professor of modern languages in the University of the South at Sewanee, Tenn. In 1899 he joined the editorial staff of the *Churchman* in New York City, and remained a member of that staff until 1912. Besides writing numerous magazine articles, he edited a number of school texts in French and German, contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA, and published: *Modern German Literature* (1895); *Modern French Literature* (1897); and *A Century of French Fiction* (1898). With W. P. Trent, he edited *Colonial Prose and Poetry, 1607–1775* (1901).

WELLS, CAROLYN (?–). An American author. Born in Rahway, N. J., she was engaged after 1895 in literary work, chiefly in New York. In addition to series of books for young people, her writings—stories, sketches, light and humorous verse, clever parodies—include: *At the Sign of the Sphinx* (1896); *The Story of Betty* (1899); *Children of Our Town* (1902); *A Matrimonial Bureau* (1905); *Emily Emmins Papers* (1907); *Fluffy Ruffles* (1907), which caught the popular fancy, and was widely read; *The Rubaiyat of Bridge* (1909); *The Gold Bag* (1911); *The Lover's Baedeker* (1912); *Technique of the Mystery Story* (1913); *The Maxwell Mystery* (1913); *Two Little Women* (1915); *The Curved Blades* (1916). As an anthologist she was responsible for: *A Nonsense Anthology* (1902); *A Parody Anthology* (1904); *A Satire Anthology* (1905); *A Whimsey Anthology* (1906).

WELLS, CHARLES (1838–). An English Orientalist, born in London and educated at King's College, London, where he won the Turk-

ish prize in 1860. He was professor of English at the Imperial Naval College at Constantinople in 1870–74, and became professor of Turkish in King's College, London, in 1889, and Oriental translator to the Foreign Office in 1892. His publications are: *Ilm Tedbir-i-Mulk* (1860), an essay on Turkish political economy; *Mehemet, the Kurd, and Other Tales from Eastern Sources* (1865); *A Practical Grammar of the Turkish Language* (1880); *The Literature of the Turks* (1891). He also published a revised and enlarged edition of Redhouse's *Turkish Dictionary* (1880).

WELLS, Charles Jeremiah (c.1799–1879). An English poet, born probably in London. He was a friend of Keats, who dedicated a sonnet to him. Wells published anonymously a volume called *Stories After Nature* (prose) in 1822, and in 1824 *Joseph and His Brethren, a Scriptural Drama*, which bore the pseudonym H. L. Howard on the title-page. These having met with no success, he abandoned literature; retired for a time to Wales; then removed to Brittany. Subsequently *Joseph* was lavishly praised by critics of the Swinburnian school, and in 1876 a revision of it was published with a critical introduction by Swinburne. It is distinguished by brilliant character study and richness of diction.

WELLS, David Ames (1828–98). An American economist, born at Springfield, Mass. He graduated at Williams College in 1847 and at the Lawrence Scientific School (Harvard) in 1851. His early interests were in the natural sciences and he published textbooks on physics, chemistry, and geology. In 1864 he won a considerable reputation in politics through an essay *Our Burden and Our Strength*. In 1865 he was made chairman of a commission to inquire into methods of raising Federal revenues, and in 1866 was appointed special commissioner of the revenue. Later he was a member of several commissions, State and Federal, and he rendered distinguished service in private enterprises, notably in the reorganization of the Alabama and Chattanooga Railway and of the Erie Railway. He was a prolific writer on economics and finance, at first defending the protectionist policy, later becoming an extreme advocate of free trade. His principal works are: *Our Merchant Marine* (1882); *A Primer of Tariff Reform* (1884); *Practical Economics* (1885); *The Relation of the Tariff to Wages* (1888); *Recent Economic Changes* (1889); *The Theory and Practice of Taxation* (1900).

WELLS, F(rederic) Lyman (1884–). An American psychiatrist. He was born in Boston, and was educated at Columbia (A.B., 1903; Ph.D., 1906), where he was an assistant in psychology (1905–06). He lectured at Barnard College in 1906–07, and thereafter was assistant pathological psychologist of McLean Hospital at Waverley, Mass. His investigations dealt with mental tests, the psychology of speech lapses, and psychopathology.

WELLS, Herbert George (1866–). An English novelist. His father was a shopkeeper and his mother, who had been a lady's maid, became a housekeeper to eke out the family fortunes. He says himself, "I was born in that queer indefinite class that we in England call the middle class. I am not a bit aristocratic." He was born at Bromley, Kent. The winning of scholarships enabled him to study at the Royal College of Science and at London University, where he took his B.Sc. with honors, having studied under Professor Huxley. Earlier, however, he had been a drug clerk and a dry-goods clerk. After graduating from the university he taught biology for several years. His beginnings in literature were contributions to the magazines and reviews, among them the *Pall Mall Gazette*, *Nature*, and the *Saturday Review*. His first hit he made with *The Time Machine* (1895), one of a number of popular romances or fantasies, which include scientific and sociological forecasts, and some of which are not without their indebtedness to Jules Verne's stories. Among these may be mentioned: *The War of the Worlds* (1898), in which our planet is invaded by monstrous creatures from Mars; *When the Sleeper Wakes* (1899), which pictures a world where men are the slaves of a huge tyrannical trust; *The Food of the Gods* (1904), where we are amongst the giants; and *In the Days of the Comet* (1906), in which human nature undergoes a sudden change for the better. In a group of his books concerned with socialistic theories and a variety of sociological topics stand: *Anticipations* (1901), which presents a picture of a society organized by the engineer with perfect scientific efficiency; *A Modern Utopia* (1905), an imaginary realization of the socialistic state, governed by a sort of beneficent Samurai; and *First and Last Things* (1908), a general statement of the foundations of Wells's socialistic creed. But it is likely that Wells will be longer remembered as a novelist than as a popular writer of romances or as a social thinker. Among the novelists of his generation he held a foremost place, thanks to his skill in characterization, his story-teller's gift, his whimsical humor, his interesting presentation in the form of fiction of advanced social and moral ideas, and his studies of contemporary English life and manners. Representative, if widely different, novels of his are: *Tono Bungay* (1909); *Ann Veronica* (1909); *The New Machiavelli* (1911); *The Passionate Friends* (1913); *The Wife of Sir Isaac Harman* (1914); and *The Research Magnificent* (1915), which was hailed as one of his most notable achievements. His writings include also: *The Island of Dr. Moreau* (1896); *The Invisible Man* (1897); *Tales of Space and Time* (1899); *Love and Mr. Lewisham* (1900); *Mankind in the Making* (1903); *The Future of America* (1906), a result of the author's visit to the United States in the year preceding publication; *War in the Air* (1908); *New Worlds for Old* (1908); *The History of Mr. Polly* (1910), one of the most engaging of impossible chronicles; *Social Forces in England and America* (1914); *The World Set Free* (1914); *Bealby* (1915), in quizzical gayety resembling *Mr. Polly*; and *What is Coming?* (1916). In 1897 a volume of Wells's essays entitled *Certain Personal Matters* made its appearance, and, in 1911, a collection of his best short stories—*The Country of the Blind. Boon: the Mind of the Race*, etc. (1915), a group of satires, though not published under his name, was undoubtedly from his pen. In 1915 a Russian edition of his novels was brought out. Consult: G. K. Chesterton, *Heretics* (New York, 1905); Victor Brooks, *The World of H. G. Wells* (ib., 1914); J. D. Beresford, *H. G. Wells* (ib., 1915).

WELLS, Horace (1815–48). An American dentist, born in Hartford, Vt. He studied dentistry in Boston, and practiced it for a time there till 1836, when he removed to Hartford, Conn. He had already conceived the idea that

some anæsthetic might be used in dentistry to prevent pain, and had thought of the employment of nitrous oxide gas as early as 1840. In 1844 he used it successfully in several cases. Early in 1845 he communicated his discovery to Drs. J. C. Warren, W. T. G. Morton, C. T. Jackson (qq.v.), and others in Boston. In 1846 Morton and Jackson obtained a patent for anæsthetics against the remonstrance of Wells. After a visit to Paris, where he communicated his discovery to the French medical societies, and on his return to America, he published *A History of the Discovery of the Application of Nitrous Oxide Gas, Ether, and Other Vapors to Surgical Operations* (1847). The dispute as to his discovery and the constant experiments upon himself with chloroform affected his mind. While in New York, where he was urging his claims before the medical profession, he committed suicide. See ANÆSTHETIC; MORTON, W. T. G. Consult *Dr. Wells, the Discoverer of Anæsthesia* (New York, 1860).

WELLS, HORACE LEMUEL (1855–). An American chemist. He was born in New Britain, Conn., and graduated at the Sheffield Scientific School (Yale) in 1877. After serving as chemist to the Connecticut Agricultural Experiment Station and the Colorado Coal and Iron Co., in 1884 he returned to Yale, where he remained, becoming in 1894 professor of analytical chemistry and metallurgy. In 1903 he was elected to the National Academy of Sciences. Among his scientific researches the more important are concerned with the double halogen salts, and the double and triple salts, especially of the alkali elements. Besides translating Fresenius' *Qualitative Analysis*, he published: *Studies from the Chemical Laboratory of the Sheffield Scientific School* (1901); *Chemical Calculations* (1903); *Text Book of Chemical Arithmetic* (1905).

WELLS, THOMAS. See WELDE, THOMAS.

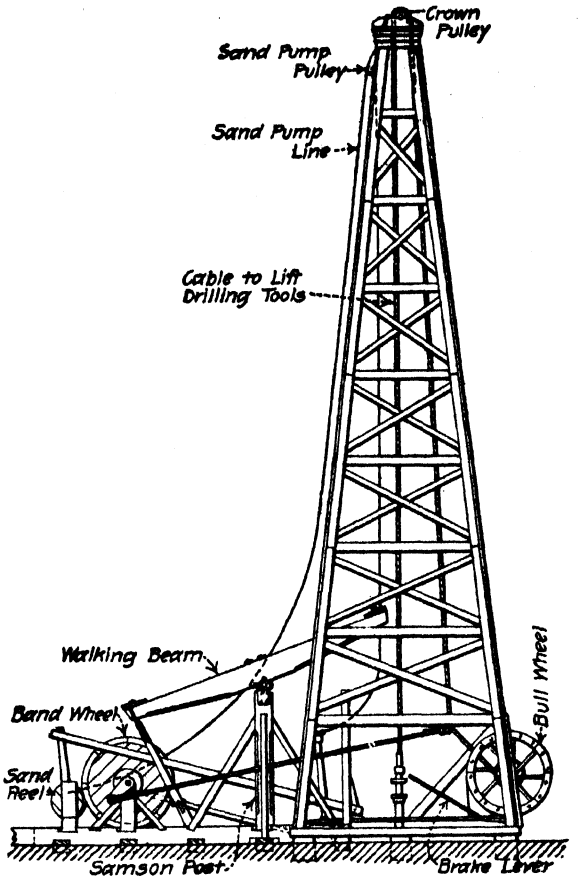
WELLS, SIR THOMAS SPENCER (1818–97). An English surgeon, born at St. Albans (Hertfordshire), and educated at Trinity College, Dublin, and at St. Thomas's Hospital, London. In 1841 he was admitted to the Royal College of Surgeons. After serving in the Naval Hospital at Malta (the Crimean War was then in progress), he studied under Magendie in Paris, and in 1853 established himself as an ophthalmic surgeon in London. He was chosen surgeon at the Samaritan Free Hospital for Women and Children (1854). There he began the work in abdominal surgery which made his name famous. In 1858 he first performed the operation of ovariotomy. In 1882 he became president of the College of Surgeons and in the following year was created Baronet. He was one of the first advocates of cremation in England. He published: *Practical Observations on Gout and its Complications* (1854); *Cancer Cures and Cancer Curers* (1860); *Diseases of the Ovaries: Their Diagnosis and Treatment* (1865–72; also Leipzig, 1866–74); *On Ovarian and Uterine Tumors: Their Diagnosis and Treatment* (1882; also Milan, 1882); *Diagnosis and Surgical Treatment of Abdominal Tumours* (1885; also Paris, 1886).

WELLS, WEBSTER (1851–1916). An American mathematician, born in Boston. He graduated in 1873 at the Massachusetts Institute of Technology, where he taught thereafter, being professor of mathematics from 1893 to 1911. His publications include: *Plane and Spherical Trigonometry* (1884); *Plane and Solid Geometry* (1887); *Higher Algebra* (1889); *College Algebra* (1890); *Academic Arithmetic* (1893); *Complete Trigonometry* (1900); *Advanced Course in Algebra* (1904); *A First Course in Algebra* (1908); *A Second Course in Algebra* (1909); *Plane Geometry* (1915).

WELLS, WILLIAM CHARLES (1757–1817). An American scientist, born in Charleston, S. C. He graduated at Edinburgh in 1780, and subsequently at Charleston was printer, bookseller, and merchant. In 1782 he accompanied the Loyalist troops to St. Augustine, Fla., where he was editor of the first weekly newspaper in the province. In 1784 he went to London, and in 1800 became a physician of St. Thomas's Hospital. His scientific reputation is based upon his *Essay on Dew* (1814; new ed., 1866). In a paper read by him in 1813 before the Royal Society he recognized, according to the statement of Charles Darwin, the principle of natural selection. He also published *Single Vision with Two Eyes* (1792). His essays were published with an autobiography in 1818.

WELLSBORO, wĕlz'bŭr-ō. A borough and the county seat of Tioga Co., Pa., 80 miles by rail north by west of Williamsport, on the New York Central Railroad (Map: Pennsylvania, G 2). It contains the Green Free Library, Woodland Park, and the Wellsboro Conservatorium of Music. Wellsboro is the shipping point and trade centre for a large area, and has fruit evaporators, flour and woolen mills, a milk-condensing plant, marble works, saw mills, foundry and machine shops, and manufactories of cut glass, chemicals, rugs, bolts, cigars, carriages, and furniture. Pop., 1900, 2945; 1910, 3183.

WELLSBURG. A city and the county seat of Brooke Co., W. Va., 16 miles north of Wheeling, on the Ohio River, and on the Pittsburgh, Cincinnati, Chicago, and St. Louis and the Wabash Pittsburgh Terminal railroads (Map: West Virginia, D 1). The manufactures include glass and glassware, cigars, coal, paper, oil cans, paper bags, tin plate, and foundry products. Bethany College is situated near here. The river at this point is spanned by a large cantilever railroad bridge. Pop., 1900, 2588; 1910, 4189.

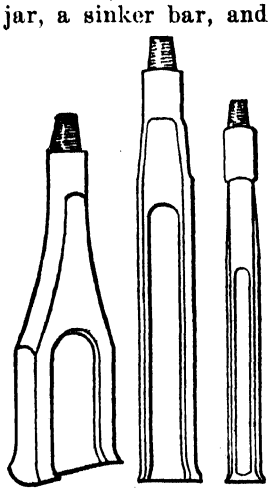


WELLS COLLEGE. An undenominational academic institution for women at Aurora, N. Y., founded in 1868 by Henry Wells. The courses of instruction are partially elective and lead to the degree of bachelor and master of arts and bachelor of music. There were, in 1915, 200 students and 33 instructors. The library contained 26,000 volumes. The grounds and buildings were valued at $400,000, the total value of the college assets being $975,000, the endowment $360,000, and the income $130,000. The president in 1916 was Kerr Duncan MacMillen.

WELL SINKING (AS. *well, wel,* well, spring, OHG. *wella,* Ger. *Welle,* wave, billow, from AS. *weallan,* to boil up). The digging, boring, or drilling of holes in the earth for the development of supplies of water, petroleum, natural gas, or salt. The process is generally accompanied or followed by the curbing or casing of the well to prevent choking by the material penetrated, or to shut out liquids except the yield of the stratum which the well is designed to tap. Besides the development of subterranean liquids, wells or their equivalent in construction are also used in prospecting for solid minerals and in determining the character of soil and rock, foundations, and other engineering structures. Wells vary in diameter from 1 inch to

100 feet and in depth from 5 feet to 6000 feet. The methods of sinking depend upon the character and depth of the material penetrated, rather than the object for which they are sunk. Wells are classified according to methods of sinking, as dug, drilled, bored, driven, and jetted; by the lining employed, as curb, tube, and case; as open, in the case of large, shallow wells; as shallow or deep; and as artesian, flowing, nonflowing, or pumping.

Wells from a few feet to a hundred or so in diameter and depth are generally sunk by means of picks and shovels, or by digging. The sides frequently require to be supported while the sinking is under way, particularly if quicksand or large quantities of water are encountered. Sheet piling or planks driven into the ground at the outer edge of the excavation may be employed, with proper cross bracing where necessary, or a wooden or metal crib or caisson provided with a shoe or cutting edge may be used. The latter generally sinks of its own weight as the material within the well is removed. The sinking process may be and generally is aided by building the curb or lining wall directly on the shoe, the increasing weight gradually forcing the shoe and curb downward. More or less water is likely to be encountered. It may be removed by a centrifugal pump, a pulsometer, or a direct-acting steam pump. Small wells of no great depth, provided with a metal tubing or casing, are often driven by hammer blows, whence the name "driven" or "tubular" wells. The tubes thus driven may have solid, pointed ends or drive points, or their lower ends may be open. In any case the lower sections must be perforated. Both round holes and slotted holes are employed, and where very fine material is encountered gauze wire strainers may be necessary. If the well casing is open at the bottom the material pierced must be removed by sand pumps or buckets, or by a hydraulic or steam jet. Artesian wells and most other deep wells penetrate more or less rock. Some shallow wells also go through or into rock, particularly in prospecting for coal and the like, or in exploring for foundations. In all such cases resort is had to drilling. For relatively small and shallow holes ordinary hand drills and diamond drills may be used. (See DRILL.) But in most operations for water, gas, and oil wells a regular drilling rig is necessary after rock is struck. So long as the sinking is through sand or other easily worked material, wrought iron or steel tubing may be driven down with mauls, either by hand, horse, or steam power; by means of a jet; or by the sand pump or bucket method, combined with rotation of the tube or casing. The hydraulic jet is simply a stream of water under pressure introduced at the bottom of the well through a supply pipe, or through a hollow drill. The force of the water aids in loosening the material and also brings it to the surface. The sand pump or bucket is a simple form of pump, lowered into the well hole, filled, raised, and emptied.



In drilling deep wells for gas, oil, or water the most common outfit employed is a portable derrick rig combined with a boiler, engine, drill, and accessories, and the necessary hoisting apparatus for raising and lowering the drills and the sand pumps. For oil wells of over 3000 feet depth the old timber tower rig is the best equipment; the tower and power plant may be left in place to operate a pump, the latter being substituted for the drill. Derricks for drilling wells are some 20 feet square at the base, 70 feet to 110 feet high, built up of either timber or steel. The engine drives a band wheel to which

STANDARD OIL-FIELD RIG FOR DRILLING DEEP WELLS.

(The band wheel is driven by an engine. The pitman has been disconnected from the band-wheel crank pin and the drill rope from the walking beam. A short "jerk line" is run from the crank to the rope near the bull wheel; this gives a short quick stroke for "spudding" — sinking through clay, etc., before rock is struck.)

a pitman is attached. The pitman works a walking beam, supported by a Samson post. To the other end of the beam the string of tools is attached. The tools include a drill, above which there are an auger stem, jar, a sinker bar, and cable for suspending the string of tools as the hole is deepened. The drill and accessories are lifted by the walking beam. The jar is a device acting on the principle of two loose links of a chain and designed to loosen the drill by giving a jarring, upward blow. A temper screw is provided for minor adjustment of the drill as to depth. As the work progresses it is necessary to lift out the drill and accessories and substitute a new one, at the same time using the sand pump to remove the material loosened by the drill. A bull wheel at the base of the derrick and a crown pulley at its top, together with a cable, are used to lift

SPUDDING BIT FOR USE IN EARTH. DRILLING BITS FOR USE IN ROCK.

the tools, by means of the engine. A sand reel at the base of the derrick, a sand-pump pulley at its top, and a sand-pump line perform a like service for the pump. Besides the tools named there are special tools for use in sinking the well, and an almost endless variety of fishing tools for recovering lost or broken drilling tools. The casing generally follows closely after the drilling. Packing rings of corrugated rubber and other devices are used to shut out any foreign fluid from the casing. Deep wells are often begun with large casings. When such a casing has been sunk as far as practicable a smaller one is inserted within it.

There are various modifications of this rig, suited to the special peculiar conditions of a location. For instance, in California, the strata generally required a separate reel for handling the casing and led to the so-called calf wheel, or California rig. The casing reel is driven by a tug rope running over a cast-iron rim bolted on the band wheel.

The cost of a full-sized artesian well outfit, such as is commonly used in the oil wells and for deep artesian wells, is about $6000. Much simpler and cheaper rigs are used for smaller wells, horse power sometimes being substituted for steam or gas engine. Effective work is often done by a spring pole operated by two or more men. The tools are suspended from the free end of a pole or beam, which is rigidly secured at or near the other end. The men pull down the pole, then slack the ropes, whereupon the pole flies back into a horizontal position, lifting the drill with it.

Well sinking is older than history. Large wells naturally preceded the bored and drilled ones by many centuries. Some of these, even in early times, were 100 or more feet deep. A laborious method of drilling was employed centuries ago by the Chinese and Hindus. The drill was raised a few feet at a time by means of a rope attached to a lever, then it was let fall by its own weight. Modern deep-well sinking methods had a rude beginning early in the nineteenth century. In 1818 an impulse to the movement for better methods was given by the French Society for the Encouragement of Agriculture. The Grenelle and Passy wells for the supply of Paris were ten and six years in the sinking. The Grenelle well is 1780 feet deep, 8 inches in diameter, and was completed in 1842. The Passy well is 1913 feet in depth, yields 5,500,000 gallons a day, and was completed in 1861. The well was started with a diameter of 40 inches. The wrought-iron drills were lifted by means of wooden poles eight inches square. Jars similar in principle to those already described were used. Subsequently a well 47 inches in diameter and 2900 feet deep was drilled at Butte-aux-Cailles, the drill being worked by a walking beam and steam engine. The first well sunk exclusively for oil was put down near Titusville, Pa., in 1859, by Col. E. L. Drake. It was sunk by a small derrick rig. Since then the American system of well drilling, as already described, has been adopted for putting down water, oil, and gas wells all over the world. It is notable for the comparative simplicity and effectiveness of the machinery employed and for the ingenuity displayed in overcoming all difficulties. In 1872 what was at least one of the earliest natural gas wells was sunk at Newton, Pa. The gas from it was piped through a 2-inch main and a 3¼-inch pipe line, 5½ miles long, to Titusville, Pa.

Among the deepest wells that have been put down the accompanying table shows the most important:

DEEP WELLS OF THE WORLD

LOCALITY	Depth	Manner of sinking	Object
	Feet		
Sperenberg, near Berlin, Germany	4170	Rotary diamond drill	Salt
Wheeling, W. Va.	4500	Oil-well outfit	Gas or oil
Peter's Creek, Pittsburgh, Pa.	5580	" "	" "
Slaughter Creek, W. Va.	5590	" "	Oil
Schladabach, near Leipzig, Germany	5740	Rotary diamond drill	Salt
Derrick City, Pa.	5820	Oil-well outfit	Oil
Paruschowitz, near Reibnik, Silesia	6600	Rotary diamond drill	Salt
Donald, Pa.	7181 (in 1916 ultimately 8000)	Oil-well outfit; welded casing	Gas

Consult C. Isler, *Well Boring for Water, Brine, and Oil* (2d ed., New York, 1911). See ARTESIAN WELLS; GAS, NATURAL; PETROLEUM; PIPE LINES; WATER SUPPLY.

WELLS'TON. A city in Jackson Co., Ohio, 85 miles south by east of Columbus, on the Baltimore and Ohio Southwestern, the Cincinnati, Hamilton, and Dayton, the Detroit, Toledo, and Ironton, and the Hocking Valley railroads (Map: Ohio, E 7). It is in the midst of a coal and iron mining district, and manufactures cement. There are also blast furnaces, foundries, a barrel factory, etc. Pop., 1900, 8045; 1910, 6875.

WELLSTON. A city in St. Louis Co., Mo., adjoining the city of St. Louis, on the Missouri River. Noteworthy features include Eden College, Eden Seminary, McKinley Seminary, Valhalla Cemetery, and Maxwellton Park. Wellston is an important industrial community, having several large plants, among which are stock yards, lumber yards, and manufactories of electrical goods, saws, edged tools, wire rope and cable, steel ranges, and creamery products. It has also a large electric power plant. Pop., 1910, 7312.

WELLS'VILLE. A town, including Wellsville village, in Allegany Co., N. Y., 90 miles by rail southeast of Buffalo, on Genesee River, and on the Erie and the Wellsville and Buffalo railroads (Map: New York, C 6). It has a public library, a fine park, a hospital and a sanitarium. The manufactured products include furniture, steam turbines, aluminium ware, gas engines, oil-well tools, boiler engines, pumps, blowers, mill machinery, and petroleum products. Pop., 1900, 4981; 1910, 5663; 1915 (State census), 4595.

WELLSVILLE. A city in Columbiana Co., Ohio, 20 miles north of Steubenville, on the Ohio River, and on the Pennsylvania Railroad (Map: Ohio, J 4). It is chiefly an industrial centre, and is especially known for its important iron, steel, and terra-cotta interests. There are railroad machine shops and roundhouse, and manufactories of pottery, boilers, machinery, nails, brick, and foundry and machine-shop products. Pop., 1900, 6146; 1910, 7769.

WELS, vĕls. A town in Upper Austria, 17 miles southwest of Linz, on the Traun River (Map: Austria, D 2). The chief features are the ninth-century Gothic church, the old castle, town hall, and park. There are manufactures

of machinery, paper, copper, brass, oil, leather, flour, etc. Pop., 1900, 12,187; 1910, 15,481.

WELSBACH, vĕls'bäĸ; *Anglicized* wĕlz'băk, KARL AUER, BARON VON (1858–). An Austrian inventor. He was born in Vienna, where he attended the university, and he also studied at Heidelberg (1880–82) under Bunsen. In 1885 he discovered two new elements, praseodymium and neodymium, and his investigations of rare elements led to his invention in the same year of the incandescent gas burner, known by his name, and of the osmium incandescent electric lamp in 1898. In 1907 he discovered another new element known as lutecium, Georges Urbain (q.v.) making the same discovery simultaneously. He built a large experiment station for scientific and technical investigation at Treibach, Kärnten. Welsbach published: *Ueber die Erden des Gadolinits von Ytterby* (2 parts, 1883); *Ueber die seltenen Erden* (1884); *Die Zerlegung des Didyms in seine Elemente* (2 parts, 1885–1903).

WELSBACH, RITTER VON. See AUER, A., RITTER VON WELSBACH.

WELS'BY, WILLIAM NEWLAND (c.1802–64). An English legal writer, born in Cheshire. He graduated at St. John's College, Cambridge, in 1823, and was called to the bar in 1826. It is as a writer and editor of legal works rather than as a practitioner that he is remembered. He edited, in collaboration with various other lawyers, 26 volumes of *Exchequer Reports* (1837–56); *Reports of Mercantile Cases* (1829–30); *Chitty's Collection of Statutes* (1851–54); a set of Blackstone's *Commentaries* (1847), and several other works of smaller proportions.

WELSER, vĕl'zĕr. The name of a famous burgher family of Augsburg, Germany. Its history can be traced back to the thirteenth century. Later its members became widely known as prominent merchants. BARTHOLOMÄUS WELSER (1488–1561) lent the Emperor Charles V a great sum of money for which in 1528 he received as security the Province of Venezuela, but in consequence of their rapacious acts the Welsers were deprived of their rule before the Emperor's reign was over. Bartholomäus' niece, PHILIPPINE (1527–80), daughter of Franz Welser, renowned for her learning and beauty, secretly married the Archduke Ferdinand, second son of the Emperor Ferdinand I. Her children were debarred from inheriting their father's rank, but one of them became a cardinal and the other distinguished himself as a soldier and was created Margrave of Burgau. Another member of the Welser family, MARKUS (1558–1614), became famous for his learning. Branches of the family settled at Nuremberg and at Ulm respectively, while the original stock at Augsburg became extinct in 1797.

WELSH, JOHN (1805–86). An American merchant, born in Philadelphia. He was educated in that city and became prominent in business there. For many years he had an active interest in municipal and educational affairs. During the Civil War he promoted measures of relief and in 1864 became president of the Philadelphia Sanitary Fair, which raised $1,080,000 for army hospitals and ambulances. In 1873 Welsh was elected president of the board of finance of the Centennial Exposition and was chosen at each subsequent election. To his executive ability the success of the Exposition was largely due, and his services were recognized by the city in a subscription of $50,000. With this he endowed the John Welsh chair of English literature at the University of Pennsylvania. He was appointed Minister to Great Britain in 1878, but resigned in the following year.

WELSH, ROBERT E. (1857–). A Canadian Presbyterian clergyman and theologian. He was born at New Cumnock, Scotland, and was educated at Glasgow and Edinburgh Universities. Ordained in 1880, he was a missionary in Japan (1880–81); rector of St. Paul's, Harrowgate, Yorkshire (1882–87); rector of St. George's, Brondesbury, London, England (1887–1904). From 1905 to 1907 he was general secretary of the Canada Bible Society, and was then appointed professor of apologetics and Church history in the Montreal Presbyterian College. He published: *In Relief of Doubt* (1895); *The People and the Priest* (1898); *God's Gentlemen* (1898); *Romance of Psalter and Hymnal* (1887); *The Challenge to Christian Missions* (1902); *Man to Man* (1905).

WELSH CALVINISTIC METHODISTS. See PRESBYTERIANISM AND THE PRESBYTERIAN CHURCHES.

WELSH LANGUAGE AND LITERATURE (AS. *Wealh*, Welshman, OHG. *Walah*, Frenchman, adulteration of *Volca*, a Celtic tribe in Italy; OHG. *walhisc*, Ger. *welsch*, foreign). The literature of Wales is more ancient and far more extensive than that of either Cornwall or Brittany, and is to be compared rather with that of Ireland. Irish is richer than Welsh as regards the quantity and interest of its ancient monuments, but modern Welsh has held its place as a literary language more successfully than modern Irish. In the history of Welsh, as in that of all the Celtic languages (q.v.), three periods are regularly recognized: Old Welsh, extending from the time of the earliest monuments through the tenth century; Middle Welsh, from the eleventh to the sixteenth century; and Modern Welsh, from the sixteenth century to the present time.

Old Welsh. The monuments of the earliest period are of the same sort in Wales as in Ireland, though much more scanty. The very oldest material is found in funeral inscriptions, some of which probably date back to the fifth century. These are written in Latin, but the proper names furnish valuable evidence with regard to the character of primitive Welsh. A considerable number of Old Welsh glosses have been preserved in manuscripts ranging from the eighth to the tenth century, but no literary texts have come down from this period. Whether any of the pieces preserved in later manuscripts, but traditionally ascribed to ancient poets, really belong to the times of their reputed authors, is still doubtful. The heroic age of Welsh history falls in the sixth century, and several great bards are supposed to have lived at that time. The most famous are the so-called *cynferdd:* Aneurin (q.v.), Llywarch Hen, Merlin (q.v.), and Taliesin; and many poems bearing their names exist in manuscripts of the twelfth and succeeding centuries. Only a few poems have come down to us which purport to have been written in this period.

Middle Welsh. The earliest texts of assured date appear in the *Book of Llandaff* (*Liber Landavensis*), a manuscript of the twelfth century. To the early Middle Welsh period belongs also the collection of ancient laws ascribed to Howel Dda and probably compiled in their substance in his time. The oldest manuscript of the laws belongs also to the twelfth century. These monu-

ments of course possess historical rather than literary interest. The Middle Welsh literature, properly speaking, falls into two main divisions —bardic poetry and prose romance.

During the ages of struggle between Saxons and Welshmen, the bards were an important class in society, and a considerable quantity of their poetry has been preserved. Their most flourishing period extends from the time of Gruffudd ab Cynan's return from Ireland in 1080 to the death of Llewelyn ab Gruffudd (see LLEWELLYN AP GRIFFITH) in 1282. Among the foremost of these Middle Welsh poets were Meilyr, Gwalchmai his son, Owain Kyveiliog and Howel ab Owain Gwynedd (both royal princes), Einion and Meilyr (sons of Gwalchmai), Dafydd Benvras, Llywarch ap Llewelyn, Cynddelw, Elidir Sais, and Phylip Brydydd. After the reign of Llewelyn ab Iorwerth in the first half of the thirteenth century, a decline began in the work of the poets. But the elegy on Llewelyn ab Gruffudd by Gruffudd ab yr Ynad Goch ranks with the best productions of the earlier bards. The poetry of this whole period lacks variety and broad human interest. The greater number of pieces are eulogistic addresses to living princes or elegies on the dead, and they contain little sustained description and almost no narration. The metrical form is usually very conventional, and the language is often obscure. But the style has much elevation and gives expression to strong national spirit. Not infrequently, too, there is revealed a genuine feeling for nature, as the poems of Gwalchmai, or fine romantic sentiment, as in the love poems of Howel ab Owain. To these centuries belong also some religious pieces, and certain mythological poems that are very difficult of interpretation.

In the fourteenth century literature received a new impulse, and the poetry of this revival, touched by the influence of the dawning Renaissance, has more general and abiding interest than most of that of the earlier bards. War songs and elegies now give place in large measure to poems of nature and romantic love. Rhys Goch and Dafydd ab Gwilym are the most conspicuous representatives of the new style. The latter, known as the Cambrian Petrarch, combines such charm of fancy and beauty of expression as to stand in the first rank of mediæval lyric poets. The fourteenth century is sometimes called the Golden Age of Welsh poetry, the main characteristic of which is the adoption of the severe principles of versification known as the *cynghanedd*. Among the bards who lived in the fifteenth century were Rhys Goch Eryri, Iolo Goch, Llywelyn Goch, Gruffudd Llwyd, Sion Cent, Dafydd ap Edmwnd, Lewis Glyn Cothi, and Gutyn Owain.

The prose literature of the Middle Welsh period consists chiefly of chronicles and romantic tales. The first do not differ in character from the annals of the surrounding nations. The prose romances, on the other hand, form perhaps the most interesting—and are the most widely known—of all Welsh writings. They have been treated in a separate article on the *Mabinogion* (q.v.). The Welsh of course possessed translations and redactions of the common stock of religious and didactic literature of the Middle Ages.

Modern Welsh. Welsh literature since the sixteenth century has relatively less interest than in the earlier periods of its history. With the decline of the bardic institution, poetry ceased to be cultivated as of old, and the prose of the modern period has been too largely confined to theological subjects to be of permanent interest. A few authors, however, deserve special mention. Huw Morus stands out among the poets in the seventeenth century and Goronwy Owen in the eighteenth. The publication of Evans's *De Bardis Dissertatio* in 1764 was an event of importance in the early history of the Romantic movement in England and one of the first signs among Welshmen of a revival of interest in their own national antiquities. The book was divided into three parts, the first containing English translations, the second a Latin treatise on the ancient bards, and the third specimens of Welsh poetry in the Middle Ages. At the beginning of the nineteenth century the *eisteddfod* was resumed once more as an important national institution, and a new enthusiasm was stimulated among both poets and prose writers.

One of the first monuments of modern Welsh prose was William Morgan's translation of the Bible, published in 1588. This version, revised in 1620 by Bishop Parry, is still in use. In the seventeenth century the most important prose writers were Morgan Llwyd and Charles Edwards. At the beginning of the eighteenth century stands Elis Wynn, whose *Gweledigætheu y Bardd Cwsc* (*Visions of the Sleeping Bard*) is generally recognized as the masterpiece of Welsh prose since the *Mabinogion*. A little later lived Theophilus Evans, whose *Drych y Prif Oesoedd* still ranks as a favorite Welsh classic. In the nineteenth century the principal prose writers have been David Owen (Brutus), Thomas Price (Carnhuanawc), Gweirdd ap Rhys, Gwallter Mechain, Lewis Edwards, and recently Daniel Owen, whose novels furnish the best pictures of Welsh life in the present day. Throughout the century a thriving periodical literature has been maintained, and in 1899 at least 29 newspapers and 39 magazines (secular and religious) were printed in Welsh. The Welsh, like all their Celtic neighbors, have been possessed of a rich and interesting folk lore, but their tales are not as well preserved as those of the Gaelic peoples. Active efforts have been made in recent years to save what is left of these popular traditions; and an extensive collection of material has been published by Rhys under the title *Celtic Folk-Lore* (Oxford, 1901). See BARD; BRETON LITERATURE; CORNISH LANGUAGE AND LITERATURE; IRISH LITERATURE; MANX LITERATURE; SCOTTISH GAELIC LITERATURE.

Bibliography. The sources for Old Welsh have never been collected. They may be found by consulting Hübner, *Inscriptiones Britanniæ Christianæ* (Berlin, 1876); Zeuss, *Grammatica Celtica* (2d ed., ib., 1871); Kuhn and Schleicher, editors, *Beiträge zur vergleichenden Sprachforschung*, vols. iv and vii (ib., 1865–73); and *Archæologia Cambrensis*, 4th series, vol. iv, published by the Cambrian Archæological Association (London, 1873). The *Liber Landavensis* was edited by Rhys and Evans (Oxford, 1893). The laws are accessible in Aneurin Owen's *Ancient Laws and Institutions of Wales* (English Record Commission, London, 1851). For discussion of the material, see Rhys and Jones, *The Welsh People*, ch. vi (4th ed., London, 1909). The most extensive collection of Middle Welsh poets is *The Myvyrian Archæology of Wales*, edited by Owen Jones, Edward Williams, and W. Owen Pughe (1801; 2d ed., 1870). For the oldest

poems see W. F. Skene, *The Four Ancient Books of Wales* (Edinburgh, 1868); *Facsimile of the Black Book of Carmarthen*, edited by J. G. Evans (Oxford, 1888); Owen Jones, *The Poetry of the Gogynfeirdd*, with an introduction by E. Anwyl (Denbigh, 1909). W. Lewis Jones, *Caniadau Cymru* (Bangor, 1898; 2d ed., 1907), is a good anthology of Welsh verse since Huw Morus. For prose see Rhys and Evans's editions of *The Mabinogion* (Oxford, 1887) and *The Bruts* (ib., 1890), from the Red Book of Hergest; J. G. Moelwyn-Hughes, *Die cymrischen Triaden; ihr Ursprung und ihr Verhältnis zu den Mabinogion* (Leipzig, 1903); Robert Williams, *Selections from the Hengwrt Manuscripts* (1876–92); Edward Edwards, *Glasuron rhyddiaith cymru* (Bangor, 1908); also the publications of the Welsh Manuscripts Society and of the Society of Cymmrodorion. For modern Welsh see *The Cambrian Bibliography* (*Llyfryddiæth y Cymry*) of Rowlands and Evans (Llanidloes, 1869), containing a catalogue of Welsh books printed up to 1800; *Catalogue of the Cardiff Free Libraries* (Cardiff, 1898); and *National Library of Wales, Bibliotheca Celtica* (ib., 1912). The best treatises on the literary history of Wales are Thomas Stephens, *Literature of the Kymry* (Clandovery, 1849; 2d ed., London, 1876); Magnus Maclean, *The Literature of the Celts* (Glasgow, 1906); J. C. Morrice, *Manual of Welsh Literature* (Bangor, 1909); L. C. Stern, "Die kymrische (walisische) Literatur" in *Die romanischen Literaturen und Sprachen* (Berlin, 1909). A commendable work on the modern period is the *Hanes Llenyddiæth Gymreig a 1650 i 1850*, by Charles Ashton (1891). Critical comments of value were made in Matthew Arnold's essay *On the Study of Celtic Literature*.

WELSH MORTGAGE. A form of mortgage formerly used in Wales and Ireland, under which a mortgagee was authorized to enter into possession, collect the rents and profits of the land, and apply the net income to the payment of the interest on the debt. Such a mortgagee could not foreclose his mortgage, or compel payment of the principal. However, the mortgagor could not exercise any acts of ownership over the land until he paid the principal. This form of mortgage is not now used. See MORTGAGE; FORECLOSURE.

WELSH MUSIC. See CELTIC MUSIC.

WELSH ONION, or CIBOL (*Allium fistulosum*). A perennial herb, a native of central Asia. Its fistular garlic-flavored leaves, which appear very early in spring, are used in soups and salads. The seed is sown in spring or summer, leaves fit for use are produced in the following spring, and the bed continues to be productive for a number of years. The small bulbous roots are not eaten.

WELSH TERRIER. See TERRIER.

WELTE, vĕl'te, MICHAEL (1807–80). A German inventor and builder of mechanical musical instruments, born at Unterkirnach (Black Forest). Having served a five-year apprenticeship with Joseph Blessing, a maker of musical clocks, he established himself, in 1832, at Vochrenbach. In 1849 he exhibited at Karlsruhe his first "Orchestrion" (q.v.), the perfection of which occupied him till his death. Instruments sent to the great expositions at London (1862), Paris (1867), Chicago (1893), etc., received the first prize. In 1872 the factory was moved to larger quarters in Freiburg.—His oldest son, EMIL, came to the United States in 1865 to establish a branch. It was he who, in 1884, first applied to a pneumatic action the then newly invented perforated paper roll, which made the present perfection of the player piano possible. Michael's grandson, Edwin, applied his uncle's (Emil) invention to the pianoforte, and in 1904 exhibited the "Welte-Mignon," an autograph piano reproducing the performances of the great pianists with photographic accuracy. The application of the same principle to the organ resulted, in 1912, in the invention of the Philharmonic Organ. See ORGAN; PIANOFORTE, *Player-pianos*.

WÉLY, LOUIS JAMES ALFRED LEFÉBURE-. See LEFÉBURE-WÉLY, L. J. A.

WELWITSCH, vĕl'vĭch, FRIEDRICH (1806–72). A German botanist, born at Klagenfurt, Carinthia. He studied at the University of Vienna, and in 1839 was sent on a journey of botanical exploration to the Cape Verde Islands and Azores by the Reiseverein of Württemberg. Having been detained in Lisbon, he took up his residence in Portugal, became director of the botanical gardens of Lisbon and Coimbra, and collected 56,000 specimens in Portugal for the Reiseverein. In 1853–61 he traveled in Africa, particularly Angola and Benguela, whence he brought important botanical and zoölogical collections. The genus *Welwitschia*, a unique African genus of gymnosperms, was named in his honor. After 1863 he lived in London. He published *Synopse explicativa das amostras de Madeiras e drogas medicinaes de collegidas na provincia de Angola* (1862), and other writings.

WELWITSCHIA, wĕl-wĭch'ĭ-à. A West African gymnospermous plant. See GNETALES.

WEMYSS, wēms, FRANCIS RICHARD WEMYSS-CHARTERIS-DOUGLAS, ninth EARL OF, and EARL OF MARCH (1818–1914). A British statesman who, while Lord Elcho, acquired great popularity as a founder of the British volunteer movement. He was born in Edinburgh, and was educated at Christ Church, Oxford. He was member of Parliament for East Gloucestershire in 1841–46, and sat for Haddingtonshire from 1847 until 1883, when he succeeded to the Earldom of Wemyss at the death of his father. As a Liberal Conservative, he supported Sir Robert Peel in the repeal of the Corn Laws, and was Lord of the Treasury in the Earl of Aberdeen's coalition Ministry (1852–55). In 1859 the menacing attitude of France and the periodical alarms of invasion, owing to the unprotected state of the English shores, led to the organization of the volunteer army of Great Britain, in which he took the earliest and most prominent part. When the government of Earl Russell brought in the Reform Bill of 1866, Lord Elcho organized a secession from the Whig party, under the leadership of Earl Grosvenor, which was nicknamed the Cave of Adullam, but which succeeded in defeating the bill and displacing the government. Lord Derby, on his accession to the premiership, offered a post in his government to Lord Elcho, but the offer was declined. He published *The New War Office* (1899).

WEN (AS. *wcn, wœn*, dialectic Ger. *Wenne, Wehne, Wähme*, wen, wart), or SEBACEOUS CYST. An encysted tumor, much more common on the scalp than in any other situation, though occasionally observed on the face or shoulders, and consisting of an obstructed sebaceous gland, which enlarges by the internal pressure of its accumulated secretion. The closed orifice may be often noticed in the form of a small dark point, and in that case the duct may sometimes

be gradually enlarged by the gentle introduction of a probe or director, and its contents pressed out. After this treatment it will sometimes shrivel up and disappear. It, however, will in all probability fill up again. If this treatment fails, and the patient finds the tumor annoying, it must be exterminated by excision, which consists in exposure and cutting out of the cystic sac, containing its cheesy contents intact. Or it may be cut into halves, evacuating the contents; after which the sac must be pulled out with forceps. Careful antisepsis must be practiced, especially upon the scalp.

WENATCHEE, wē-năch'ē. A city and the county seat of Chelan Co., Wash., 174 miles by rail west by south of Spokane, on the Columbia River, and on the Great Northern Railroad (Map: Washington, E 3). Lake Chelan and Lake Wenatchee are of great scenic beauty. The city is the shipping point and distributing centre for the fertile Columbia valley, which has considerable horticultural, farming, and fruit-growing interests. Pop., 1900, 451; 1910, 4050.

WENCESLAUS, wĕn'ses-las, Ger. **WENZEL**, vĕn'tsel (1361–1419). Holy Roman Emperor from 1378 to 1400 and King of Bohemia (as such Wenceslaus IV) from 1378 to 1419. He was the son and successor of the Emperor Charles IV. At first he tried to restore order in Germany and to check the growth of the power of the nobles, but, proving unsuccessful, gave himself up to the pleasures of the chase and of wine. In 1393 he caused the priest John Nepomuk (see JOHN OF NEPOMUK) to be tortured to death for refusing to betray the secrets of the confessional. In 1394 the Bohemian nobles organized a conspiracy, arrested him, and confined him at Prague; but he was released by the influence of the German princes. In 1395 Wenceslaus sold to Gian Galeazzo Visconti the title of Duke of Milan for 100,000 gold florins. He joined with France in the attempt to put an end to the great Schism by demanding the resignation of the rival popes Boniface IX and Benedict XIII. This resulted in arousing the enmity of the powerful Archbishop of Mainz, through whose influence Wenceslaus in 1400 was deposed as Emperor by a majority of the Imperial electors, Rupert of the Palatinate being chosen to succeed him. In Bohemia, meanwhile, fresh strife had arisen, and in 1402 his brother Sigismund arrested Wenceslaus and imprisoned him for 19 months in Vienna. Wenceslaus favored Huss and his party, and his decree of Jan. 18, 1409, brought about the secession of the Germans from the University of Prague, and thus greatly weakened the German ascendency in Bohemia. Not long after this he resigned the reins of government in Bohemia to Sigismund. Consult Thomas Lindner, *Deutsche Geschichte unter den Habsburgern und Luxemburgern*, vol. ii (Stuttgart, 1893), and F. Palacky, *Geschichte von Böhmen*, vol. iii–iv (Prague, 1857–1896).

WĔNCHOW, or **WENCHAU**, wĕn'chou'. A departmental city of Chekiang, China, opened as a treaty port in 1877. It stands on the right bank of the Ow River about 20 miles from the sea (Map: China, M 6). Its walls are 35 feet high, have a circuit of 6 miles, and are pierced with 7 gates, the east and west walls passing over low hills which they partly inclose. It stands in a well-watered plain and is intersected by numerous tidal canals. The streets are unusually clean and the shops good. In the middle of the river is a small island covered with the buildings of a Buddhist monastery, flanked by two pagodas, dating from the ninth and tenth centuries respectively. The town has little trade, even though an open port. Pop., about 85,000.

WEN'DELL, BARRETT (1855–). An American scholar, born in Boston. He graduated from Harvard in 1877, studied at Harvard Law School, and for two years practiced law. Appointed instructor in English at Harvard in 1880, he became assistant professor in 1888 and professor in 1898. In 1904–05 he was American lecturer at the Sorbonne and other French universities, and in 1914 was exchange professor from Harvard to the University of Berlin. He was elected to the National Institute of Arts and Letters. His writings include: *The Duchess Emilia* (1885) and *Rankell's Remains* (1886), both novels; *English Composition* (1891); *Cotton Mather* (1891); *Stelligeri, and Other Essays Concerning America* (1893); *William Shakspere* (1894); *Raleigh in Guiana* (1894); *A Literary History of America* (1900); *The Temper of the Seventeenth Century in English Literature* (1904), Clark lectures at Trinity College, Cambridge; *History of Literature in America* (1904), with C. M. Greenough; *Liberty, Union, and Democracy* (1906); *The France of To-day* (1907); *The Privileged Classes* (1908); *The Mystery of Education* (1909).

WEND'ISH LANGUAGE. A Slavic tongue now spoken by about 150,000 persons within the German Empire. (See WENDS.) Wendish was in ancient chronicles the generic name for Slavic. Little by little German began to oust Wendish, and by the fifteenth century the process was completed in the north, while in the south the struggle is still going on. The last religious service in Wendish in the north was performed at Lüneburg in 1751, and in 1826 old men were still living who could speak Wendish; but at present there is not a single person to be found in the region who knows the language. Hemmed in by the Germans, the South Wendish, at present called simply Wendish, Lusatian, Lusatian-Serbian, Sorbian, or Sorabian, has survived in Lusatia. Since about 1830 a considerable national literature has been developed in the Sorbian dialects of Bautzen and Cottbus. Consult Pypin and Spasovich, *Geschichte der Slavischen Literaturen* (Ger. trans., Leipzig, 1880 et seq.), and the current and retrospective literature published in *Časopis Macice* (Bautzen). There are Sorbian grammars and dictionaries by Pfuhl, Mucke (Muka), and others.

WENDOVER, ROGER OF. See ROGER OF WENDOVER.

WENDS. The name given by the Germans to the Slavic tribes of the western group, whose migrations early in the Middle Ages carried them from their primitive seats into the heart of modern Germany. At the time of the rise of the German Kingdom we find them under the names of Obotritians, Lutitians, and Sorabs, occupying the country between the Elbe and Saale on the west and the Bober on the east, and between the parallel of Berlin on the north and the Erzgebirge on the south. The cities of Leipzig, Dresden, and Meissen were once Slavic settlements. The early kings of Germany waged bloody wars against these Slavs and they were gradually forced eastward and finally subdued.

A fragment of the Wends has survived to the present day in Lusatia (part of the Prussian provinces of Brandenburg and Silesia and the eastern part of the Kingdom of Saxony). They call themselves Serbs (Serbjo), whence the German name Sorben (Sorbs), or Sorabs, which is applied by historians to the mediæval Wends. The Wends or Sorbs number about 150,000. They are a peasant people, mostly Protestants. There are, however, some 15,000 Catholics living in the neighborhood of Bautzen (Budyšin). In 1854 about 400 Sorbs settled in the State of Texas. Consult: Andree, *Wendische Wanderstudien* (Stuttgart, 1874); E. Müller, *Das Wendenthum in der Niederlausitz* (Cottbus, 1893); Tetzner, *Slaven in Deutschland* (Brunswick, 1902); Pogodin, *The Slavic World* (in Russian; Moscow, 1915). See WENDISH LANGUAGE.

WENDT, HANS HINRICH (1853–). A German Evangelical theologian. Born at Hamburg, he was educated at Leipzig, Tübingen, and Göttingen. He held professorships in theology successively at Kiel (1883–85), at Heidelberg (1885–93), and at Jena. One of the most distinguished theologians of his time, Wendt published: *Die Begriffe Fleisch und Geist im biblischen Sprachgebrauch* (1878); *Die christliche Lehre von der menschlichen Vollkommenheit* (1882); *Die Lehre Jesu* (2 vols., 1886–90; 2d ed., 1901; Eng. trans., 1892); *Die Norm des echten Christentums* (1893); *Der Erfahrungsbeweis für die Wahrheit des Christentums* (1897); *Das Johannesevangelium* (1900; Eng. trans., 1902); *The Idea and Reality of Revelation* (1904); *System der christenlichen Lehre* (1906); *Die Schichten im vierten Evangelium* (1911).

WENER, vā'nẽr, LAKE. See VÄNER.

WENIGER, vā'nī-gẽr, LUDWIG (1841–). A German classical scholar, born at Neumarkt. He studied at the University of Berlin (1861–63), and at Bonn (1863–65), taught at various Gymnasia, and was director of the Gymnasium at Weimar (1881–1908). He published a large number of papers, especially on matters relating to Olympia (q.v.), and contributed many articles to W. Roscher's *Lexikon der griechischen und römischen Mythologie.* Mention may be made of *Gottesdienst in Olympia* (1884); *Das Hochfest des Zeus in Olympia* (1904–05); *Olympische Forschungen* (1906–07); *Das Schild des Achilles* (1912).

WEN'LEY, ROBERT MARK (1861–). A philosophical scholar, born in Edinburgh, Scotland. He graduated at the University of Glasgow in 1884, and studied in Italy, France, and Germany. From 1886 to 1894 he was assistant professor of logic at Glasgow; from 1888 to 1895 was head of the philosophical department in Queen Margaret College, Glasgow University; and in 1896 became head of the department of philosophy in the University of Michigan. He was associate editor of the *Dictionary of Philosophy,* and published: *Socrates and Christ* (1889); *Aspects of Pessimism* (1894); *Contemporary Theology and Theism* (1897); *Introduction to Kant* (1897); *Preparation for Christianity in the Ancient World* (1898); *Modern Thought and the Crisis in Belief* (1900); *Kant and his Philosophical Revolution* (1910); *The Anarchist Ideal* (1913); *Robert Flint* (1914).

WEN'LOCK. A municipal borough in Shropshire, England, 12 miles southeast of Shrewsbury (Map: England, D 4). The principal buildings are the church, bearing traces of Saxon and Norman architecture; the town hall, an interesting structure, decorated internally with elaborate oak carvings of the time of Charles II; and the extensive ruins of a Cluniac abbey, founded in 680. Wenlock has manufactures of bricks and tiles, and large ironworks. Pop., 1901, 15,866; 1911, 15,244.

WENNERBERG, vĕn'er-bär'y', GUNNAR (1817–1901). A Swedish poet, composer, and statesman, born at Lidköping. He won fame by a collection of poems, *Gluntarne,* describing the life of students at Upsala, and for these he himself composed melodies. The same success met his trios, his patriotic hymns, as *Hör os, Svea, O, Gud, som styrer folkens öden, Stå stark du ljusets riddarvakt,* and the oratory *Jesu födelse.* He was Minister of Education (1870–75 and 1888–91), Governor (1875), and Senator. His *Samlade Skrifter* were published in four volumes in 1881–85.

WENSLEYDALE, wĕnz'lī-dāl, JAMES PARKE, BARON (1782–1868). An English jurist, born at Highfield, Lancashire. He was educated at Trinity College, Cambridge, was a fellow of the college in 1804–17, was called to the bar at the Inner Temple in 1813, was very successful in common-law practice, and in 1828 became a justice of the Court of King's Bench. In 1834 he was transferred to the Court of Exchequer, from which he resigned in 1856. As a jurist he was thoroughly versed in the common law. Consult Manson, *Builders of Our Law* (London, 1895).

WEN'TLETRAP' (from Ger. *Wendeltreppe,* wentletrap, winding stair; from *wenden,* to turn + *Treppe,* stair). A small prosobranch gastropod of the family Scalariidæ, also called staircase shell and ladder shell. The shell is spiral with many whorls, the whorls deeply divided, and crossed by remarkably elevated ribs. The aperture is round and rather small. The animal is furnished with a proboscis, and has the eyes placed on an external convexity, the foot short and oval. About 200 species are known, some found in northern seas, as *Scala* (*Scalaria*) *communis* on the coasts of Europe, and *Scala grænlandica* on those of North America. The best known is probably the precious wentletrap, *Scala pretiosa,* from the coasts of China and Australia, at one time highly valued by collectors who paid as much as $200 for a single shell.

WENT'WORTH, BENNING (1696–1770). An American Colonial governor. He was born at Portsmouth, N. H., graduated at Harvard in 1715, and settled in Portsmouth, where he became a leading merchant. He represented the town in the Assembly, and became a king's councilor in 1734. When New Hampshire was made a separate province in 1741, Wentworth was appointed its first Governor, remaining in office until 1767. It was during this period that the famous controversy over the New Hampshire Grants arose. Patents for land granted by Governor Wentworth in what is now southern Vermont were disputed by the Governor of New York. Wentworth raised troops in New Hampshire in 1745 for Shirley's Louisburg expedition. He gave Dartmouth College the land upon which its buildings were erected. His second wife was the subject of Longfellow's poem, "Lady Wentworth." Bennington, Vt., was named in his honor.

WENTWORTH, CHARLES WATSON. See ROCKINGHAM, MARQUIS OF.

WENTWORTH, GEORGE (1868–). An American mathematician, the son of George A. Wentworth. He was educated at Exeter Academy and at Harvard University, and began in 1894 to assist his father in the writing of textbooks. On his father's death he joined with David Eugene Smith (q.v.) in the publication of the Wentworth-Smith mathematical series.

WENTWORTH, GEORGE ALBERT (1835–1906). An American mathematician, born at Wakefield, N. H. He was educated at the Wakefield and Exeter academies and at Harvard College. After graduation in 1858 he became instructor of ancient languages in Exeter Academy, and in 1859 he was appointed to the chair of mathematics in the same institution, a position which he retained till 1891, when he was elected president of the Exeter Banking Company. He wrote: *Elements of Geometry* (1878, and several subsequent editions), a work which had a marked influence on the teaching of geometry in the United States; *Elements of Algebra* (1881, and several later editions); *Plane and Spherical Trigonometry* (1882); *Surveying and Navigation* (1882); *Five Place Tables of Logarithms* (1882); *Elements of Analytic Geometry* (1886); *School Algebra* (1887); *College Algebra* (1888); *Higher Algebra* (1891), and a large number of other textbooks. He was joint author with Hill of a textbook on *Physics* (1898), and also wrote works on arithmetic. After his death the series was revised and carried on by his son George Wentworth (q.v.) and David Eugene Smith (q.v.).

WENTWORTH, SIR JOHN (1737–1820). An American Loyalist, born at Portsmouth, N. H. He graduated at Harvard in 1755, in 1765 acted as an agent of New Hampshire in England, and in the following year was made Governor of New Hampshire and Surveyor of the King's Woods for all North America. In his administration, although he opposed the arbitrary taxation imposed upon the Colonies, he attempted to preserve the loyalty of the colonists to England. For a time he was very popular, but, by dissolving the New Hampshire Assembly because it had nominated a Committee of Correspondence, and by attempting to assist General Gage at Boston, he destroyed all his influence, and after a bitter controversy with the Assembly retired to Fort William and Mary and then to a British warship. A monument of his administration remains in Dartmouth College, which he helped to found in 1770. In 1783 he received a new commission as Surveyor-General of the King's Woods, and went to Nova Scotia, of which he was acting Governor from 1792 until 1808. In 1795 he was created Baronet.

WENTWORTH, THOMAS, first EARL OF STRAFFORD. See STRAFFORD, THOMAS WENTWORTH, first EARL OF.

WENTWORTH, WILLIAM CHARLES (1793–1872). An Australian statesman, born on Norfolk Island, at that time a penal station of New South Wales, where his father was a government surgeon. From 1816 to 1824 he was in England studying at Peterhouse, Cambridge, and at the Middle Temple in London. He was admitted to the English bar in 1822 and to the Australian in 1824. On his return to his native country he gave himself up to the cause of Australian self-government, advocating his views through a newspaper, the *Australian*, which he established at Sydney. In 1842, after a struggle of nearly 20 years, Lord Stanley (afterward Earl of Derby) procured legislation conferring partial self-government on New South Wales. Wentworth was a member of the first partially elective Legislative Council and became the head of the so-called Squatter party. He was the founder of the University of Sydney (1852), was the leading spirit in the movement which carried the new constitution through the Council in 1854, and was president of the upper chamber of the new House in 1861–62. At the end of 1862 he returned to England and settled there. Wentworth was a man of force and aggressiveness, of restless mind, and great eloquence. He was accused in his later years of being influenced by personal considerations in his political views, yet there is little doubt that to him as much as to any other one man New South Wales owed her prosperity and Australia her autonomy. His publications include *A Statistical Account of the British Settlements in Australasia* (1819). Consult Barton, *The Poets and Prose Writers of New South Wales* (Sydney, 1866), and Rusden, *History of Australia* (London, 1883).

WEN WANG, wŭn wäng (1231–1135 B.C.). One of the most noted names in Chinese history. It was posthumously conferred on Ch'ang, the Duke of Chow, by his fourth son, the noted Chow Kung. He was hereditary chieftain of a small principality in what is now the Province of Shensi, was commonly known as Si-Peh, Chief of the West, and was honored by everybody, except the infamous tyrant Chow-sin (then on the throne of China), as a pattern of every princely virtue. Denounced to Chow-sin in 1144 by the Marquis Ch'ung as a menace to the dynasty, he was imprisoned for two years. Yielding at last to the entreaties of the people, Chow-sin released him, and gave him a commission to make war on the frontier tribes. He died at the age of 96, bequeathing his army to his son Fa, who, in 1123, overthrew Chow-sin and became the first ruler of the new dynasty of Chow (1122–255 B.C.) under the title of Wu Wang, his younger brother, Chow-kung, becoming his wisest and most trusted counselor. Consult Friedrich Hirth, *Ancient History of China* (New York, 1911).

WENZEL, vĕn'tsel. See WENCESLAUS.

WEPT OF WISH-TON-WISH, THE. An historical novel by James Fenimore Cooper (1827).

WERDAU, vĕr'dou. A town of the Kingdom of Saxony, Germany, on the river Pleisse, 40 miles south of Leipzig (Map: Germany, E 3). It has important industries, including manufactures of woolen fabrics, chemicals, machinery, shoes, paper, playing cards, motors, wagons, and upholstery goods. Pop., 1900, 19,352; 1910, 20,830.

WERDEN, vĕr'den. A town of Rhenish Prussia, Germany, on the Ruhr, 17 miles northeast of Düsseldorf. It has manufactures of cloth, linen, and silk. There are coal mines in the vicinity. Pop., 1910, 11,741.

WERDER, vĕr'dĕr, AUGUST, COUNT VON (1808–87). A Prussian general, born at Schlossberg, East Prussia. He entered the Prussian army in 1825, took part in the Russian campaign in the Caucasus in 1842–43, and as lieutenant general commanded the Third Division at Gitschin and Sadowa in the Seven Weeks' War with Austria. In the Franco-Prussian War he led the army corps of Baden and Württemberg at the battle of Wörth, was then placed in

command of a siege corps before Strassburg, after the capitulation of that city was put in command of the new Fourteenth Army Corps, and defeated Garibaldi in the southeast of France. When Bourbaki, with about 150,000 men, threatened the communications of the German army besieging Paris, Werder with a much smaller force delayed the French march by an attack at Villersexel on Jan. 9, 1871, and then took up his famous defensive position southwest of Belfort. Here on January 15–17 he repulsed all the French assaults. After the war closed he was given a grant of 200,000 thalers, and a statue was erected in his honor at Freiburg. Consult Conrady, *Leben des Grafen August von Werder* (Berlin, 1889), and Varnhagen, *Werder gegen Bourbaki* (ib., 1897).

WERDT, JOHANN VON. See WERTH.

WERENSKIOLD, vĕr'en-shôld, ERIK THEODOR (1855–). A Norwegian illustrator and painter. He was born at Vinger, studied at the University of Christiania, then sculpture with Middelthun in Christiania and painting under Löfftz and Lindenschmit (1876–80) at Munich and under Bonnat and Roll in Paris (1881–83). He is chiefly known for his illustrations of Norwegian folk and fairy tales, in which field he ranks as the most poetic and creative of Norwegian artists; as in Asbjörnsen and Moe's *Norske Folke-og Huldreeventyr* and *Eventyrbog for Börn* (3 vols.), Snorri Sturluson's *Norske Kongesagaer* and Jonas Lie's *Familien paa Gilje*. The same poetic sentiment characterizes his paintings of Norwegian folk life, rendered with strong realism and modern plein-air methods, of which the best known is his "Peasant Burial" (Museum of Christiania). His powerful portraits include those of Ibsen and Björnstjerne Björnson, Professor Helland, Erika Nissen, Björn Björnson, Edvard Grieg, Christian Michelsen, Professors J. E. Sars, Sophus Lie, and Schönberg, Mrs. Jonas Lie, and Hans Mustad.

WEREWOLF, wĕr'wụlf *or* wĕr-, or **WERWOLF,** wĕr'wụlf (AS. *werwulf*, man-wolf, from *wer*, man + *wulf*, wolf). According to a widespread superstition, a man who either periodically or at any time is transformed or transforms himself into a wolf, becoming possessed of all the powers and appetites of a wolf in addition to his own, and being especially remarkable for his appetite for human flesh. The belief is not yet extinct, even in Europe, although its details vary. The animal whose shape is taken is usually a wolf.

Occasional notices of lycanthropia are found in classical writers; and lycanthropia, as there described, was the change of a human being into a wolf, or, more rarely, into a dog or bull, so as to enable the person to gratify an appetite for human flesh, either by magical means or through the judgment of the gods, as a punishment for some dire offense. According to Herodotus, the Neuri were believed to be sorcerers who had the power of taking once a year, for several days, the shape of wolves. One of the earliest werewolf stories of the modern type is found in the *Satyricon* of Petronius, in which a friend of the hero removes his clothing and immediately becomes a wolf. In this form he is wounded, runs away, and is later found in human form with a knife stab where he had been wounded as a wolf.

In Norway and Ireland it used to be believed that there were men who were "not of one skin." Such men could take upon themselves other shapes than that of man, their natures then corresponding to the shapes which they assumed, and they also had the strength and other powers of the animal whose shape they bore, as well as their own. It was believed that the change of shape might be effected in one of three ways: simply by putting on a skin of the animal; by the soul of the man deserting the human body for a time and entering into a body borrowed or created for the purpose; or, without any actual change of the form, by means of a charm, which made all beholders see the man under the shape of the animal whose part he was sustaining. Nothing of the man remained unchanged except his eyes; by these only could he be recognized. Perhaps the best stories of werewolves which are to be found are contained in the northern sagas. Scarcely anywhere did the belief in them go so deep into the minds of the people as among the northern races, although the Lithuanians and Livonians also shared in this belief. For the story in Petronius consult L. Friedländer, in *Cena Trimalchionis* (2d ed., Leipzig, 1906).

Instances of persons being changed into wolves by way of punishment were freely believed in the Middle Ages: e.g., St. Patrick was believed to have changed Vereticus, King of Wales, into a wolf; and there was an illustrious Irish family which had incurred the curse of St. Natalis, every member of which, male and female, according to the popular belief, had to take the shape of a wolf and live the life of a wolf for seven years. The werewolves, like the witches, were now regarded as servants of the devil, from whom they got the power—often exercised by anointing with salve—of assuming the wolf's form; and it was believed that great numbers of them trooped together to the Devil's Sabbath. The stories of mutilations and other mishaps befalling them in the wolf state, by which, when they resumed the human form, they were identified as werewolves, are exactly like the stories told of witches. In September, 1573, we find a court of Parliament sitting at Dôle, in Franche-Comté, authorizing the country people to take weapons and beat the woods for a werewolf, who had already—thus went the recital—"carried off several little children, so that they had not since been heard of, and done injury to some horsemen, who kept them off only with great difficulty and danger." Throughout Europe the judicial cognizance of witchcraft and of lycanthropy ceased at the same time. In Great Britain, where wolves had early been exterminated, the werewolf was only known by rumors coming from abroad. The belief, however, that witches could transform themselves into cats and hares, which did prevail, was analogous to the belief in werewolves, especially in its later forms. Consult: Wilhelm Hertz, *Der Werwolf* (Stuttgart, 1862); Sabine Baring-Gould, *The Book of Werewolves* (London, 1865); K. F. Smith, "The Werewolf in Latin Literature," in *Johns Hopkins University Circular*, vol. xii (Baltimore, 1893); id., "An Historical Study of the Werewolf in Literature," in *Modern Language Association of America, Publications*, vol. ii (Cambridge, Mass., 1894); Elliott O'Donell, *Werwolves* (London, 1912). See JUPITER, *Greek;* LYCAON.

WERFF, vĕrf, ADRIAEN VAN DER (1659–1722). A Dutch historical and genre painter, born at Kralingen. He was a pupil of Cornelis Picolet and of Eglon van der Neer. He resided in Rot-

terdam, where in 1696 he became known to the Elector Palatine John William, by whom he was appointed court painter, and ennobled (1703). His minute, correctly drawn, and elegantly composed biblical, mythological, and genre paintings, with their porcelain-like finish, pallid color, and conventionally academic style, typical of the decadence of Dutch art, were in great demand. Thirty were until recently in the Munich Pinakothek and 12 are in the Dresden Gallery, besides the famous copy of Correggio's "Repentant Magdalen," formerly attributed to that master. Many others are to be found in the principal European galleries. Werff is said to have designed the Exchange at Rotterdam.

WERGELAND, vĕr'ge-lànd, HENRIK ARNOLD (1808–45). A Norwegian poet, born in Christianssand. He studied theology in Christiania but withdrew from the ministry in 1834 to study medicine. He was given a post in the state library in 1836 and was made Keeper of the Archives in 1840. In poetry he used his great enthusiasm and genius as a prophet of national independence and personal individualism, to which many considered him unfaithful when in 1838 he accepted a small pension from King Karl Johan. His verse was at first erratic, exuberant in imagination, but lacking alike taste and knowledge. Of Wergeland's work up to 1831 *Skabelsen, Mennesket, og Messias* (1830), a formless epic of 720 pages, is sufficiently characteristic. From 1831 to 1835 Wergeland's style improved and his thought matured. By 1840 he had outgrown his audience and in becoming a great poet had sacrificed his political hold on the masses as a liberal patriot. His dramas are negligible and his *Norges Constitutions Historie* (1841–43) is forgotten, but his lyric narratives, *Jan van Huysums Blomsterstykke* (1840), *Svalen* (1841), *Jöden* (1842), *Jödinden* (1842), and *Den Engelske Lods* (1844), are the best of their kind in the Norwegian language. Among the poems of his last years are lyrics of great beauty, forming part of the permanent treasure of Norwegian poetry. A statue was erected to his memory in Christiania (1881) and at Fargo, N. D. (1908), and grateful Hebrews in 1849 had placed a fine monument on his grave in Christiania (he had worked hard to have the Jews admitted to the country and after his death the ban against them was raised). There is a good selection of Wergeland's *Works* in seven volumes (Christiania, 1896–97). Consult the biographies by Lassen (1866; 2d ed., ib., 1877); Schwahenflügel (Copenhagen, 1877); Vullum (Christiania, 1881; new ed., 1908); Skavlan (ib., 1892); Koht (ib., 1908); also Halvorsen, *Norsk Forfatter-Lexikon* (6 vols., ib., 1885–1908).

WERGILD, wĕr'gĭld, **WEREGILD,** or **WERGELD** (AS., compensation for a man). A composition by which, according to the custom of the Anglo-Saxons, Franks, and other Teutonic peoples, homicide and other heinous crimes against the person were expiated. There was an established, progressive rate of wergild, varying from that of the peasant to that of the King. The sum paid to the relatives in case of homicide, also known as the *man-wyrth*, seems to have been looked on as the equivalent of the dead man's value. As the power of the community or King increased, the exaction of retribution for the death of its members was considered to be the duty of the state, as well as of the relatives, and the principle of division was applied to homicide as well as minor crimes; each payment being a separate full equivalent for the value of the deceased, the one to appease the feud, the other to make atonement to the state. By the Mercian law the King's wergild was 7200 shillings payable to his relatives, and at the same time an equal sum, the *cynebot*, was due to his people. In general it does not appear that, among the nations who recognized the principle of wergild, the relatives were bound to accept a compensation for their kinsman's slaughter, in place of appeasing the death feud by blood; the latter practice was often resorted to instead. A similar principle seems to have been recognized by Celtic nations, and there are traces of it in the Mosaic code. Consult E. W. Robertson, *Scotland under her Early Kings*, vol. ii (Edinburgh, 1862), where the wergilds of the different Germanic races are given.

WERMELSKIRCHEN, vĕr'mĕls-kĭrK'en. A town of Prussia, 19 miles southeast of Düsseldorf, with important manufactures of cotton, silk, and woolen goods, and upholstery plush. Pop., 1900, 15,469; 1910, 16,380.

WER'NER. A five-act poetical drama by Lord Byron (1822), produced by Macready, who played the title rôle in 1830.

WERNER, vĕr'nĕr, ABRAHAM GOTTLOB (1749–1817). A German geologist and mineralogist, born at Wehrau, Prussia. He studied at the Mining Academy of Freiberg, and afterward at Leipzig. His first original work, *Ueber die äussern Kennzeichen der Fossilien* (1764), won him a position as instructor in the Mining Academy of Freiberg, where he labored for more than 40 years, attracting students from all parts of Europe and establishing a high reputation for the school, which it still enjoys. His principal service to geology consisted in arranging data collected from all sources into a systematic discipline. He divided the various geological formations into five groups, which, being largely founded upon his observations in Saxony and Bohemia, proved defective in the light of more extended research. In his mineralogical system Werner had to depend largely upon the criteria of external characters, as the methods of chemistry at that time had not attained to any degree of perfection. The other published works of Werner include *Kurze Klassifikation und Beschreibung der Gebirgsarten* (1787) and *Neue Theorie über die Entstehung der Gänge* (1771), besides short articles on mineralogical and petrographical subjects. The *Life* of Werner has been written by Frisch (Leipzig, 1825).

WERNER, ALFRED (1866–). A Swiss chemist. He was born in Mühlhausen, Alsace, and was educated in the Karlsruhe Technical School and in the Zurich Polytechnic, where he took up stereochemistry, and where in 1889 he was appointed laboratory assistant to Prof. Georg Lunge (q.v.). In 1890 he took his Ph.D. with honors at the University of Zurich. Later he worked under Berthelot in the Collège de France, but by 1895 had become professor in the University of Zurich, where in 1902 he was placed in charge of the lectures on inorganic chemistry. His important publications include: *Ueber die räumliche Anordnung der Atome in stickstoffhaltigen Molekülen* (1891), with Hautzsch; *Beiträge zur Theorie der Affinität und Valenz* (1891); *Beitrag zur Konstitution anorganischer Verbindungen* (1893); *Lehr-*

buch der Stereochemie (1904), *Neuere Anschauungen auf dem Gebiete der anorganischen Chemie* (1905; 3d ed., 1913; Eng. trans., 1911); *Ueber die Konstitution und Konfiguration von Verbindungen höherer Ordnung* (1914). Werner's views on valence and coördination in complex compounds have led to the most important advances in our theories of chemical constitution, and his brilliant generalization concerning the probability of optical rotatory power existing in complexes in which, according to his views, an asymmetric metal atom must be present, has been abundantly confirmed by the discovery of this phenomenon in compounds of cobalt, chromium, and other metals. Werner's eminence was fittingly recognized by the award to him of the Nobel prize for chemistry in 1913.

WERNER, ANTON ALEXANDER VON (1843–1915). A German historical and portrait painter and illustrator. He was born at Frankfort-on-the-Oder, and studied at the Berlin and Karlsruhe academies under Lessing and Schrödter, and then in Paris and Italy. His earliest, and perhaps his best, work was in illustration, particularly for *Der Trompeter von Säckingen* and other poems of Victor Scheffel. The first of his historical and genre paintings appeared in 1865. During the Franco-Prussian War he accompanied the Third Army Corps and became practically the official German painter of the war and of the new Empire. In 1875 he was appointed director of the Berlin Academy. His art is soberly realistic and typically Prussian, and his draftsmanship is excellent. Among his numerous patriotic paintings are "The Negotiations for Surrender at Sedan"; "Meeting of Bismarck and Napoleon III at Donchery"; "In Quarters before Paris, 1871" (Berlin Gallery); "The Proclamation at Versailles of William I as Emperor," in the Royal Palace, Berlin (same subject, as a mural painting, in the Berlin arsenal); "Close of the Congress of Berlin" (Rathaus, ib., 1881); "Opening of the Reichstag by Emperor William II, 1889" (1894); and "Unveiling of the Wagner Monument, Berlin" (1908). His portraits include several of Emperor William II. Consult the monograph by Rosenberg (Bielefeld, 1895).

WERNER, KARL (1808–94). A German water-color painter. He was born at Weimar, and after studying at Leipzig under Selinorr spent almost 20 years in Italy. On a visit to England in 1851 he was made member of the Society of Painters in Water Colors. Extensive travels in Italy, Spain, and the Orient furnished subjects, mostly architectural, for his drawings, some of which have been published as *The Holy Places* (1866) and *Nilbilder*. He is considered one of the best German aquarellists of the nineteenth century, and his work is distinguished for careful execution, brilliancy of color, and poetic conception. Among his easel pictures are to be noted: "Partenkirchen" (1833), and "Cathedral of Cefalù" (1838), in the National Gallery, Berlin; "Interior of House at Granada" (1856) and "View of Spalato," in the Leipzig Museum.

WERNER, REINHOLD VON (1825–1909). A German admiral and writer. He was born at Weferlingen, Prussia, and after a number of years' experience in the merchant marine, in the course of which he made numerous voyages to the East Indies, he became, in 1849, an officer in the newly organized fleet of the German nation. In 1852 he entered the Prussian service, became lieutenant captain in 1856, took part in the East Asia expedition of 1859–62, and as commander of a corvette during the war with Denmark in 1864 fought at Jasmund. During the Seven Weeks' War Werner seized the Hanoverian ports on the North Sea. He became rear admiral in 1875, but was retired three years later. In 1898 he was nominated to be vice admiral, and in 1901 was ennobled. He wrote: *Die preussische Expedition nach China, Japan, und Siam* (1863; 2d ed., 1873); *Die Schule des Seewesens* (1866); *Das Buch von der deutschen Flotte* (1868; 8th ed., 1902); *Seebilder* (1876); *Erinnerungen und Bilder aus dem Seeleben* (1881; 7th ed., 1898); *Berühmte Seeleute* (2 vols., 1882–84); *Drei Monate an der Sklavenküste* (1885); *Dirk Mallinga* (1888); *Bilder aus der deutschen Seekriegsgeschichte von Germanicus bis Kaiser Wilhelm II.* (1898).

WERNER, ZACHARIAS (1768–1823). A German romantic dramatist, born in Königsberg, Prussia. He studied law at Königsberg, entered (1793) the Prussian civil service, and after sojourns in Warsaw and Berlin went to Rome, where he joined the Catholic church. He had earlier made the acquaintance of Goethe. He became a priest in 1814 and thereafter resided mainly in Vienna, where he became noted for the sensational eloquence of his preaching. Werner owes his place in literature to four dramas, *Die Söhne des Thals* (1803), *Das Kreuz an der Ostsee* (1806), *Martin Luther* (1807), and especially *Der 24 Februar* (1809). His *Works* (13 vols., 1841) contain four other dramas and many poems, hymns, and sermons. The dramas are typical of the luridly romantic "Fate Tragedy." Consult: Minor, *Die Schicksalstragödie* (Frankfurt, 1883); Lives of Werner by Hitzig (Berlin, 1823), Schütz (Grimma, 1841), and Düntzer (*Zwei Bekehrte*, Leipzig, 1873); also Thomas Carlyle, *Miscellanies* (4th ed., London, 1857), and Madame de Staël, *L'Allemagne* (ib., 1813).

WERNERITE, wĕr'nĕr-īt (named in honor of Abraham Gottlob Werner, q.v.). A mineral calcium-sodium-aluminum silicate of the scapolite group (q.v.), crystallized in the tetragonal system. It has a vitreous or pearly lustre, and is light gray, blue, green, or red in color. It occurs in crystalline rocks, in granular limestone, frequently near granite contacts. This mineral includes a brown variety called nuttallite, from Bolton, Mass., and a massive pale violet-blue to indigo-blue variety called glaucolite, from Siberia. Wernerite is included in the scapolite group of minerals, and is frequently referred to by that name.

WERNER VON HEIDENSTAM, KARL GUSTAF. See HEIDENSTAM, K. G. WERNER VON.

WERNHER, vĕrn'hĕr, SIR JULIUS (CHARLES) (1850–1912). A British capitalist, born at Darmstadt, Hesse, Germany. He went to London in 1870 as clerk of an Anglo-German firm, but returned to Germany to participate in the Franco-German War. He engaged in business in Paris for a short time, and then went to South Africa, where he was the representative of a great French diamond house. In 1880 he settled in London as English partner in the firm of Porges and Wernher, but in 1884 was again at Kimberley. There he formed a connection with Alfred Beit, became life governor of the De Beers corporation in 1888 when Cecil

Rhodes (q.v.) and Alfred Beit amalgamated the Kimberley diamond mines, and when Porges retired from business formed the firm of Wernher, Beit, and Company. Wernher possessed other important mining interests. In 1905 he was created a baronet. With Beit he gave large sums to the new South African University.

WERNIGERODE, vĕr'nē-ge-rō'de. A town of Prussia, in the Province of Saxony, 43 miles southwest of Magdeburg, at the northern base of the Brocken. In the castle, the residence of the former counts, now princes, of Stolberg-Wernigerode, is an extensive library of over 118,000 volumes, including a famous biblical and hymnological collection of 8500 volumes, and 10,000 maps. The town manufactures chocolate, machinery, cigars, and dyestuffs. Pop., 1900, 11,581; 1910, 18,359.

WERNLE, vĕrn'le, PAUL (1872–). A Swiss Protestant theologian, born at Zurich. He was educated at the universities of Göttingen, Berlin, and Basel, where by 1905 he had become professor of modern Church history. Wernle took a high place among the theologians of his time. His publications include: *Der Christ und die Sünde bei Paulus* (1897); *Paulus als Heidenmissionar* (1899; 2d ed., 1910); *Die Anfange unserer Religion* (1901; 2d ed., 1904; Eng. trans., *The Beginnings of Christianity*, 2 vols., 1903–04); *Was haben wir heute an Paulus?* (1903); *Die Quellen des Lebens Jesu* (1904; Eng. trans., *Sources of our Knowledge of the Life of Jesus*, 1907); *Einführung in das theologische Studium* (1908; 2d ed., 1911); *Renaissance und Reformation* (1912); *Evangelisches Christentum in der Gegenwart* (1914).

WERNZ, vĕrnts, FRANZ XAVER (1842–1914). A German Jesuit, born at Rottweil, Württemberg. Entering the Society of Jesus at the age of 15, he was ordained a priest in 1871. When Bismarck banished the Jesuits from Germany, Wernz was sent to England, where in 1876–83 he taught canon law at Ditton Hall, Liverpool. In the latter year he was called to the chair of canon law in the Gregorian University, Rome, of which he became rector in 1904. In 1906 he was elected the twenty-ninth General of the Society of Jesus. He published *Jus decretalium ad usum prælectionum* (4 vols., 1898–1904; 2d ed., 1905).

WERRA, vĕr'rä. A river of Germany, rising in Saxe-Meiningen in the southeastern part of the Thuringian Forest (Map: Germany, C 3). It flows in a generally northwesterly direction, passing Meiningen and at Münden uniting with the Fulda to form the Weser. It is 181 miles long and is navigable from Wanfried, 42 miles.

WERTH, vĕrt (or **WERDT**), JOHANN VON (c.1600–52). A German soldier, born at Büttgen, near Jülich. He entered the Imperial army, and then the Bavarian army, and fought in the Thirty Years' War. Although not able to read or write, he was a cavalry leader of ability, and rose to high rank. By a spirited charge at Nördlingen in 1634 he turned the day against the Swedes and was made Baron and lieutenant marshal. In 1635 he took Speyer; and in 1636 he invaded France, caused alarm at Paris, and finally retreated with immense booty. Two years afterward he was defeated by Bernhard of Saxe-Weimar at Rheinfelden, and was taken prisoner, but in 1642 was exchanged for the Swedish General Horn. In 1643 he helped the Imperialists to win the great victory of Tuttlingen. He shared in the defeat at Jankau in 1645. In the same year his cavalry decided the battle of Mergentheim against Turenne and he conducted the retreat of the Imperialists after the death of General Mercy at Allersheim. When the Elector of Bavaria made peace with France and Sweden in 1647, Werth attempted to transfer a part of the Bavarian army into the service of the Emperor, but his plan was discovered, and he escaped with only a few followers. When the Elector again declared war, he was restored to command, but the Peace of Westphalia soon afterward brought an end to the long struggle. Consult Teicher, *Johann Freiherr von Werth* (Augsburg, 1876).

WERTHER, vĕr'tĕr. An opera by Massenet (q.v.), first produced in Vienna, Feb. 16, 1892; in the United States, March 29, 1894 (Chicago).

WERTHER. See SORROWS OF WERTHER.

WERWOLF. See WEREWOLF.

WESEL, vā'zel, or UNTERWESEL. A fortified town of Prussia on the Rhine, 32 miles north-northwest of Düsseldorf (Map: Germany, B 3). Of its churches, the Willibrord Kirche, consecrated in 1181, is one of the finest Gothic edifices on the Lower Rhine. Wesel has sugar refineries, brick kilns, wire and lead works, soap factories, flour and saw mills, and shipyards. Pop., 1910, 24,441.

WESEL, JOHANN RUTHRATH VON (?–1481). A German Reformer, born at Oberwesel. Between 1445 and 1456 he taught at the University of Erfurt, where he was rector in 1456–57. He then became a preacher at Mainz in 1460, and at Worms in 1462. Summoned before a Dominican inquisitor in 1479, he was sentenced to life imprisonment for his theological views, and he died in prison at Mainz. Wesel opposed the sale of indulgences, and denied the infallibility of the Pope. Consult C. Ullmann, *Reformatoren vor den Reformation* (Gotha, 2d ed., 1866).

WESEL, JOHN OF. See JOHN OF WESEL.

WESER, vā'zēr. A river of Germany, formed by the junction of the Werra, which rises in the Thüringerwald, and the Fulda, rising in the Rhöngebirge, at Münden, near the south extremity of the Prussian Province of Hanover. After passing the Westphalian Gate the Weser flows north, mainly watering Prussian territory, till, passing Bremen, it forms for about 40 miles the boundary between Oldenburg and Hanover, and enters the North Sea by a wide estuary, so much interrupted by sand flats that the entrance by boats is extremely difficult (Map: Germany, C 2). Its length from the confluence of the head streams is 280 miles and from the source of the Werra 447 miles. It is navigable at high water to Münden and small vessels proceed some distance up the Werra, while the Fulda has been canalized as far as Cassel. A canal connects the estuary with that of the Elbe. The principal affluent of the Weser is the Aller, which has a large tributary in the Leine.

WESLEY, CHARLES (1707–88). An English clergyman, brother of John Wesley, with whom he was closely associated. He was born at Epworth, the eighteenth child of Samuel Wesley. At nine years of age he entered Westminster School, from which he went to Christ Church, Oxford, in 1726. Here, with some friends, he began the observance of a strict system of life, persuading them "to observe the method of study prescribed by the statutes of the university." "This gained me," he says, "the harm-

less nickname of methodist"—which seems at first not to have had a religious significance. After taking his degree, he had pupils for a while, whom he influenced in the spiritual life, though at this time he had not decided to take orders. He was, however, ordained in 1735, just before joining his brother John in the Georgia mission. His sojourn in America was even shorter than John's; it was marked by unpopularity arising from what was considered excessive strictness in life and doctrine. Returning to England, he became curate of St. Mary's, Islington, and threw himself vigorously into evangelistic work. In 1739, after some unfriendliness and censure from the constituted authorities of the church, he entered definitely on the itinerant ministry, which he pursued with great earnestness for the next 17 years. He was of a more cautious and conservative temperament than John, and looked with distrust upon the gradual development of a tendency in the Methodist societies to separate from the Church of England, and upon his brother's views of perfection which he thought must be attained by a gradual process. He died in London, after a period of failing health, and was buried in Marylebone churchyard. He is known chiefly for his hymns, of which he wrote over 6000, many of them still in constant use. The poetical works of the brothers were published in 13 volumes by the Rev. G. Osborn (London, 1868–72). Consult: the *Journal* of Charles Wesley (2 vols., London, 1879); the first section (1736–39) was republished with additions by Nehemiah Curnock from the shorthand journals recently deciphered (ib., 1909); also Thomas Jackson, *Life of Charles Wesley* (2 vols., New York, 1842); Telford, *Life of the Rev. Charles Wesley* (ib., 1900); R. Green, *Works of John and Charles Wesley: A Bibliography* (2d ed., ib., 1906); also references under METHODISM; WESLEY, JOHN.

WESLEY, JOHN (1703–91). An English clergyman, generally known as the founder of Methodism. He was born at Epworth, in Lincolnshire, the fifteenth child of the Rev. Samuel Wesley, and of a family which had been known as Nonconformists, though Samuel had taken orders in the Church of England. At 10 he was sent to Charterhouse School, where for a time he suffered from persecution by older boys, but finally won the esteem of all. In 1720 he matriculated at Christ Church, Oxford. He took his degree in 1724, and not long after began to think about following his father's profession. He was ordained deacon in 1725, and next year elected a fellow of Lincoln College. Ordained priest in 1728, for a while he acted as curate to his father at Epworth, but was recalled to Oxford by college regulations. Finding his brother Charles and some other undergraduates associated in what was called by unsympathetic outsiders the Holy Club, he naturally saw much of them, and became their director. On his father's death he was urged to accept the living of Epworth, but thought his place was at Oxford.

It was not long before he changed his mind, and was persuaded to go with General Oglethorpe as a missionary to Georgia. His mission was not altogether a success; he was regarded as too strict, and some points on which he insisted were not thought to be in harmony with Protestantism. His sojourn in Georgia was not without good, and his departure was regarded as a real loss to the Colony. On his voyage to Savannah, he met some of the Moravian Brethren, whose simple evangelical piety made a deep impression on him. On his return to London, he sought them out, and from Peter Böhler, one of their preachers, imbibed the doctrine of saving faith, and broke away from the influence of William Law, strong in his earlier life.

In the summer of 1738 he went abroad to visit their leaders, and stayed at Herrnhut and with Zinzendorf at Marienborn. He corresponded with Zinzendorf for some time, and his letters are still preserved at Herrnhut. His new experiences made a vital difference in him. He associated with Moravians in England, and with other societies interested in the growth of the spiritual life.

Early in 1739 he took more definite steps in the direction he was afterward to follow. His friend George Whitefield invited him to Bristol. When he saw Whitefield preaching in the open air, his High Church principles were at first offended, but on April 2 he preached his first open-air sermon, and thus began his real life work. His success in the neighborhood of Bristol was so great that a special place had to be built to care for converts. An important step was taken on July 20, 1740, when he formed the first society under his direction. They met in a building called the Foundry, formerly government property, but long disused, near Finsbury Square in London, which for many years was the headquarters of Methodism.

Wesley's preaching success soon called him so much away that he was unable to give his societies proper care. In 1742 one of his followers proposed that the members should be divided into bands of 12, with a leader over each. The plan worked well. The leaders reported to Wesley the conduct of the members and the receipt of money. The class meetings thus originated contributed greatly to the success of the movement. Wesley now preached frequently all about London and Bristol. But the fervor and enthusiasm of his converts were looked upon with suspicion by the clergy in general, accustomed to an orderly conduct of religious matters. He began to develop his organization by the appointment of lay preachers, who were to be communicants of the Church of England, and not to conflict in their preaching with the church services. Among the early preachers of this sort were John Cennick and Thomas Maxfield. In 1744 the first conference of his principal helpers was held.

As a result of the Arminian tendencies of Wesley and his friends, Whitefield and Cennick withdrew from relations with them and formed the Calvinistic Methodist Society, but the success of Wesley's work was unabated. In five years from the preaching of the Bristol sermon 45 preachers were laboring with him, and there were 2000 members in London alone. There is no question that the religious life of England was in need of stirring and vivifying influence, which the burning words and ardent faith of Wesley brought. His evangelistic labors extended to all parts of the British Isles. He preached twice to four times daily, and traveled (on horseback until age compelled him to use a carriage) about 4500 miles a year. He met societies, classes, and boards, and inquired minutely into their affairs. He saw to the erection of chapels, and collected money for the

expense. He found time for an amazing variety of literary work, selecting, condensing, abridging, and writing on all kinds of subjects what he thought would be most useful for his followers. He joined in every movement for the improvement of humanity. Sunday schools, the abolition of slavery, education, the circulation of tracts, and charitable associations of all kinds interested him and enlisted his coöperation.

By 1790 he found himself at the head of 511 preachers and 120,000 members, while at least four times that number were in attendance with the Methodist Congregations. He died March 2, 1791, in the house attached to the City Road Chapel in London, and was buried there. He was of less than the average height, but well proportioned, and of attractive appearance. In social life he was a charming man, a good talker, and never ill at ease. He numbered many of all classes among his friends. The obedience which he exacted, for the good of the cause, from his followers was readily given. It is not too much to say that in eighteenth-century England "no single figure influenced so many minds, no single voice touched so many hearts."

Bibliography. Wesley's *Prose Works* were first published by himself (32 vols., Bristol, 1771–74); the religious writings, edited by Thomas Jackson (London, 1829–31; 11th ed., 1856–62); an American edition in seven volumes (New York, 1831). The *Poetical Works* by John and Charles Wesley were edited by G. Osborn (13 vols., London, 1868–72). The sources for the study of Wesley are: his *Journal*, extending from 1735 to 1790, published in 20 parts (London, 1740–89), with many subsequent editions, among them being one in Everyman's Library (4 vols., New York, 1908), and the edition by Nehemiah Curnock, from original manuscripts, with notes from unpublished diaries (6 vols., ib., 1910–15); also *John Wesley's Letters*, edited by George Eayres (ib., 1914). Consult also: Julia Wedgwood, *John Wesley and the Evangelical Reaction of the Eighteenth Century* (London, 1870); Luke Tyerman, *Life and Times of Rev. John Wesley* (2d ed., 3 vols., ib., 1872–75); J. H. Rigg, *The Churchmanship of John Wesley* (ib., 1887); Robert Southey, *Life of Wesley and the Rise of Methodism* (new ed., ib., 1890); J. H. Rigg, *The Living Wesley* (2d ed., ib., 1891); J. H. Overton, *John Wesley* (ib., 1891); W. E. H. Lecky, *History of England in the Eighteenth Century* (new ed., 7 vols., New York, 1892–93); J. H. Overton, *Evangelical Revival in the Eighteenth Century* (ib., 1900); F. J. Snell, *Wesley and Methodism*, in "World's Epoch Makers" (Edinburgh, 1900); Leslie Stephen, *History of English Thought in the Eighteenth Century*, vol. i (3d ed., New York, 1902); P. Livingston (ed.), *Heart of John Wesley's Journal* (ib., 1903); C. T. Winchester, *Life of John Wesley* (ib., 1906); John Telford, *John Wesley* (new ed., London, 1906); W. H. Fitchett, *Wesley and his Century: A Study in Spiritual Forces* (Toronto, 1906); Augustin Leger, *La jeunesse de Wesley* (Paris, 1910); S. P. Cadman, "John Wesley and the Eighteenth Century," in *Three Religious Leaders of Oxford and their Movements* (New York, 1916), containing bibliography.

WESLEY, SAMUEL (1662–1735). An English clergyman, father of John Wesley. He was born at Winterborn-Whitchurch, Dorsetshire, and educated first at Dorchester Grammar School and then at Stepney and Newington, in London, with a view to the Independent ministry. Some severe invectives having appeared against the Dissenters, he was asked to reply to them; but while doing the necessary reading he changed his opinions, and decided to conform to the Established church. He entered Exeter College, Oxford, and graduated in 1688. He was ordained deacon almost immediately, and priest in 1690. After two curacies and a year as chaplain on board a man-of-war, he obtained the living of South Ormsby in Lincolnshire in 1690, and in 1695 that of Epworth, which is closely associated with the later history of his family, and which he held until the year before his death. He was a prolific author, especially in verse, in which he published a *Life of Christ* (1693); *Maggots, or Poems on Several Subjects* (1695); *Elegies on the Queen and Archbishop* (1695); *The History of the Old and New Testaments in Verse* (3 vols., 1701–04); *Marlborough, or the Fate of Europe* (1705); *The Battle of the Sexes* (1723); *Poems on Several Occasions* (2d ed. with additions, Cambridge, 1743); and in prose several works of a theological nature. Consult his *Life* by Luke Tyerman (London, 1866), and references under WESLEY, JOHN.

WESLEY, SAMUEL (1691–1739). An English poet and clergyman, elder brother of John and Charles Wesley and namesake of his father. He was born in London, and graduated at Christ Church, Oxford, in 1715. He was ordained not long after, and for the next twenty years was a master in Westminster School. In 1732 he became head master of Blundell's School at Tiverton, where he remained until his death. At Westminster he became acquainted with Pope, Swift, Prior, Harley, and other Tory poets and statesmen, who thought highly of his abilities in satiric and humorous verse. The first edition of his poems appeared in 1736; a second, with additions, in 1743; and a third, with biography by Nichols, in 1862. Some of his hymns are still in common use.

WES'LEYAN FEMALE COLLEGE. An institution for the higher education of women, founded at Macon, Ga., in 1836. The first degrees were conferred in 1840. The total enrollment in 1915–16 was 467, and the officers and teachers numbered 43. The endowment of the college was about $140,000, the grounds and buildings were valued at about $450,000, and the annual income was about $100,000. The library contained 5400 volumes. The president in 1916 was C. R. Jenkins, D.D.

WESLEYAN METHODIST ASSOCIATION. See METHODISM.

WESLEYAN METHODIST CONNECTION. See METHODISM.

WESLEYAN UNIVERSITY. The college was founded in 1831, at Middletown, Conn. The campus and grounds include about 40 acres, situated on a terrace above the Connecticut River. The college offers two courses leading respectively to the degrees of Bachelor of Arts and Bachelor of Science. At least one year's study in college of Latin or Greek is required for the former degree, and courses in advance mathematics and in modern languages are required for the Science degree. The study of English is required of all, and the election of studies must conform to a major and a group requirement. The college gives the degrees of Master of Arts and Master of Science for graduate work, but not the degree of Doctor of Philosophy. From 1872 to 1912 the college was coeducational. In

1916 the attendance was 504, including 21 graduate students, and the faculty numbered about 45. The library contained 103,000 volumes. The grounds and buildings were valued in 1916 at $1,176,315. The total value of property under control of the college was $3,591,083, with an endowment of $2,339,092, not including certain building funds of the value of $175,675. The gross income, excluding gifts, was $164,976. The total value of money gifts in 1914–15 was $283,778. The president in 1916 was William A. Shanklin, LL.D.

WESSEL, vĕs'sel, JOHAN HERMAN (1742–85). A Norwegian poet, born at Jonsrud, Akershus Stift. He was a grandnephew of Peter Wessel Tordenskjold (q.v.). Wessel was educated in Christiania and Copenhagen, where he lived from 1761 to 1785. With others he founded the *Norske Selskab* (1772), and in the same year wrote the classic *Kierlighed Uden Strömper* (Love Without Stockings), a parody of formal and linguistic elegance that is hardly to be matched. His stories, as *Gaffelen, Herremanden, Smeden og Bageren, Hundemordet*, and his witty verses are also notable. Few poets of the period have held their own so well as Wessel. The best edition of his *Samlede Skrifter* is by J. Levin (1862; 2d ed., 1878), with biography.

WESSEL, vĕs'sel, JOHANNES, surnamed GANSFORT (c.1420–89). A mystic of the Brothers of Common Life (q.v.) at Zwolle, and a friend of Thomas à Kempis. He was born at Groningen and studied at Cologne, Louvain, and Paris. He visited Rome and taught philosophy at Heidelberg and at Paris. Johann Reuchlin and Rodolphus Agricola (qq.v.) were among his scholars. His later years were spent in monastic retirement in Holland. Wessel's friends, among whom were the Bishop of Utrecht, David of Burgundy, brother to Charles the Bold, called him *lux mundi*, with reference to his evangelical views, but his critics called him master of contradictions, in allusion to his attitude to the Roman Catholic church and to his mind, which held scholastic, mystic, and classical culture together with scientific knowledge in one consciousness without feeling the contradiction. His friends saved his manuscripts and sent them to Luther, who published a farrago of them (1512), leaving out an essay on the Eucharist, because it advocated Zwingli's view and not his own. Consult: Muurling, *Commentatio Historica-Theologica de Wesseli* (Utrecht, 1831); id., *De Wesseli Principiis atque Virtutibus* (Amsterdam, 1840); Ullmann, *Reformers before the Reformation* (Edinburgh, 1877).

WES'SEX (AS. *Westseaxe*, West Saxons). An Anglo-Saxon kingdom. It was situated in Southern Britain, extending from Watling Street to the Channel. About 495 the West Saxons, or Gewissas, landed about where Southampton is now under the leadership of Cerdic and Cynric. After defeating the Britons in several battles, they became kings of the conquered territory in 519. Further progress was checked for a time by a victory of the Britons in 520. After Cerdic's death, Cynric became sole ruler, and in 552 again took up the work of conquest. Under his son Ceawlin the kingdom was widely extended, but the King's own people finally rose against him, and he was defeated at Woddesbeorg or Wanborough in 592. For some time thereafter Wessex was of little importance. In the seventh century it became Christian and was often ruled by other kingdoms, notably Mercia. A new period began with Ine, who ruled from 688 to 726. He drove back the Mercians, and his laws are the earliest ones of the West Saxons we possess. After his death war was renewed with Mercia, which again asserted its overlordship successfully. The great period of Wessex history begins with Egbert (q.v.). In time he became the ruler of the whole of England, and Wessex henceforth had no independent history. The word "Wessex" has been used by Thomas Hardy (q.v.) to cover the region which forms a background to his novels. Consult J. R. Green, *A Short History of the English People*, vol. i (new ed., New York, 1905). See ANGLO-SAXONS.

WEST, ANDREW FLEMING (1853–). An American Latinist, born at Allegheny, Pa. He obtained his collegiate education at Princeton, from which he received his A.B. in 1874. In 1883 he became professor of Latin, and in 1901 dean of the Graduate School, in Princeton University. He was for many years chairman of the Managing Committee of the American School of Classical Studies at Rome. Oxford University gave him the degree of D.Litt., and he was elected to the National Institute of Arts and Letters, and in 1901 served as president of the American Philological Association. He wrote many articles on university education; *A Life of Alcuin* (1902); and was editor of Terence's *Andria* and *Heautontimoroumenos* (1888), of *The Philobiblon of Richard de Bury* (1880), and of *A Latin Grammar* (1902).

WEST, BENJAMIN (1738–1820). An American historical painter. He was born at Springfield, Pa., Oct. 10, 1738, of Quaker parentage. After desultory study with an artist named Williams he set up as a portrait painter in Philadelphia at the age of 18. Later he spent a year in New York, and in 1760 went to Italy. There he remained three years and was very successful, being elected an honorary member of the academies of Florence, Bologna, and Parma. In 1763 he went to London, where he passed the rest of his life. He was well received and encouraged by Sir Joshua Reynolds, and his success was assured by the painting "Agrippa Landing with the Ashes of Germanicus," for Drummond, Archbishop of York, who obtained for him the royal patronage. In 1772 George III appointed him historical painter, and in his "Death of General Wolfe" (Grosvenor Gallery, London) he discarded the convention of painting figures in a modern battle clothed in the costumes of the Greeks and Romans, though Sir Joshua Reynolds and the Archbishop of York tried to dissuade him from his intentions. Sir Joshua subsequently retracted his objections and acknowledged West's success, proclaiming the change as an epoch-making innovation. West was one of the founders of the Royal Academy and succeeded Sir Joshua Reynolds as its president in 1792. He produced over 400 canvases of heroic size, but of rather commonplace merit. They are conceived in the impersonal eclectic spirit of the day, good in composition but flat and spiritless in color, and devoid of real imaginative power. His real importance consists in his activity as a teacher, adviser, and unfailing friend of the entire younger generation of American artists, who studied with him in London, and in the fact that he was instrumental in laying the foundation of the Royal Academy. His pictures may be seen in England at the National Gallery and at Hampton Court. In the Metropolitan Museum, New York, are nine ex-

amples, including "Hagar and Ishmael" and "Triumph of Love"; in the Pennsylvania Academy, Philadelphia, "Christ Healing the Sick," "Penn's Treaty with the Indians," and "Death on the Pale Horse"; and in the Boston Museum, "Kingdom." Consult his *Life* by Galt (London, 1820), and Samuel Isham, *History of American Painting* (new ed., New York, 1915).

WEST, EDWARD WILLIAM (1824–1905). An English Pahlavi scholar, born in London. In 1839 he entered King's College, London, from which he graduated as a civil engineer in 1842. In 1844 he went to India in connection with the railway system of the Bombay presidency. He visited the cave temples at Elephanta in 1846, and later those at Kanheri, and in 1848 began his studies of Pahlavi inscriptions and manuscript texts. In 1876 he retired from his engineer duties in India, returned to Europe, and devoted his time to editing and translating the most important works of Pahlavi literature. His publications include: *The Book of the Mainyō-i-Khard* (1871); *The Book of Ardāvīrāf and a Glossary* (1872–74); *Shikandgūmānīk Vijār* (1887); five volumes of *Pahlavi Texts* translated in *Sacred Books of the East*, edited by F. Max Müller, v, xviii, xxiv, xxxvii, xlvii (Oxford, 1880–97); and "Pahlavi Literature," in Geiger and Kuhn, *Grundriss der iranischen Philologie*, vol. ii (Strassburg, 1904).

WEST, REBECCA. The principal female character in Ibsen's *Rosmersholm*.

WEST, THOMAS. See DE LA WARR, LORD.

WEST AFRICA, PORTUGUESE. See ANGOLA.

WEST ALLIS. A city in Milwaukee Co., Wis., 4 miles west of Milwaukee, of which it is an industrial suburb; on the Chicago, Milwaukee, and St. Paul and the Chicago and Northwestern railroads (Map: Wisconsin, E 6). It contains a National Soldiers' Home. There is a large automobile factory. Other manufactured products are mining and other machinery, tanks, castings, wheelbarrows, trucks, stamped metal goods, and sashes, doors, and blinds. Pop., 1910, 6645.

WEST AUSTRALIA. See WESTERN AUSTRALIA.

WEST BEND. A city and the county seat of Washington Co., Wis., 33 miles north-northwest of Milwaukee, on the Milwaukee River, and on the Chicago and Northwestern Railroad (Map: Wisconsin, E 5). The manufactures are pocketbooks and purses, wagons and wagon wood stock, farm machines, aluminium ware, and foundry and machine-shop products. There also is a large creamery. West Bend contains several fine county buildings, a city hall, and a public library. Pop., 1900, 2119; 1910, 2462.

WEST BERWICK. A borough in Columbia Co., Pa., 28 miles southwest of Wilkes-Barre, on the Susquehanna River, and on the Delaware, Lackawanna, and Western Railroad (Map: Pennsylvania, J 4). It is the home of the American Car and Foundry Company. Pop., 1910, 5512.

WEST'BORO. A town in Worcester Co., Mass., 12 miles east of the city of Worcester, on the Boston and Albany Railroad (Map: Massachusetts, D 3). It has a public library, the Lyman School for Boys, and the Westboro State Hospital. The town is mainly interested in manufacturing, the most important products being straw goods, underwear, tape, and leather specialties. Westboro was settled about 1659, and was known as Chauncy until it was incorporated as a town in 1717. Pop., 1900, 5400; 1910, 5446; 1915 (State census), 5925.

WEST BROMWICH, brŭm'ĭch *or* ĭj. A manufacturing town in the south of Staffordshire, England, 5 miles northwest of Birmingham (Map: England, E 4). There are fine municipal buildings. The city has rich mines of coal and iron, blast furnaces, and slitting mills, and manufactures firearms, swords, cutlery, agricultural implements, and metal goods of every kind. Pop., 1901, 65,170; 1911, 68,345.

WEST'BROOK. A city in Cumberland Co., Me., 6 miles northwest of Portland, on the Boston and Maine and the Maine Central railroads (Map: Maine, B 5). Manufacturing is the most important industry, the chief establishments including paper mills, warp mills, brick works, and silk mills. Westbrook was part of Falmouth until incorporated as a separate town in 1814. It included Deering (now a part of Portland) until 1870. Pop., 1900, 7283; 1910, 8281; 1915 (U. S. est.), 8807.

WESTBURY, wĕst'bĕr-ĭ, First LORD. See BETHELL, RICHARD.

WEST'CAR PAPYRUS. See EGYPT, *Literature and Science*.

WEST CHES'TER. A borough and the county seat of Chester Co., Pa., 27 miles west of Philadelphia, on the Pennsylvania Railroad (Map: Pennsylvania, K 8). It has the West Chester State Normal School; Darlington Seminary for Young Ladies; the Chester County Hospital; the Homeopathic Hospital; and several libraries, including a public library. Marshall Square with its botanical gardens, Turk's Head Hotel, dating from pre-revolutionary times, the county courthouse, and the county jail are other noteworthy features. Dairy implements are the principal manufactured products. There are also a creamery, a large grain elevator, wheel works, a tag factory, planing mills, gasoline-engine works, etc. Pop., 1900, 9524; 1910, 11,767; 1915 (U. S. est.), 12,949.

WEST'COTT, BROOKE FOSS (1825–1901). An English scholar and divine, born in Birmingham. He was educated at King Edward VI's School, Birmingham, and at Cambridge University. In 1852 he left Cambridge to become one of the masters of Harrow. His more public career began in 1869, when he became canon of Peterborough. This office he held until 1883. From 1870 he was also regius professor of divinity at Cambridge. In 1883 Gladstone appointed him a canon of Westminster, and in 1890 he was appointed Bishop of Durham. Westcott was an accurate and widely read scholar, a profound and spiritual theologian, and an influential adviser in social reform movements. His joint editorship of Westcott and Hort's Greek New Testament gave him a place among the first New Testament scholars of the last century. His more important writings are: *The History of the Canon* (1855), *Introduction to the Study of the Gospels* (1860), *The New Testament in the Original Greek* (with Dr. Hort, 1881), *Social Aspects of Christianity* (1887), *The Epistle to the Hebrews* (Greek text with notes and essays, 1889), *The Incarnation and Common Life* (1889). Consult Arthur Westcott, his son, *Life and Letters of Brooke Foss Westcott* (2 vols., London, 1903); H. S. Holland, *Brooke Foss Westcott* (ib., 1910); A. C. Benson, *The Leaves of the Tree* (New York, 1911).

WESTCOTT, EDWARD NOYES (1847–98). An American author. He was born in Syracuse,

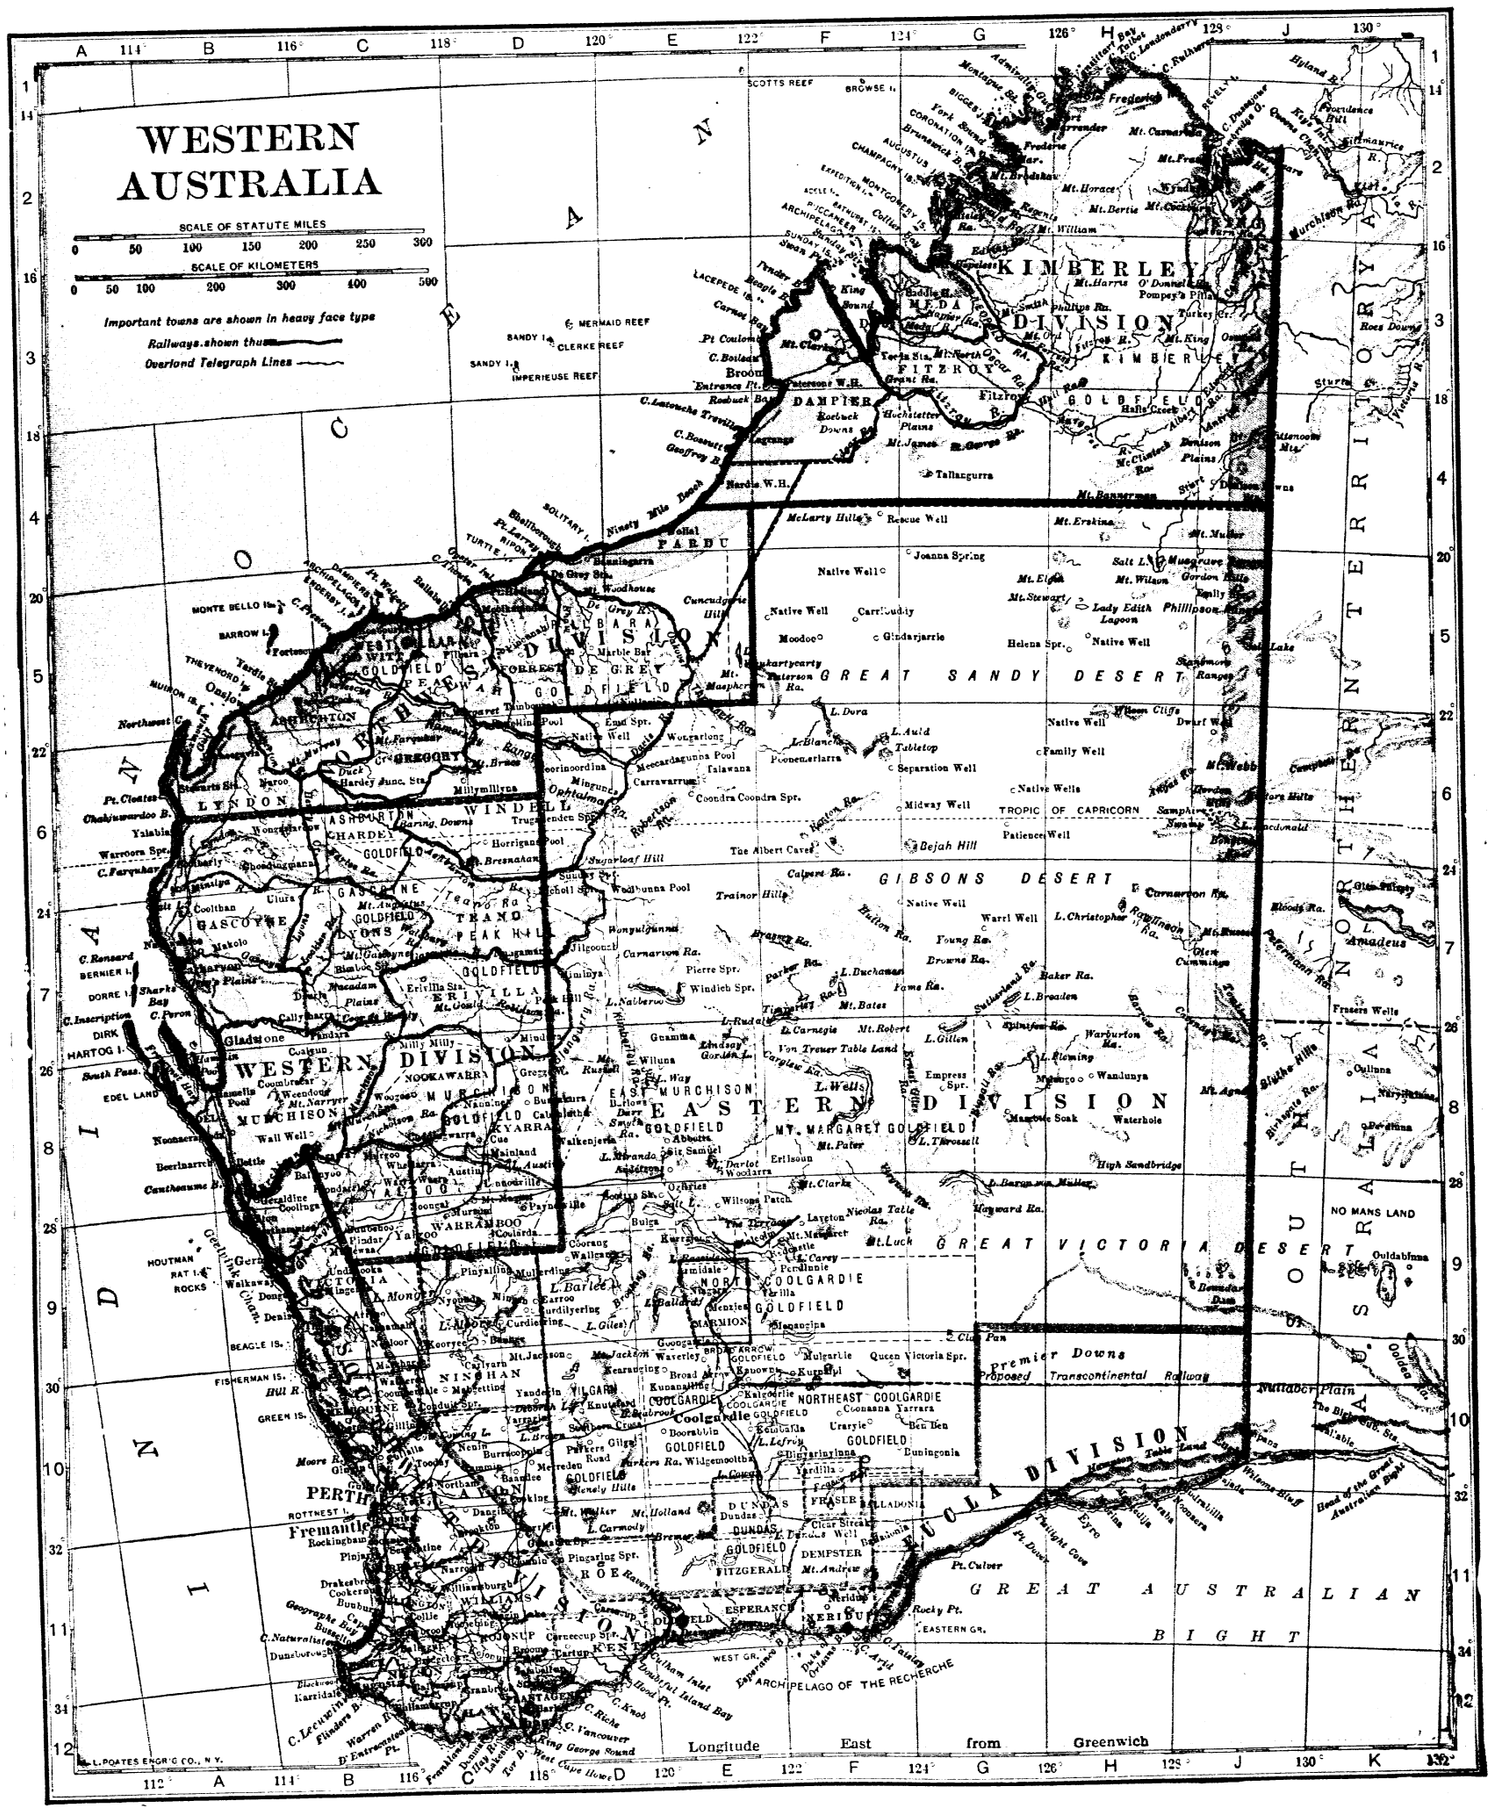
N. Y., and spent most of his life there. Until ill health compelled his retirement, he was a banker and broker, senior member of the firm of Westcott and Abbott. He wrote a number of songs, both words and music, but it is for his one literary work, *David Harum: A Story of American Life*, that he is known. This book, written after Westcott's retirement, was published (1898) six months after his death. Although it had been rejected by six publishers, 400,000 copies were sold within about a year, a record which had been equalled in the United States only twice before. The quaint and mellow humor of the chief character of the story brought it a sustained as well as an early success.

WESTERÅS. See VESTERÅS.

WESTERGAARD, vĕs'tĕr-gôrd', NIELS LUDVIG (1815–78). A Danish Orientalist and philologist, born and educated in Copenhagen. In 1838 he went to Bonn, where he studied Sanskrit, and then visited Paris, London, and Oxford, finally returning to Denmark. In 1841 he made a journey to India and in 1843–44 to Persia and Russia. In 1844 he became lecturer and in 1845–78 was professor of Indian philology at the University of Copenhagen. Noteworthy among his publications are: *Radices Linguæ Sanskritæ* (1841), *Sanskrit Læsebog* (1846), and *Bundchesh, Liber Pehlvicus* (1851). His most important work was his edition of the *Zendavesta, or the Religious Books of the Zoroastrians* (1852–54).

WEST'ERLY. A town, including several villages, in Washington Co., R. I., 44 miles southwest of Providence, on the Pawcatuck River, and on the New York, New Haven, and Hartford Railroad (Map: Rhode Island, A 4). It manufactures cotton and woolen goods, thread, printing presses, elastic fabric, shirtings, etc. There is a handsome post-office building, a town hall, a courthouse, the Westerly Memorial Library, and Wilcox Park. Watch Hill, within the town limits, on the coast, is a popular summer resort, being known for its good bathing. Westerly was settled in 1661 and was known as Misquamicutt until 1669, when it was incorporated under its present name. Pop., 1900, 7541; 1910, 8696; 1915 (State census), 10,175. Consult Denison, *Westerly and its Witnesses for 250 Years* (Providence, 1878).

WESTERMARCK, wĕs'tĕr-märk, EDWARD ALEXANDER (1862–). A Finnish-British anthropologist, born at Helsingfors, where he became professor in the university (1894). In 1898–1902 he traveled in Morocco to study the moral conceptions of primitive races. In 1904 he became professor at the University of London, but lectured frequently at Helsingfors. His important works include: *The History of Human Marriage* (1891; 3d ed., 1901; Ger., Fr., Ital., Swed., Span., Russ., Jap., trans.), which earned for him an international name; *The Origin and Development of the Moral Ideas* (2 vols., 1906–08; 2d ed., 1912; Ger. trans., 1907–09), a standard work on the subject; *Marriage Ceremonies in Morocco* (1914).



WESTERN AUSTRALIA. A state of Australia, occupying the entire western third of the continent. It is bounded on the north, west, and south by the Indian Ocean, and on the east by South Australia. Western Australia is the largest of the Australian states, having an area placed at 975,920 square miles, or 624,588,800 acres.

Physical Features. The interior consists mainly of undulating sand or sandstone plateaus of no great elevation, their level surfaces being broken by isolated sandstone ranges, sand hills, and wind-blown ridges. The southeastern part of the state consists of a limestone plateau about 200 miles wide and ending in a line of steep cliffs running for several hundred miles along the south coast. Along the southwest coast is the most important mountain range, the Darling, rising to 1500 feet, and 40 miles inland is the Stirling Range, culminating in Bluff Knolls, 3640 feet, the highest elevation in the state. The extreme northern part of the state, known as the Kimberley District, consists of elevated plains in the interior, falling toward the coast in several lines of precipitous and rugged escarpments broken by deep ravines. The coasts of Western Australia are very little indented and consequently natural harbors are wanting. The length of the coast line, following known indents, is approximately 5200 miles. On the west coast there are a number of rivers, some of considerable size, such as the Murchison, Gascoyne, Ashburton, and Fitzroy. Most of the smaller streams are little more than wet-weather channels. The lakes of the interior are filled to four or five feet after the rains but in the dry season are nothing but mud flats covered with incrustations of salt.

Climate and Vegetation. The climate is healthful and pleasant but varies in different parts of the state. The range of temperature is considerable, and frost may occur in winter. The annual rainfall is between 30 and 40 inches in the extreme southwestern and northeastern sections, between 10 and 20 inches along the western coast, and less than 10 inches in the great interior. The southeastern plateau is covered with rich grass during the wet season, and good grazing land is also found in the upper valleys of the western rivers. The southwestern section of the state is a great forest region, in which the eucalyptus grows to an immense height. The interior, however, consists mainly of sandy and stony desert, partly barren, partly covered with acacia scrub and spinifex, and almost destitute of surface water.

Geology. The state is largely built up of crystalline and schistose rocks; on the west coast are Tertiary formations and older deposits, carboniferous to cretaceous, occur in the north. Auriferous quartz occurs along the west coast from Coolgardie to the Kimberley Division, and gold forms the colony's richest source of wealth.

Mining. The chief source of income is the gold mines. Gold was discovered in the Kimberley District in 1882, and in the Yilgarn District in 1887. Progress in mining, however, was at first slow, and in 1891 the year's product was valued at only £115,182. The year following, however, the Coolgardie discoveries were made, and mining rapidly developed at that point. In 1896 water was obtained farther east at Kalgoorlie, and this became the most active gold-mining centre. Subsequently mining developed in the Mount Margaret and a number of other districts. The value of the gold obtained in 1914 was £5,237,351. The total output of the state since 1886, when gold mining first commenced, to the end of 1914 was 28,278,147 fine ounces, valued at £120,117,931. During 1913, 484 tons of tin ore and ingot were raised, valued at £72,142; coal 313,818 tons, value £153,614; lead ore 3169 tons, value £59,002. The copper ore

produced during the year amounted to 4339 tons, value £136,622.

The value of silver, obtained as a by-product, was £23,420 and 188,020 fine ounces were exported. Ironstone and limestone are also produced. The total value of the mineral products in 1913 was £6,036,265.

Agriculture. Cultivation is carried on to a considerable extent south of latitude 28°. The wheat grown in the state, and the grain generally, is of a superior description. A large extent of land is available for cultivation. The rainfall is copious and regular. The area of land under crop in 1914 was 1,537,922 acres. The area of the principal crops was: wheat, 1,097,193 acres; oats, 133,625 acres; hay, 246,640 acres; potatoes, 5229 acres; vineyards, 2864 acres; orchards, 20,574 acres. The yield of wheat in 1914 was 13,331,350 bushels. The quantity of wine made during the same period was 208,738 gallons. At the end of June, 1914, of the entire acreage of the state, 7,795,319 acres of land had been alienated. The area leased or licensed at that date was 184,220,586 acres. In 1913 there were in the state 4,421,375 sheep, 834,265 cattle, 156,636 horses, 27,463 goats, and 47,966 swine. There were at the same date 4284 camels; these animals are used as beasts of burden. There were 3366 mules and donkeys.

Transportation. In June, 1914, there were 2967 miles of government railway in operation. There were several hundred miles of private railway, of which the Midland, 277 miles long, is the chief. The cost of construction and equipment of the state-owned railways to June 30, 1912, was £13,233,093. The gross receipts of the state railways for the year ending June 30, 1914, was £2,257,011, and the working expenses £1,572,008.

Government. The Governor is appointed by the British crown. The Parliament consists of a Legislative Council of 30 members elected for six years, and a Legislative Assembly of 50 members elected for three years. Electors must be 21 years of age, residents of the election district, or have certain property qualifications. The right of suffrage is conferred without distinction of sex. The capital is Perth.

Trade. The value of the imports in 1914 was £8,960,397. Of this amount nearly three-fourths of the trade was with Britain and the commonwealth, and the remainder with foreign countries. The exports during the same year amounted to £8,406,182. The principal articles of export were gold and gold specie, £3,825,714; wool, £614,894; timber, £1,022,622; hides and skins, £173,363; pearls and shell, £210,672.

Finance. In 1913–14 the total revenue amounted to £5,205,343 and the expenditures to £5,340,754. The participation of the government in the construction of railways and other public enterprises has created a heavy public debt, which amounted in 1914 to £30,728,078.

Population. Western Australia is one of the most sparsely settled regions in the world. Most of it is wholly uninhabited, the population being confined mainly to portions of the coast region and the gold-mining settlements in the interior. The first reports of gold at Kimberley and Yilgarn did not result in any marked immigration, and in 1890 the total population was only 49,200. The remarkable discoveries of gold at Coolgardie in 1892 caused a rush of miners into the region which has not yet ceased. In 1895 the population had increased to 101,238, in 1911 to 280,310, and on Dec. 31, 1914, the official estimate of the population was 323,952. The aborigines (exclusive of wild tribes) number about 6000. As is common in a mining region, a large percentage of the population is centred in the towns. In 1911 Perth contained, with suburbs, 85,945 inhabitants; Fremantle, 20,847; Kalgoorlie, 8781; Boulder, 10,824.

Religion. In 1911 the adherents of the Church of England numbered 109,435; Roman Catholics, 56,616; Methodists, 34,348; Presbyterians, 26,678, Congregationalists, 6203; Baptists, 4801.

Education. School attendance is compulsory between the ages of 6 and 14. The teaching is free. Of the total white population of 15 years and upward in 1911, 1.70 per cent were unable to read. Public instruction is secular, but religious instruction may be given by clergymen of the same denomination with the child's parents. In 1913 there were 42,081 pupils enrolled in 583 state schools and 10,335 in 119 private schools. For the year ended June 30, 1914, £318,721 was expended on education. Only those private schools are given aid which had enjoyed that advantage prior to 1895. The Perth Technical School is affiliated with Adelaide University. There is also a technical school at Fremantle. There are numerous high schools, and in several places other than Perth and Fremantle provision is made for manual or technical training. Trinity College was opened in 1902.

History. The coast was probably visited by Spanish and Portuguese navigators in the sixteenth century. In the following century the Dutch explored the shores, and Tasman surveyed the north coast. The west coast was only surveyed after numerous later explorations. The earliest settlement—English—was made in 1825. The British took formal official possession of the land in 1827. The colonization of Western Australia was definitely commenced in 1829 by a British organization to which the government gave large land grants. Several thousand convicts from Sydney were numbered among the early settlers. It was not until 1870, however, that great efforts began to be made by the British to facilitate the development of the colony. On Jan. 1, 1901, Western Australia became a state of the Australian Commonwealth. See AUSTRALIA.

Calvert, *Western Australia, its History and Progress* (ib., 1894); id., *Mineral Resources of Western Australia* (ib., 1894); T. Chambers, *Western Australia* (Perth, 1897); May Vivienne, *Travels in Western Australia* (London, 1901); *Western Australian Official Year Book*, *Geological Survey Bulletins*, and other periodical government publications issued at Perth.

WESTERN COLLEGE, now LEANDER CLARK COLLEGE. A coeducational institution founded at Western, Iowa, in 1855, and in 1881 removed to Toledo, Iowa. The college is under the control of the United Brethren of Christians, but is nonsectarian in its teaching. There are two courses, classical and scientific, which lead to the degrees of B.A. and B.S. There are also a preparatory department, a conservatory of music, a school of elocution, and a department of art. The total enrollment in all departments in 1916 was 250. The faculty numbered 23. The productive funds amount to about $200,000, and the total annual income to about $27,000.

The library contains about 8000 volumes. The president in 1916 was Marion E. Druary, D.D.

WESTERN EMPIRE. See ROME.

WESTERN ISLES. See HEBRIDES.

WESTERN PORT. A town in Allegany Co., Md., about 175 miles by rail west by north of Washington, D. C., on the Potomac River, and on the Western Maryland Railroad (Map: Maryland, B 2). Coal mining and the manufacture of paper constitute the chief industries. Pop., 1900, 1998; 1910, 2702.

WESTERN RESERVE. In American history the name given to a section of northern Ohio, reserved by Connecticut when that State ceded to the general government in September, 1786, her claim to the western lands. By her charter of 1662 Connecticut was made to extend from sea to sea. Her claim to considerable tracts of land in the West, however, was disputed by both New York and Pennsylvania. In September, 1786, Connecticut yielded all claim except that to the territory between 41° and 42° 2′, extending westward 120 miles from the western boundary of Pennsylvania. Out of this tract she kept a half-million acres in the West, later known as the Fire Lands. The remainder was sold in 1795–96 for $1,200,000 to 48 men who with others afterward formed the Connecticut Land Company, and in 1796 began a survey. (See PHELPS, OLIVER.) Settlement was slow at first, as there was doubt concerning the title. After 1812 settlement was rapid, largely from Connecticut and other New England States, and 13 counties have been formed wholly or in part from the territory. Consult Mathews, *Ohio and her Western Reserve* (New York, 1902).

WESTERN RESERVE UNIVERSITY. An institution for higher education at Cleveland, Ohio. It was founded in 1826 as the Western Reserve College. The campus, occupying 36 acres, is situated in the midst of the city's park system. The university consists of 11 departments: Adelbert College, the original institution, which was removed from Hudson to Cleveland in 1882, and was renamed in honor of the son of a benefactor, Amasa Stone, who gave the institution $600,000; Men's College Department of the University; the College for Women, established in 1888; the Department of Graduate Instruction, established in 1892; the School of Medicine, formerly the Cleveland Medical College, founded in 1844; the Franklin Backus Law School, opened in 1892; the Dental School, established in 1892; the Library School, opened in 1904; the School of Pharmacy, founded in 1882; the School of Education, summer session opened in 1915; the School of Applied Social Sciences, founded in 1915 and opened in September, 1916. The schools of medicine and of law are graduate schools. The university confers the degrees of B.A., B.S., LL.B., M.A., Ph.D., M.D., Ph.G., and Ph.C. In 1916 the students in all departments numbered 1970 and the faculty and official staff 275. The library had 117,700 volumes. The total resources amounted to about $7,000,000. The president in 1916 was Charles F. Thwing, D.D.

WESTERN SCHISM. See SCHISM, WESTERN.

WEST FARNHAM, färn′ăm. See FARNHAM.

WEST′FIELD. A town, including several villages, in Hampden Co., Mass., nine miles west of Springfield, on the Westfield River, and on the Boston and Albany and the New York, New Haven, and Hartford railroads (Map: Massachusetts, B 4). It is the seat of a State normal school, and has the Westfield Athenæum, the Westfield State Sanitarium, Noble Hospital, and Woronoco Park. The town is chiefly engaged in manufacturing and is especially known for its extensive whip-making establishments and cigar, bicycle, and motorcycle factories. There are also paper mills, machine shops, and manufactories of thread, boxes, brick, steam-heating apparatus, organs, etc. Settled as a trading post, probably as early as 1642, Westfield was known as Woronoco until incorporated under its present name in 1669. Pop., 1900, 12,310; 1910, 16,044; 1915 (State census), 18,411. Consult Holland, *History of Western Massachusetts* (Springfield, (1855).

WESTFIELD. A town in Union Co., N. J., 18 miles southwest of New York City, on the Central Railroad of New Jersey (Map: New Jersey, D 2). As a residential suburb of New York City it contains many fine homes. Pop., 1910, 6420; 1915 (State census), 8147.

WESTFIELD. A village in Chautauqua Co., N. Y., 60 miles southwest of Buffalo, on Chatauqua Creek, and on the New York Central, the New York, Chicago, and St. Louis, the Jamestown, Westfield, and Northwestern and the Chautauqua Traction railroads (Map: New York, A 6). It has large grape-juice factories, grist mills, a canning factory, lumber yards, wine cellars, and grape-basket works. Pop., 1900, 2430; 1910, 2985.

WEST FLANDERS. See FLANDERS, WEST.

WEST′FORD. A town in Middlesex Co., Mass., 8 miles southwest of Lowell, on the Boston and Maine Railroad (Map: Massachusetts, E 2). Interesting features are the First Parish Meeting House, built in 1794, Westford Academy, the town hall, and the J. V. Fletcher Library. There are large ice houses and manufactories of machinery, worsted and carpet yarns, etc. Granite is quarried here and shipped in large quantities. Pop., 1900, 2624; 1910, 2851.

WEST GRIQUALAND. See GRIQUALAND WEST.

WEST HAM. See HAM, EAST AND WEST.

WEST HAMMOND. A city in Cook Co., Ill., 21 miles south by east of Chicago, on Calumet River, and on Indiana Harbor Belt Railroad (Map: Illinois, J 2). Noteworthy features are St. Margaret's Hospital, the high school, and the city hall. There are manufactories of glue and beer. Pop., 1900, 2935; 1910, 4948.

WEST HARTFORD. A town in Hartford Co., Conn., adjoining the city of Hartford (Map: Connecticut, E 2). It contains Mount Joseph Seminary, for young ladies; St. Mary's Home, for aged people; St. Augustine Normal School; St. Agnes Home, for orphans; a high school; the Noah Webster Memorial Library (public); and Elizabeth and Reservoir parks. The chief industries are tobacco growing and shipping, dairying and market gardening. Pop., 1900, 3186; 1910, 4808. West Hartford is the birthplace of Noah Webster (q.v.).

WEST HARTLEPOOL, härt′l-pōōl′. A municipal borough of Durham County, England, an extension of Hartlepool (q.v.), forming with that town the Parliamentary borough and port of The Hartlepools (Map: England, E 2). It carries on an important trade with Baltic ports, exporting coke, cement, etc. Its harbors and docks cover 300 acres. The town has fine parks and public buildings. Pop., 1901, 62,600; 1911, 63,923.

WEST HAVEN. Formerly a borough in

New Haven Co., Conn., consolidated in 1911 with Allington and Orange Centre, to form the town of Orange (Map: Connecticut, D 4). It is chiefly residential, and has a fine town hall, the Union High School, a Carnegie library, the Florence Crittenton Home, the county orphan asylum, two sanitariums, a home for inebriates, and a county hospital. Manufacturing is the leading industry of the community, the most important products being munitions, automobiles, buckles, safes, fertilizers, and hack saws. Savin Rock, near here, on Long Island Sound, is a noted summer resort. Pop., 1910, 8543.

WEST HAZLETON. A borough in Luzerne Co., Pa., 31 miles south of Wilkes-Barre, on the Wilkes-Barre and Hazelton Electric Railroad (Map: Pennsylvania, K 4). It has a foundry. Hazle Park is of great beauty. Pop., 1900, 2516; 1910, 4715.

WEST HO'BOKEN. A town in Hudson Co., N. J., adjoining Jersey City and Hoboken (Map: New Jersey, E 2). It occupies an elevated site and commands an extended view. The Monastery church, town park, and boulevard, St. Joseph's Auditorium, and Carnegie library are notable. West Hoboken is primarily noted for the manufacture of silk, silk goods, and embroideries. Other products include braid, artificial flowers, feathers, cloaks, and suits, pipes, chemicals, sashes, doors, blinds, etc. West Hoboken was originally a part of Bergen, and was separately incorporated in 1861. Pop., 1900, 23,094; 1910, 35,403; 1915 (State census), 38,776.

WEST HOMESTEAD. A borough in Allegheny Co., Pa., 8 miles southeast of Pittsburgh, on the Monongahela River, and on the Baltimore and Ohio Railroad (Map: Pennsylvania, A 6). It has a Carnegie library. There are important industrial interests, represented by steel mills, axle works, brickworks, and manufactories of machinery, car wheels, etc. Pop., 1910, 3009.

WESTHOUGHTON, wĕst'hou't'n *or* -hō't'n. A town in Lancashire, England, 5 miles southwest of Bolton. Coal mining and the manufacture of silk and cotton goods and nails constitute the principal industries. Pop., 1901, 14,377; 1911, 15,046.

WEST INDIAN BOXWOOD. A yellow wood of great density and hardness that is chiefly used for turning. This wood has been known to the trade for many years, the principal commercial supply coming through Maracaibo, Venezuela, but the botanical identity of the tree has only recently been established. It is the wood of *Cascaria præcox*, a small tree, about a foot in diameter, belonging to the family Flacourtiaceæ. In addition to northern South America the tree is found in Cuba and other West Indian islands.

WEST INDIES, ĭn'dĭz. A large archipelago in the Atlantic Ocean between the North and South American continents. It consists of the Bahama Islands, a somewhat irregular group, lying to the southeast of the peninsula of Florida and the Greater and Lesser Antilles (see ANTILLES), a long chain of islands stretching in a great curve from the entrance to the Gulf of Mexico eastward and southward to the mouths of the Orinoco, and inclosing the Caribbean Sea between it and the mainland. The total area of the archipelago is about 92,000 square miles, of which the Greater Antilles alone take up over 82,000. With the exception of the Bahamas, which are low, of coral formation, the islands are nearly all mountainous. The Antilles are, in fact, the projecting remnants of a former mountain range which was similar in formation to the Central American Cordillera, and formed a continuous or nearly continuous bridge between the northern and southern continents. The range consists of a core of crystalline rocks flanked by Cretaceous and Tertiary deposits, and these formations make up the larger portion of the Greater Antilles, but appear only sporadically in the Lesser Antilles, chiefly in the Virgin Islands, in the eastern half of Guadeloupe, and in Barbados and Trinidad. The other members of the Lesser Antilles owe their origin to a line of volcanic activity, and consist of recent, and generally still active, volcanic cones. The West Indian cordillera culminates in Haiti at an altitude of over 10,000 feet, while in the Lesser Antilles the maximum elevation is about 5000 feet. The climate of the West Indies is tropical, with an average mean temperature of 72° for the coldest and 80° for the warmest month, and average extremes of 54° and 100°. The annual rainfall varies between 40 and 66 inches. Most of the rain is brought by the northeast trade wind, which is the prevailing wind in summer. Hence the summer is the wet season, the winter months being comparatively dry, as the winds then are generally southeast. A peculiar feature of the climate is the extremely violent hurricanes which from time to time, generally between July and November, cause serious destruction of life and property. The flora is related to that of tropical South America, though less rich in distinctively tropical species. The fauna is characterized chiefly by a paucity of large mammals as compared with the fauna of the mainland, though the other divisions of the animal kingdom are well represented. For details of the flora and fauna of the principal islands see the separate articles.

The industries are mainly agricultural, and sugar, tobacco, and coffee are the principal economic plants. The importance of cane sugar has declined in recent years, but fruit, cocoa, and cotton culture is developing. The population of the whole archipelago is a little more than 6,000,000. Two-thirds of the inhabitants are negroes or of African blood, though in Cuba and Porto Rico the whites are in the majority. The Europeans are chiefly descendants of Spanish, French, and English settlers. The principal remaining element of the population is the imported Chinese and Indian coolies, the aboriginal Indian population being almost wholly extinct. Politically the West Indies are much divided. Of the Greater Antilles, Porto Rico belongs to the United States and Jamaica to Great Britain, while Cuba and Haiti represent independent republics, the latter containing two—Haiti and Santo Domingo. The other islands are colonial possessions of Great Britain, France, the Netherlands, and Denmark, the British possessions being by far the largest.

The West Indies were so called because they were at first believed to be a part of India. They were the earliest parts of the New World to be discovered and settled, and served as a base for the Spanish expeditions of conquest and exploration on the mainland. For details of history, see articles on the separate islands.

WEST INDIES, DANISH. A group of three West Indian islands, situated east of Porto Rico, belonging geographically to the Virgin Islands and constituting a colony of Denmark. It consists of Saint Croix, Saint Thomas (q.v.), and Saint John, with a total area of 139 square miles (Map: West Indies, F 3). The chief industry is the cultivation of sugar. The trade is chiefly with the United States and Denmark, the exports consisting almost entirely of sugar and rum. The executive power is in the hands of the Governor, appointed by the crown. The revenue is derived principally from customs and is insufficient to cover the expenditures. Pop., 1901, 30,527; 1911, 27,086; St. Croix (84 square miles), 15,467; St. Thomas (33 square miles), 10,678; St. John (21 square miles), 941. The inhabitants are mostly negroes, the Danish element being represented almost exclusively by the officials and their families. The chief language is a Spanish dialect, but English is generally spoken in the ports. The seat of government is Christiansted (pop., 4592 in 1911), in St. Croix. The largest town is Charlotte Amalie (pop., 8247) in St. Thomas. Negotiations for the sale of the islands to the United States have been in progress for a number of years.

WEST INDIES, DUTCH. See CURAÇAO; GUIANA, *Dutch Guiana;* NETHERLANDS, *Colonies.*

WEST'INGHOUSE', GEORGE (1846–1914). An American inventor and engineer, famous for his invention of the air brake. He was born Oct. 6, 1846, at Central Bridge, Schoharie Co., N. Y., but removed when a young boy to Schenectady, where he was educated in the public schools. His father was a large manufacturer of agricultural machinery, and George Westinghouse showed inventive and mechanical genius at an early age. In the Civil War he served with the Twelfth New York Regiment and the Sixteenth New York Cavalry until the latter part of 1864, when he became assistant engineer in the United States navy. On his return to Schenectady in 1865 he matriculated at Union College and studied until the end of the sophomore year, being occupied in the meantime with mechanical investigations. His first invention of note was a railway frog, and from this and other railway appliances his attention was turned to brakes. In 1868 he invented the air brake (q.v.), which was successfully used in that year and soon came to be employed universally throughout the United States and gradually in Europe, constantly receiving important and extensive improvements at the hands of Westinghouse. Railway signaling also attracted his attention, and many inventions and improvements in safety devices followed. Becoming interested in electricity, Westinghouse acquired patents for alternating current machinery and immediately devoted himself to the development of this branch. Through his efforts the alternating current for power and lighting was used on a large scale, notably at the Chicago Exposition of 1893, and despite the opposition of the direct-current advocates, came rapidly into widespread use. The induction motor of Tesla (q.v.) and other inventions that were developed under his direction made possible long-distance transmission of power. To construct air brakes, and electrical and other machines, large works were erected at Pittsburgh, which were constantly added to and maintained at a high degree of efficiency, especially as regards equipment and organization. From these works were supplied the generators for the great power plants at Niagara Falls, and for the elevated and rapid-transit systems of New York, while in their different departments were constructed steam and gas engines, steam turbines, and electrical and other machinery, which in nearly all cases was of improved form, invented or developed in the Westinghouse shops and laboratories. The electrical equipment for the Metropolitan Railway in London was also from the Westinghouse works. In addition to being the head of a number of corporations in America, representing an investment of many millions, Westinghouse established large factories and works in Europe. In 1907 the Westinghouse Electric and Manufacturing Company was compelled to pass into the hands of a receiver, but the various interests were later reorganized according to Westinghouse's own ideas. He served as president of the American Society of Mechanical Engineers in 1910, received the John Fritz medal, and was decorated with the French Legion of Honor, the Royal Crown of Italy, and the Order of Leopold. Westinghouse's work in mechanical engineering was always typical of the best American practice both in the field of invention and in the organization and operation of manufacturing plants, and he was considered one of a small number of men responsible for establishing the industrial preëminence of the United States. Few works have been operated on a larger scale or more efficiently than those under his control. He died March 12, 1914, in New York.

WEST LAFAYETTE. A town in Tippecanoe Co., Ind., 1 mile northwest of Lafayette (Map: Indiana, D 4). It is the seat of Purdue University (q.v.). Pop., 1900, 2302; 1910, 3867.

WEST'LAKE, JOHN (1828–1913). An English legal scholar, born at Lostwithiel, Cornwall. He graduated at Trinity College, Cambridge, in 1850, was fellow of the college in 1851–60, was called to the bar at Lincoln's Inn in 1854, and became a bencher of the Inn in 1874. In 1885 he was elected to Parliament as Liberal member for the Romford Division of Essex, from 1888 to 1908 was professor of international law in the University of Cambridge, and in 1900–06 was a member for Great Britain of the International Court of Arbitration at The Hague. His works, of the highest importance in their field, include: *A Treatise on Private International Law* (1858; 2d ed., rewritten, 1880; 5th ed., 1912); *Chapters on the Principles of International Law* (1894); *International Law* (2 vols., 1904–07; 2d ed., 1910–13). His *Collected Papers on Public International Law* were edited by L. Oppenheim in 1914.

WEST LOTHIAN, lō'THĬ-an *or* lō'thĭ-*a*n. A county of Scotland. See LINLITHGOW.

WEST'MACOTT, SIR RICHARD (1775–1856). An English sculptor. He was born in London,

and studied with his father. In 1793 he went to Rome, where he studied with Canova, carrying off the gold medal of the Academy of St. Luke with his bas-relief of "Joseph and his Brethren." In the same year (1795) he was made a member of the Florentine Academy. Returning to London in 1797, he was in 1811 elected Academician, in 1827 he succeeded Flaxman as professor of sculpture at the Royal Academy and in 1831 he was knighted. A large number of public works in England, India, and the colonies were executed by him, including the statues of Addison, Pitt, Fox, and Percival in Westminster; the monuments to Abercromby, Collingwood, Captain Cook, and General Pakenham in St. Paul's; a colossal bronze statue of Achilles in Hyde Park, after the original on Monte Cavallo at Rome; the statue of the Duke of York on the column in Waterloo Place, and the pediment groups representing the "Progress of Civilization," executed for the British Museum (1847).

WESTMACOTT, RICHARD (1799–1872). An English sculptor, son of Sir Richard Westmacott. He was born in London, and studied under his father, then at the Royal Academy and in Italy (1820–26). His earliest works, exhibited at the Royal Academy, were ideal figures, but from 1840 until 1855, when he retired from his profession, he was principally engaged in executing monumental sculptures and portrait busts, like those of John Henry Newman, Lord Russell, Sir Roderick Murchison. From 1857 to 1867 he was professor of sculpture at the Royal Academy, succeeding his father. He was the author of *Handbook of Ancient and Modern Sculpture* (1864).

WESTMEATH, wĕst'mēth'. An inland county of the Province of Leinster, Ireland (Map: Ireland, D 4, 5). Area, 708 square miles, largely devoted to pasturage. Chief towns, Athlone and Mullingar, the capital. Pop., 1901, 61,629; 1911, 59,812.

WEST MINNEAPOLIS. A village in Hennepin Co., Minn., 5 miles southwest of Minneapolis. Threshing machines, sewer pipe, and steel springs are the leading manufactured products. Pop., 1900, 1648; 1910, 3022.

WEST'MINSTER. A metropolitan borough of London, England, on the left bank of the Thames, southwest of the city so called. In this borough the laws and fashions of Great Britain are made, and the government officials and aristocracy dwell. It contains the Houses of Parliament, the government offices, Westminster Abbey, St. James's Palace, Buckingham Palace, Belgrave Square, the eastern end of Hyde Park, Green Park, Trafalgar Square, the Mall, Pall Mall, Piccadilly, Whitehall, and Charing Cross and Victoria stations. Pop., 1901, 182,977; 1911, 160,261.

WESTMINSTER. A city and the county seat of Carroll Co., Md., 34 miles by rail northwest of Baltimore, on the Patapsco River, and on the Western Maryland Railroad (Map: Maryland, F 1). It is the seat of the Western Maryland College (Methodist Protestant), opened in 1868, and of the Westminster Theological Seminary (Methodist Protestant), opened in 1882. The city manufactures flour, canned goods, shirts, etc. Pop., 1900, 3199; 1910, 3295.

WESTMINSTER, HUGH LUPUS GROSVENOR, DUKE OF (1825–99). An English nobleman. He was born in London and was the son of Richard, second Marquis of Westminster. He was educated at Eton and at Balliol College, Oxford; was member of Parliament for Chester from 1847 to 1869 when he succeeded to the Marquisate; was created Duke in 1874, and held several high official positions, including that of Lord Lieutenant of the County of London in 1888. His vast landed estates won for him the reputation of the wealthiest of English nobles. He was an active and steadfast supporter of Gladstone during that statesman's crusade against the Turkish atrocities in Bulgaria.

WESTMINSTER, MATTHEW OF. See MATTHEW OF WESTMINSTER.

WESTMINSTER, PROVISIONS OF. In English history, a number of ordinances enacted in October, 1259, supplementary to the well-known Provisions of Oxford (q.v.) and designed by the barons for the redress of the grievances of the younger nobility. See ENGLAND; MONTFORT, SIMON DE.

WESTMINSTER ABBEY. One of the principal churches, and, in a peculiar sense, the national sanctuary, of England. It was originally the abbey church of a monastery founded in the reign of King Offar of Mercia, and reorganized by Dunstan in 971. The first church is said to have been built by King Sebert of Essex (616) on Thorney Isle, in the Thames. The foundation did not, however, achieve importance until the reign of Edward the Confessor, who had a palace at Westminster, and in 1049–65 built a church on the present site, dedicated to St. Peter, whence the present official name of Westminster Abbey, the Collegiate Church of St. Peter. In the later thirteenth century Henry III undertook the reconstruction of the church. The choir and transepts were built between 1245 and 1258, and, with the eastern half of the nave, consecrated in 1269. The work was continued by his successors, but haltingly, with long interruptions, and the nave was not wholly completed till the end of the fifteenth century. In spite of this, its unity of style is remarkable. The chapel of Henry VII was added in 1502–20 under Henry VIII, the two west towers by Sir Christopher Wren and Hawkesmoor (1722–40), and the north transept was restored in 1890. The abbey was heavily endowed and under the special protection of the kings of England, whose palace was at Westminster. It was disendowed during the Reformation as a cathedral (1540–50), but restored by Queen Mary, and received its present organization, under a dean and 12 prebendaries, from Elizabeth.

Westminster Abbey is one of the largest and best examples of the early English style. More than any other it shows the French influence, in its polygonal apse and chapels, the loftiness of the nave, and heavy flying buttresses. Its proportions are grandiose. The total exterior length, including Henry VII's chapel, is 423 feet 6 inches; the breadth is 71 feet 9 inches, for nave and aisles, and 203 feet 2 inches across the transepts. The nave is the loftiest in England (101 feet 8 inches); the towers measure 225 feet 4 inches. The imposing effect of the interior, with its beautiful stone and fine glass windows, is somewhat marred by restorations and the monuments. The chapel of Henry VII, begun by him as a Lady chapel, but completed as his mausoleum chapel by his successor, is a very remarkable structure in the Perpendicular style (q.v.), having a ceiling vaulted with fan tracery of the most elegant character imaginable. The beautiful oak choir stalls are appropriated

by the Knights of the Bath, each seat bearing the armorial bearings of the occupant, whose sword and banner hang overhead.

Of all English churches none is so intimately connected with the national life and history. English kings since William the Conqueror have been crowned there, and there the ancient regalia were kept till their destruction under the Commonwealth. The coronation chair, containing the ancient Stone of Scone, brought by Edward I from Scotland, still stands in the chapel of Edward the Confessor. In Westminster Abbey lie buried 13 kings, including Edward the Confessor, and others from Henry III to George II, five sovereign queens, besides the consorts and descendants of kings. Among the most celebrated tombs are the Shrine of Edward the Confessor, erected by Henry III in that saint's chapel, and the tombs of Henry VII and his consort, Elizabeth of York, beautiful marble effigies, by the Florentine sculptor Torrigiano. The practice of interring courtiers, statesmen, and soldiers in the abbey began under Richard II, and continues to be practiced. The two Pitts, Fox, Palmerston, Warren Hastings, Gladstone, and other modern statesmen too numerous to mention have been accorded this honor. In the Poets' Corner (South Transept) repose some of England's greatest poets, Chaucer, Spenser, Dryden, Gray, Browning, Tennyson, and others, and near by rest the men of letters. There are places for theologians, actors, musicians, artists, and scientists. Wordsworth, Bulwer Lytton, and Charles Darwin are all buried here. By no means all of England's great men have been offered or accepted the honor of interment in the abbey; but for such special statues, busts, or tablets frequently are erected there. With a few exceptions, all these monuments are disappointing from the artistic standpoint. On the east side of the abbey is the Chapter House, a beautiful octagonal Gothic hall, in which from 1282 till 1547 the House of Commons assembled. The Jerusalem Chamber, to the southwest of the abbey, and so called because of its former decorations, is celebrated as the death chamber of Henry IV. Westminster School, founded by Queen Elizabeth in 1560 from revenues of the abbey, occupies the ancient dormitory of the abbey as a schoolroom and its refectory as a dining room. The latter contains some ancient tapestry and stained glass.

WESTMINSTER ASSEMBLY. A convocation appointed by the Long Parliament for settling the doctrine, liturgy, and government of the Church of England meeting at Westminster. It consisted of 121 clergymen and 30 laymen—10 of whom were lords and 20 commoners—together with 4 clerical and 2 lay commissioners from the Church of Scotland. It held its first meeting on July 1, 1643, and continued to sit until Feb. 22, 1649, during which time it had met 1163 times. The Presbyterians formed a large majority in the Assembly, and exercised a corresponding influence on its decisions. In doctrine, the members were almost unanimous; but on the subject of church government, opinions extremely opposite were maintained with keenness, especially on the question touching the sphere and limits of the civil power in matters ecclesiastical. The principal fruits of these deliberations were the *Directory of Public Worship*, submitted to Parliament April 20, 1644; the *Confession of Faith*, October and November, 1646; the *Shorter Catechism*, Nov. 5, 1647; and the *Larger Catechism*, Sept. 15, 1648. These several formularies, which contain a clear and rigid embodiment of Calvinistic theology and Presbyterian church government, constitute to this day the authorized standards of the Presbyterian churches of Scotland, Ireland, and England. The *Directory of Public Worship* was ratified by both Houses of Parliament, Oct. 2, 1644, and the doctrinal part of the *Confession of Faith* in March, 1648. An order of the House of Commons, Oct. 13, 1647, ordained that the Presbyterian form of church government should be tried for a year, but no further legislation followed.

Consult: W. M. Hetherington, *History of the Westminster Assembly* (5th ed., Edinburgh, 1890); A. F. Mitchell, *The Westminster Assembly: Its History and Standards* (new ed., Philadelphia, 1897); *Cambridge Modern History*, vol. iv (New York, 1906); and David Masson, *Life of Milton*, vol. ii (new ed., London, 1877–96), where a list of the members, with brief biographic notices, is given. See CREEDS AND CONFESSIONS.

WESTMINSTER HALL. The great hall of the ancient palace of Westminster, which was built by Edward the Confessor upon the site of the present Houses of Parliament (q.v.). The hall, begun by William Rufus in 1097, was destroyed by fire in 1291, later rebuilt and enlarged, and in 1397–98 reconstructed by Richard II and covered with a superb open-timber hammer-beam roof of oak. It fortunately escaped the fire which destroyed the palace in 1834. The ceiling, covering a hall 290 feet long, 68 feet broad, and 92 feet high, is one of the most remarkable pieces of timber architecture in existence, both as to beauty and constructive skill. No other hall in England is as rich in historical associations. Here the King, surrounded by his chaplains, heard legal cases and administered justice. A year after its completion its builder, Richard II, was deposed in it, as was Edward II before him; Charles I received in it the death sentence, and a few years later Cromwell was installed here. Among the great men condemned here were Sir William Wallace, Sir John Oldcastle, Sir Thomas More, and the Earl of Strafford. Here the seven bishops who opposed James II were acquitted, as was Warren Hastings. The hall was used for important trials and for great public festivals, as during the coronation ceremonies, or when the Lord Mayor was sworn into office, for the last time in 1882.

WESTMINSTER PALACE. The ancient palace by this name was built by Edward the Confessor, perhaps on the site of an earlier structure. It was improved and altered from time to time by succeeding sovereigns, especially by Henry III. It was not a homogeneous building, but a complex of separate apartments. In

WESTMINSTER ABBEY
FROM A PHOTOGRAPH

1834 the entire complex, except the great hall, was destroyed by fire. See PARLIAMENT, HOUSES OF; WESTMINSTER HALL.

WESTMINSTER SCHOOL. One of the oldest of English public schools, established by Henry VIII, refounded in 1560 by Queen Elizabeth, and reorganized in 1868 as one of the nine great public schools. There are 60 foundationers, about 20 vacancies occurring every year. The school is particularly famous for the Westminster Play, an annual representation of a Latin comedy, produced by the scholars. Consult W. T. Shore, *Westminster* (London, 1910).

WESTMINSTER STANDARDS. A set of books drawn up by the Westminster Assembly, comprising: (1) the Confession; (2) the Larger and Smaller Catechisms; (3) the Directory of Public Worship; and (4) the Directory for Church Polity and Discipline. The name is often used for the first two alone. For their history and contents, see CREEDS AND CONFESSIONS; PRESBYTERIANISM. For the text, consult: Philip Schaff, *Creeds of Christendom* (New York, 1884); the Edinburgh edition (University Press, 1855); and the various editions of the American Presbyterian Board of Publication (Philadelphia); also: A. F. Mitchell and Struthers, *Minutes and Sessions of the Westminster Assembly* (London, 1874); A. F. Mitchell, *The Westminster Assembly: Its History and Standards* (new ed., Philadelphia, 1897); B. B. Warfield, *Significance of the Westminster Standards as a Creed* (New York, 1898).

WEST'MORELAND or **WESTMORLAND.** A county of northwest England (Map: England, D 2). In the southwest it has a short coast line on Morecambe Bay, separating Lancashire into two detached portions. Area, 783 square miles. Its surface is mountainous, rising in Helvellyn, on the Cumberland boundary, to a height of 3118 feet. The western part belongs to the Lake District; Lake Windermere lies on the western boundary. Large areas are wooded. Only one-half of the county is improved, and of this by far the greater part is pasture. Cattle and sheep raising are the chief occupation. Pop., 1911, 63,575. County town, Appleby. Consult: Fleming, *Description of Westmoreland* (London, 1882); Ferguson, *History of Westmoreland* (London, 1894).

WEST'MOUNT. A city in Hochelaga County, Quebec, Canada, and a residential suburb of Montreal. Pop., 1901, 8856; 1911, 14,579.

WEST NEWTON. A borough in Westmoreland Co., Pa., 33 miles by rail southeast of Pittsburgh, on the Pittsburgh and Lake Erie, and the Baltimore and Ohio railroads (Map: Pennsylvania, B 7). The manufacture of radiators and boilers are the chief industries. Pop., 1900, 2467; 1910, 2880.

WEST NEW YORK. A town in Hudson Co., N. J., on the Hudson River, adjoining Weehawken on the north, and connected with New York City by ferry to Forty-second Street. Silk, rubber goods, cottonseed oil, embroidered goods, pianos, braids, buttons, textiles, electric bulbs, sugar, and powder are manufactured. The first settlement here probably was made about 1612. Pop., 1900, 5267; 1910, 13,560; 1915 (State census), 22,943.

WES'TON, AGNES (?–). An English philanthropist. She was born in London, and became known as the founder of Royal Sailors' Rests at Portsmouth (where she resided) and Devonport. She also had tracts sent in her name to every ship touching at a port in the United Kingdom. The degree of LL.D. was conferred on her by Glasgow University. Miss Weston published *My Life among the Bluejackets* (1910; 9th ed., 1912). She received the honorary degree of LL.D. from Glasgow University.

WESTON, EDWARD (1850–). An American electrician, born in London, England. He studied medicine in England, but in 1870 came to the United States, and there became chemist to a nickel-plating company. He improved the process of nickel plating, made investigations in electricity, and in 1875 established at Newark, N. J., the first factory in the United States exclusively for the manufacture of dynamo-electric machines. This was consolidated in 1881 with another company, and he was electrician of the new organization until 1888, when he formed the Weston Electric Instrument Company, Newark, N. J., of which he became president in 1905. He made particular study of incandescent and arc electric lighting, and patented many devices in both systems. Among his inventions are a series of improved meters for electric measurements, which have attained international repute for accuracy and general efficiency, a standard cell (see VOLTAIC CELL OR BATTERY), an improved carbon filament for incandescent lamps, and a system of high-power incandescent lamps. He was a founder of the American Institute of Electrical Engineers, and its president in 1888.

WESTON, EDWARD PAYSON (1839–). An American pedestrian, born at Providence, R. I., and educated in Boston. During most of his life he was engaged in newspaper work. His first notable pedestrian trip was in 1861, when he walked from Boston to Washington (443 miles) in 208 hours. In 1867 he walked from Portland, Me., to Chicago (1326 miles) in 26 days, and 40 years later accomplished the same feat in 29 hours' less time. Weston attracted most attention by crossing the continent on foot when 70 years old (3895 miles in 104 days, 7 hours; returned, 1910, 3500 miles in 76 days, 23 hours). In 1913 it took him 51 days to get from New York to Minneapolis (1546 miles), where he laid the corner stone of the Athletic Club House. At various times he also appeared in England; in 1883–84 he covered 5000 miles in 100 days, and delivered each evening a temperance lecture under the auspices of the Church of England.

WESTON NORMAL CELL. See VOLTAIC CELL OR BATTERY.

WESTON-SUPER-MARE, -sū'pēr-mā'rē. A watering place in Somerset, England, on the Bristol Channel, 20 miles southwest of Bristol (Map: England, C 5). Pop., 1901, 19,047; 1911, 23,235.

WEST ORANGE. A town in Essex Co., N. J., 5 miles northwest of Newark, and 12 miles west of New York City; on the Erie Railroad (Map: New Jersey, D 2). It is finely situated at the base and along the slope of Orange Mountain. Eagle Rock (elevation over 600 feet) commands a magnificent view. The town has two public parks owned and maintained by the county. Llewellyn Park, of 750 acres, studded with handsome dwellings, is one of the most beautiful residence parks in the country. Manufacturing is the leading industry, the principal establishments being the Edison Phonograph and Electrical Works and hat, box, and carriage factories. Pop., 1900, 6889; 1910, 10,980; 1915 (State census), 13,610.

WEST PALM BEACH. See PALM BEACH.

WEST PARK. A village in Cuyahoga Co., Ohio, adjoining the city of Cleveland, of which it is a residential suburb, on the Lake Shore and Michigan Southern, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads. Pop., 1900, 2038; 1910, 3179.

WESTPHAL, vĕst'fȧl, JOACHIM (1510–74). A German theologian, born at Hamburg. He studied theology at Wittenberg under the guidance of Luther, and then at the universities of Heidelberg, Strassburg, and Basel. In 1541 he was appointed preacher in his native city. He became specially known through his polemical activity on the Lutheran side in the controversy between the Swiss and German reformers concerning the Lord's Supper. Among the pamphlets Westphal published on this contest are: *Recta Fides de Cœna Domini* (1553); *Collectanea Sententiarum Aurelii Augustini de Cœna Domini* (1555); *Confutatio Aliquot Enormium Mendiorum I. Calvini* (1558).

WESTPHAL, KARL FRIEDRICH OTTO (1833–90). A German alienist, born in Berlin. He studied medicine at Berlin, Heidelberg, and Zurich (M.D., 1856), and settled in his native city, where he held several hospital positions and where he was professor of psychiatrics in the university from 1874 until his death. In 1868 he became editor of the *Archiv fur Psychiatrie und Nervenkrankheiten.* He was a voluminous writer. In 1875 he pointed out the importance of the knee jerk in diagnosis and he described several new forms of insanity.

WESTPHAL, RUDOLF (1826–92). A German classical scholar, born at Obernkirchen, Schaumburg. He studied at Marburg, was professor extraordinary at Breslau in 1858–60, and professor of philology at Moscow in 1875–79. His works, most of which deal with Greek music and versification, include: *Metrik der griechischen Dramatiker und Lyriker* (1854–65; rewritten in the third edition, under the title of *Theorie der musischen Künste der Hellenen,* 1885–86); *Prolegomena zu Æschylus' Tragödien* (1869); *Theorie der neuhochdeutschen Metrik* (1870); *Elemente des musikalischen Rhythmus mit Rücksicht auf unsere Opernmusik* (1872); *Vergleichende Grammatik der indogermanischen Sprachen* (of which only the volume on the verb appeared, 1873); and *Die Musik des griechischen Altertums* (1883).

WESTPHALIA, wĕst-fā'lĭ-ȧ. A province of Prussia (Map: Germany, B 3). Area, 7803 square miles. It is nearly altogether mountainous and hilly, the highest point being about 2700 feet above the sea. The region belongs to the basins of the Rhine, Ems, and Weser.

Westphalia is rich in iron and coal. The output of coal in 1913 was 53,075,640 tons. Dortmund is the chief coal centre. In iron the province leads all the others in Prussia, the output of iron ore in 1913 having been 1,563,752 tons. Westphalia also ranks among the first Prussian provinces in the production of zinc and copper. Lead and other ores are also mined. The stone output is heavy and the salt industry considerable. The supply of coal and iron has lent great impetus to manufacturing interests. There are numerous ironworks, and machinery and all varieties of metal wares are largely manufactured. The region between the Weser and the Lippe has for centuries been the seat of important linen industries. Woolen cloths, hosiery, and cottons are among the conspicuous manufactures. Paper, sugar, leather, and wood carvings also figure extensively in the shipments.

About 40 per cent of the total area of Westphalia is in farms, gardens, and vineyards, about 28 per cent in woodland, and about 25 per cent in meadows. Rye and oats lead in importance among the cereals. Potatoes and wheat are produced in considerable quantities, and the province is noted for excellent flax. Dairying and gardening thrive, and the cattle and swine industries are prominent.

The province embraces the administrative districts of Münster, Minden, and Arnsberg. Capital, Münster. It sends 17 members to the Reichstag and 31 to the Prussian Landtag. Pop., 1900, 3,187,777; 1910, 4,125,904—about evenly divided between Protestants and Roman Catholics. At the head of the excellent provincial education system stands the Academy of Münster.

History. The ancient duchy of the Saxons was divided into Westfalen (Westphalia) in the west, Ostfalen (Eastphalia) in the east, and Engern, between the two. With the dissolution of the Saxon duchy at the close of the twelfth century the name Westphalia came to designate a duchy ruled by the archbishops of Cologne. Its territory lay in the southeastern part of what is now the Province of Westphalia. The archbishops held sway till 1803. The district then passed to Hesse-Darmstadt, which in 1815 transferred it to Prussia. This duchy was one of many sovereignties which arose in the Middle Ages in the present Province of Westphalia. In the seventeenth century Brandenburg acquired dominion in the region by obtaining possession of the counties of Mark and Ravensberg and the see of Minden. The Congress of Vienna (1814–15) assigned to Prussia the whole of Westphalia within its present limits. One of the circles into which the Holy Roman Empire was divided was called the Westphalian Circle. It embraced an extensive region between the Rhine and Weser, extending northward to the North Sea and a large territory west of the Rhine, comprising part of the modern Netherlands and Belgium. See WESTPHALIA, KINGDOM OF.

Consult: Otto Weddigen, *Westfalen, Land und Leute* (Paderborn, 1896); Schücking and Freiligrath, *Das malerische und romantische Westfalen* (ib., 1898); G. Schulze, *Die Provinz Westfalen* (Minden, 1900); *Cambridge Modern History,* vols. ix, x (New York, 1906–07).

WESTPHALIA, KINGDOM OF. A kingdom created by Napoleon in August, 1807, for his brother Jerome Bonaparte. It was constituted out of part of the territories given up by Prussia in the Treaty of Tilsit and of the dominions of the Elector of Hesse-Cassel and the Duke of Brunswick. It had an area of about 15,000 square miles and a population of about 2,000,000. The Kingdom came to an end in 1813, after the defeat of Napoleon at Leipzig.

WESTPHALIA, PEACE OF. The treaty which closed the Thirty Years' War (q.v.) in 1648 and gave a new adjustment to the religio-political affairs of Europe. It is so called from the fact that the envoys met in the cities of Münster and Osnabrück, in the Circle of Westphalia. It is sometimes spoken of as the Treaty of Münster. The minor German states had long sought relief from the devastations of war, and in 1641, at a convention held at Hamburg, preliminaries regarding the conduct of negotiations for peace were agreed upon. In 1644 a

congress which had been called to meet in March, 1642, opened. The representatives of France, the Empire, Spain, and the German Catholics met at Münster, and those of Sweden, the Empire, and the German Protestants at Osnabrück. Portugal, the United Provinces, Savoy, Tuscany, Lorraine, Mantua, and Switzerland were also represented. The negotiations were long drawn out, but Torstenson's decisive campaign in 1644–45 and the successes of Turenne and Wrangel in southern Germany, together with the capture of part of Prague by Königsmark in July, 1648, forced the Emperor Ferdinand III to give up his dilatory tactics. After the signing of treaties at Osnabrück and Münster the Osnabrück diplomats went to Münster in October, 1648, and the general Peace of Westphalia was signed there on the 24th. Its terms, as regards the German Empire, were as follows: The sovereignty and independence of the different states of the Empire were fully recognized, and liberty was given them to contract any alliances with each other, or with foreign powers, if these were not against the Emperor or the Empire. All religious persecution in Germany was interdicted. The Treaty of Passau of 1552 and the religious Peace of Augsburg of 1555 were confirmed. With respect to the secularization of ecclesiastical benefices, everything was to remain in Austria as it was in 1624, and in the Palatinate, Baden, and Württemberg as it was in 1618. The power of putting under the ban of the Empire was only to be exercised with the consent of the Diet. The Reformed or Calvinist Protestants were put on a footing of equality as to privileges with the Lutherans. In every state the religion of the Prince might be made incumbent on his subjects, but the right of emigration for dissenters was guaranteed. The territorial changes were as follows: The Lower Palatinate was restored to the eldest son of Frederick V, Elector Palatine, and an eighth electorate was created in his favor, but the Upper Palatinate was confirmed to Bavaria, on condition that, should the two states become united, one electorate was to be abolished. France was confirmed in the possession of the bishoprics of Metz, Toul, and Verdun, and obtained possession of the Austrian territories in Alsace with the suzerainty over the 10 Imperial cities of that region; Breisach, on the right bank of the Rhine, remained in French hands. Sweden obtained Hither Pomerania, with Stettin, the island of Rügen, Wismar, and the secularized sees of Bremen and Verden, with minor territories. These remained fiefs of the Empire, and Sweden was given three deliberative voices in the Diet. Brandenburg obtained, as compensation for its cessions in Pomerania, the secularized bishoprics of Halberstadt, Minden, and Cammin, together with the succession to the see of Magdeburg. Mecklenburg was enlarged by the secularized sees of Schwerin and Ratzeburg. Hesse-Cassell obtained the rich abbacy of Hirschfeld. The Elector of Saxony was allowed to retain Lusatia. The see of Osnabrück was to be alternately in the hands of a Catholic bishop and a Prince of the house of Brunswick-Lüneburg. The independence of the United Provinces was recognized by Spain, and they, together with Switzerland, were declared independent of the Holy Roman Empire. France and Sweden became guarantors for the execution of the provisions of the treaty. The Peace of Westphalia, by weakening the central authority of the Empire, destroyed its unity, and afforded France, as one of the guarantors, a pretext for continual interference with its internal affairs. France now became the chief power of the continent, taking the place formerly occupied by Spain. The Peace of Westphalia marks the close of the period of religious wars. Henceforth European contests were mainly for political ends.

Woltmann, *Geschichte des westphälischen Friedens* (Leipzig, 1808); François Ogier, *Journal du congrès de Münster* (Paris, 1893); F. Philippi, *Der westphälische Friede* (Münster, 1898); *Cambridge Modern History*, vol. iv (New York, 1906), containing a bibliography; also references under THIRTY YEARS' WAR.

WEST PITTSTON. A borough in Luzerne Co., Pa., on the Susquehanna River, opposite Pittston (q.v.), with which it is connected by two bridges, and on the Delaware, Lackawanna, and Western Railroad (Map: Pennsylvania, K 3). Mine screens, cut glass, crackers, knit and silk goods are manufactured, and there are machine shops and coal mines. Pop., 1900, 5846; 1910, 6848.

WEST PLAINS. A city and the county seat of Howell Co., Mo., 112 miles east-southeast of Springfield, on the St. Louis and San Francisco Railroad (Map: Missouri, E 5). West Plains College is situated here. Farming and stock raising are the chief interests. There are iron and zinc mines, large orchards and vineyards, an overall factory, flour mills, and an oxide plant. West Plains has adopted the commission form of government. Pop., 1900, 2902; 1910, 2914.

WEST POINT. A city and the county seat of Clay Co., Miss., 97 miles north of Meridian, on the Southern, the Illinois Central, and the Mobile and Ohio railroads (Map: Mississippi, H 3). It has a large cotton factory, carriage and wagon factories, lumber mills, electrical-apparatus works, and manufactories of brick, tiling, cottonseed oil, fertilizers, foundry and machine-shop products, axe handles, etc. The city contains the Southern Christian College and a Carnegie library. Pop., 1900, 3193; 1910, 4864.

WEST POINT. A military post on the right bank of the Hudson River, on the east edge of Orange Co., N. Y., 50 miles from the city of New York, with which it is connected by the West Shore and New York Central and Hudson River railroads and daily steamboats (Map: New York, A 1). Its site is one of remarkable picturesqueness, the Hudson here breaking through the Highlands in a winding gap. It is the seat of the United States Military Academy. The reservation comprises 3294 acres, not counting Constitution Island (280 acres), given to the United States by Mrs. Russell Sage in 1908. During the American Revolution, the position of West Point was of the first importance to the rebel cause; its fall to the British would probably have caused the revolution to collapse. At various times (1775–80) some of the surrounding heights were fortified at a total cost of $3,000,000. The Polish patriot Kosciuszko served for some time here as chief engineer in charge of the works. His services are commemorated by a monument on the parapet of Fort Clinton. The defenses comprised a massive iron chain stretched across the channel from the Point to Constitution Island. In 1779 West Point was for a time headquarters of the commander in chief of the Continental Army. One year later (August, 1780) it was commanded by Major

General Benedict Arnold (q.v.) who tried to betray it to the British. On the disbandment of the army at the close of the Revolution, West Point was designated as one of the depots for the storage of military property; in 1794 it was garrisoned by the new Corps of Artillerists and Engineers; in 1802 the Corps of Engineers was created to be stationed at West Point and to constitute a military academy. Until 1866 the immediate supervision and command of West Point were vested in the Corps of Engineers, but since that time officers of the army at large have been eligible to this detail. In addition to the academic and military staff, an excellent band and detachments of engineers, artillery, and cavalry are stationed at the post for duty in connection with its police and security. There is besides an Army Service Corps, charged with construction and repair work. Officers' quarters follow the crest of the river terrace (about 160 feet above the river), north and south of the parade, which is, roughly speaking, surrounded on three sides by the cadet barracks, academic buildings, library, headquarters building and museum, mess hall, hospital, and riding hall. By bequest of a former superintendent, Brevet General G. W. Cullum, a handsome and spacious building—known as Memorial Hall—was erected in 1898. It contains relics and trophies of the wars in which the United States has been engaged and portraits and busts of distinguished graduates. On the north side of the parade rises a marble shaft surmounted by a figure of Victory, in memory of the officers and men of the Regular Army who fell in defense of the Union (1861–65), the names of all of whom are recorded upon it. In 1915 a handsome equestrian statue of George Washington was erected by anonymous and private gift. Under acts of Congress, from 1902 to 1906, appropriating $7,500,000 additional cadet barracks, a new academic building, a new chapel, officers' quarters, a riding hall (600 × 150 feet), artillery and cavalry barracks, stables, a gymnasium, and a heating and lighting plant were built. These improvements have greatly increased the capacity of the academy and the attraction of this famous military educational institution and picturesque military post. Consult: E. C. Boynton, *History of West Point and the Military Academy* (New York, 1863): E. S. Farrow, *West Point and the Military Academy* (2d ed., ib., 1881); *Centennial of the United States Military Academy at West Point*, 1802–1902 (2 vols., Washington, 1904); M. V. Woodhull, *West Point in our Next War* (New York, 1915); and official documents, especially annual reports of the superintendent (Washington, 1854 et seq.). See MILITARY ACADEMY, UNITED STATES, and Plate of HUDSON RIVER.

WEST'PORT. A town in Fairfield Co., Conn., three miles northeast of Norwalk, on the Saugatuck River, and on the New York, New Haven and Hartford Railroad (Map: Connecticut, B 5). Westport has some importance as an industrial centre, the chief manufactured products being cotton, rope, twine, starch, paper, leather, embalming fluid, disinfectants, buttons, planes, and scales. Pop., 1900, 4017; 1910, 4259.

WESTPORT. A town in Bristol Co., Mass., seven miles south of Fall River (Map: Massachusetts, E 6). Cotton warp and twine and other cotton products are manufactured. Pop., 1900, 2890; 1910, 2928.

WEST PRUSSIA. See PRUSSIA, WEST.

WEST RIVER. See SI KIANG.

WEST RUTLAND. A town in Rutland Co., Vt., four miles west of Rutland, on the Delaware and Hudson and the Clarendon and Pittsford railroads (Map: Vermont, B 6). Marble quarrying is the leading industry. Pop., 1900, 2914; 1910, 3427.

WEST SAINT PAUL. A city in Dakota Co., Minn., two miles west of St. Paul, on the Chicago Great Western Railroad. The city is a residential subsurb of St. Paul. Pop., 1900, 1830; 1910, 2660.

WEST SPRING'FIELD. A town, including several villages, in Hampden Co., Mass., on the Connecticut River, opposite Springfield, and on the Boston and Albany Railroad. It is the residence of many business people of Springfield. Of interest are the old Day House, the Old White Church on the Hill, the high school, and the public library. The community is chiefly interested in farming, market gardening, and the manufacture of paper and cigars. The Boston and Albany Railroad maintains extensive repair shops here. West Springfield, originally a part of Springfield, was settled about 1655, and was incorporated in 1774. Pop., 1900, 7105; 1910, 9224; 1915 (State census), 11,339.

WEST TAMPA. A city in Hillsboro Co., Fla., adjoining Tampa. It has a public library. There are many cigar factories, the city being considered one of the most important cigar manufacturing centres in the country. Pop., 1900, 2355; 1910, 8258; 1915 (U. S. est.), 11,370.

WEST TERRE HAUTE. A town in Vigo Co., Ind., one mile west of Terre Haute, on the Wabash River, and on the Cleveland, Cincinnati, Chicago and St. Louis Railroad. There are 14 coal mines, three large clay plants, sand and gravel works, and a paving brick plant. Pop., 1900, 651; 1910, 3083.

WEST'VILLE. A town in Pictou Co., Nova Scotia, Canada, on the Intercolonial Railway, 5 miles from New Glasgow (Map: Nova Scotia, H 5). Its industries include coal mining, lumbering, woodworking, and brick making. Pop., 1901, 3417; 1911, 4471.

WESTVILLE. A village in Vermilion Co., Ill., six miles south of Danville, on the Chicago and Eastern Illinois, the Cleveland, Cincinnati, Chicago and St. Louis, and the Illinois Traction railroads (Map: Illinois, J 5). Coal mining, corn growing, and the manufacture of steel are the leading industries. Pop., 1900, 1605; 1910, 2607.

WEST VIRGINIA. A South Atlantic State of the United States, sometimes called the Panhandle State. It lies between lat. 37° 13′ and 40° 38′ N., long. 77° 40′ and 82° 40′ W. Most of the boundaries are natural, i.e., formed by rivers or mountain ridges, whence the outlines of the State are irregular. The general shape is that of an oval, 210 miles long from southwest to northeast and 125 miles wide, but two narrow tongues known as panhandles extend northward between Pennsylvania and Ohio and eastward between Virginia and Maryland. The area of the State is 24,170 square miles, making it fortieth in size among the States.

Topography. The surface of West Virginia is, as a whole, uneven, and in the east mountainous. The main range of the Alleghanies crosses the northeastern section, and farther south forms the State boundary towards Virginia. The greater part of the mountain region,

Longitude West from Greenwich

occupying more than one-third of the State, belongs to the Alleghany Plateau, though the mountains in the extreme southern section may be considered as a northern extension of the Cumberland Plateau. The mountains of the northeast are chiefly in the form of parallel ridges with a southwest and northeast trend, but the southern part of the plateau is irregularly dissected by river valleys, presenting broad domes with spurs running in all directions, and but few definite ridges. The elevation of the valleys is about 2000 feet, and the elevation of the ridges is from 3000 to over 4000 feet. The highest point is Spruce Knob, with an altitude of 4860 feet. West of the mountains there is a belt of broad, flat hills from 1000 to 2000 feet in elevation, followed by a more gently rolling country which slopes towards the banks of the Ohio River, along which the altitude ranges between 500 and 650 feet.

Hydrography. With the exception of the northeastern section, the whole State belongs to the Ohio basin, and is drained by a number of streams flowing from the mountain belt northwestward to the main river on the boundary. The largest of these tributaries are the Big Sandy, which forms the southwestern boundary of the State, the Guyandot, Great Kanawha, Little Kanawha, and Monongahela; the last flows northward into Pennsylvania, but its two main headstreams are within West Virginia. The Ohio forms the boundary on the Ohio side. The Potomac forms most of the boundary on the side of Maryland, and its largest headstream, the South Branch, drains most of the northeastern section of the State. All of these streams furnish abundant water power, and several of them are navigable.

Geology. The Carboniferous covers nearly the entire State, from the Alleghanies to the Ohio, but a large part of this contains no workable coal. The oldest rocks in the State, viz., the Cambrian quartzites, form the Blue Ridge at the eastern line of Jefferson County, while the most of the outcropping strata from North Mountain westward to the Alleghanies belong in the Devonian system, except where Silurian beds come to the surface on the crests of the large anticlinal waves. A small area of Siluro-Cambrian limestone comes to the surface along the crest of a great arch in Pendleton County. The only dike of igneous rock which penetrates the overlying strata and reaches the surface is also in Pendleton County. It is only a foot or so in width, however, and is similar in lithological character to that in which diamonds are found in Arkansas, South Africa, and elsewhere. Sulphur and mineral springs abound, the most famous being in Greenbrier, Monroe, and Webster counties.

Climate. West Virginia enjoys an agreeable and healthful climate, with pure mountain air and freedom from violent extremes of heat or cold. The mean temperature for January ranges from 30° in the northeastern mountains to 32° and 35° in the west and southwest. For July the mean is between 75° and 76° in nearly all sections of the State. The average maximum is between 94° and 98°, though a temperature of 104° has been recorded; the average minimum is between 5° and 10° above zero, the extreme being 10° below. The average rainfall ranges from 33 inches in the northeast to 45 inches in the south, and is fairly evenly distributed through the year.

Soil and Vegetation. The soils are mostly formed from disintegration of rocks in situ, except along the valleys of streams where they are largely composed of clays, sands, and organic matter transported during flood stages, and therefore represent a mixture of soils from the entire upper drainage basin of each stream. The soils of the Ohio valley consist largely of decomposed glacial drift material transported into the valley during the early history of that river by tributary streams from the north which flowed across the terminal moraine in Ohio and Pennsylvania.

There is much limestone in the northeastern portions, and the soils in these counties are very fertile, while in the great belt of red soil counties in the west, there is not much limestone but sufficient limy shales and marly clays to constitute a very fertile soil.

The soils in the mountain belt are thin and sandy, and agriculture is mostly confined to the narrow valleys or flood plains of the streams, the mountain slopes rising at angles of 30° to 40°, and thus rendering cultivation difficult or impossible, except on broad upland plateaus. Large areas, especially in the east and south, are still covered with dense forests, mostly of deciduous trees, such as black, red, white, and chestnut oak, hickory, chestnut, cherry, locust, maple, walnut, tulip trees, and on the higher mountains, birch. On the high mountains there are also extensive forests of black spruce, white pine, and hemlock.

Mineral Products. In total value of mineral products West Virginia ranks second only to Pennsylvania. The bulk of the value of mineral production is contributed by coal, natural gas, and petroleum. The State is second in the Union in quantity and value of coal products. The production in 1914, the greatest in the history of the State, was 71,707,626 short tons with a spot value of $71,391,408. As a natural gas producing State West Virginia has ranked first for six years. Although the numerous gas wells are scattered over 22 counties, the most prolific fields are in Lewis, Harrison, and Ritchie counties, where many large wells show little decline in pressure from year to year. The production of natural gas in 1914 amounted to 238,740,162,000 cubic feet valued at $35,515,329. In value of petroleum produced in 1914 West Virginia ranked fourth. Oil and gas fields constitute a belt from 40 to 60 miles in width lying to the west of the Appalachian range and reaching from Pennsylvania to Kentucky. The total production of oil in 1914 was 9,680,033 barrels valued at $18,468,540. West Virginia ranked ninth in 1914 in the value of the output of clay products with a production valued at $5,761,411. The total value of all mineral products in 1914 was $134,071,803.

Agriculture. Of the total land area of approximately 15,374,080 acres 10,026,442 acres were in farms in 1910, of which 5,521,757 were improved land. The total number of farms in that year was 96,685 and the average number of acres per farm was 103.7. The total value of all farm property including land, buildings, implements and machinery, domestic animals, poultry and bees, was $314,738,540, the average value of all farm property per farm $3255, and the average value of land per acre $20.65. Of the total number of farms 76,850 were operated by owners and managers, and 19,835 by tenants. The native white farmers numbered 95,138, the

foreign-born whites 839, and the negroes and other nonwhites 708. The larger part of the foreign-born farmers came from Germany, Ireland, Switzerland, and England in the order named.

The following table gives the acreage, production, and value of some of the more important crops as estimated by the United States Department of Agriculture for 1915.

CROPS	Acreage	Prod. in bu.	Value
Corn	800,000	25,200,000	$18,648,000
Wheat	300,000	4,500,000	4,860,000
Oats	120,000	3,480,000	1,775,000
Rye	16,000	224,000	208,000
Potatoes	50,000	5,850,000	3,802,000
Hay	730,000	*1,095,000	16,425,000
Tobacco	11,300	†9,831,000	983,000
Buckwheat	38,000	836,000	669,000

* Tons. † Pounds.

The total value of all crops in 1909 was $40,374,776. The leading crops in order of importance were corn, hay and forage, wheat, potatoes, tobacco, and oats. In that year there was in corn an acreage of 676,311, a production of 17,119,097 bushels valued at $11,907,261; in hay and forage an acreage of 708,900, a production of 639,104 tons valued at $7,492,747; in wheat an acreage of 209,315, a production of 2,575,996 bushels valued at $2,697,141. The acreage devoted to potatoes in that year was 42,621 and the production amounted to 4,077,066 bushels valued at $2,278,638. Tobacco had an acreage of 17,928, the yield being 14,356,400 pounds valued at $1,923,180. The acreage of vegetables (other than potatoes, sweet potatoes, and yams) was 43,524 and their value $4,520,000.

The total quantity of orchard fruits produced was 4,709,959 bushels valued at $3,040,192. Apples contributed about nine-tenths of this amount, peaches most of the remainder. The acreage of small fruits was 2913 and the production 2,336,562 quarts valued at $191,002. Strawberries, raspberries, blackberries, and dewberries are the most important of the small fruits. The production of grapes amounted to 3,224,751 pounds valued at $92,834. The value of the maple sugar and sirup made in 1909 was $46,568. In the same year 48,094 tons of sorghum cane was grown, from which was made 604,201 gallons of sirup valued at $300,188.

Live Stock and Dairy Products.—The total value of all live stock on farms in 1909 was $41,318,436. According to the estimates of the United States Department of Agriculture there were on the farms on Jan. 1, 1916, horses, 194,000 valued at $20,952,000; mules, 12,000 valued at $1,392,000; milch cows, 241,000 valued at $12,050,000; cattle other than milch cows, 362,000 valued at $13,141,000; sheep, 796,000 valued at $4,060,000; swine, 378,000 valued at $3,402,000. The total value of milk, cream, and butter fat sold and butter and cheese made was $5,000,158. The milk sold amounted to 4,050,471 gallons valued at $864,958, the butter made amounted to 18,969,699 pounds valued at $4,054,498. The total number of fowls of all kinds on the farms was 3,310,155 valued at $1,628,700.

Forest Products. This industry is one of the most important in the State. The total amount of rough lumber sawed in 1909 was 1,472,942 M feet B. M., valued at $26,148,157. The laths produced numbered 150,820 thousand, the shingles 6829 thousand. Of the total timber cut, 907,547 M feet was hardwood, which was composed of oak 456,424 M feet, yellow poplar 154,581 M feet, and chestnut 119,762 M feet. The soft wood sawed amounted to 565,395 M feet of which hemlock contributed 279,832 M feet and spruce 242,897 M feet. West Virginia was first in the production of cherry and chestnut lumber and second in the output of oak and yellow poplar. The State took high rank also in the production of several other species of wood. In addition to the figures quoted above there were produced on the farms of the State forest products valued at $4,004,484.

Manufactures. With its vast deposits of coal, its abundance of petroleum and natural gas, its extensive timber areas, and its excellent water power facilities, the State is well adapted for manufacturing purposes. The manufactures as yet are practically in an early stage of development and in 1909 the total value of the manufactured products per capita was $133.

The following table gives the most important figures relative to the manufactures for 1904 and 1909.

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — FIVE LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY: Total	PERSONS ENGAGED IN INDUSTRY: Wage earners (average number)	Capital	Wages	Value of products	Value added by manufacture
					Expressed in thousands			
All industries	1909	2,586	71,463	63,893	$150,923	$33,000	$161,950	$69,072
	1904	2,109	48,880	43,758	86,821	21,153	99,041	44,622
Lumber and timber products	1909	1,016	20,799	18,643	30,333	8,632	28,758	20,082
	1904	765	13,257	11,619	14,663	5,390	18,697	12,495
Iron and steel, steel works and rolling mills	1909	16	5,445	5,060	16,276	3,887	22,435	6,539
	1904	12	4,516	4,409	8,716	2,813	13,455	4,713
Leather, tanned, curried, and finished	1909	20	1,688	1,571	18,164	775	12,451	2,068
	1904	33	1,043	946	8,751	434	6,062	1,293
Glass	1909	51	6,509	6,190	7,369	3,628	7,779	5,483
	1904	39	3,867	3,673	4,300	2,054	4,599	3,340
Flour-mill and gristmill products	1909	207	884	452	3,766	210	7,696	1,095
	1904	194	780	400	2,623	183	6,200	987

For details regarding the lumber and timber industry see paragraph on *Forest Products*. The most important of the steel and iron products is skelp with an output value of $6,060,225. There was produced in the same year tin plate valued at $6,360,880 and terneplate valued at

$2,561,219. The large and convenient supply of oak and hemlock bark encourage the development and manufacture of leather. By far the most important product of this industry is sole leather the value of which in 1909 represented 82.5 per cent of the total. The most important of the glass products is pressed and blown glass, the total value of output being $1,685,863.

The average number of wage earners was 63,893 of whom 1053 were under 16 years of age. There were 4505 female wage earners 16 years old and over. For the majority of wage earners the prevailing hours of labor were from 54 to 60 per week, only 12.9 per cent working more than 60 per week.

The six cities with a population each of 10,000 or more gave employment to 24.3 per cent of the average number of wage earners and turned out 28.6 per cent of the total value of products. Wheeling gave employment to 7809 wage earners and manufactured products valued at $27,077,151; Huntington gave employment to 3156 wage earners and manufactured products valued at $6,511,260; other important manufacturing cities are Parkersburg, Charleston, Martinsburg, and Bluefields. See articles on the cities.

Transportation. The Ohio River, forming the northwestern boundary and navigable for large boats throughout this entire distance, is the most important waterway. Its affluents, the Kanawha and Little Kanawha, are also important waterways though of much less value. Railroads tap all the mining and lumbering sections and the manufacturing districts have adequate facilities in this regard. The total mileage of first track in 1915 was 3704. The most important roads and their mileage in that year are the Baltimore and Ohio, 1115; the Chesapeake and Ohio, 731; the Norfolk and Western, 445; and the Western Maryland, 198.

Banking. The condition of the banks in 1915 was as follows:

	National banks	State banks
Number	118	160
Capital	$10,150,000	$8,058,977
Surplus	6,627,000	5,282,073
Cash, etc.	3,411,000	2,208,036
Deposits	57,734,000	49,699,341
Loans, etc.	56,650,000	50,185,155

Government. The present constitution of the State was adopted in 1872 and has been amended in certain important details. Amendments to the constitution may be proposed in either House of the Legislature, and if agreed to by two-thirds of the members of each House are submitted to the voters at the next general election. If they are ratified they become a part of the constitution.

Legislative.—The legislative power is vested in the Senate and House of Delegates. The Senate is composed of 30 members, and the House of Delegates of 86 members. Senators are elected for a term of four, and delegates for a term of two, years. The Legislature meets every two years, in odd years on the second Wednesday of January. Sessions of the Legislature may not be more than 45 days without the concurrence of two-thirds of the members elected to each House.

Executive.—The executive department consists of Governor, Secretary of State, State Superintendent of Free Schools, Auditor, Treasurer, Attorney-General, and Commissioner of Agriculture. Their term of office is four years, beginning with March 4 next after their election. The Governor is not eligible for immediate re-election.

Judiciary.—The judicial power is vested in the Supreme Court of Appeals, and in circuit courts, and in such inferior tribunals as are authorized by law. The Supreme Court of Appeals consists of five judges, who are elected by the voters and hold office for 12 years. The State is divided into 23 circuits. In the first circuit two judges are elected, and in the other circuits one, for a term of eight years. Circuit courts are held in each county at least three times a year. In each county is a county court composed of three commissioners. They are elected by the voters of the county and hold office for six years.

Suffrage and Elections.—Any male citizen of the United States is entitled to vote if he has been a resident of the State for one year, and of the county for 60 days. General elections of the State and county officers are held on the Tuesday following the first Monday in November. The Legislature of 1915 passed a primary election law providing for the nomination of candidates for office. Provision was also made for the designation of party preference for the President of the United States. Candidates for judges of the Supreme Court of Appeals, the circuit court, and criminal or intermediate courts are excepted, as are also candidates for office to be filled by cities, towns, or villages of less than 5000 inhabitants. Primary elections for nomination of candidates are held on the first Tuesday in June in the year in which the President of the United States is elected, and in all other years on the first Tuesday of August preceding the general election.

Local and Municipal Government.—The county is the unit of government, and in each county are elected for a term of four years a surveyor of lands, a prosecuting attorney, a sheriff, and not more than two assessors.

Miscellaneous Constitutional and Statutory Provisions.—White and colored persons may not be taught in the same schools. There are an inheritance tax and laws regulating insurance rates. There is also a workingmen's compensation act. The State is under constitutional prohibition, effective on July 1, 1914.

Finance. When West Virginia was set off from Virginia the question arose as to the share of the public debt to be borne by either Commonwealth. The financial welfare of West Virginia has been safeguarded by the most stringent provisions in the constitution, and there has been no debt incurred since the State entered the Union. The receipts for the fiscal year ending June 1, 1914, were $6,964,377, and the disbursements, $6,691,537, leaving a balance on hand June 30, 1914, of $956,306. See HISTORY.

Militia. The males of militia age in the State in 1910 numbered 275,048. The organized militia included in 1915, 1741 enlisted men and 123 officers. It comprised two regiments of infantry and a detachment of sanitary troops.

Population. The population of the State at each Federal census was: 1870, 442,014; 1880, 618,457; 1890, 762,794; 1900, 958,800; 1910, 1,221,119. The estimated population for 1915

was 1,359,474. The State ranked twenty-eighth in population in 1910 and the average number of persons to the square mile was 50.8. The urban population, i.e., that in places of 2500 or more, was 228,242. The native born of native whites numbered 1,042,107, the native whites of foreign or mixed parentage 57,638, the foreign-born whites 57,072, and the negroes and other nonwhites 64,302. Of the foreign-born whites 30.3 per cent came from Italy, 14.6 from Austria, 11.1 from Germany, and 10.4 per cent from Hungary. Of the total native population 80 per cent was born in the State. Of that born in other States Virginia furnished 7.2 per cent, Ohio 4 per cent, and Pennsylvania 3.3. The males in that year numbered 644,044, and the females 577,075. The males of voting age numbered 338,349. The more important cities with their populations for 1910 and 1915 (estimated) are: Wheeling 41,641 and 43,097; Huntington 31,161 and 43,572; Charleston 22,996 and 28,822; Parkersburg 17,842 and 20,165; Bluefield 11,188 and 14,637.

Education. With the exception of Delaware and Maryland the percentage of illiterates is lower than in any other of the South Atlantic States. There were in 1910 74,866 persons of 10 years of age or over, or 8.3 per cent of the total, who were unable to read or write. The percentage of illiteracy among whites of native parentage was 6.7 per cent, among foreign-born whites 23.9 per cent, and among negroes 32.3 per cent. The total school population in 1910 according to the thirteenth census was 396,812. Of this number 259,971 attended school in that year. According to the reports furnished by the State Superintendent of Education the total school population in 1915 was 409,969. The enrollment in the public schools in that year was 304,871, and the average daily attendance 221,062. The total number of teachers in 1915 was 10,084. The average salary paid to teachers per month in all grades was $46.37. The total number of schoolhouses in 1915 was 6821. The high schools in that year numbered 152. The total disbursements for schools in that year were $6,984,350. Most of the rural schools in the State are now graded. Consolidation of rural schools has been accomplished with good results. Manual training, domestic science, music, and drawing have been introduced in a large number of rural schools. Agriculture is one of the prescribed subjects of study in these schools. In many rural and town schools savings banks have been organized. The majority of all rural teachers have organized their communities into social centres. Night schools are conducted in a number of public schoolhouses.

There were in the State in 1915, 82 four-year high schools, 76 high schools of the first class, 34 of the second class, 35 of the third class, and 11 not classified. The total enrollment in the high schools in 1915 was 11,296. There were in 1915 nine colored high schools.

The Legislature has enacted important measures which have resulted in the improvement of educational conditions. Among these are provisions for increase in school funds, an industrial education law, provision for medical inspection, improvement in the compulsory school law, and a law requiring boards of education not maintaining high schools to pay the tuition of pupils of their districts wishing to attend high schools elsewhere. The State normal schools are the Concord State Normal School at Athens, Fairmont State Normal School at Fairmont, the Glenville State Normal School at Glenville, the Marshall College Normal School at Huntington, the Sheperd College Normal School at Sheperdstown, and the West Liberty State Normal School at West Liberty. West Virginia University at Morgantown is a part of the educational system of the State. Other institutions of collegiate rank are Bethany College at Bethany, West Virginia Wesleyan College at Buckhannon, and Davis and Elkins College at Elkins. These are all coeducational. Colleges for women are St. Hildes at Charleston and Lewisburg Seminary at Lewisburg.

Charities and Corrections. The charitable and correctional institutions of the State are under the supervision of the State Board of Control. They include the following: Weston State Hospital, Spencer State Hospital, Huntington State Hospital, Welch Hospital No. 1, McKendree Hospital No. 2, Fairmont Hospital No. 3, West Virginia Penitentiary, West Virginia Industrial School for Boys, West Virginia Industrial Home for Girls, West Virginia Schools for the Deaf and Blind, State Tuberculosis Sanitarium, West Virginia Colored Orphan's Home, West Virginia Children's Home.

Religion. The Methodists are the strongest denomination, closely followed by the Baptists. Together they number more than two-thirds of the total communicants. Next in order come the Roman Catholics, Presbyterians, Disciples of Christ, and Lutherans.

History. For many years after the settlement of the eastern part of Virginia the western section was entirely unknown. John Lederer, a German surgeon in the employ of Governor Berkeley, was probably the first white man to explore the region, in 1669. In the same year La Salle floated down the Ohio River and landed at several places within the State. Abraham Wood in 1671 discovered the Great Kanawha, and Governor Spotswood of Virginia made an expedition into the present State in 1716. The grant to Lord Fairfax of the northern neck of Virginia included part of the present State, and his surveyors planted a stone at the headwaters of the northern branch of the Potomac to show the limits of his grant. When the western part of Virginia began to fill up with the adventurous Scotch-Irish after 1732, scattered pioneers crossed the mountains, and soon came in conflict with the French, who also claimed the country. (See FRENCH AND INDIAN WAR; OHIO; VIRGINIA.) The Six Nations of New York also claimed this country by right of conquest, but ceded their claim to the whites in 1754 at Fort Stanwix. The other Indians refused to acknowledge the cession, and in 1774, at Point Pleasant, one of the bloodiest of Indian battles was fought between a confederacy of Shawnees, Delawares, Wyandots, Cayugas, and other Indians under Cornstalk, and Virginia settlers and militia under Gen. Andrew Lewis. Lord Dunmore, the Governor of Virginia, did not attempt to aid the settlers, though he was near with a strong force, and it was openly charged that his hope was to cripple the Colony so that it could not join in resistance to Great Britain. In spite of the King's proclamation of 1763 declaring the western territory to be "Indian country," colonization was rapid and counties were formed. After the Revolution an entirely different society grew up in the western woods

compared with that in the east. The hardy backwoodsmen had few luxuries, few slaves, and little touch with European culture. Jealousies ensued between the sections, and the west complained bitterly that they had all the burdens of government without corresponding benefits. The representation in the eastern counties was based partially upon the number of negroes, and a western freeman did not have the same representation as a resident of the east. The peculiar shape of the western part of the State made a number of the counties border on the free States of Ohio and Pennsylvania, and many of the counties were Northern in sentiment at the approach of the Civil War. When Virginia passed the ordinance of secession there was much dissatisfaction. Numerous small meetings were held, and on May 13, 1861, delegates from 25 counties met at Wheeling and called a convention to meet June 11. Representatives from 40 counties attended, declared their independence of Virginia, and took measures for the establishment of a provisional government by electing Francis H. Pierpont (q.v.) Governor. On July 2 a Legislature met and elected representatives to the United States Senate, who were admitted by that body. This action was approved by the people October 24, and delegates were also elected to a convention which met at Wheeling on November 26 to frame a constitution, which was adopted on May 3, 1862. On May 13 the Legislature of the "Restored Government of Virginia" gave its consent to the formation of a new State. The act of admission was approved by President Lincoln, Dec. 31, 1862, to take effect upon the insertion of a clause providing for gradual emancipation, and the State was formally admitted June 19, 1863. During the war an unusually large part of the population was in arms, and 32,068 men were furnished to the Federal army. Slavery was entirely abolished Feb. 3, 1865, in advance of the adoption of the Thirteenth Amendment. The return of the Confederate soldiers to the southern and eastern counties threatened the Republican control, and in 1866 an amendment was added to the constitution disfranchising all who had given aid and comfort to the Confederacy after June, 1861. In 1869 the number of voters numbered about 50,000, and the disfranchised 29,316. By a compromise, general amnesty and negro suffrage were coupled and adopted in 1871, and in 1872 a new constitution went into force. The vote of the State was cast for Republican electors before this time. For the 20 years from 1872 to 1892 Democratic candidates were uniformly successful. The great development of mining and manufacturing has brought about a change of sentiment, and in 1896, 1900, 1904, and 1908 the State was found in the Republican column.

In 1907 a suit was brought by the State of Virginia against the State of West Virginia in the United States Supreme Court to compel the latter State to assume its proportion of the State debt created prior to 1861, when West Virginia separated from the other State. Virginia contended that West Virginia had agreed to assume her proportionate share at the time of separation. West Virginia alleged that most of the money realized from the sale of the bonds was expended in the present State of Virginia, and therefore she was under no obligation to assume any of the debt. The suit was pending in the Supreme Court until June, 1915, when that body handed down a decision holding that West Virginia should pay Virginia $12,393,929 as its net share of the debt. In addition West Virginia was required to pay $8,178,000 in interest. The court held, however, that West Virginia was entitled to a share of the assets arising from the original principal debt, and fixed that amount at $2,966,000. In the presidential election of 1908 Taft received 137,869 votes, and Bryan 111,418. The Republicans elected their candidate for Governor, William C. Glasscock, and the entire State ticket. In the presidential election of 1912 Wilson received 113,048 votes, Roosevelt 78,819, and Taft 56,657. A constitutional amendment providing for State-wide prohibition was carried by a majority of nearly 100,000 in this election. The Republicans elected their candidate for Governor, H. D. Hatfield.

GOVERNORS OF WEST VIRGINIA

Arthur I. Boreman	Republican	1863–69
D. D. T. Farnsworth (acting)		1869
William E. Stevenson	Republican	1869–71
John J. Jacobs	Democrat	1871–77
Henry M. Matthews	"	1877–81
Jacob B. Jackson	"	1881–85
E. Willis Wilson	"	1885–90
A. Brooks Fleming	"	1890–93
William A. McCorkle	"	1893–97
George W. Atkinson	Republican	1897–1901
Albert B. White	"	1901–05
William M. O. Dawson	"	1905–09
William C. Glasscock	"	1909–1913
Henry D. Hatfield	"	1913–

WEST VIRGINIA UNIVERSITY. A coeducational State institution of higher learning at Morgantown, W. Va., founded in 1868. It absorbed the West Virginia Agricultural College, the Monongahela Academy, and the Woodburn Seminary. It now comprises colleges of art and sciences, engineering and mechanical arts, agriculture, medicine, and law, schools of music, military science and tactics, a summer school, at Morgantown, and preparatory schools at Montgomery, and Keyser. Its principal sources of support are the land grant of 1862, the Morrill, Hatch and Adams funds, and biennial State appropriations, the total income in 1914–15 being $410,464. The university has a campus of 50 acres, and farms of about 600 acres for the use of the agricultural experiment station and the college of agriculture. The buildings and grounds were valued in 1915 at $1,600,000. The library contained 43,500 volumes. In 1916 the university proper had an enrollment of 892, while in the Summer School, Farmer's Work, and special courses in agriculture were 1441. The faculty numbered 101.

WEST VIRGINIA WESLEYAN UNIVERSITY. A coeducational college founded under the auspices of the Methodist Episcopal Church at Buckhannon, West Virginia in 1890. Connected with the college is a preparatory department and a summer school is also main-

tained. The total attendance in all departments in 1915–16 was 455, and the faculty numbered 26. The productive funds amount to about $100,000, and the annual income to about $50,000. The library contains about 6000 volumes. The president in 1916 was Wallace P. Fleming, Ph.D.

WESTWARD HO! 1. A comedy by Webster and Dekker, printed in 1607. 2. A novel (1855) by Charles Kingsley.

WESTWOOD, JOHN OBADIAH (1805–93). An English entomologist and antiquary, born in Sheffield. He was a founder of the Entomological Society of London, and finally its honorary life president. In 1861 he was appointed Hope professor of zoölogy at Oxford. He published more than 400 memoirs and articles on insects, covering their habits and transformations as well as their classification, his *Introduction to the Modern Classification of Insects* (1839–40) being of great importance in the systematics of this group. He also published extensively on English archæology.

WETHERALD, wĕth'ĕr-*a*ld, AGNES ETHELWYN (1857–). A Canadian poet. She was born at Rockwood, Ontario, and was educated at Pickering College. She edited the Woman's department of the Toronto *Daily Globe,* later became a member of the staff of the *Ladies' Home Journal,* and contributed frequently to American magazines. Her poetical works include: *The House of the Trees* (1896); *Tangled in Stars* (1902); *The Radiant Road* (1904); *The Last Robin* (1907).

WETHERELL, wĕth'ĕr-*e*l, ELIZABETH. The pen name of Susan Warner (q.v.).

WETAS'KIWIN. A city and the capital of Strathcona District, Alberta, Canada, on the Canadian Pacific Railway, 40 miles south of Edmonton (Map: Alberta, G 6). It has thriving manufactures. Pop., 1901, 550; 1911, 2411.

WETHERSFIELD, wĕth'ĕrz-fēld. A town in Hartford Co., Conn., four miles south of Hartford, on the Connecticut River, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, E 3). It is the seat of the State Prison. The leading industries are seed growing, market gardening and dairying. Wethersfield is one of the oldest towns in the State, having been settled in 1634. Pop., 1900, 2637; 1910, 3148.

WET'MORE, EDMUND (1838–). An American lawyer. He was born at Utica, N. Y., and was educated at Harvard (A.B., 1860) and Columbia (LL.B., 1863). Thereafter he engaged in law practice in New York City, and in 1900–01 was president of the American Bar Association. At various times he was also president of the Republican Club and the University Club in New York, and of the Sons of the Revolution. In 1906 he received the degree of LL.D. from Yale.

WETMORE, ELIZABETH BISLAND (1861–). An American author, born on the Fairfax Plantation, La. She was educated at home, and early did literary work for the New Orleans *Times-Democrat.* Later she came north, in 1891 being married to Charles W. Wetmore in New York. For a time Mrs. Wetmore served as one of the editors of the *Cosmopolitan,* and she contributed to the *Atlantic Monthly* and the *North American Review.* In later years she made her home in Surrey, England. Books written or edited by her, under her maiden name, include: *A Flying Trip around the World* (1891); *A Candle of Understanding* (1903); *The Secret Life* (1906); *Life and Letters of Lafcadio Hearn* (2 vols., 1906); *Seekers in Sicily* (1909), with Anne Hoyt; *At the Sign of the Hobby Horse* (1910), essays; *Japanese Letters of Lafcadio Hearn* (1910).

WET PACK. See BATH, *Therapeutic Baths;* HYDROTHERAPY; PACK.

WETSTEIN, vĕt'stĭn (or **WETTSTEIN**), JOHANN JAKOB (1693–1754). A Swiss theologian, born at Basel. He studied for the Church, and after 1717 devoted himself to the critical study of the Scriptures in Basel, where he was a curate. He was forced to leave the city in 1730 on account of suspected heretical beliefs. He was called to Amsterdam in 1733 as professor of Church history in the university, and spent the rest of his life in that city. Among his writings are *Prolegomena* (1730; annotated by Semler in 1764 and republished by Lotze in 1831), and a critical edition of the New Testament (2 vols., 1751–52). The latter was a distinct advance towards modern scholarship.

WETTER, vĕt'tĕr. A lake of Sweden. See VÄTTER.

WETTEREN, vĕt'tĕr-*e*n. A town in the Province of East Flanders, Belgium, 8 miles east by south of Ghent, on the Scheldt River (Map: Belgium, B 4). It is of considerable industrial importance, having extensive bleaching establishments and manufactures of cotton goods, lace, gunpowder, etc. Pop., 1910, 25,066.

WETTEREN POWDER. See EXPLOSIVES.

WETTERHORN, vĕt'tĕr-hôrn. A peak of the Bernese Alps in Switzerland. It belongs to the Finsteraarhorn group, and is situated 8 miles southeast of the Lake of Brienz and east of Grindelwald (Map: Switzerland, C 2). It rises from the valley in an abrupt rocky wall, and has three summits, the highest of which has an altitude of 12,165 feet.

WETZLAR, vĕts'lär. A Prussian town in a detached part of the Rhine Province, on the Lahn, opposite the mouth of the Dill, 33 miles northwest of Frankfort-on-the-Main (Map: Germany, C 3). Pop., 1910, 13,389. The cathedral dates from the eleventh century, with additions in the fourteenth, fifteenth, and sixteenth centuries. Wetzlar was formerly an Imperial free city, and from 1691 to 1806 was the seat of the Imperial Court of Justice. Here, on June 15, 1796, the Archduke Charles defeated the French under Jourdan. The town, which had been held by Prince Dalberg, was transferred to Prussia by the Congress of Vienna in 1815. During the summer of 1772 Goethe lived at Wetzlar; here and in the vicinity occurred the incidents which suggested the *Sorrows of Werther.*

WEXELS, vĕk'sels, WILHELM ANDREAS (1797–1866). A Norwegian theologian and hymn writer, born in Copenhagen of Norwegian parents. He was educated at Christiania University. Throughout his long pastorate in Christiania he fought rationalism with speech and pen and won reputation both as an orator and as an author. For the clergy, the laity, and schools, he wrote religious books that were notably popular. He edited a hymn book (1849) and was himself the author of many hymns.

WEX'FORD. A maritime county of the Province of Leinster, Ireland (Map: Ireland, E 7). Area, 901 square miles. The surface is in general level or undulating, becoming mountainous towards the northwest. The soil is fertile. The barley crops are the largest in Ireland, and

rye, oats, potatoes, and turnips are also raised, while dairy products are exported in large quantities. Pop., 1901, 104,104; 1911, 102,287. County seat, Wexford.

WEXFORD. The capital of Wexford County, Ireland, a seaport, Parliamentary and municipal borough, at the mouth of the Slaney, 82 miles south of Dublin (Map: Ireland, E 7). The town is situated on the southwest shore of the estuary of the Slaney, known as Wexford Harbor, along which the quay extends nearly 1000 yards. The chief occupations are distilling and the grinding of corn. An active shipping trade is carried on mainly through the artificial harbor constructed in 1906 at Rosslare, some 8 miles distant. The town was occupied by the Danes as one of their strongest settlements. From the time of the invasion, it became an English stronghold against the native population. During the Civil War it was occupied by the confederated Catholics, but was taken by Cromwell in 1649. The insurgents of 1798 had possession of it for a short time. Pop., 1901, 11,154; 1911, 11,455.

WEYBURN, wā'bŭrn. A town and the capital of Assiniboia District, Saskatchewan, Canada, on the Souris River and the Canadian Pacific Railway, 125 miles southeast of Regina (Map: Saskatchewan, G 8). It contains a customhouse, two hospitals, and has thriving manufactures. Pop., 1901, 113; 1911, 2210.

WEYDEN, vī'den, ROGIER VAN DER (c.1400–64). An early Flemish painter, founder of the school of Brabant. He was not a pupil of Jan van Eyck, as was formerly supposed, but rather a rival. Modern research has established his identity with Rogelet de la Pasture, who was born at Tournai, where he became a pupil of Robert Campin in 1427, and a master of the Painters' Guild in 1432. In April, 1435, he removed to Brussels, and in the following year the office of painter to the city was created for him. His four great paintings for the town hall, historical themes illustrating incorruptible justice, survive only in three tapestries in the Bern Museum. From a few surviving notices concerning his life and family, it would seem that he was both pious and wealthy. In 1449 he went to Italy to celebrate the Pope's jubilee, held in the following year. There he enjoyed the highest reputation and the most distinguished patronage, and was employed seemingly as court painter at Ferrara. The great paintings of Italy, however, had no influence upon his art. He returned to Brussels, where he died in 1464, after entering a religious fraternity.

Rogier van der Weyden's art was as deeply religious as his personality. In sentiment it represents a reaction against the placid painting of Jan van Eyck, intended for comfortable middle classes, and appeals to the more popular religious tendency of the day. His intense dramatic action sometimes leads to exaggeration, and his drawing, though always careful, is sometimes defective. His colors are less bright and luminous than Van Eyck's, being rendered with dawn and twilight effects. The heads, with their large eyes and prominent brows, are wonderfully expressive and spiritual. His influence was even wider than Van Eyck's. In the Netherlands Hans Memling was his pupil, and he exercised a formative influence upon Dierick Bouts and Quinten Matsys. The Cologne school of the later fifteenth century was dependent upon him; Martin Schongauer of Colmar was probably his pupil, and even Wolgemut and the Nurembergers felt his influence. Through his designs for reliefs he had a wide influence upon the sculpture of the day.

As Rogier's works are not signed and were often reproduced in his atelier, they are difficult to identify. The earliest surviving example seems to be a "Descent from the Cross" (c.1435), now in the Escorial, a powerful and imposing work, passionate yet restrained in sentiment, still showing the influence of Campin. Not long afterward comes the triptych of St. John Baptist in the Berlin Museum, and between 1443 and 1449 the important "Last Judgment" in the Hospital of Beaune. To his Italian journey belongs the "Madonna with Four Saints" (Städel Institute, Frankfort) bearing the coat of arms of Cosimo de' Medici; and to his ripest period the altar of the "Epiphany" at Munich, the wings of which, especially the "Annunciation," were often repeated (example in the Metropolitan Museum, New York). One of his latest works, a masterpiece of color, is the Middelburg Altar, with the "Nativity," and two other subjects, in the Berlin Museum, which also possesses his "Altar of the Blessed Virgin." The pathetic figure of the "Magdalen" in the National Gallery, London, is by his hand; but the triptych of the "Seven Sacraments" in the Antwerp Museum seems a school piece, as do also the different versions of St. Luke painting the Virgin (Munich, Boston, etc.). Although he was famed as a portraitist, only two portraits have survived: the "Man with an Arrow" in the Brussels Museum, and "Duke Lionello d'Este," in the Speyer collection, London.

Bibliography. Early biographies were by Wauters (Brussels, 1856) and Pinchart (ib., 1876). Later research is represented by C. Hasse, *Rogier von Brügge* (Strassburg, 1904); id., *Rogier van der Weyden and Rogier von Brügge* (ib., 1905); Karl Voll, *Die altniederländische Malerei* (Leipzig, 1906); Paul Lafond, *Rogier van der Weyden* (Brussels, 1912); Friedrich Winkler, *Der Meister vom Flémalle und Rogier van der Weyden* (ib., 1913).

WEYERHAEUSER, wī'ĕr-hoi'zĕr, FREDERICK (1834–1914). An American capitalist, born at Neidersaulheim, Germany. He came to the United States in 1852 and settled in Pennsylvania, but moved to Illinois in 1856, and to St. Paul, Minn., in 1891. He came to be known as the "lumber king," being president of the Weyerhaeuser Timber Company, and head of the so-called Weyerhaeuser Syndicate, which controlled millions of acres of timber lands.

WEY'ER'S CAVE. A large stalactite cavern in Augusta Co., Va., opening into a western spur of the Blue Ridge, 11 miles northeast of Staunton (Map: Virginia, F 3). It ranks next in importance to the Mammoth and Wyandotte caves, and contains several chambers, of which the largest is Washington's Hall, 250 feet long and more than 90 feet high.

WEYLER, wĕ'lĕr *or* wā'lĕr, VALERIANO, MARQUIS OF TENERIFFE (1839–). A Spanish general. He was born in Palma, Majorca, entered the army early, was military attaché of the Spanish Legation in the United States during the Civil War, and accompanied General Sheridan on some of his campaigns. In the 10 years' war in Cuba (1868–78) he held a command under Balmaceda, and in 1873 served in Spain against the Carlists. He was Governor-General of the Canaries (1879–83), of the

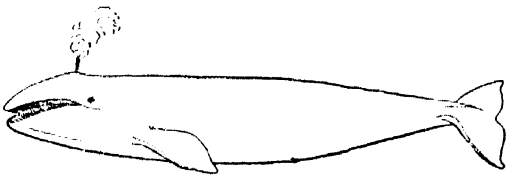
Balearics (1883–86), and in 1889 became Captain General of the Philippines, where he amassed a fortune. He was later commissioned as Provincial Governor of Catalonia, and in 1896 he was sent to Cuba, in response to the demands of the advocates of severe methods, to succeed Martínez Campos (q.v.). His ruthless policy aroused a strong protest in the United States, and he was recalled in 1897. In 1900 he was made Captain General of Madrid. He was Minister of War in the Sagasta cabinet, which held office from March, 1901, to December, 1902, and in the cabinet of Montero Ríos in 1905–06, and Minister of Marine in 1905. As Captain General of Catalonia in 1909 he handled with skill the dangerous situation connected with the Ferrer riots. His marquisate was conferred for his services in the Canaries; and his other services were rewarded with grand crosses in many of the most distinguished orders of knighthood.

WEYMAN, wā'man, STANLEY JOHN (1855–). An English novelist. He was born at Ludlow, Shropshire, and was educated at Christ Church, Oxford. He was called to the bar in 1881, and practiced until 1889. His first three books, *The House of the Wolf* (1890), *The New Rector* (1891), and *The Story of Francis Cludde* (1891), were followed by *A Gentleman of France* (1893), which established his reputation as an historical Romanticist. It was translated into several languages. Weyman later published, notably: *Under the Red Robe* (1894); *My Lady Rotha* (1894); *Memoirs of a Minister of France* (1895); *The Red Cockade* (1895); *The Man in Black* (1896); *Shrewsbury* (1897); *The Castle Inn* (1898); *Sophia* (1900); *In King's Byways*, 12 short stories (1902); *Abbess of Vlaye* (1904); *Starvecrow Farm* (1905); *Wild Geese* (1908).

WEYMOUTH, wā'mŭth. A town, including several villages, in Norfolk Co., Mass., 12 miles southeast of Boston, on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, F 4). It has the Tufts Library and the Fogg Library. Weymouth is primarily an industrial town, being especially interested in the manufacture of shoes and in wool scouring. Pop., 1900, 11,324; 1910, 12,895; 1915 (State census), 13,969. Thomas Weston came to Weymouth in 1622, but the first permanent settlement was made by Capt. Robert Gorges in 1623. It was here that Thomas Morton of Merrymount was first seized in 1628 by the Plymouth colonists. Until 1635, when it was incorporated, the place was called by its Indian name, Wessagusset. Consult C. F. Adams, *Wessagusset and Weymouth*, published by the Weymouth Historical Society (Weymouth, 1905), and other publications of the Society.

WEYMOUTH, or MELCOMBE REGIS AND WEYMOUTH. A seaport and fashionable watering place in Dorsetshire, England, on a bay at the mouth of the Wey, four miles north of the Isle of Portland, and eight miles south of Dorchester (Map: England, D 6). A fortified point, called the Nothe, separates the old town of Weymouth, lying to the south, and Melcombe-Regis, extending to the north. The two communicate by means of a bridge. The old town is uninteresting in appearance. Melcombe Regis, elegantly built, stands on a narrow peninsula, with the sea on the east, and an estuary on the west side. Its chief features are the sea terrace and an esplanade, over a mile long, adorned with a statue of George III. Ship and boat building, rope and sail making, and brewing are carried on, and there is steam traffic with France and the Channel Islands. The boroughs were united in 1571, and enlarged in 1895. Pop., 1901, 19,831; 1911, 22,324.

WEYPRECHT, vī'prĕkt, KARL (1838–81). A German polar explorer, born near Michelstadt, Hesse. He entered the Austrian navy in 1856, and was promoted for gallantry in the naval action at Lissa (1866). With Payer he explored Barents Sea (1871), reaching the high latitude of 78° 45′ N., 41° E. He commanded (1872–73) the Austro-Hungarian expedition which discovered Franz Josef Land (q.v.). At the meeting of German naturalists at Graz, he proposed (1875) that isolated expeditions for geographical work in polar regions be replaced by concerted scientific work at selected stations. This plan was agreed to at the Hamburg Polar Conference (1879) where the coöperation of 10 nations was assured. Eventually 14 stations were occupied (1881–83) by 11 nations. Weyprecht published: *Die Metamorphosen des Polareises* (1879); *Astronomische und geodätische Bestimmungen der österreichisch-ungarischen arktischen Expedition* (1877); *Praktische Anleitung zur Beobachtung der Polarlichter und der magnetischen Erscheinungen in hohen Breiten* (1881). Consult Littrow, *Karl Weyprecht, Erinnerungen und Briefe* (Vienna, 1881), and A. W. Greely, *Three Years of Arctic Service*, chap. ii (New York, 1886).



WEYR, vīr, RUDOLF VON (1847–). An Austrian sculptor. He was born in Vienna, where he studied under Bauer and Cæsar at the academy. He became widely known through his marble reliefs for the hexedra of the Grillparzer Monument, Vienna (1878), depicting scenes from the poet's dramas. His sense of the decorative and rich imagination found further expression in plastic works for the New Museum, the University, and the Burg Theatre, the latter containing his masterpiece, a frieze in high relief of the "Triumphal Procession of Bacchus and Ariadne." Among his other sculptures in Vienna are several public monuments, particularly that to Brahms, fountains, and excellent portrait statues. In his works sculpture and architecture are skillfully combined, with a preference for the baroque, tempered by a refined sense of beauty.

WHALE (AS. *hwæl*, OHG. *wal-fisc*, Ger. *Walfisch*, whale). Any large marine mammal of the order Cetacea (q.v.), the only essential difference between a whale and a dolphin or porpoise being the size, though the name is more particularly applicable to the toothless or whalebone whales. One of the most widely current errors in zoölogy is the notion that a whale is some kind of a fish. The warm blood, the well-developed brain, the double circulation, lungs, mammary glands, and reproductive organs, combine to show clearly the far higher organization of a whale as compared with even the highest fishes. Their young are born alive, well developed after a long pregnancy, and are suckled and cared for by the mother as in the case of land mammals. Nevertheless, in their extreme adaptation to an exclusively aquatic life, whales have superficial resemblances to fishes—the elongated, tapering body, the finlike limbs, and the termination of the body in a caudal fin, the principal organ of locomotion. The skin of a whale is, however, smooth and without scales, though there are frequently many barnacles and

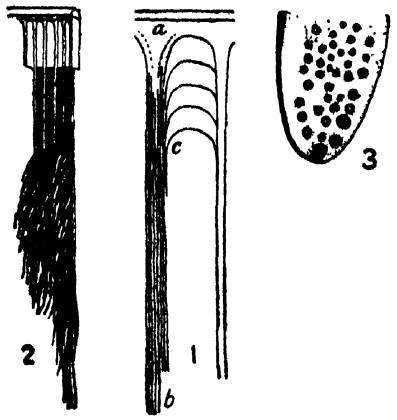
parasitic crustaceans attached to it. The only outgrowths of the skin are hairlike bristles near the mouth, and these are not always present, being rather a characteristic of the young. The fore limbs of whales are supported by the same bones as in other mammals, but are much flattened, and the digits, which have an unusual number of phalanges, are all united in a common skin. The clavicle is wanting, the scapula is very large, and the humerus and forearm bones are very short. The hind limbs are entirely wanting, the only evidence of their ancestral occurrence being a pair of small, slender bones, completely embedded in the body wall and not connected with the backbone, supposed to represent vestigial ischia. The caudal fin, unlike that of a fish, is flattened horizontally, and the two halves, known as flukes, are therefore right and left, not dorsal and ventral as in a fish; this fin is connected with the body by a narrow but extremely muscular part, known as the "small."

The tail serves for locomotion, and is also a most effective weapon of both offense and defense. Most whales have more or less of a dorsal fin on the median line of the back, but it is simply an outgrowth of the integument, and even in those forms where it is most highly developed it has no bony supports. The head of a whale is very large proportionately, in some species as much as one-third of the total length. The eyes are small, as is the ear opening; there are no external ears. The nostrils or nostril (there is often only one) are situated far back from the nose, on the vertex of the head, and are closed by a plug-like valve, which can only be opened by pressure from the inside. The so-called blowing of a whale takes place through the nostrils, and is merely the release of the long-confined moisture-laden breath, which condenses in the cooler air and gives the appearance of a column of water being blown from the nostrils. The idea that a whale takes water in at the mouth and blows it out through the nostrils is baseless, though water may be blown into the air if the breath is released before the animal has quite reached the surface. The mouth is always large, though the œsophagus may be quite narrow. Teeth are wanting in the true whales, but in all other cetaceans they are present, at least in the lower jaw, and in the embryos of true whales they are found well formed about the middle of fœtal life, but they are gradually absorbed and no trace of them exists at birth. The teeth are always simple, with conical or compressed crowns and single roots, and there is only one set, milk teeth not being developed. The number of teeth shows wide variation.

In the toothless whales the roof of the mouth is provided with a large number of vertical horny plates, quite close together, placed transversely on each side, so that there is a bare space in the median line. The outer end of each plate is smooth and hard, but the inner end is frayed out into long bristly fibres, so that the roof of the mouth looks as though covered with hair. (See WHALEBONE.) This whole apparatus serves as a sieve for straining out the minute animals on which these whales feed, the water being taken into the mouth anteriorly and then let run out at the sides of the mouth, between the ends of the baleen plates. The surface water of the ocean swarms with animal life, consisting largely of mollusks of various kinds, with some crustacean material. All this animal life is collectively known by whale fishermen as "brit" and is the only food supply of the toothless whales. Owing to the large size of the mouth, the maxillary and mandibular bones of the skull are greatly elongated, giving the cranium proper a disproportionately small appearance, although it is in reality of relatively good size. There are always seven vertebræ in the neck, but they are crowded close together, are practically immobile, and are more or less fused together into a single piece. The remaining vertebræ are remarkably large, numerous, and freely movable upon each other. There is no union of any of them in the sacral region. All the bones of a whale are spongy, the cavities being filled with oil.



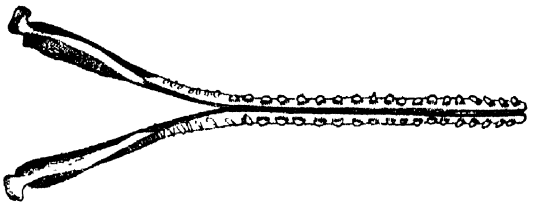
There are many peculiarities in the soft parts of the whales, notably the development of blubber, a layer of fat, consisting of a dense mesh of areolar tissue, with interstices filled with oil. This is an extraordinary nonconductor of heat and maintains the temperature of the body, thus replacing the external coat of hair present in other mammals but wanting in all cetaceans. The salivary glands of a whale are rudimentary or wanting, the stomach is many-chambered and quite peculiar, the intestinal cæcum is wanting or small, the gall bladder is wanting, the larynx has a peculiar shape, the blood system is remarkable for its plexuses, both arterial and venous, the brain is large and round, with numerous and complex cerebral surface convolutions, and the mammary glands are situated far back, one on each side of the female reproductive opening. There is a special arrangement of dilated ducts and compressor muscles, so that the milk can be forced into the mouth of the young one in considerable quantities at a time, by the action of the mother, so that sucking under water is made feasible.

Whales are widely distributed in all parts of the ocean and are frequently gregarious, sometimes occurring in thousands. Some species, however, are generally seen singly or in pairs. A few species appear to be regularly migratory, while others wander almost at will, restricted by no natural barriers. All whales are carnivorous, but only the killers (q.v.) eat other warm-blooded vertebrates. Fishes and squids are the chief articles of diet of the toothed whales, while small mollusks and other invertebrates maintain the whalebone whales. Whales are generally timid, inoffensive animals, active and graceful in their movements and very affectionate towards one another, especially parents and offspring.

Commercially whales are of great importance. Ambergris, spermaceti, whale oil, whalebone, glue, and guano are the principal substances supplied by these animals, although leather is made from the skins of some of the smaller species. Before the discovery of petroleum, illuminating oil was derived almost wholly from whale oil, but kerosene has now entirely supplanted the animal oil. Numerous substances have also been discovered or invented for replacing whalebone, which have proved in some cases superior to baleen itself. This has resulted in an almost complete elimination from the market of Arctic whalebone. Ambergris (q.v.) is only incidentally a product of the whale fishery, but spermaceti is one of the principal productions of the sperm whale. It is a peculiar oily substance, which at the body temperature of the whale is a whitish fluid, but on cooling becomes solidified. After purification by refining it is a

white crystalline substance used largely in pharmacy and in making candles. It is nearly odorless and tasteless.

The study of the anatomy, development, and natural history of whales is attended with unusual difficulties, and the accumulation of large series of specimens in museums is out of the question. It is therefore a matter of question



STRUCTURE OF WHALEBONE.

Below this is shown the elastic substance cementing the plates together, beyond which the plates project free and terminate in a fringe of bristles. 3, transverse section of a portion of a baleen plate showing the area of the tubular cavities of the coarse central fibres, and the outer, denser substance.

whether a given species of whale wanders into all parts of the ocean, and the number of species and their geographical distribution is practically unknown. Not more than 25 well-defined species can be recognized, though nearly three times that many have been named. The classification is based primarily on the presence or absence of teeth after birth, the two suborders Denticete and Mysticete being generally accepted, though under varying names.

The Denticete (Odontoceti, Delphinoidea) include, besides the toothed whales, all those other cetaceans known as dolphins, narwhals, porpoises, killers, etc. The most important whale in this group is the sperm whale (*Physeter macrocephalus*), also called cachalot and spermaceti whale. It has a wide geographical range, occurring in all the important oceans, but it is most abundant off New Zealand, in the Sulu Sea, about the Cape Verde Islands, and off the coast of Japan. It occurs more generally in the tropics and warm temperate seas than elsewhere. The sperm whale reaches a length of 60 feet or more, the female being much smaller than the male. The head is enormous, forming about one-half of the entire bulk of the animal and occupying more than one-third of the length. From the head, the body tapers to the tail, at last rather rapidly. The general color is very dark gray, nearly black on the upper parts, lighter beneath. Old bull whales usually have a large gray spot on the front of the head. The muzzle is obtuse, almost as if squarely cut off in front, the breadth of it almost equaling the thickness of the body. In a protuberance on the upper part of it is the blow hole, which is single, situated a little on the left side, and in form not unlike the letter S elongated. The mouth is large and wide; and the throat, unlike that of the Greenland whale, is very wide, sufficiently so to admit the body of a man. The upper jaw projects some feet beyond the lower, and is destitute of teeth; the lower jaw has from 20 to 25 teeth on each side, varying with individuals. The teeth are conical and slightly recurved, projecting about two inches from the gum. The lower jaw is extremely narrow, the two branches being in contact throughout the greater part of its length; it fits into a groove in the upper, in which are cavities for the teeth. The eyes are small, and placed far back in the head, above the angles of the mouth; the left eye is said to be smaller than the right. Just above the eyes the dorsal line rises considerably; the dorsal fin is also represented by a protuberance about half way between the neck and the tail; and these parts are seen above water in the ordinary swimming of the animal (at the rate of 3 to 7 miles an hour), and just under the surface of the water, though when alarmed it swims with greater velocity. The enormous head of the sperm whale is occupied by an aggregation of numerous small

LOWER JAWS AND TEETH OF A SPERM WHALE.

chambers separated and divided by connective tissue, in front of the cranium and above the upper jawbones, called by whalers the case, which are filled with the spermaceti; sometimes 10 barrels of it occur in a single case. The blubber of the sperm whale is only about a foot thick and is not rich in oil, a large whale yielding about 100 barrels. When aroused these whales are dangerous, and by biting or striking with the tail they can destroy whaleboats, while by using the head as a ram they can sink small vessels. The remaining Denticete are mostly of small size and comparatively little importance. See DOLPHIN; KILLER; NARWHAL; PORPOISE.

The Mysticete (Mystacoceti, Balænoidea) include the true whales, those without teeth. They are nearly all of large size, some of them being the largest of living animals. The largest species is probably the sulphur-bottomed or blue whale (*Balænoptera musculus*), which reaches a length of 90 feet or more, and the weight of which has been calculated to approach 70 tons. Several genera of whalebone whales are recognized, the most important being *Balæna*, to which belong species that supply the most valuable whalebone and oil. The most important species is the Greenland or Arctic right whale (*Balæna mysticetus*), circumpolar in its distribution, but not ranging far to the southward, preferring regions of icebergs and ice floes. It reaches 60 or 70 feet in length. The body is thickest just behind the flippers or pectoral fins, tapering conically towards the tail and slightly towards the head. The tail is 5 or 6 feet long and from 20 to 25 feet broad, formed of two diverging lobes, broadest almost where they are united, but with a slight indentation. The pectoral fins are 8 or 9 feet long and 4 or 5 feet broad. The mouth is 15 or 16 feet long. The eyes, situated on the sides

of the head, about a foot above and rather behind the angles of the mouth, are not larger than those of an ox; but the sense of sight seems to be acute, at least in the water. The blow holes are on the most elevated part of the head, from 8 to 12 inches long, but of comparatively small breadth. The upper parts are velvety black, the lower parts white. The upper parts, in old whales, sometimes become piebald, the black being mixed with white and gray. The period of gestation is uncertain; one young is produced at a birth, and is from 10 to 14 feet in length when born. The mother displays great affection for her offspring, of which whale fishers sometimes take advantage, harpooning the young one—itself of little value—in order to secure the mother. Suckling is performed at the surface of the water, and the mother rolls from side to side, that she and the young may be able to breathe in turn. The usual swimming speed is about 4 or 5 miles an hour, and whales often swim not far beneath the surface of the water, with the mouth wide open to take in food. This whale is capable, however, of swimming with greater rapidity. Its tail is powerful, its single blow sufficient to destroy a large boat. Whales usually come to the surface to breathe at intervals of eight or ten minutes, but may remain under water half an hour or more. When they come up to breathe they generally stay on the surface about two minutes, during which they blow eight or nine times and then descend. The noise which they make in blowing is very loud, and the spout of spray ejected ascends several yards into the air, appearing at a distance like a puff of smoke. They often assume, as if in sport, a vertical position, with the head down, and flap the surface of the water with the tail, making a sound heard two or three miles off. The Greenland whale is not properly gregarious, being generally found alone or in pairs, except when numbers are attracted to particular feeding grounds, as is sometimes the case in the bays and inlets of northern coasts.

A closely related and very important species is the north Atlantic right whale (*Eubalæna glacialis*), with a smaller head, shorter baleen, and a differently shaped under lip. It has 15 dorsal vertebræ and ribs, while the Greenland whale has generally only 12. The southern right whale is found in all temperate seas in both the northern and southern hemispheres, although generally wanting in the tropics, and is not known to occur in the Antarctic Ocean. The right whales of the north Atlantic have been separated from those of the south Atlantic, and both from the Pacific Ocean forms, as distinct species, but the differences are slight. All of the right whales have been, and are still to a certain extent, pursued by whalers, and their numbers have become greatly reduced during the past century; the north Atlantic form is now very rare. The smallest of the whalebone whales is the New Zealand right whale (*Neobalæna marginata*), which reaches a length of only about 20 feet. Other whales are the gray whale (*Rhachianectes glaucus*) of the north Pacific, the baleen of which is very short and coarse; the humpback whales, of the genus *Megaptera*, which are two-thirds as large as the Greenland whale and have black baleen; and the rorquals of the genera *Balænoptera* and its allies. The rorquals (q.v.) are the largest whales and have a distinct and falcate dorsal fin. The pectoral fins are rather small and the skin of the throat is plicated, as is the case with the humpbacks, which, however, have very large pectoral fins. The rorquals are the most abundant and widely distributed of whales at the present time, as it is only recently that they have been sought by the whalers. The fossil remains of whales occur in the Miocene and Pliocene and later strata. See CETACEA.

Whale Fishery. The beginnings of the whale fishery are obscure, but it appears that in the ninth century the Norwegians sent out vessels in their pursuit, perhaps even to Greenland. The Biscayans, however, seem to have been the first to make it a regular commercial pursuit for profit in the sale of oil, whalebone, etc. Between about 1300 and 1500 whaling in the Bay of Biscay and adjoining waters was one of the principal industries of the Basque provinces and Gascony. Whales' tongues were then an important article of commerce, and in 1261 were subjected to a special tax. The Biscayan fishery finally died out through lack of whales, but meanwhile the northern fishery prosecuted by the English, French, Spanish, and Dutch came into prominence. The coasts of Spitzbergen became the centre of a very successful industry carried on mainly by the Dutch, who, it is said, supplied all Europe with oil during the latter half of the seventeenth century. In 1680 they had 260 ships and about 14,000 men employed in the whale fishery, but after that their fishery began to decline. In the eighteenth century Great Britain took the lead, encouraging the sending out of sailing vessels to engage in whale hunting by a generous bounty, the object being quite as much the training of seamen as the development of the whale fishery. The industry was in its most flurishing condition in 1815, when 164 ships were engaged. During the nineteenth century the United States became the great centre of the whale fishery, and is to-day the principal producer of whale products. Nantucket was the original centre of the American whaling industry, and sent her boats to Newfoundland, the Gulf Stream, West Indies, and even as far as the Cape Verde Islands and Brazil. The Revolutionary War paralyzed the industry and many of the interests were transferred to England and France. The whalers ventured into the Pacific in 1787, but the famous Kodiak ground on the coast of Alaska was not discovered until 1835. New Bedford fitted out her first vessel in 1755 and soon became the centre of the industry, for years the greatest whaling port in the world. In 1846 there were 735 vessels engaged in the fishery, valued at more than $20,000,000, and 70,000 people were more or less directly dependent on whaling for their livelihood. With the discovery of the abundance of whales in the Pacific and the growth of San Francisco, that city became a small centre for the whalers, but the universal use of mineral oils and cheap substitutes for whalebone has relegated the whaling industry to a comparatively unimportant place.

The vessels engaged were usually sailing vessels of 300 to 500 tons burden, or screw steamers of somewhat greater tonnage. Each vessel carried from four to seven boats and a crew of 35 to 60 men, each boat requiring at least six. The crew, from captain to cabin boy, had their wages regulated, at least to a certain extent, by the number of whales taken and the amount of oil brought home. Harpoons and lances were at first the only means of capture, but later rifles

with explosive bullets were considerably used. The introduction of prussic acid or strychnine into the body of the whale with the harpoon or bullet has been tried, as it results in a more rapid death for the animal and consequently less danger of loss; but it is said that sailors object to the use of poisons.

When the ship arrived at the whaling ground a lookout was stationed at the masthead. As soon as a whale was discovered, the boats were lowered, and a competition ensued among their crews, all exerting their utmost strength to reach the whale first. The harpooner was ready, as soon as the boat was sufficiently near the whale, to hurl his harpoon with all his force; the crew instantly backed the boat, and the whale generally plunged in terror to a great depth, sometimes carrying out more than 200 fathoms of line. It remained below for 20 minutes or more, and when it rose the boats hastened to it again; it was struck with a second harpoon, and probably, instead of at once descending, it struck violently with its tail, to destroy its enemies. It could not remain long below the surface, and when it came up it often spouted blood through the blowholes if the lungs had been injured. When it was lanced, it sometimes died almost at once, but occasionally there was a terrific struggle—the water was lashed into foam and dyed with blood. It not infrequently happened that, instead of dying at the surface of the water, the whale descended, and did not rise again, so that it was lost to the whaler. The carcass of the whale was towed by the boats to the ship, and made fast to the ship's chains. Should the prize have proved to be a right whale, the process of flensing was then commenced. Some of the crew, having their boots armed with iron spikes, to prevent them from slipping, descended upon the carcass, and cut into the blubber with blubber spades, removing a broad strip or blanket of skin, 20 or 30 feet long, which was hoisted to the deck by means of a hook and tackle. Great cubical pieces of blubber, of half a ton or a ton in weight, were then cut out and hoisted on deck. In this way the process was carried on, the whale being turned over and over, that every part might be reached; till in three or four hours the whole mass of blubber was removed from it—probably amounting to 20 or 30 tons. The remainder of the carcass was then flung adrift, and sometimes sank, but often floated, in consequence of incipient putrefaction. The blubber, after being hoisted on deck, was cut into smaller cubical pieces, and subjected at leisure to a process by which the cellular tissue was separated from it. This is called "making off" or "trying out"; and to accomplish it the blubber was heated in a large pot and afterward strained, the scraps or cracknels from one pot serving as fuel for another, and the ship being made filthy with smoke, soot, and grease. The product was finally stored in casks, to be conveyed home and boiled for oil. A ton of blubber yielded nearly 200 gallons of oil. A single whale has often furnished blubber and whalebone to the value of $3500 or $4000.

The pursuit and capture of sperm whales was not essentially different from that of the right whale, but after their capture the carcass was handled somewhat differently, as the head was the most valuable part. The whale was first secured by the head and then the whole case with the attached blubber was cut away and hauled up beside the vessel and made fast. The contents of the case were then bailed out with a bucket and the spermaceti separated from the oil by cooling. The blanket strips were then removed from the body and the blubber was tried out as in the right whale.

All this is now past history and the modern shore-whaling methods have wholly superseded the old whaling ships. So efficient and wholesale are these new undertakings that there is great danger of the complete extermination of a number of species of whales. The Norwegians first perfected the new ways and means of whaling, but very rapidly they were adopted all over the world and now we find shore stations in southeast Alaska, British Columbia, Newfoundland, Bermuda, South America, Japan, Africa, Russia, and Australia. The harpoon gun insures the death and securing of every whale encountered by the swift ships. If necessary the carcass is inflated with air. It is towed rapidly in to the whaling station, and even before quite out of the water men begin to strip off the blubber. In Japan, where every portion of the whale is put to some use, the wholesome meat is eaten, either fresh or canned, a single whale supplying as much as 80,000 pounds.

Verrill, *The Real Story of the Whaler* (ib., 1915). See Colored Plate of MAMMALS, and Plate of WHALES.

WHALEBACK. The name applied to a type of freight steamer developed on the Great Lakes. The sides of a whaleback are curved in to meet a narrow flat deck several feet above the water line. Circular hatchways rise above this deck and support small deck houses and (in some instances) a flying fore-and-aft bridge. The whaleback is well suited to the lake trade, but the poor accommodations for the crew on long voyages have prevented its general adoption in ocean traffic. The first whaleback to cross the Atlantic was the *Charles W. Wetmore*, of 3000 tons, which made the voyage to Liverpool in 1891. The shape of the whaleback makes it particularly steady at sea, and it is possible that vessels of this type may have increased use in carrying ore and similar heavy cargoes. A modification of the type, called the turret deck, has been brought out in England. The sides are curved inward as in the whaleback, but at about one-fourth the beam from the side they are curved up again to form a narrow superstructure, which extends from stem to stern. A typical lake whaleback passing through the lock at the Sault Ste. Marie Canal is shown on the Plate accompanying the article CANAL.

WHALEBOAT. A rather narrow boat, sharp at both ends and with considerable sheer (i.e., the ends rise considerably above the middle part), which was much used in the whale fishery. These boats are now carried by many vessels in all trades and by men-of-war. They are suitable for nearly all uses at sea and are very generally fitted as lifeboats. The shape of the stern adapts them to use as surf boats or in

rough seas, in which case they are steered with a heavy oar working in a crutch on the stern-post. See BOAT.

WHALEBONE. The baleen plates which take the place of teeth in the mouths of the baleen whales (see WHALE) constitute the whalebone of commerce. They vary in length from a few inches up to 10, and even in rare instances 12 feet. Chemically they consist of albumen hardened by a small proportion of phosphate of lime. Their color is usually of a bluish black, but in some species they are striped longitudinally with bands of a whitish color; and they terminate at the point in a number of coarse black fibres of the baleen, which fibres are also found more or less down both sides of the blade. These fibres are used by brush makers. Whalebone before being fit for use is first trimmed, i.e., all the hairs are removed from the point and edges of each blade; and generally the surface of each flat side is scraped, the shavings being used for pillows and mattresses. The blades are then boiled in water or heated in steam for several hours, until they become soft enough to be cut with a common knife. The workman then cuts them into lengths fitted for the purposes to which they are to be applied. They were formerly extensively used in thin strips, in corsets and waists, and even for umbrella ribs, but within recent years steel rods have been largely substituted in these manufactures, while gutta percha, celluloid, featherbone, and similar compositions are used in dressmaking.

WHALEHEAD. See SHOEBILL.

WHALING INDUSTRY. See MERCHANT MARINE; WHALE.

WHALLEY, hwŏl'ĭ, EDWARD (?–c.1678). An English regicide, born in Nottinghamshire. He fought with distinction under his cousin, Oliver Cromwell, in the Civil War, and afterward acted as custodian of the King. He served in the Second Civil War under Fairfax, was one of those who signed the King's death warrant, and was wounded in the battle of Dunbar. Afterward he assisted Lambert in defeating Ker at Hamilton, and also participated in the battle of Worcester. On Aug. 13, 1652, he presented to Parliament the petition of the army. When the Restoration came, he, as one of the regicides, fled, in company with his son-in-law, Major General William Goffe (q.v.), to Boston. In 1661 they removed to New Haven and in 1664 to Hadley. Several attempts were made by the home government to secure their arrest, but all were unsuccessful. Consult Ezra Stiles, *History of Three of the Judges of King Charles I* (Hartford, 1794).

WHALSAY, hwŏl'sĭ. See SHETLAND ISLANDS.

WHANG-TI. An old spelling of Hwang-ti (q.v.).

WHARF (AS. *hwerf*, breakwater, Icel. *hvarf*, shelter, OSwed. *hvarf*, shipyard). In law, a structure on the bank or margin of navigable waters to which vessels can be moored and from which they may be loaded and unloaded. On the Western rivers in the United States it is common to build wharf boats which are moored to the banks of the river, and which are always accessible at any stage of the water. This is rendered necessary by the fact that such rivers are subject to great freshets and extremely low water at different seasons of the year.

Owing to a doctrine of the common law that the soil of tide waters between high and low water mark belongs to the State, a riparian owner along such waters cannot establish a wharf without permission from the State, as such a structure would otherwise constitute a public nuisance. The State may grant to a city the permission to establish wharves upon its water front, as was done by the State of New York to the city of New York. In such cases a city may be authorized by the Legislature to condemn lands for the erection of public wharves, the revenue from which shall be paid into the city treasury. The number of public wharves, their locations, and the rates of wharfage which may be charged are fixed and regulated by statutes in most of the United States.

WHARF'AGE. A sum paid for the privilege of mooring a vessel to a wharf and loading or unloading her cargo, or for the storage of goods thereon before or after shipment. Wharfage may be charged for mooring a vessel to a natural landing. In most States the rates of wharfage are fixed by statute, and are a lien upon goods which remain in the possession of a wharfinger, and also upon vessels moored to a wharf if the charges are made for that privilege. Such a lien on a vessel may be enforced in courts of admiralty, and the vessel detained in the custody of a United States marshal unless the charges are paid.

WHARF'INGER (for **wharfager*, with epenthetic *n*, from *wharfage*). The owner or keeper of a wharf. The responsibility of a wharfinger for goods in his care is practically that of a bailee. He is only liable to exercise reasonable and ordinary care and diligence for the protection of goods left with him. His responsibility begins when the goods are delivered at the wharf, and ends only when they are delivered to a person duly authorized to receive them. See WHARFAGE.

WHARTON, hwar'ton. A borough in Morris Co., N. J., 20 miles west of Paterson, on the Rockaway River, on the Morris Canal, and on the Delaware, Lackawanna and Western, the Central of New Jersey, the Mount Hope Mineral, and the Wharton and Northern railroads (Map: New Jersey, C 2). There are iron mines, blast furnaces, silk mills, and army and navy arsenals, manufacturing powder. Pop., 1900, 2069; 1910, 2983.

WHARTON, ANNE HOLLINGSWORTH (1845–). An American writer, born at Southampton Furnace, Pa. She was educated at a private school in Philadelphia, devoted herself chiefly to the study of the social history of the Colonial and Revolutionary periods of the United States, wrote a number of entertaining books and magazine articles in this field, and was chosen historian of the National Society of Colonial Dames of America. Her publications include: *St. Bartholomew's Eve* (1866); *The Wharton Family* (1880); *Through Colonial Doorways* (1893); *Colonial Days and Dames* (1894); *A Last Century Maid* (1895); *Life of Martha Washington* (1897); *Heirlooms in Miniatures* (1897); *Salons Colonial and Republican* (1900); *Social Life in the Early Republic* (1902); *An English Honeymoon* (1908); *In Château Land* (1911); *A Rose of Old Quebec* (1913); *English Ancestral Homes of Noted Americans* (1915).

WHARTON, EDITH (NEWBOLD JONES) (1862–). An American novelist who, alike by her short stories and her novels, took a foremost place among the writers of her day and country. She was born in New York and was educated at home. In 1885 she married Edward Wharton

of Boston. Her first book, *The Greater Inclination*, a collection of short stories notable for their clean-cut brilliance and finished artistry, appeared in 1899, to be followed by two other volumes of short stories—*Crucial Instances* (1901) and *The Descent of Man and Other Stories* (1904)—which fairly represent her success in this literary kind. Among her novels, *The Valley of Decision* (1902), *The House of Mirth* (1906), *Madame de Treymes* (1907), and *The Fruit of the Tree* (1907), are in different ways typical. From her pen came also: *The Touchstone* (1900); *Italian Villas and their Gardens* (1904); *Italian Backgrounds* (1905); *The Hermit and the Wild Woman* (1908); *A Motor Flight Through France* (1908); *Tales of Men and Ghosts* (1910); *Ethan Frome* (1911); *The Reef* (1912); and *The Custom of the Country* (1913). In 1915 she wrote *Fighting France, from Dunkerque to Belfort*, and edited *The Book of the Homeless*, to which notable writers and illustrators contributed in order to aid the Belgian refugees whom the German invasion had brought to want. In other ways she did much for sufferers from the great war in 1916, being rewarded by the cross of the French Legion of Honor. She maintained a residence in Paris.

As a novelist Mrs. Wharton's point of view is that of the cultured class with a wide social experience in the more exclusive circles at home and abroad. The people she presents in her novels are mainly from the artistic and literary worlds, or from the world of wealth and fashion; and her backgrounds—such as would be expected from her choice of characters—are faithfully and vividly painted, and often in circumstantial detail. It was with *The House of Mirth* that Mrs. Wharton most impressed the public of her day, and that novel, in point of characterization, and as a finely executed picture of a phase of American society, has strong claims to rank as her most notable achievement in fiction. Consult: H. D. Sedgwick, *The New American Type, and Other Essays* (Boston, 1908); Hildegard Hawthorne, *Women and Other Women* (New York, 1908); F. T. Cooper, *Some American Story Tellers* (ib., 1911); J. C. Underwood, *Literature and Insurgency* (ib., 1914).

WHARTON, Francis (1820–89). An American jurist, born in Philadelphia. After graduating at Yale College in 1839, he practiced law in Philadelphia until 1855. He was professor of English literature, jurisprudence, and history at Kenyon College (Gambier, Ohio) from 1856 to 1863, when he was ordained in the Protestant Episcopal Church and accepted a rectorate at Brookline, Mass. In 1866 he was called to the chairs of ecclesiastical and international law at the Episcopal Theological School in Cambridge and Boston University. From 1885 he was counsel to the United States Department of State and examiner of international claims, and in 1888 was made editor of the Revolutionary diplomatic correspondence of the United States. This work, in course of publication at the time of his death, superseded Sparks's *Diplomatic Correspondence of the American Revolution*. His best-known original work is *A Treatise on the Criminal Law of the United States* (1846), which was long standard. Among his other valuable legal writings are: *State Trials of the United States During the Administrations of Washington and Adams* (1849); *A Treatise on the Law of Homicide in the United States* (1855); *A Treatise on the Conflict of Laws, or Private International Law* (3d ed., 1905); and various commentaries. He also wrote *A Treatise on Theism and Modern Skeptical Theories* (1859) and *The Silence of Scripture* (1867). Under his editorship was published in 1886 *A Digest of the International Law of the United States*, a work of great value, "taken from Documents issued by Presidents and Secretaries of State, and from Decisions of Federal Courts and Opinions of Attorneys General."

WHARTON, Thomas, first Marquis of (1648–1715). An English statesman, son of Philip, Baron Wharton, the Puritan statesman, and born at Woburn, Bedfordshire. His interest in politics was not marked till 1679, when he urged the Exclusion Bill (q.v.). He was suspected of complicity with Monmouth and was certainly most active in arranging for the reception of William, Prince of Orange, in 1688. The preceding year he composed the satirical ballad "Lilli Burlero, Bullen-a-la," by means of which, as he used to boast, he had sung a king out of three kingdoms. On the accession of William he was rewarded by numerous lucrative offices. In 1702, at the accession of Anne, he was removed from office, but by clever intriguing and the liberal use of money within the next few years he became one of the leaders of the Whig party. After June, 1706, he was a member of the Whig Junto, Halifax, Oxford, Somers, and Sunderland. In 1708 he was made Lord Lieutenant of Ireland, and held the post two years. For part of this time Joseph Addison was his secretary. Wharton was the shrewdest party manager of his day and a sincere if not disinterested Whig. Consult *Memoirs of the Kit-Kat Club* (London, 1821), and Leopold von Ranke, *History of England*, vols. iv, v, and vi (Eng. trans., Oxford, 1875).

WHARTON, Thomas (1735–1778). An American patriot, born in Chester Co., Pa. Upon the news of the passage of the Stamp Act in 1765 he joined in the nonimportation movement; became a member of the Committee of Correspondence in 1774; and was one of the 25 members of the Committee of Safety in 1775. On July 24, 1776, he was chosen president of the Council of Safety, and from 1777 until his death was President of Pennsylvania.

WHAT'COAT, Richard (1736–1806). A Methodist Episcopal bishop. He was born in Quinton, Gloucestershire, England, and entered the Wesleyan Conference in 1769. He was sent to America with Coke in 1784 to aid in forming the Methodist Episcopal church. In 1800, the health of Bishop Asbury being poor, Whatcoat was elected to assist him. Consult Phoebus, *Memoirs of Bishop Whatcoat* (New York, 1828).

WHATELY, hwāt'lĭ, Richard (1787–1863). An English prelate and scholar. He was born in London, and after some years at a private school, educated at Oriel College, Oxford, where he took his degree in 1808. He took the English essay prize in 1810, and a year later won the blue ribbon of Oxford scholarship of that period, being elected a fellow of Oriel, a member of the brilliant society adorned by Arnold, Pusey, Keble, and John Henry Newman. In 1819 he published his first book, *Historic Doubts About Napoleon Buonaparte*, in which he endeavored, with a success popular rather than scientific, to show that Hume's doubts in regard to miracles had equal force with reference to the existence of Napoleon. In 1822 he took the living of Halesworth, in Suffolk, and delivered the Bampton

lectures at Oxford, on "The Use and Abuse of Party Feeling in Religion." He was appointed principal of St. Alban Hall, Oxford, in 1825. About this time he wrote for the *Encyclopædia Metropolitana* articles on logic and rhetoric, which were also published in separate form, *Elements of Logic* (1826), and *Elements of Rhetoric* (1828). He became professor of political economy in 1829, but in 1831 left Oxford for good with his elevation to the Archbishopric of Dublin. In this post he was active in all matters of ecclesiastical and social importance, and showed a deep interest in every question affecting the welfare of Ireland. The success of the national system of education there was in large measure due to him. He belonged to the liberal school both in religion and in politics; but his ability and conscientiousness were admitted even by those who differed most widely from him on such burning questions as catholic emancipation or the doctrine of the atonement. In addition to the works named above, Whately published *Introductory Lectures on Political Economy* (1831); *Essays on Some of the Peculiarities of the Christian Religion* (1825); *Thoughts on Secondary Punishments* (1832); *The Search After Infallibility* (1847); and the *Kingdom of Christ Delineated* (1841). Consult: E. J. Whately (his daughter), *Life and Correspondence* (new ed., 2 vols., London, 1875); W. J. Fitzpatrick, *Anecdotal Memoirs of Richard Whately* (ib., 1864); Tuckwell, *Pre-Tractarian Oxford* (1909).

WHAT YOU WILL. A comedy by John Marston, written about 1601, printed in 1607.

WHAUP. See CURLEW.

WHEAT (AS. *hwæte*, Ger. *Weizen*, wheat, from AS. *hwit*, Goth. *hweits*, OHG. *wīz*, Ger. *weiss*, white). The best known and most valuable of all cereal crops. Under the name wheat are included nearly all the forms of the genus *Triticum* producing seeds, or grain used for human food. Its original home is unknown, but evidence seems to indicate that it is probably a native of western Asia. The cultivation of wheat antedates history, as the most ancient monuments show that at their erection it had been domesticated. The ancient Egyptians and Greeks attributed its origin to some of their deities, among them to Demeter (Latin, Ceres), goddess of agriculture. It was cultivated as early as the Stone Age by the lake dwellers of Switzerland, and in China, where it was considered a direct gift of heaven, it was grown 2700 years before the Christian Era. It is one of the five species annually sown by the Chinese in a public ceremony. Wheat was not grown in America prior to Columbus's discovery. The hypothesis that cultivated wheat was a modification of *Ægilops ovata*, a grass of the Mediterranean regions and of western Asia, led to studies in Europe from about 1840 to 1860 which showed that while this wild grass underwent considerable change when cultivated for a series of years, and that the blossoms would be fecundated with wheat pollen, there was neither evidence nor indication that this grass could ever have been developed into wheat. Although none of the various species of wheat known to agriculture is found in a wild state, some botanists consider that the species of one-grained wheat (*Triticum monococcum*) has a wild representative which occurs in the Balkan region. It was an important crop in ancient Egypt and Palestine, and continues to be most important in our own days in all temperate parts of the globe. It is cultivated to a considerable extent in India, and vast areas in the United States and Canada are admirably adapted to it. Wide regions in South America are equally suitable, and wheat of fine quality is produced in Australia. In the torrid zone it does not succeed except in elevated situations, and although extensively grown in some cases in warm climates, as in California, Egypt, and India, the greater part of the world's supply is obtained in regions of cold winters.

Wheat is a hardy plant and is successfully cultivated from 39° to 60° north lat., and from the Tropic of Capricorn to 40° south lat. Its cultivation does not extend so far north as that of barley, oats, or rye. It requires a mean temperature of at least 55° F., for 3 or 4 months of the year. As it is an annual, its capacity of enduring the cold of winter is of importance only in connection with growing winter wheat, which is sown in the fall. The quality of the grain varies in different soils and climates, and particular varieties are distinguished by differences in quality as well as by external characters. Wheat grown in comparatively dry climates is superior in quality to that grown in humid regions. Dry weather with bright sunshine from the time the plants begin to head until they are ripe is everywhere of the greatest importance. The different varieties are classified by farmers as spring and winter wheats, bearded and beardless or bald varieties, soft and hard wheats, and also according to the color of the grain, as red, white, amber, etc. In consequence of long cultivation in various climates and on different soils, the varieties of wheat are very numerous and new varieties are continually coming into notice.

Botanists have classified the cultivated varieties of the genus *Triticum* into eight species and subspecies. The most important, *Triticum vulgare*, comprises the common bread wheats, by far the most valuable and widely distributed, containing more varieties than all other species put together. This species includes soft and hard winter wheats, hard spring wheats, white wheats, and early wheats. The soft winter wheats are grown in the eastern United States, western and northern Europe, Australia, Argentina, and in portions of Asia. The hard winter wheats are produced in the Rocky Mountain and the Mississippi River regions of the United States, in southeastern Europe, and western Asia. These are usually grown on good black soils in regions of hot and dry summers. The hard spring wheats are distributed over the northern portion of the great plains in the United States, in western Canada, eastern Russia, and western and southern Siberia. The white wheats are cultivated along the Pacific coast in both North and South America, in Australia, and western Asia. The early wheats occur in the southern United States, Australia, India, and Japan. Only a few varieties are grown in the United States. The club or squarehead wheats are by some botanists named *Triticum compactum*, but are generally considered only a subspecies. The heads of this group are generally short and frequently square. Club wheats are grown chiefly along the Pacific coast, and in Turkestan, Abyssinia, and in scattered districts of Europe. *Triticum turgidum*, or poulard wheat, is a subspecies of *Triticum vulgare*, distributed in the Mediterranean and the Black Sea regions. Some varieties of this group

are used in making macaroni, and are sometimes mixed with the bread wheats in the manufacture of flour. *Triticum durum* is similar to *Triticum turgidum*, and, like it, a subspecies of *Triticum vulgare*. They are the hardest-grained of all the wheats grown, and are popularly known as the durum or hard wheats. They are specially valuable for the manufacture of macaroni. They are cultivated in the Mediterranean and Black Sea regions, the northern Great Plains region of the United States and to some extent in Mexico, Chile, and Argentina. Durum wheats were effectively introduced into the United States by the Department of Agriculture in 1898 and have since then become an important crop in parts of the semiarid region. *Triticum polonicum*, or Polish wheat, is a distinct species, similar in quality to *Triticum durum*, but less frequently cultivated. *Triticum spelta*, or spelt, although very different from the preceding groups, is considered a subspecies. Its striking characteristic is that the chaff adheres to the grain and is not removed in threshing. Spelt is grown in central and southern Europe, and to a small extent in America. Emmer (*Triticum dicoccum*) resembles the preceding group and is often erroneously called spelt, from which it differs mainly in the compact heads and harder grain of a deeper red color. Its distribution is about the same as that of spelt. *Triticum monococcum*, or Einkorn, is a very distinct species. The spikelets of this species usually have but one grain. It is grown to a limited extent in central and southern Europe.

Wheat requires a fertile and well-prepared soil. The fact that it makes a poor growth on light, humid, and acid soils shows the necessity of fertility and proper drainage. The most favorable soils are permeable and deep, a little clayey and of medium fertility. Gravelly and sandy soils are not suited to it. The crop grows well on alluvial soils, and on most soils which may be classed as heavy but which do not possess great tenacity. Since young wheat plants are injured by the heaving of the soil due to the action of frost, perfect drainage is essential. Rolling the land before sowing winter wheat leaves the soil in a drier condition and thus minimizes the action of frost. Although the character of the soil mainly affects the yield, and the character of the climate the quality, friable, fertile, calcareous soils produce a softer, plumper, and starchier grain than a less fertile, light, clayey soil. This latter class of soils has a tendency to produce elongated, hard, glutinous grains, or a wheat having the qualities of a good bread wheat. The preparation of the land for winter wheat consists in plowing the soil about four or five inches deep as early in the season as possible, to allow it to become somewhat compact before seed is sown. This is sown broadcast or in drills. When broadcast, usually with machines for the purpose, it is harrowed in. Drilling, however, is the most popular method and has the advantage of evenly distributing the seed and covering it at a uniform depth. The drill leaves the soil in small ridges, which tend to hold the snow and protect the soil to a certain extent against the alternate thawing and freezing so injurious to the crop. Spring wheat is usually grown on fall-plowed land, and in the United States also frequently follows a corn crop without plowing the soil. It is generally sown as soon as the soil is capable of being worked in the spring. Since wheat grows best and makes most of its growth during the cool part of the year, it should be sown as early as conditions will permit. A moist soil at sowing time, provided it is not so moist that it cannot be properly worked, is the desirable condition. Where wheat follows a corn crop (maize) without an intervening plowing of the soil, it is sown broadcast among the corn stalks and the field then cultivated with a disk harrow or a corn cultivator and the surface smoothed down by repeated harrowings. The corn stalks are either cut into short pieces with a stalk cutter or are simply broken down by means of the harrow or other implement to facilitate seeding and harvesting.

Wheat is generally harvested before it has become dead ripe in order to prevent the grain from shattering. In California, however, where this precaution is not so necessary, wheat is often left standing for a week or more after it is ripe enough for cutting. The time of harvesting, like the time of sowing, varies with the latitude. In the United States the harvest begins in Texas early in May and ends in some of the northern States in August. Harvesting is usually done with the self-binder, although where labor is cheap the reaper is still largely used. After the grain has been bound into sheaves it is set up into shocks for protection against rain and to dry and cure. When the work of cutting and shocking is done the crop is either threshed directly from the field or the sheaves are hauled and stacked, remaining so until threshing time. The principal point to be observed in building a stack is that the sheaves, especially the outer tier, must have an outward slant in order to shed the rain. In some countries, as those of Europe, the stacks are built with great care and the grain is frequently not threshed until the following spring. In the United States threshing is usually completed in the fall. In sections of the United States where wheat is grown on an extensive scale the grain is often harvested with headers, or machines which cut the grain just below the head. Some of these machines cut the heads and thresh out the grain at the same time. At the present day wheat is threshed with improved and perfected machines operated by horse or other power. The old method of flail threshing is now even less common than hand sowing. In Europe, where the straw represents a greater value than in the United States, machines are used which thresh the heads, but allow the straw to pass through straight and be rebound into sheaves for more convenient storage.

In the United States the place of wheat in the rotation is generally after corn, since corn leaves the soil in clean condition. Where wheat is sown without previously plowing, it necessarily follows corn. The method of sowing wheat among the corn stalks and working it in with cultivator and harrow is practicable only on comparatively new soils or lands in a very good condition. It is largely practiced in regions newly opened up to cultivation. In Europe wheat is preferably grown after clover. In the eastern United States the use of commercial fertilizers in wheat growing is quite common, but in the western part of the country fertilizers are generally not applied. Barnyard manure is rarely applied directly to wheat, but usually to a preceding corn crop.

The wheat crop of the world amounts to about 4,000,000,000 bushels, of which Europe supplies

nearly one-half. The total crop of the United States in 1915 was 1,011,505,000 bushels produced on 59,898,000 acres, the average yield per acre being 16.9 bushels. This was the largest crop produced up to that time. The chief wheat-growing States and their production in 1915 were: North Dakota, 151,970,000 bushels; Kansas, 106,538,000 bushels; Minnesota, 73,420,000 bushels; Nebraska, 72,154,000 bushels; and South Dakota, 63,762,000 bushels. Illinois and Washington produced over 50,000,000 bushels, and Indiana and Ohio over 40,000,000. The progress of wheat cultivation in the western States was extremely rapid during the latter part of the nineteenth century, owing to the influx of settlers into new regions. In 1821 the total exports of wheat from the United States were valued at $178,314, and of wheat flour at $4,298,043; in 1900 at $73,237,080 and $67,760,886, respectively, and in 1914, $87,953,456 and $54,454,175. In the calendar year 1915 exports of wheat amounted to $282,457,092 and of flour $96,201,234. Great Britain, Germany, France, Austria-Hungary, the United States, and Russia rank in yield per acre in the order mentioned. In total yield the United States leads all other countries.

The most common diseases to which wheat is subject are rust (*Puccinia graminis*), stinking smut, or bunt (*Tilletia fœtens*), and black or loose smut (*Ustilago tritici*) (see RUST; SMUT; FUNGICIDE, and Plate of FUNGI, TYPES OF), and the most common insect enemies are the chinch bug and the Hessian fly (qq.v.).

Food Value. The wheat grain consists mainly of a large starchy mass surrounding an embryo and surrounded by six layers of tissue, known to the miller as bran, which forms about 13 per cent of the seed by weight. The innermost layer of the bran, averaging about 8 per cent of the entire seed, contains cerealin or aleurone, a nitrogenous substance. The bulk of the seed within this layer consists of starch, nitrogenous substances (especially gluten) and fat. Wheat flour of various sorts is used almost universally for making bread and various kinds of pastry. From wheat rich in gluten, macaroni and other Italian pastes are made. These are common articles of diet in most countries, and staple articles in some, notably Italy. In recent years the consumption of breakfast foods made from wheat has increased very greatly. In some of these the grain is more or less finely ground; in others it is rolled or flaked. Some of these foods are cooked in the process of manufacture. Cereal breakfast foods are also made from the parched grain. The average composition of wheat and some of its products is shown in the following table:

TABLE I. COMPOSITION OF WHEAT, FLOUR, BREAD, AND OTHER PRODUCTS

	Water	Protein	Fat	CARBOHYDRATES		Ash
				Starch, etc.	Crude fibre	
Average values	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*

Flaked wheat breakfast food	8.7	13.4	1.4	74.3		2.2
Macaroni	10.3	13 4	0.9	74.1		1.3

As shown by analyses, the different sorts of flour do not vary very greatly when ground from the same lot of wheat, although the amount of mineral matter and protein is somewhat larger in the whole wheat and Graham flour than in the higher grade flour. Digestion experiments with healthy men have shown that the fine-flour bread is more digestible than the breads made from the coarser grain. The average coefficients of three sorts of bread made from flours ground from the same lot of wheat, obtained experimentally by Snyder, are stated in Table II.

It has been calculated that wheat flour bread and crackers, pastry, and similar products constitute 19 per cent of the total food of the average American family, furnishing about 27 per cent of the total protein, 6 per cent of the total fat, and 46 per cent of the total carbohydrates. They contain a high percentage of

starch and may be profitably combined with materials rich in protein, meat, eggs, etc., to form a well-balanced diet. Many foods contain minute amounts of physiologically active substances, to some of which the name vitamines has been given. Vitamines are found in the outer layers of cereal grains, and so it comes about that, to prevent illness, the grain products containing the outer layer should be used, unless the diet is abundant and varied, in which case any lack of vitamines in the grain food will be made up from vegetables, eggs, and other foods.

Wheat is ordinarily so valuable for human food that it is not used for feeding farm animals. But when the crop is very abundant and the market value correspondingly low, it may be profitably fed. Several milling products of wheat, such as bran, shorts, and middlings, are important feeding stuffs, as are also various by-products obtained in the manufacture of wheat breakfast foods. Wheat straw is a well-known feeding stuff, and is also used for bedding. The unthreshed wheat is sometimes fed under the name of sheaf wheat. The green wheat is occasionally cut and cured as hay. Shrunken or damaged wheat is very often more valuable as a feeding stuff than for marketing, while wheat screenings (inferior grains and weed seeds) are also fed. The average composition of winter and spring wheat and several wheat products is shown in the following table:

TABLE II. COEFFICIENTS OF DIGESTIBILITY OF BREAD OF DIFFERENT SORTS

	Protein	Fat	Carbohydrates	Energy
	Per cent	*Per cent*	*Per cent*	*Per cent*
White bread (standard patent)	85.3	56.4	97.5	90.1
Entire-wheat bread	80.4	55.8	94.1	85.5
Graham bread	77.6	58.0	88.4	80.7

TABLE III. COMPOSITION OF WHEAT AND WHEAT PRODUCTS

	Water	Protein	Fat	Nitrogen-free extract	Crude fibre	Ash
	Per cent	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*

Wheat straw	9.6	3.4	1.3	43.4	38.1	4.2

A great advance has been made in the chemistry of wheat, particularly its protein, to which Osborne and his associates have made especially noteworthy contributions.

As regards composition, wheat grain is very nutritious. It contains somewhat more starch, less fat, and more protein than corn, and thus is a better balanced feeding stuff. Winter and spring wheat do not differ materially in composition. Low-grade flour of dark color and not very satisfactory for baking has a high feeding value, especially for growing pigs, hard-worked horses, and milch cows. Stale bread is sometimes fed to farm animals. The terms "middlings" and "shorts" are often used interchangeably. Occasionally shorts consist of reground bran, almost free from floury particles, with the sweepings and dirt of the mill added. Such material is very inferior for stock and should not be used. Good middlings do not have a very high content of crude fibre and are especially useful for feeding pigs and horses. For the latter, middlings should be mixed with corn meal, oats, or other feeding stuffs, as this material is rather concentrated. Digestion experiments with middlings have shown that about 75 per cent dry matter, 80 per cent protein, 33 per cent crude fibre, and 81 per cent nitrogen-free extract are digestible. Bran contains a high percentage of crude fibre, and in this respect somewhat resembles straw. Although it contains considerable nutritive material, it is given by many horsemen only as an occasional food. It is especially useful for feeding dairy cows, as it gives the desired bulk to the ration and supplies a considerable amount of protein and ash, which are needed for the production of milk. Digestion experiments have shown that on an average about 62 per cent of the total dry matter, 78 per cent protein, 29 per cent crude fibre, and 69 per cent nitrogen-free extract, of wheat bran are digestible. See Plate of CEREALS.

See FLOUR; MACARONI; PLOW, PLOWING; REAPERS, REAPING; ETC.

WHEATEAR' (variant of *white ear*, corrupt supposed singular of *whitearse*, in allusion to its white rump; influenced by popular etymology with *wheat* + *ear*). A small European migratory song bird (*Saxicola* or *Œnanthe œnanthe*) of the thrush family, which now and then occurs on the north coasts of Asia and America. Its colors are gray, black, and white, with the under parts buffy. Its form is slender and its wings and legs are long. It is terrestrial in habits, and feeds on worms and insects. The

wheatear makes its nest in an old wall, or in a crevice of a quarry or gravel pit, often in a deserted rabbit burrow, and generally lays six pale-blue eggs. The male has a pleasant but not loud song, and sings well in confinement, in winter as well as in summer.

WHEAT GRASS. See AGROPYRON.

WHEAT INSECTS. In Europe 53 species of insects are recorded by Kaltenbach as feeding upon wheat; in North America the number is much larger. Except the chinch bug and the Hessian fly (qq.v.), which are the most dreaded, the following are the most important species.

The wheat midge (*Diplosis tritici*) was probably imported into the United States from Europe, first into the Province of Quebec, spreading gradually through the New England States into New York and westward throughout the Mississippi valley. The orange or yellow adult insect, which appears in early summer and is one-tenth of an inch long, lays small and pale-red eggs singly or in clusters in the crevices in the wheat heads, from the kernels of which the small orange-yellow larvæ extract the milky juice, causing the grain to shrivel and the heads to blight. When full grown the larvæ, which live about three weeks, descend to the ground and form small cocoons, in which they hibernate. Deep plowing of wheat fields and the prompt burning of chaff and screenings after threshing are the best remedies.

The joint worm of wheat (*Isosoma tritici*), a true gall insect of the family Chalcididæ, most species of which are parasites, is a small, black, four-winged fly, a little over an eighth of an inch long. Its eggs are laid in the wheat stalk, where the larvæ produce little oblong galls, usually in groups of three or four at or near the joints. (See JOINT WORM.) The wheat straw worm (*Isosoma grande*), a close relative which produces no galls, but lives on the inner surface of the stems, is of great interest, since it has an alternation of the generations, the sexual generation being wingless and rather small and the summer generation large, winged, and composed entirely of parthenogenetic females. Burning the stubble during the fall or winter is recommended as a control for both these species. Several species of plant lice are occasionally found upon wheat; the wheat plant louse (*Nectarophora cerealis*), probably a European species, is frequently troublesome.

The wheat bulb worm (*Meromyza americana*) is, in the adult stage, a small, greenish, black-striped fly of the family Oscinidæ, which also attacks other cereals, timothy, and the blue grass throughout the wheat belt, where it develops three or more generations annually. The flies lay their eggs upon the young plants, and the pale-green maggots work their way down to the crown and feed upon the central part of the stem, cutting it off and causing the central blade to wither. Prompt burning of the straw and stubble after harvest and rotation of crops are recommended. The army worm and the grass worm (qq.v.) are dangerous enemies of the wheat crop, and there are several sawflies which do a lesser amount of damage. The principal European insect enemies of the crop are the frit fly (*Oscinis frit*), the Hessian fly, the wheat midge, and a stem borer—one of the sawflies (*Cephus pygmæus*) just mentioned, which appears as an adult in April and deposits eggs in the stems of young wheat. The larvæ bore through the joints and work up and down the stem, and when full grown cut and almost saw the straw circularly on the inside near the ground, forming a cocoon in which they pass the winter as larvæ, transforming to pupæ and issuing as adults the following summer. This insect has been imported, and is known in Canada and New York, but is rather scarce and does little damage; in Europe it is ranked as one of the principal enemies.

Stored wheat suffers from the attacks of several insects. The granary weevil, the rice weevil, the Angoumois grain moth, the wolf moth, the Mediterranean flour moth, the Indian meal moth, the meal snout moth, and several species of flour beetles and meal worms, as well as certain of the grain beetles (see GRAIN INSECTS), feed upon wheat in storage and after it is ground. The remedies for all of these insects are practically identical, and comprise cleanliness and the treatment of bins or establishments with the vapor of bisulphide of carbon, or with hydrocyanic acid gas, both of which, however, should be applied with great care, and in accordance with specific rules laid down by economic entomologists.

Consult F. H. Chittenden, *Some Insects Injurious to Stored Grain* (Washington, 1897), and C. L. Marlatt, *The Principal Insect Enemies of Growing Wheat* (ib., 1901).

WHEAT'LEY, HENRY BENJAMIN (1838–). An English scholar and bibliographer, born at Chelsea, London. For the Early English Text Society (q.v.), of which he became honorary secretary, he edited Alexander Hume's *Of the Orthographie and Congruitie of the Britain Tongue* (1865), the prose romance of *Merlin* (1865–69), the *Manipulus Vocabulorum* of Peter Levins (1868); and he edited Wraxall's *Historical and Posthumous Memoirs* (5 vols., 1884); *Pepys's Diary*, including *Pepysiana* (9 vols., 1893–99), his most important work, and *Diary and Correspondence of John Evelyn*, with a life (4 vols., 1906). He also published *Samuel Pepys and the World he Lived in* (1880); *Story of London* (1904); *Hogarth's London* (1909).

WHEATLEY, PHILLIS (c.1753–84). An American negro poet, born in Africa. She was brought to the United States in 1761 and purchased by John Wheatley, of Boston. He had her well educated, and she soon showed remarkable intellectual quickness. When still a girl, she wrote many verses, and in 1773, a year before she visited England, her *Poems on Various Subjects, Religious and Moral, by Phillis Wheatley, Negro Servant to Mr. John Wheatley, of Boston, in New England*, were published in London with the indorsement of several distinguished men. She was made much of by the Countess of Huntingdon's set, and in America drew forth a complimentary letter from Washington. Of real poetic ability she was destitute. In 1775 the family to which she belonged was broken up, and three years later she made an unfortunate marriage with a colored man named John Peters. There were at least four posthumous editions of her poems, and her letters were printed in 1864 at Boston in *Proceedings of Massachusetts Historical Society*.

WHEAT'ON. A city and the county seat of Du Page Co., Ill., 25 miles west of Chicago, on the Chicago and Northwestern Railroad (Map: Illinois, H 2). Wheaton College is situated here. The city has a public library. It is a shipping point for grain and general farm produce. Pop., 1900, 2345; 1910, 3423.

WHEATON, FRANK (1833–1903). An American soldier, born in Providence, R. I. He received a public-school education, and was a civil engineer in California until 1855, when he was commissioned lieutenant in the First United States Cavalry. In March, 1861, he was promoted to the rank of captain. Four months later he was appointed lieutenant colonel of the Second Rhode Island Volunteers, and before the end of the year he was commissioned colonel. He participated in the first battle of Bull Run and in the Peninsular and Maryland campaigns. In November, 1862, he was promoted to be brigadier general of volunteers, and was brevetted major general in both the volunteer and the regular service. In 1864 he commanded a division in the Shenandoah valley and at the battle of Cedar Creek he was one of the first to rally his forces. During the last year of the war he served under Grant, and took part in the campaign which ended at Appomattox. In 1866 he was commissioned lieutenant colonel of the Thirty-ninth Infantry and rose to the rank of major general in the regular army before his retirement in 1895.

WHEATON, HENRY (1785–1848). An American lawyer, diplomat, and publicist, born in Providence, R. I. He graduated at Brown University in 1802, was admitted to the bar in 1805, and studied for several years in Paris and London. He then practiced for some time in Providence, and in 1812 settled in New York City, where for three years he edited the *National Advocate*. In 1814 he became a judge advocate of the army, and in 1815–19 was a justice of the Marine Court of New York City. From 1816 to 1827 he was reporter of the United States Supreme Court, and the *Reports* published by him in 12 volumes are of exceptional value. In 1821 he was a member of the New York Constitutional Convention, in 1823 of the State Assembly, and in 1825 of the Commission appointed to revise the statute law of New York. In 1827 he was sent as chargé d'affaires to Denmark. In 1835 he was appointed Minister Resident to the court of Prussia and from 1837 to 1846 was Minister Plenipotentiary there. A treaty negotiated by him in 1844 formed the basis upon which future German treaties were drawn up. His best work is his *Elements of International Law* (1836). It has been republished in many editions in America, of which that of Lawrence (1855), with a biographical memoir, and that of Dana (1866) are the most valuable. It has also been republished in London, and translated into French, Chinese, and Japanese. Among his other publications are: *A Digest of the Decisions of the Supreme Court of the United States from its Establishment in 1789 to 1820* (1820–29); *Life of William Pinkney* (1826), abridged for Sparks's "American Biographies"; *History of the Northmen* (1831; French trans., 1844); *Histoire du progrès des gens en Europe depuis la paix de Westphalie jusqu'au congrès de Vienne, avec un précis historique du droit des gens européens avant la paix de Westphalie* (1841; Eng. trans., 1846); and *An Enquiry into the Validity of the British Claim to a Right of Visitation and Search of American Vessels suspected to be engaged in the Slave Trade* (1842).

WHEATON, LOYD (1838–). An American soldier, born at Penfield, Mich. He entered the Federal army as a first sergeant in the Eighth Illinois Infantry on the outbreak of the Civil War, participated in the siege of Vicksburg, in the battle of Shiloh, and in many other engagements, and became successively captain (1862), major (1863), and lieutenant colonel (1864), in the volunteer service. In 1866 he entered the regular army as a captain, and in October, 1871, was instrumental in suppressing a Fenian raid from United States territory upon the Province of Manitoba. He was then engaged for some years in frontier duty; took part, in July and August, 1874, in Custer's expedition to the Black Hills, and became major in 1891 and lieutenant colonel in 1895. In 1898, during the Spanish-American War, he was made a brigadier general of volunteers, and for a short time commanded the First Division of the Seventh Army Corps in Cuba. Sent to the Philippines early in 1899, he there served with great ability against the insurrectionary forces, commanded temporarily the pacified provinces in southern Luzon, and in 1900 became commander of northern Luzon. He was made major general of volunteers in the latter year and in 1901 brigadier general (February) and major general (March) in the regular army. In 1902 he was retired.

WHEATON COLLEGE. An institution for the higher education of women, located at Norton, Mass., and founded in 1834 as Norton Female Seminary. The name was changed to Wheaton Female Seminary in 1839, and it was so known until 1912 when it assumed the name and responsibilities of the college. A pioneer school in the education of women, its organization was superintended by Mary Lyon, who directed its work for the first two years. In 1897 the school was reorganized and the departments of study enlarged and strengthened. The courses are adapted to both cultural and vocational ends, and there is a two years' course for graduates of high schools who do not care to enter for a degree and take the full college course of four years. The campus, containing 18 buildings, embraces more than 100 acres. The student enrollment in 1915–16 was about 220, and the faculty numbered 30. The productive funds amount to about $1,000,000, and the annual income to about $120,000. The library contains about 10,000 volumes. The president in 1916 was Samuel V. Cole, D.D., LL.D.

WHEATSTONE, hwēt'stōn *or* -stŭn, SIR CHARLES (1802–75). An English physicist and inventor. He was born at Gloucester, and when 21 entered into business in London as a maker of musical instruments. The scientific principles involved in their construction occupied his attention, and in 1833 he communicated his first paper, *On Acoustic Figures*, to the Royal Society—a discussion of the figures produced in Chladni's well-known experiment. This was followed in 1834 by *Experiments to Measure the Velocity of Electricity*, in which, with a mirror revolving 800 times in a second, he demonstrated its velocity. (See CHRONOSCOPE.) In 1834 he was appointed professor of experimental physics in King's College, London. In the course of experiments at the college on the velocity of electricity he devised an electric telegraph for transmitting messages. In May, 1837, a patent was taken out in the joint names of Cooke and Wheatstone "for improvements in giving signals and sounding alarms in distant places by means of electric currents transmitted through metallic circuits." From this instrument, which had five needles, grew the system of electric telegraphs which was extensively used in Great Britain.

After the five-needle telegraph came apparatus

where but two needles were employed, then the letter-showing dial telegraph, the type-printing telegraph, the magneto-electric dial telegraph, and the automatic telegraph system, in which great speed of transmission was obtained. In a paper on binocular vision before the Royal Society (1838) he explained the principle of the stereoscope (q.v.), an instrument of his invention subsequently improved by Brewster. The polar clock, another of his inventions, was an interesting application of Brewster's discovery that the plane of polarization of the light of the sky always made an angle of 90° with the sun. In 1840 he showed that by means of electro-magnetic regulating devices a number of clocks far apart could be kept going synchronously from a central clock. Wheatstone's bridge (q.v.), though not the invention of this famous electrician, but of Hunter Christy, was first brought into general use through his efforts in 1843, and has proved a fundamental method in the measurement of electrical resistance. Wheatstone was one of the first to recognize the importance of Ohm's law and to apply it in electrical measurements. He also had a share in the development of the dynamo, devising a method for making the magneto-machines then in use self-exciting by employing a shunt circuit passing around the field magnets. Wheatstone was more successful as an experimenter, skillful mechanician, and inventor than as a professor, and, though he held his chair many years, he rarely lectured in public, owing to his diffidence. Many of his important discoveries were communicated to the Royal Society by Faraday. This did not prevent his contributing many interesting papers to scientific journals and the *Proceedings* of various learned societies, which were collected and published in 1879 by the Physical Society of London under the title of *Scientific Papers of Sir Charles Wheatstone*.

WHEATSTONE'S BRIDGE. An important and much-used method for the measurement of electrical resistance. Employing a battery, a galvanometer, and auxiliary resistances, it is possible to determine the resistance of a conductor with a high degree of accuracy. The principle of the method will be readily understood by reference to the accompanying diagram, which shows the simplest form of Wheatstone's bridge, viz., the slide wire bridge. The terminals of a battery are connected with the ends of a straight wire of German silver, stretched along a scale.

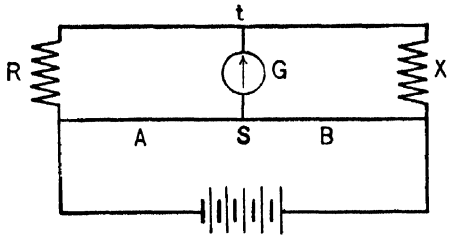

Fig. 1.

The current divides, a part of it traversing the bridge wire, and a part flowing through R and X, the former being a resistance whose value is known and the latter the unknown resistance. The two branch circuits unite and return to the battery. At t, the junction of R and X, one terminal of the galvanometer, G, is attached, while the other is connected with a slider, S, which can be moved along the wire so as to make contact at any desired point. According to Ohm's law there will be a fall of potential along the wire depending upon the resistance, and, since it is a uniform conductor, this will be proportional to the length. The same fall of potential as along the wire must also take place through R and X, consequently some point will be found which is at the same potential as t. Where there is a difference of potential, there must result a flow of electricity which will deflect the needle of the galvanometer. We can determine when the two points are at the same potential by moving the sliding contact until there is no deflection of the needle on closing the circuit. The potential at S is proportional to the distances of these parts from the ends of the wire, A and B, therefore the resistance R must be to the resistance X as A is to B. In practice R is selected so that the measurement will be made when the point of contact is at the centre of the wire rather than at the ends, for, as can be readily seen, the degree of accuracy is far greater when A and B are of nearly the same value than when

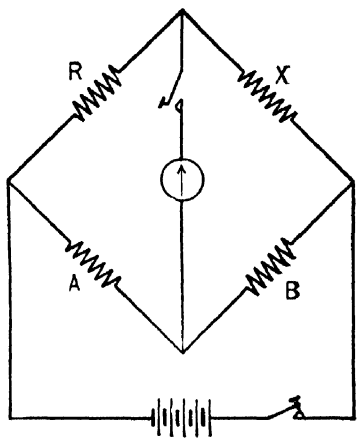

Fig. 2.

one is large with respect to the other. The slide wire bridge is useful for many purposes and answers well in explaining the principle, but the apparatus is generally constructed with a series of resistance coils. In the usual arrangement as indicated in the diagram, Fig. 2, there is a series of fixed ratios formed by coils of wire taking the place of the stretched wire used above and other coils so arranged as to give R any value between 1 and 10,000 ohms. The ratio coils generally have their resistances 10, 100, and 1000 ohms, which permits a range of measurements from $\frac{1}{1,000,000}$ to 1,000,000 ohms. See RESISTANCE, ELECTRICAL. Consult H. R. Kempe, *Electrical Testing* (7th ed., London and New York, 1908); S. P. Thompson, *Elementary Lessons in Magnetism and Electricity* (7th ed., ib., 1915); E. F. Northrup, *Methods of Measuring Electrical Resistance* (ib., 1912).

WHE'DON, DANIEL DENISON (1808–85). An American professor and Methodist Episcopal editor. He was born at Onondaga, N. Y., and graduated from Hamilton College in 1828, and was ordained to the ministry. After teaching at Cazenovia Seminary and at Hamilton, he served as professor of languages at Wesleyan University (1833–43) and as professor of rhetoric at the University of Michigan (1845–54). From 1856 to 1884 he edited the *Methodist Review*, New York. He wrote a *Commentary on the New Testament* (5 vols., 1860–80); *The Freedom of the*

Will as the Basis of Human Responsibility (1864); *Essays, Reviews, and Discourses* (2 vols., 1887).

WHEEL (AS. *hwēol, hwiol, hweohl,* Icel. *hjōl,* E. Frisian *wēl,* wheel). Part of the apparatus for steering a large ship. It consists of a horizontal barrel on which the tiller ropes are wound in opposite directions—one on the forward end and one on the after—and one or more wheels with 8 to 12 radial spokes which project beyond the rim of the wheel 6 or 8 inches to form handles. The difference in diameter of the wheel and barrel is a measure of the gain in power that the wheel affords. In vessels steered by steam or other power the wheel is used, but it is smaller than in hand-steered ships, and either connects to the steering engine by means of shafts and gearing, operates small wire ropes which lead to the engine valve, or effects electric connections to the motors.

WHEEL, BREAKING ON THE. A mode of inflicting the punishment of death among the Greeks and Romans. It was used in western Europe until the end of the eighteenth century for assassins, incendiaries, highwaymen, and pillagers of churches. It was first instituted in France by an edict of 1534. There was some variety in the mode: the accused was sometimes extended on beams formed like an X and his bones broken by blows with an iron bar. Then the body was placed on a wheel, bent round, with its arms and legs behind the back and its head turned up to the sky. The culprit was then left to die, his sufferings perhaps continued for 24 hours. By way of terminating the suffering the executioner was sometimes permitted to deal two or three severe blows on the chest or stomach, known as *coups de grâce;* and occasionally, in France at least, the sentence provided that the criminal was to be strangled after the first or second blow. The punishment was abolished in France in 1789, and in Prussia in 1811.

WHEEL AND AXLE. A machine which is a modification of the lever (q.v.). Its most primitive form is a cylindrical axle, on which a wheel concentric with the axle is firmly fastened. When employed for raising heavy weights, the weight is attached to a rope which is wound round the axle, and the force raising the weight is applied to a rope wound round the grooved rim of the wheel. The wheel and axle is neither more nor less than a lever whose extremities are not points as in the normal form, but the circumferences of circles. Accordingly the raising force and weight are not attached to particular points in these circumferences, but to cords wound round them, and thus the imaginary simple lever (formed by joining the points where the cords become tangents to the circles) is preserved unaltered in position and magnitude. The conditions of equilibrium are, that F (the force required to raise the weight) × R (the radius of the wheel) = W (the weight) × the radius of the axle, or, since the circumferences of circles are proportional to their radii, that F : W : : circumference of axle : circumference of wheel. When there is no wheel, but only a winch, the circumference described by the power in one revolution is substituted for the circumference of the wheel. The capstan and windlass are simple and common examples of this mechanical power, and combinations of toothed wheels, or of wheels from one to another of which motion is communicated by an endless band, are compound illustrations of the same.

WHEEL ANIMALCULE. See ROTIFERA.

WHEEL BUG. See PIRATE BUG.

WHEELER, ANDREW CARPENTER (1835–1903). An American author, born in New York City. As a young man he went to Milwaukee, Wis., and remained there till the outbreak of the Civil War, when he went to the front as correspondent. In 1865 he returned to New York and was connected with the *Leader* and the *World.* While dramatic critic of the latter paper he began the publication of essays and sketches under the pseudonym of Nym Crinkle. These were widely read, and many of them were collected in book form. Afterward he wrote under the name of J. P. (or Jay Paul) Mowbray (sometimes J. P. M.). As Nym Crinkle he produced between 1870 and 1885: *The Chronicles of Milwaukee; The Primrose Path of Dalliance; The Iron Trail; Easter in a Hospital Bed;* and a play, *The Twins.* As J. P. Mowbray he published: *A Journey to Nature* (1901); *The Making of a Country Home* (1902); *Tangled Up in Beulah* (1902); and *The Conquering of Kate* (1903).

WHEELER, ARTHUR OLIVER (1860–). A Canadian alpinist and topographer, born near Kilkenny, Ireland, and educated at Balinasloe and Dulwich colleges. In 1876 he went to Canada, where he became a land surveyor and entered government work. As Dominion topographer (1893–1910) he made irrigation and phototopographical surveys in Alberta, British Columbia, and near a part of the Alaskan boundary. In 1906, with Mrs. H. J. Parker, of Winnipeg, he founded the Alpine Club of Canada, was its president in 1906–10, and organized 10 annual camps, no two of them in the same place. During 1906–14 he continued surveying and exploring in the region now known as Mount Robson Park. Wheeler climbed more than 300 peaks in the Canadian Rockies. He edited the *Canadian Alpine Journal* in 1906–13 and published *The Selkirk Range* (1903); *The Selkirks: A Guide for Mountain Pilgrims* (1911), with Mrs. H. J. Parker.

WHEELER, BENJAMIN IDE (1854–). An American educator and classical scholar, born at Randolph, Mass. He graduated at Brown University in 1875, taught classics at the Providence (R. I.) High School and at Brown; traveled in Greece, and studied at Leipzig, Heidelberg (Ph.D., 1885), Jena, and Berlin. Upon his return to America he taught for a year at Harvard, in 1886 became professor of comparative philology in Cornell University, and two years later professor of Greek. In 1895–96 he held also the chair of Greek literature at the American School for Classical Studies, Athens. He was appointed president of the University of California in 1899. In 1909–10 he served as Roosevelt professor at the University of Berlin. Among his works are: *Der griechische Nominalaccent* (1885); *Analogy, and the Scope of Its Application in Language* (1887); *Introduction to the Study of the History of Language* (1891), with H. A. Strong and W. S. Logeman; *Principles of Language Growth* (1891); *The Organization of Higher Education in the United States* (1897); *Life of Alexander the Great* (1900); *Unterricht und Demokratie in Amerika* (1910).

WHEELER, EVERETT PEPPERRELL (1840–). An American lawyer and author. Born in New York City, he graduated from the College of the City of New York in 1856, and from Harvard (LL.B.) in 1859. He served as a mem-

ber of the Board of Education of New York City (1877–79), as chairman of the New York City Civil Service Commission (1883–89 and 1895–97) and of the committee on law reform of the American Bar Association (1908–11), and as president of the Reform Club (1889–90) and of the New York Civil Service Reform Association. His writings include: *Wages and the Tariff* (1888); *Modern Law of Carriers* (1890); *Real Bimetallism* (1895); *The Harter Act* (1899); *The Knowledge of Faith* (1904); *Daniel Webster, Expounder of the Constitution* (1905).

WHEELER, HENRY LORD (1867–). An American chemist. He was born in Chicago, and was educated at Yale (Ph.B., 1890; Ph.D., 1893), also pursuing higher studies in chemistry at Leipzig and Chicago. He had become an assistant at Yale in 1890 and by 1908 had risen to be professor of chemistry. In 1909 he was elected to the National Academy of Sciences. He contributed largely to the literature of his chosen specialty and his many papers, chiefly on organic chemistry, appeared in the *American Chemical Journal* and the *Journal of the American Chemical Society.*

WHEELER, JOSEPH (1836–1906). An American soldier, born at Augusta, Ga. He graduated at West Point in 1859, was commissioned a second lieutenant of dragoons, and served at the cavalry school at Carlisle, Pa., until April, 1861, when he resigned his commission and entered the Confederate service. In the following September he was appointed colonel of the Nineteenth Alabama Infantry, and was actively engaged in the earlier campaigns in Kentucky and Tennessee. At Shiloh, in April, 1862, he commanded a brigade, and later in the year was transferred to the cavalry and participated in the battle of Perryville and other engagements of General Bragg's Kentucky campaign. On Oct. 30, 1862, he was promoted to the rank of brigadier general, and covered the retreat of Bragg's army to the southward. In January, 1863, he was commissioned major general. He commanded the Confederate cavalry at Chattanooga and at Chickamauga, and covered Bragg's rear after the defeat at Lookout Mountain and Missionary Ridge. He harassed Sherman's flank during the march to Atlanta. In August, 1864, he led a successful raid in Sherman's rear northward as far as the Kentucky line. Subsequently he opposed Sherman's advance on Savannah, and in February, 1865, was promoted to the rank of lieutenant general, and continued in command of the cavalry division of General Johnston's dwindling army until its surrender. After the war he became a lawyer and cotton planter. In 1880 he was elected to Congress as a Democrat and was a member continuously until 1899. In May, 1898, he was appointed by President McKinley a major general of volunteers, and was assigned to the command of the cavalry division of the Army of Santiago in the Spanish-American War. He commanded the troops in the engagement of Las Guasimas, was senior field officer in the battle of San Juan Hill, and subsequently was one of the American commissioners to arrange for the surrender of Santiago. In 1899–1900 he commanded a brigade in the Philippine Islands, was commissioned a brigadier general in the Regular Army in June, 1900, and retired in the September following. He published *The Santiago Campaign, 1898* (1899).

WHEELER, SCHUYLER SKAATS (1860–). An American electrical engineer, born in New York City. He studied at Columbia, but left college in 1881 to become assistant electrician of the Jablochkoff Electric Light Company, and in 1883 was a member of Edison's engineering staff. In 1888 he organized the firm of Crocker and Wheeler, and in the following year became president of the Crocker-Wheeler Company at Ampere, N. J., manufacturers of electrical equipment. Wheeler had an important part in the development of the electric motor and in the direct application of electricity to driving tools, inventing an electric elevator and an electric fire engine, and devising paralleling of dynamos and series multiple motor control. For his invention of the electric buzz fan he received the John Scott medal of the Franklin Institute in 1904. He served as president of the American Institute of Electrical Engineers in 1905–06. Besides contributions to the technical press, Wheeler published *Practical Management of Dynamos and Motors* (1894), with F. B. Crocker.

WHEELER, WAYNE BIDWELL (1869–). An American temperance worker, born at Brookfield, Ohio. He graduated from Oberlin in 1894, and in law from Western Reserve University in 1898. While a student he engaged in temperance work, and after graduation joined the Ohio Anti-Saloon League as a field secretary, later becoming district superintendent, attorney, and in 1902, superintendent. He led a spectacular fight against the reëlection of Myron T. Herrick as Governor of Ohio in 1906, and obtained the first great victory for the Anti-Saloon League in American politics. Wheeler became a member of the executive committee, and also attorney, of the national organization of the league.

WHEELER, WILLIAM ADOLPHUS (1833–74). An American lexicographer, born at Leicester, Mass. A graduate of Bowdoin (1853), Wheeler, after teaching for several years, assisted Joseph E. Worcester in preparing his *Dictionary*, and contributed to the revision of Noah Webster's *Dictionary* (1864). Alone or with others, he was also responsible for other dictionaries or compilations.

WHEELER, WILLIAM ALMON (1819–87). An American legislator, Vice President of the United States from 1877 to 1881. He was born at Malone, Franklin Co., N. Y. He studied for two years at the University of Vermont. After studying law at Malone, he was admitted to practice, and met with considerable success in his profession. From 1847 to 1849 he was district attorney of Franklin Co., and in 1850 and 1851 was a Whig member of the New York State Assembly. In 1851 he abandoned his law practice for banking, and was also interested in railroads. In 1857 he was chosen, as a Republican, to the State Senate, and was elected president pro tempore. In 1860 he was elected a member of the Thirty-seventh Congress. In 1867 he was a member of the New York Constitutional Convention, of which he was elected president. From 1869 until 1877 he was again a member of Congress, serving as chairman of the important committees on Commerce, the Pacific Railroads, and Southern Affairs, and taking a leading part in legislation affecting the reconstructed Southern States. In 1875–76, while chairman of the Committee on Southern Affairs, he originated and effected the compromise, known by his name, between the warring political factions in Louisiana. From 1877 to 1881, during the administration of President Hayes, he was Vice President of the United States.

WHEELER, WILLIAM MORTON (1865–). An American zoölogist, born in Milwaukee, Wis. He was educated at the German American Normal College at Milwaukee and at Clark University (Ph.D., 1892). After two years as assistant professor of zoölogy at the University of Chicago, he became professor at the University of Texas (1899), and was curator of invertebrate zoölogy in the American Museum of Natural History, New York, from 1903 to 1908, and thereafter professor of economic entomology at Harvard. He remained connected with the Natural History Museum as honorary curator of social insects. He was elected to the National Academy of Sciences, and joined the editorial staff of the *Biological Bulletin*, *Journal of Morphology*, *Journal of Animal Behavior*, and *Psyche*. He published important monographs, mainly on insects, besides *Ants, Their Structure, Development, and Behavior* (1910).

WHEEL'ING. The largest city of West Virginia and the county seat of Ohio County, 66 miles by rail southwest of Pittsburgh, on the Ohio River, and on the Pittsburgh, Cincinnati, Chicago, and St. Louis, the Baltimore and Ohio, the Pennsylvania, and the Wheeling and Lake Erie railroads (Map: West Virginia, D 1). It is situated on ground rising gradually from the river. A steel railroad bridge spans the Ohio, and there is a suspension bridge, 1010 feet long, which is one of the chief attractions of the city. Noteworthy features include also the Henry Clay Monument, the site of Old Fort Henry, the custom house and post office, the public library, Linsly Institute, public hospitals, and the county courthouse. Among the prominent structures, besides those mentioned, are the Y. M. C. A. and Y. W. C. A., the Market Auditorium, Board of Trade Building, the high school, the Elks Home, the Home for the Aged, and the Roman Catholic Cathedral. Owing to its excellent transportation facilities, Wheeling is an important wholesale and jobbing centre, and is also of considerable industrial prominence, being known especially for its iron and steel interests. The manufacture of glass, enameled ware, pottery, smoking tobacco, and stogies is extensive. The smaller establishments comprise packing houses, print works, and manufactories of wagons and carriages, boxes, leather, etc. Coal mining is carried on extensively in the district, 15,000 miners being employed within a radius of 10 miles. According to the 1914 census of manufactures the industries of the city were capitalized at $26,858,000, and had an output for the year valued at $27,879,000.

In 1915 the city adopted the commission-manager form of government, to go into effect in 1917. The water works, which represent an expenditure of $1,500,000, and the electric-light plant are the property of the municipality. For maintenance and operation the city spent in 1915 about $500,000, the chief items being: schools, $200,000; gas plant, $34,000; water works, $75,000; fire department, $70,000; police department, $57,000; and interest on the debt, $42,000. Pop., 1900, 38,878; 1910, 41,641; 1915 (U. S. est.), 43,097.

Settled by Col. Ebenezer Zane in 1769, Wheeling was the first town established on the Ohio River. It was laid out in 1793, was incorporated as a town in 1806, and was chartered as a city in 1836. In 1774 Fort Henry, named in honor of Gov. Patrick Henry, was built here. In September of the same year it was fiercely attacked by a force of 300 Indians, who killed 23 out of a garrison of 42. In 1781 the Indians made another attack, and in 1782 a force of English and Indians unsuccessfully besieged the place for several days. In 1861 the Wheeling Convention, representing the people of Virginia opposed to secession, met here and established the restored government, and here the Constitutional Convention of West Virginia met in 1861–62. From 1863 to 1870 and again from 1875 to 1885 Wheeling was the capital of the State.

WHEEL LOCK. See SMALL ARMS.

WHEELOCK, hwē'lok, ELEAZAR (1711–79). An American educator, born at Windham, Conn. He graduated at Yale in 1733, was ordained pastor of the Congregational church at Lebanon, Conn., in 1735, and there established a school for the education of Indian and white youths. In 1770 he removed to Hanover, N. H., and there reëstablished his school, for which an endowment of $50,000 had been obtained, under the name of Dartmouth College (q.v.). During the remaining nine years of his life Dr. Wheelock was president of the new college, and despite privation and hardship succeeded in putting it on so firm a basis that it survived the disasters of the Revolution. He published a number of sermons and a *Plain and Faithful Narrative of the Indian School at Lebanon.* Consult Baxter P. Smith, *History of Dartmouth College* (Boston, 1878); Frederick Chase, *History of Dartmouth College and the Town of Hanover* (Cambridge, 1891); and David McClure and Elijah Parish, *Memoirs of the Rev. Eleazar Wheelock, D.D.* (Newburyport, 1811).

WHEELOCK, JOHN (1754–1817). An American educator, born at Lebanon, Conn., the son of Eleazar Wheelock (q.v.). After three years in Yale, he attended Dartmouth for a year, and in 1771 graduated with the first class that went out from that college. He then tutored for four years in Dartmouth; served in the Patriot army during the Revolutionary War, attaining the rank of lieutenant colonel. In 1780, soon after the death of his father, he succeeded him as president of Dartmouth. Four years later he went to Europe to secure assistance for that institution, but on his return in 1784 was shipwrecked and lost all the money he had collected. He then succeeded in getting aid from the State, and was able to enlarge the institution. In 1815, owing to friction between him and the board of trustees, he was removed from the presidency; but the Legislature created a new corporation, which in 1817 restored him. Out of this dispute grew the famous Dartmouth College Case (q.v.). Wheelock died in 1817 before the case was decided. Among his published works may be mentioned *Sketches of the History of Dartmouth College* (1816).

WHEEL ORE. See BOURNONITE.

WHEELSTONES. See BEADS, ST. CUTHBERT'S.

WHEEL'WRIGHT, EDMUND MARCH (1854–1912). An American architect, born at Roxbury, Mass. He graduated from Harvard in 1876, and studied architecture at the Massachusetts Institute of Technology and in Europe. He was employed in the offices of Peabody and Stearns in Boston, and later by firms in New York City and Albany, N. Y. In 1883 he established himself independently in Boston, later becoming head of the firms of Wheelwright and Haven and Wheelwright, Haven, and Hoyt. In

1891–95 he was city architect of Boston, in which capacity he designed many important school buildings and the Harvard Bridge over the Charles River. Wheelwright also designed Jordan Hall, Boston, the Boston Opera House, the Cleveland Museum of Art, additions to the Massachusetts General Hospital, and the Cambridge bridge. In 1904 he was sent to Europe with R. Clipston Sturgis (q.v.) by the Trustees of the Boston Museum of Fine Arts to study museum buildings, and thereafter they served jointly with the late Professor Despradelle, as advisory architects to Guy Lowell (q.v.) for the design of the new Museum of Fine Arts. Wheelwright published *Municipal Architecture in Boston* (2 vols., 1898), and *School Architecture* (1901).

WHEELWRIGHT, JOHN (1592–1679). A New England clergyman. He was born in Lincolnshire, England, graduated at Cambridge in 1614, and was vicar of Bilsby (1623–31); suspended by Laud for nonconformity, he went to America in 1636, and became pastor at Braintree, Mass. His adoption of the religious views of his sister-in-law, Anne Hutchinson (q.v.), alienated Wilson, pastor of the Boston church; this and a sermon in her defense, considered seditious, caused his banishment from the colony by the General Court (1638). He went to New Hampshire, founded the town of Exeter, and organized a church; in 1643 he removed with a part of the church to Wells, Maine. His sentence of banishment having been revoked on his declaration that he had erred, at least in part, he returned to Massachusetts and was minister at Hampton, 1646–54; went to England in 1657 and was well received by Oliver Cromwell, who had been his fellow student; he returned in 1660 and became minister at Salisbury, N. H. (1662). The sermon alluded to above is in the *Collections of the Massachusetts Historical Society* (ed. by C. Deane, Boston, 1867). Wheelwright's writings with memoirs by Bell were published by the Prince Society (Boston, 1876).

WHEELWRIGHT, WILLIAM (1798–1873). An American capitalist, born at Newburyport, Mass. He was United States consul at Guayaquil, in Ecuador, from 1824 to 1829, when he removed to Valparaiso, in Chile, where he established a line of passenger vessels along the coast. He founded a line of coasting steamships to connect all the ports between Valparaiso and the Isthmus of Panama, and in 1840 the first two vessels of the Pacific Steam Navigation Company reached the west coast. Wheelwright also built a number of railroads in South America, established the first gas and water works, and strung the first telegraph line on that continent. He wrote *Statements and Documents Relative to the Establishment of Steam Navigation in the Pacific* (1838) and *Observations on the Isthmus of Panama* (1844). Consult: J. B. Alberdi, *La Vida y los trabajos industriales de William Wheelwright en la America del Sur* (Paris, 1876; Eng. trans. by Caleb Cushing, Boston, 1877), and John Codman, *Biographical Sketch of William Wheelwright, of Newburyport, Mass.* (Philadelphia, 1888).

WHELK (AS. *weluc, wiluc*, whelk, probably from *wealcan*, to roll, walk, OHG. *walkan*, to roll, wallow, Ger. *walken*, to full cloth). The popular name of many prosobranch gastropod mollusks, of the family Buccinidæ. In the true whelks (*Buccinum*) the shell is ovate, turreted, and more or less ventricose, its mouth ovate, emarginate, or produced into a very short canal below. The animal has a broad head, with two tentacles, with the base of which the stalks bearing the eyes are united; the proboscis is large, and the tongue armed with teeth, which are used for the purpose of rasping substances used for food—almost any animal substances being welcome for this use—or for perforating the shells of other mollusks in order to prey upon them. There are numerous species, chiefly found on the coasts of the colder parts of the world. The coasts of the North Atlantic produce several species, of which the most abundant is the English whelk (*Buccinum undatum*). It occurs from low-water mark to a depth of 600 fathoms, is sometimes three inches in length, grayish or brownish white, with numerous raised ridges and spiral striæ. On the American coast it is common as far south as Cape Cod. It is much used in Europe as an article of food. For the giant whelks see CONCH. The dog whelks are small coiled mollusks of the genus *Nassa* common along both the Atlantic and Pacific coasts. All of these whelks are carnivorous and occasionally destructive to clams and oysters.

WHETSTONE. See ABRASIVES; HONES.

WHET'STONE, GEORGE (?1544–?1587). An English author, of a wealthy Lincolnshire family. He served in the Low Countries in 1572 and was present at the battle of Zutphen (Sept. 13, 1586), when Sir Philip Sidney was mortally wounded. He also accompanied Sir Humphrey Gilbert on the disastrous voyage to Newfoundland (1578–79). Whetstone is mainly of interest because his *Promos and Cassandra*, a play in rhymed verse (1578; reprinted by Collier and Hazlitt's *Shakespeare's Library*, 1875), and the prose tale with the same title, in his *Heptameron of Ciuill Discourses* (1582; also reprinted by Collier and Hazlitt), furnished the plot for Shakespeare's *Measure for Measure*. Among his other works are the *Rocke of Regard*, verse tales mostly from the Italian (1576; reprint by Collier, 1870); *A Remembraunce*, an elegy on George Gascoigne (1577; in Arber's reprints of Gascoigne's works, 1868); and *A Mirour for Magestrates of Cyties*, a prose treatise (1584).

WHEWELL, hū'el, WILLIAM (1794–1866). A distinguished English scholar and philosopher. He was born at Lancaster, graduated with honor at Trinity College, Cambridge, in 1816, and became a fellow (later tutor) of Trinity. In 1820 he became a fellow of the Royal Society, and in 1827 of the Geological Society. He spent much time in traveling and studying architecture and natural science. He was professor of mineralogy at Cambridge (1828–32), and (1838–55) Knightbridge professor of moral philosophy. He became master of Trinity in 1841, and in the same year was president of the British Association. In his earlier literary career he produced several textbooks on mathematical subjects, now superseded and also contributed a variety of papers to scientific journals and to the *Transactions* of learned societies. Later in life he concentrated mainly on the production of large works. Among important books are: *On the True Motion of Points* (1832); *Astronomy and General Physics considered with Reference to Natural Theology* (the third Bridgewater treatise, 1833); *On the Principles of English University Education* (2d ed., 1838); *History of the Inductive Sciences* (1840); *Phi-*

losophy of the Inductive Sciences (1840); and *The Elements of Morality, Including Polity* (1845). His treatise on *The Plurality of Worlds* (1853) had a considerable popularity from its subject; his *Lectures on the History of Moral Philosophy in England* (1852), and *The Platonic Dialogues for English Readers*, a selected translation, may also be mentioned. Most of his works have appeared in numerous editions. He died at Trinity in consequence of injuries sustained through a fall when riding. He was a man of varied acquisitions, a clear-headed student, a vigorous and independent thinker and writer. His chief ambition was to grasp, survey, and coördinate the sciences. He did excellent service to both science and history in his endeavor to gratify it. He helped to reorganize the course of study at Cambridge, and left his mark as one of the most efficient masters of Trinity, besides twice holding the office of vice chancellor. He became wealthy through two marriages, and was generous in the use of his money; his gifts to the university alone are estimated at over £100,000. In philosophy he was an intuitionist, and is now best remembered as an opponent of J. S. Mill. Consult Isaac Todhunter, *William Whewell: An Account of his Writings with Selections from his . . . Correspondence* (2 vols., London, 1876), and Mrs. Stair Douglas, *Life and Selections from the Correspondence of William Whewell* (ib., 1881).

WHEY (AS. hwæg, MDutch, *wey*, *huy*, *hoy*, *hui*, Dutch *wei*, whey, of unknown etymology). A by-product obtained in the manufacture of cheese (q.v.). When milk is curdled with rennet or any similar substance, the curd separates from the liquid portion of the milk, and the latter is termed "whey." If skillfully manipulated, the curd contains the casein and holds most of the fat of the milk mechanically. In continuing the process, the whey is drawn off from the curd, and later more completely removed by pressing. For every pound of Cheddar cheese made, there is nearly nine pounds of whey as a by-product. Its principal use is as a feed for pigs, calves, and sometimes for cows. It is less valuable for this purpose than skim milk or buttermilk, for the casein, which contributes largely to the value of both of these, is lacking in whey. It contains about 93 per cent of water (only 7 per cent of solids), 5 per cent of milk sugar, 0.9 per cent of casein and albumin, 0.3 to 0.5 per cent of fat, and about 0.5 per cent of ash. Hence its principal constituent is sugar. It is, in reality, a very thin feed and spoils quite readily. In large factories whey is used for making milk sugar. (See SUGAR.) Whey cheese, made in some of the countries of northern Europe, is practically evaporated whey, with some cream added. Butter has been made from whey by running it through a separator, but in good cheese-making practice whey contains very little butter fat. Wheyn is a nourishing, mildly stimulating beverage prepared from whey. The whey of goats' milk is regarded by some as especially beneficial in the treatment of certain diseases, and in Switzerland and elsewhere there are large establishments for carrying out the whey cure, either alone or associated with the grape cure.

WHICH'COTE, BENJAMIN. See CAMBRIDGE PLATONISTS.

WHICKHAM, hwĭk'am. A manufacturing town in Durham, England, 3 miles west-southwest of Newcastle. It has iron foundries, chemical works, timber yards, and saw mills. Pop., 1901, 12,851; 1911, 18,332.

WHIFFIN, hwĭf'ĕn, BLANCHE, better known as MRS. THOMAS WHIFFIN (1845–). An American actress, born in London. Her maiden name was Galton. She was educated in France; made her stage début at the Royalty Theatre, London, in 1865; came to America in 1868; and toured the United States under John Templeton's management. In 1879 she played Buttercup in the first American production of Gilbert and Sullivan's *Pinafore*. She joined Daniel Frohman's company at the Lyceum in 1887, and later Charles Frohman's company at the Empire. Mrs. Whiffin in later years appeared in *Zira* (1905); *The Great Divide* (1905–07); *The Builder of Bridges* (1909); *The Brass Bottle* (1910); *Cousin Kate* (1912); *Tante* (1913); *A Scrap of Paper* (1914); *Rosemary* (1915). She was still active at 70 and a great favorite.

WHIG AND TORY (Whig, probably abbreviated from *whiggamore*, a nickname for the Presbyterian peasantry of the western lowlands of Scotland, from *whiggam*, apparently a word to urge on a horse, from *whig*, to jog along; Tory, from Ir. *toridhe*, *tornidhe*, *tornighe*, pursuer, plunderer, from *torighim*, to fancy, pursue). The names which for about two centuries were popularly applied to the two great political parties in Great Britain. Both were at first names of reproach. Whig was meant to imply that those who were thus designated were no better than the Presbyterian rebels of Scotland, while the name Tory was intended to imply some connection with Irish brigands, who were supposed to desire a Catholic king. The names came into use about 1680. In general, the Tories were adherents of the ancient Constitution of England and the supporters of regal and ecclesiastical authority, while the Whigs as a rule favored reform in the direction of a more democratic government. In the eighteenth century, however, the Whigs represented to a great extent the aristocratic oligarchy which ruled England. In 1832, when the Reform Bill was passed through the efforts of a wing of the Whig party, the two old parties really disappeared, the Tories being ultimately succeeded by the Conservatives and the Whigs by the Liberals.

WHIG PARTY. In American history, the name first applied to those who during and immediately preceding the Revolutionary War opposed the measures of the British Government, in contradistinction to the Loyalists or Tories. The name came to be synonymous with patriot in America, and is believed to have made its appearance first in New York in 1768. After the Revolution the word disappeared as an American party term until about 1834, when it came to be applied to a new political party opposed to the Democratic party. After the close of the War of 1812 the Federalists as a party disappeared, and with the absence of any well-defined political issues an "era of good feeling" followed. During the administration of John Quincy Adams party lines were again drawn, those who supported the Administration and favored a system of internal improvements, a protective tariff, and a national bank, together with a broad construction of the Constitution generally, being designated as National Repub-

licans, while their opponents were known as Democrats or Democratic-Republicans. (See DEMOCRATIC PARTY.) In the presidential election of 1828 those of the former belief voted for Adams, while the latter supported Jackson. Nullifiers, whose enmity President Jackson had incurred by his measures in 1832 (see NULLIFICATION), Antimasons, the followers of Hugh L. White (q.v.) in Tennessee, and the States Rights party in the South constituted in addition to the National Republicans some of the elements of the opposition, and by 1833 these were drawing together on the basis of their common dislike for Jackson. In 1834 the opposing elements became fused into a new party, which was called "Whig," in allusion to its opposition to executive usurpation, by Col. James Watson Webb, editor of the New York *Courier and Enquirer*. By 1836 the party had not become sufficiently well organized to enter successfully into a presidential contest. No national convention was held, but in 1835 several candidates were put forward—Webster in the northeast, in the northwest Gen. W. H. Harrison, and in the southwest Senator Hugh L. White, of Tennessee—by numerous mass meetings and by several Whig State conventions. In 1840 the party passed over its real leaders, Clay and Webster, renominated General Harrison, and went before the people with no platform except the personal popularity of the candidate. After a remarkable campaign, the Whigs triumphed, but their rejoicing was soon cut short by the death of the President and the accession of a Vice President, Tyler, who was not of their political faith and who greatly embittered the Whigs by his vetoes of the bank bill. In 1844 the Whig party nominated its leader, Henry Clay, and likewise for the first time adopted a platform of principles, summed up in the following words: "A well-regulated national currency; a tariff for revenue to defray the necessary expenses of the government, and discriminating with special reference to the protection of the domestic labor of the country; the distribution of the proceeds from the sales of the public lands; a single term for the presidency; a reform of executive usurpations." The hopes of the party were destroyed by the injection of the Texas question into the campaign, for the trimming attitude of their candidate caused many antislavery Whigs in the North to refuse their support. The question of the annexation of Texas did not sever the bond between the Northern Whigs and Southern Whigs, although it was the first of the series of causes which ultimately led to the disruption. The Whigs of both North and South supported the war with Mexico after it was once declared, but the question of admitting or excluding slavery from the territory acquired thereby (see WILMOT PROVISO) clearly revealed that Northern and Southern Whigs could not much longer stand together. The antislavery or Conscience wing of the Whig party in Massachusetts now arose in opposition to the so-called "Cotton Whigs." In the presidential election of 1848 the Whigs, with Gen. Zachary Taylor as their candidate, were for the second and last time successful. It was chiefly through the efforts of Henry Clay that the passage of the Compromise Measures of 1850 was effected. The Whig National Convention at Baltimore in 1852, by a vote of 212 to 70, recognized this compromise as a finality, though it was destined to seal the fate of the Whig party. The election of that year resulted in the overwhelming defeat of the Whig candidate, General Scott. The Kansas-Nebraska Bill (q.v.) of 1854 led to the disruption of the Whig party and to the formation of a new party in the North (see REPUBLICAN PARTY), which was finally joined by most of the Northern Whigs, many of whom were at first affiliated with the Know-Nothing movement. In the South most of the Whigs for a time acted with the Know-Nothing party. In 1856 a convention representing what was left of the Whig party indorsed the nomination of Fillmore, the candidate of the Know-Nothings, for the presidency. In the presidential election of 1860 remnants of the old Whig and Know-Nothing parties under a different name, the Constitutional-Union party (q.v.), supported Bell and Everett for President and Vice President, but upon the outbreak of the Civil War the last trace of the Whigs disappeared, the Southern Whigs having become absorbed by the Democratic party. Consult: R. McK. Ormsby, *History of the Whig Party* (2d ed., Boston, 1860); T. H. McKee, *National Conventions and Platforms of all Parties, 1789–1901* (4th ed., ib., 1901). An authoritative work is A. C. Cole, *The Whig Party in the South* (Washington, 1913); also references under POLITICAL PARTIES.

WHIM'BREL, or WHAUP. See CURLEW.

WHIN. See FURZE.

WHINCHAT (from *whin*, furze, gorse, from Welsh *chwyn*, weed + *chat*, on account of its chattering note). A small, ground-keeping European bird (*Pratincola* or *Saxicola rubetra*), seen in Great Britain in summer, wherever furze (or whin) bushes grow.

WHIP (from ME. *whippen*, probably a variant of *wippen*, from Dutch *wippen*, to move up and down, shake). A term used in English politics to designate the party representative whose duty it is to notify members of Parliament belonging to his party of the near approach of a division and to compel their attendance while the vote is being taken. The whip of the party in power is appointed a junior lord of the Treasury, with some minor patronage, in order to increase his influence.

WHIP'PET. See GREYHOUND.

WHIPPING. Corporal punishment meted out to petty offenders by the criminal law of various countries. It is still used in Russia, England, and Delaware in the United States. It is sometimes administered in private, but more often in public, the culprit in some cases being tied to a so-called whipping post. In early English times this form of punishment could not be inflicted on a gentleman, but was frequently inflicted upon the villein, tenant, and laborer. Until within a century whipping was even more common in Scotland than in England, but by the Act of 25 Vict., ch. 18, no person above the age of 16 can now be whipped in that country. The Act of 26 and 27 Vict., ch. 44 (not applicable to Scotland), authorizes whipping in addition to penal servitude for various crimes in England, and this sentence is still in favor with many English magistrates. In both England and Scotland the whipping of juvenile offenders is regarded as a salutary discipline by a public opinion which is no longer quite in favor of the similar treatment of adults. In Russia the terrible punishment of the knout is inflicted on both common criminals and political offenders. Many penologists believe that a

substitution of whipping for imprisonment in a large class of cases would be wise. For corporal punishment in the army and navy, see FLOGGING.

WHIP'PLE, ABRAHAM (1733–1819). An American naval officer, born at Providence, R. I. He was captain of the privateer *Gamecock* in the French and Indian War, and on one cruise took 23 prizes. On the night of June 8–9, 1772, he commanded the eight longboats that surprised and destroyed the British revenue vessel *Gaspée*. In 1775 he was put in command of two vessels belonging to Rhode Island, and soon afterward captured one of the tenders of the frigate *Rose*. He did much damage to British shipping, as captain successively of the *Columbus*, of the schooner *Providence*, and of the frigate *Providence*. In the last he slipped through the blockade of Rhode Island and carried important dispatches to France. In July, 1779, with the *Providence* and two other vessels, he fell in with a British merchant fleet of nearly 150 sail, convoyed by a 74 and some smaller vessels, and succeeded in capturing 10 vessels, eight of which reached Boston, where they were sold for about $1,000,000. At the defense of Charleston, S. C., in 1780, he commanded the naval forces, was captured, and remained a prisoner until the end of the war.

WHIPPLE, EDWIN PERCY (1819–86). An American critic, born at Gloucester, Mass. He was long a distinguished lecturer on literary and biographical topics. His first book was *Essays and Reviews* (2 vols., 1848–49), which was followed by: *Literature and Life* (1849); *Character and Characteristic Men* (1866); *Literature of the Age of Elizabeth* (1876); *Recollections of Eminent Men* (1887); *American Literature and Other Papers* (1887); and *Outlooks on Society* (1888). Whipple, in his day, attained a high position as a critic, and was a formative force in American literature; and some of his work, e.g., the *Age of Elizabeth*, is still read. An edition of his *Charles Dickens* (2 vols., Boston), with an introduction by Arlo Bates, appeared in 1912.

WHIPPLE, HENRY BENJAMIN (1822–1901). An American Protestant Episcopal bishop, born at Adams, N. Y. Because of ill health he gave up his plan of a college course and engaged in business. In 1847 he began to study theology privately, was ordained priest in 1850, and became rector at Rome, N. Y. In 1857 he removed to Chicago. Two years later he was elected and consecrated Bishop of Minnesota. He was a warm friend and defender of the Indians, among whom he established successful missions. He also founded a group of schools at Faribault, Minn. He wrote much for current periodicals, and also an autobiography, *Lights and Shadows of a Long Episcopate* (New York, 1899; new ed., 1912).

WHIPPLE, SQUIRE (1804–88). An American civil engineer, born at Hardwick, Mass. He graduated at Union College in 1830; became a civil engineer on the Baltimore and Ohio Railroad; in 1840 designed a successful scale for weighing canal boats and patented an iron bridge truss; also after 1852 erected several important bridges of the Whipple trapezoidal type. He was sometimes called the father of iron bridges. In 1872 he patented a lift drawbridge, and in the following year built one over the Erie Canal at Utica. He published *Treatise on Bridge Building* (1847; enlarged ed., 1873) and *The Doctrine of Central Forces* (1866).

WHIPPLE, WILLIAM (1730–85). A signer of the Declaration of Independence, born at Kittery, Me. He became the captain of a merchant vessel before he was 21 years of age, and engaged in the West India trade and in slave-trading voyages to Africa. At the age of 29 he withdrew from the sea, and entered business at Portsmouth, N. H. In 1775 he was a delegate to the New Hampshire Provincial Congress, was elected a member of the Provincial Council of Safety, and was elected to the Continental Congress in January, 1776. He continued to be a member of the Congress until September, 1779; in 1777, as brigadier general of militia, he commanded one of the New Hampshire brigades in the operations against Burgoyne and helped negotiate the terms of surrender; and in 1778 commanded the New Hampshire troops in the operations against the British in Rhode Island. In 1780 he was elected to the State Assembly and was several times reëlected. He was superintendent of finance for New Hampshire from 1782 until 1784, and was president of the commission that settled the dispute between Pennsylvania and Connecticut over the Wyoming valley. In 1782 he became a judge of the Superior Court of Judicature.

WHIP'POORWILL'. A North American nightjar (*Antrostomus vociferus*), famous for the call which has given it this name, but which might be more nearly expressed by the syllables *whup'per'ee'*. It is common in summer throughout the eastern part of the United States. It is about 10 inches long, the plumage much mottled and indistinctly marked with small transverse bands of black, white, and buff, the top of the head streaked with black, a narrow white collar on the throat. The bristles at the base of the bill are very stiff, and more than an inch long. This bird is seldom seen during day, but seeks its food by night, catching moths and insects on the wing. Its flight is near the ground, zigzag, and noiseless. Its notes are heard usually just after sunset in the early summer, rapidly reiterated, often several hundred times with hardly a pause for breath. When several of these birds are near by the noise will prevent sleep. The whippoorwill makes no nest, but the female deposits her eggs, two in number, on the ground or leaves in the woods. The eggs are white, prettily marked with lilac and brown. In the southern parts of the United States the whippoorwill is replaced by a larger species, the chuck-will's-widow (q.v.), and on the upper Missouri and to the west by a smaller one, the poorwill (q.v.).

WHIP SNAKE. One of the long, slender, whiplash-like green tree serpents of the family Dryophidæ of India and the Malay countries. They are poisonous, and one species (*Dryophis nasutus*) of India is said by the natives to dart at the eyes of men passing it. Wallace remarks that the ease and rapidity with which these snakes glide through the bushes almost without disturbing a leaf is very curious, and they are so well protected by their color that they may often be touched before they are seen.

The same name is given in the United States to a slender, swift, brownish blacksnake (*Zamenis flagelliformis*) of Texas and westward, usually called coachwhip snake. The Indians and negroes believe it will whip or lash its adversary with its tail, and fear it, but it is quite harmless, though ready to fight when cornered.

WHIP-TAIL SCORPION. See SCORPION.

WHIRLICOTE, hwĕr'lĭ-kōt. See CARRIAGE.

WHIRLIGIG BEETLE. See WATER BEETLE.

WHIRLIGIG MULLET. A curious little mullet (*Querimana gyrans*) of the southeastern coast of the United States, often found swimming round and round in great schools at the surface like whirligig beetles; usually mistaken for young mullet or bluefish.

WHIRLPOOL RAPIDS. A remarkable series of rapids in the Niagara River, 3 miles below Niagara Falls. The central portion of the current is forced by the narrowness of the channel (300 feet) to a height of 20 to 30 feet above the edges. In spite of the dangerous character of the rapids, they have several times been passed by persons in barrels and once by a steamer, the *Maid of the Mist* (q.v.). A short distance below is the whirlpool from which the rapids take their name.

WHIRLWIND. A term specifically applied to small whirls or eddies of winds that continue only a few seconds, seldom longer than a minute; the diameter of the whirl is correspondingly small, and is made visible principally by dust, leaves, or light objects flying in the air. The most extensive dust whirls occur in hot, dry plains, as in India, Texas, and the eastern slope of the Rocky Mountains, and especially in the Desert of Sahara, where heaps of sand, sufficient to cover a caravan, are said to fall to the ground occasionally as the whirling simoom passes over. In the smaller whirls the rotation of the eddy may be either positive or negative, but in the larger whirls the direction, like that of the tornado, is always the same as that of the storms attending areas of low pressure, viz., from the west, by the south, to the east in the Northern Hemisphere, and the reverse in the Southern. Consult: P. F. H. Baddeley, *Whirlwinds and Dust Storms of India* (London, 1860); Theodor Reye, *Die Wirbelstürme* (Hanover, 1880); William Ferrel, *On Cyclones, Tornadoes, and Waterspouts* (Washington, 1882); W. M. Davis, *Whirlwinds, Cyclones, and Tornadoes* (Boston, 1884); also references under STORM.

WHISKY (probably a variant of *usquebaugh*, from Gael., Ir. *uisgebeatha*, water of life, from *uisge*, OIr. *usce*, water; connected with AS., OHG. *waschan*, Ger. *waschen*, Eng. *wash*). A distilled liquor, chiefly obtained from the fermented mash of different varieties of grain. The term is sometimes used to designate liquors obtained from starchy or saccharine substances other than grain, as, e.g., potato spirits.

Although it is customary to use a mixture of different kinds of grain in the preparation of a mash for the production of whisky, the classification of different varieties is based mainly upon the kind of grain in the infusion. Thus rye whisky is made from a mash composed of rye with sufficient barley malt to change the starch into sugar; corn whisky, chiefly from corn or maize; wheat whisky, from wheat; malt whisky, from malted barley, etc. Each variety has it own peculiar aroma derived from the grain, modified somewhat by the character of the ferment used. Rye whisky, sometimes called Monongahela, is produced largely in Pennsylvania; corn whisky is chiefly made in Kentucky, and is frequently called Bourbon, from the county in Kentucky of that name. Malt whisky is not extensively produced in the United States, but a small percentage of malt is used in the mash of all whiskies, in order to secure its diastatic action on the starch of grains.

As grain, particularly maize, is the cheapest source of either starch or sugar in the United States, distilled liquors, including both alcohol and whisky, are principally made from it; consequently the processes and methods of production for the latter are covered, as to the main features, by descriptions of the ordinary procedure followed in the manufacture of a strong alcoholic liquor from a starchy or saccharine mash. (See DISTILLED LIQUORS.) While the chief constituent of whisky is alcohol, and a large quantity of factitious liquor is sold under this name which is simply rectified alcohol, colored and flavored to resemble whisky, yet genuine whisky is very far from being merely a 50 per cent mixture of alcohol and water. The pharmacopœia definition is: "An alcoholic liquor obtained by the distillation of the mash of fermented grain (usually a mixture of corn, wheat, and rye), and at least four years old." This recognizes one very important distinction between whisky and alcohol, viz., the process of aging, to which the former is subjected in order to fit it for beverage purposes. Again, the fermentation is not carried to the same degree of attenuation in the production of whisky as in the production of alcohol, where the highest possible spirit yield is desired. Two different methods of fermentation are in use for whisky, the products of which are known respectively as sweet-mash and sour-mash whiskies.

In a sour-mash distillery the hot slop from the previous fermentation as it comes from the still is used instead of water to mash the next lot of grain. In the sweet-mash distillery the grain is mashed with water. In both kinds of distilleries yeast is added, but the period of fermentation allowed is 72 hours in the sweet-mash distillery and 96 hours in the sour-mash. The yield of proof spirits is generally slightly larger in the sweet-mash process. The old-style method of making a sour mash has largely gone out of use, and instead a certain amount of the slop is mixed in the fermenters with the water-mashed grain.

In the distillation and rectification processes the aim in alcohol production is to obtain a highly concentrated alcoholic liquor freed from all volatile impurities, and, so far as possible, chemically pure; very elaborate rectifying stills are used, therefore, and the operation is completed by filtration through wood or bone charcoal. In the production of whisky the conservation of alcohol is not so important an object, and it is not desirable to eliminate all other volatile constituents, as some of them, when modified and mellowed with age, impart to the liquor its fine flavor. Patent stills wherein fractionation is effected, like the Coffey still, produce a spirit which does not give the best results on maturing. This explains also why whisky made by crude and obsolete methods, such as Scotch and Irish pot-still whisky, often far surpasses in quality the product of the most modern and best-equipped distilleries.

Aging constitutes the final and most important difference in the treatment of alcohol and whisky. Alcohol is ready for sale and use as soon as it leaves the rectifying still and char filter. Whisky, on the other hand, is entirely unfit for consumption when first produced, being fiery and unpalatable; it requires long storage

in wooden casks to bring about the changes in secondary constituents which develop its aroma. It is sometimes sent on long sea voyages, in the holds of vessels, this being supposed to have a favorable effect upon its maturing. Various quick aging processes have been devised and some patented, but none has so far proved satisfactory. Chemically the change which occurs in a matured liquor is considered as a process of oxidation, promoted by the porosity of the wooden cask (a liquor does not age in a glass or metal container), whereby the alcohols present are converted into acids, aldehydes, and the corresponding fragrant ethers, and possibly in part still further oxidized and eliminated. The liquor also acquires some new constituents from the wood of the cask, which is often charred inside, with the idea of promoting chemical action. Freshly distilled whisky is colorless, and contains no solid matter whatever; after being stored in wood several years it has the amber tint familiar to every one, and contains perhaps 100 grains of solid matter per gallon—tannin, extractive and coloring matter—all derived from the oak commonly used in the barrels.

The importance of the maturing process is recognized in the United States laws governing the production of whisky, and provided for by the privilege accorded distillers of deferring the payment of the gallon tax until the liquor is "withdrawn from bond"; the bonded period may be extended as long as eight years with allowance for loss by evaporation, during which time the whisky remains in a bonded warehouse under government control. The government stamp on whisky withdrawn from bond is practically a guarantee of its age and purity, and the Act of March 3, 1897, known as the Bottling in Bond Act, is intended to enable the purchaser of even so small a quantity as a quart to secure a product which comes direct from government control and has, therefore, suffered no addition or adulteration. The internal-revenue strip stamp over the cork of the bottle is imprinted with the age and quantity of the contained whisky.

After the passage of the Food and Drugs Act of June 30, 1906, there arose in the United States and also in England a great controversy as to whether the highly rectified alcohol produced in the rectifying still was entitled to be called whisky. In England a royal commission was appointed, and after long deliberation decided that it was. In this country the controversy raged for several years without final decision until President Taft took up the question personally and rendered a decision that any distillate of grain diluted to potable strength was whisky.

Whisky, in common with other kinds of distilled liquors, bears a heavy burden of taxation in the United States. (See INTERNAL-REVENUE SYSTEM.) The gallon tax has been $1.10 since 1894, which is at least four times the cost of production, and a yearly license, called special tax, is exacted from distiller, wholesaler, and retailer. The entire process of manufacture is subject to supervision by government officers, and the distiller is held to a rigid accounting for all materials used; he must pay tax upon not less than 3½ gallons of proof spirits for every bushel of grain mashed, whether he obtains that yield or not, and heavy penalties are provided for fraud or evasion of tax. In proportion to alcoholic content the rate of tax upon distilled liquors is much higher than upon any form of fermented liquors. See LIQUORS, FERMENTED AND DISTILLED, STATISTICS AND HISTORY OF.

WHISKY INSURRECTION. The term popularly applied to the organized opposition among the farmers and distillers of the four western counties of Pennsylvania in 1794 to the enforcement of the Federal law of March, 1791, imposing an excise tax on whisky. The law was exceedingly unpopular in this part of the country, where whisky was the chief article of manufacture, and from which, by reason of the remoteness of the country, grain could not well be shipped to the East except in the more portable form of whisky. The frontier inhabitants regarded the law as an unjust discrimination against them, and vigorously opposed its enforcement. The government at once instituted prosecutions against some of the chief offenders, but when the marshal undertook to serve the necessary processes he was compelled by a body of armed men to desist. In pursuance of an act passed by Congress in May, 1792, President Washington issued a proclamation commanding the insurgents to disperse, and warning others against abetting them. On Aug. 14, 1794, a convention of more than 200 delegates, representing the western counties of Pennsylvania and one county in Virginia, assembled at Parkinson's Ferry on the Monongahela, with Albert Gallatin (q.v.) as secretary of the meeting. Three commissioners who had been appointed by the President, together with commissioners appointed by the Governor of Pennsylvania, appeared at the convention, and offered a general amnesty, conditioned upon submission to the laws, but no promises or pledges could be secured from the convention. The commissioners thereupon returned to Philadelphia, and on the basis of their report the President issued a second proclamation on September 25, commanding submission and announcing the march to the scene of disturbances of a force of militia, a requisition for 15,000 militiamen having already been made upon the Governors of Pennsylvania, New Jersey, Virginia, and Maryland. Upon the approach of the troops the ardor of the insurgents was somewhat dampened, and David Bradford, the prime mover in the insurrection, fled to New Orleans. Meantime another convention assembled at Parkinson's Ferry and passed resolutions pledging submission and obedience to the laws. Thereupon Governor Henry Lee of Virginia, who was acting as commander of the militia, issued a proclamation of amnesty, requiring an oath of allegiance to the United States, and ordered the arrest of those offenders who refused to make a declaration of submission. A number of suspected persons were seized. Some were dismissed for want of evidence, and others were bound over to appear for trial. Two were convicted of treason, but were pardoned by the President. As a precautionary measure, 2500 troops under the command of General Morgan were retained in the disaffected community throughout the winter to serve as a police force. The real significance of the disturbances, which never rose to the dignity of an insurrection, was that it was the first instance in which the strength of the new Federal government to maintain domestic tranquillity and enforce laws was put to the test. The promptness with which the resistance was put down won respect for the government and established valuable precedents with regard to its

power and duty on similar occasions in the future.

WHISKY JACK. See JAY.

WHISKY RING. In American history, a term popularly applied to an association of internal revenue officers and distillers formed during the administration of President Grant for the purpose of defrauding the government of the excise on distilled spirits. Distillers who refused to pay the assessment were entrapped into technical violations of the law and were forced to contribute or submit to prosecution. Finally it was discovered that the revenue returns were far short of the average, but the criminals could not be reached, on account of the prompt information which they received from members of the ring in the Treasury Department. In 1875, through the active efforts of Benjamin H. Bristow, the Secretary of the Treasury, the frauds were discovered. On May 10, 16 distilleries in St. Louis, Milwaukee, and Chicago were seized and indictments were promptly found against some 240 distillers and revenue officials, besides the chief clerk in the Treasury Department, Avery, and O. E. Babcock, the private secretary and confidential adviser of the President. The trials began at Jefferson City, Mo., in October, 1875, and resulted in the conviction of a Treasury agent and a supervisor. Babcock was acquitted in 1876. Most of the other offenders either pleaded guilty or were convicted. The leading defendants who were convicted were pardoned after a short interval. A select committee appointed by the House of Representatives made an exhaustive investigation of the subject. The report with the testimony taken is published in the *House Miscellaneous Document*, No. 186, first session, Forty-fourth Congress. It was shown that during the ten months ending May 1, 1875, the government had been defrauded of $1,650,000 in taxes.

WHISPERING GALLERY. The name given to a number of galleries on the interior of domed buildings which from their construction possess a peculiar echo, transmitting sounds with great intensity to distant points. The most noted of such whispering galleries is in the cupola of St. Paul's, London, where a low whisper uttered near one wall may be distinctly heard at the opposite wall 108 feet away.

WHIST. A game of cards played with a full pack by four persons, two in partnership against the other two. Its origin, like that of most card games, is very obscure. Under its old name of triumph it had become so commonly understood that when Bishop Latimer preached the Christmas sermon at Cambridge in 1529, he had no doubt his hearers could follow his allegories based upon it. Its first serious study and the formulation of its rules came about by the frequent meetings of a party of whist players at the Crown Coffee House in Bedford Row, London, of whom Edmond Hoyle (q.v.) was one. Up to this time it had been usual to discard the deuces, so that the tricks were often even, six on each side. By bringing the entire pack of cards into play they added the potent factor of the odd trick. In 1760 the laws were revised by the members of two celebrated London clubs, Whites and Saunders, and the rules so revised remained in existence until 1862, when Cavendish published his celebrated treatise, of which more than 30 editions have since been issued. The next important change in the methods of play was the adaptation by Cavendish of the American leads, a method suggested by Nicholas B. Trist of New Orleans, in 1883–84, to classify the various scattered rules for leading, so as to make it possible to establish general principles. This system involves a systematic course of play when opening, and the continuing of leads from strong suits. The rules revised by the Portland Club of London govern whist, except where it is necessary to adopt those of the American Whist League, or where German whist, or Bridge (q.v.) is played. The two pairs of partners sit facing each other, and the entire 52 cards are dealt one at a time, face down, 13 to each player, the last card being turned face upward and its suit determining trumps; the player at the left of the dealer leads first, and the succeeding player must follow suit if he can. The highest card of the suit led (unless some player not having a card of that suit has played a trump) wins the trick. The winner of the trick then leads, playing any card of any suit he chooses, and so on in turn, until all the cards, making 13 tricks, have been played.

Long whist, a game of 10 points in which honors are scored, is now seldom played. Short whist, a game of five points, where honors are scored, is popular in England. The American game is of seven points without honors. Dummy whist is a game played by three persons, the fourth hand, called the dummy, being exposed on the table. The dummy deals at the beginning of each rubber, and is not liable to a penalty for a revoke, neither is the dummy's partner liable to any penalty for an error from which he can gain no advantage, but otherwise the laws are the same as those of whist proper. Double dummy is played by two persons, each player having a dummy or exposed hand for his partner. In this game there is no misdeal and the laws are the same as for dummy whist. In duplicate whist the deal is played but once by each player, but in order to bring the play of teams, pairs, or individuals into comparison each hand is played over again. When it comes the turn of a player to play, he is required to place his card face up before him and let it remain until the others play to the trick, after which he turns it over with the ends towards the winners of the trick. When the deal is played, each player places his hand in the tray or whatever device is employed, face downward, and the trump card is placed face upward on top of the dealer's hand. Russian whist closely resembles the American game, except that there are no trumps and the scoring varies according to agreement, although it is generally as in long whist.

There is a very large bibliography of whist which is easily accessible. The standard work is Cavendish, *Principles of Whist, Stated and Explained* (21st ed., London, 1902). Consult also, Foster, *Complete Hoyle* (New York, 1908).

WHISTLER, or SIFFLEUR. A large marmot (q.v.) of the Rocky Mountains, which dwells mostly in the open region above timber line and is noted for its clear whistling note. It is closely related to the woodchuck, and, like other marmots, burrows deeply, and hibernates. Two species are recognized, *Arctomys flaviventer* from Texas to northern Montana, and *Arctomys pruinosus* from the Columbia River to Arctic America. The latter is the siffleur of the old fur hunters.

WHISTLER, hwis'lẽr, JAMES ABBOTT MCNEILL

(1834–1903). An American painter and etcher. He was born at Lowell, Mass., July 10, 1834, of an old American military family. His father, Major George Washington Whistler, of the United States army, was a distinguished engineer, and his mother, a Miss McNeill of Wilmington, N. C., was of a well-known Southern family. In 1837 the family removed to Stonington, Conn., thence in 1840 to Springfield, Mass., and in 1843 to St. Petersburg, Russia, Major Whistler having been commissioned by the Czar to construct the railroad between St. Petersburg and Moscow. While in St. Petersburg Whistler attended the Imperial Art Academy. After the Major's death (1849) the family returned to Stonington, then settled at Pomfret, Conn., where the lad was sent to school preparatory to entering West Point in 1851. Military discipline and attention to detail were odious to him, and although he distinguished himself in drawing, his record in other subjects was such that after three years he was dismissed from the academy. He was, however, assigned to the United States Coast Survey, but did not remain long, because of a prank in engraving caricatures on the margin of a plate executed in that service. In 1856 he became a pupil of the classicist Gleyre in Paris, but was not perceptibly influenced by this master. He was for some time a follower of Courbet, whose sincere realism he deeply admired, and was intimate with Fantin-Latour and Legros. The low tones and the grand lines of his work call Velazquez to mind, though he never saw the best of the great Spaniard's works in Madrid. From the Japanese he learned subtle decorative effects. But none of these elements dominate his art to such an extent that he can with propriety be called any man's pupil. His individuality was from the beginning unique.

From 1857 to 1863 his pictures were refused at the Salon; but in the latter year his "Little White Girl" achieved a signal success in the Salon des Refusés. As an etcher he found earlier recognition. His *Little French Series* (1858) representing Parisian views, some of a genre character, established his reputation, and the wonderful *Thames Series* (1871) placed him in the first rank. Being executed with considerable detail, these plates met with greater approbation than those of his later life, when he had carried the process of selection to its logical conclusion. His later subjects were taken from Holland, France, and other localities which he visited, but the best known are the *First Venice Series* (1880) and the *Second Venice Series* (1881). They are the culmination of his etching, and place him in the same rank with Rembrandt, the world's greatest etcher, whom he even excels in subtlety of execution. In the rendition of color and of light and shade, in the subtle grouping of line, these works are unique. Whistler was also highly successful in dry-point etching and lithographic drawing, in which media he executed a number of plates. Some 300 of his etchings have been published with comments by Frederic Wedmore (1899), and good examples may be found in the print rooms of the Venice Academy, Dresden Gallery, Bibliothèque Nationale, British Museum, Public Library, New York, and elsewhere.

The eccentricities of Whistler and his quarrels with English artists and critics during his long residence in London from 1859 were, for a long time, better known than his paintings. He was of a very combative disposition, and profoundly impressed with the importance of his own views. His central idea was that painting should appeal only to the eye, and that it was not a medium for the expression of ideas or emotions, the subject being absolutely irrelevant. Emphasizing the analogy with music, he called his paintings arrangements, symphonies, nocturnes, and the like, pitching them in one or two related color tones. For him the public and the critics were fools with no right to an opinion whatever. He quarreled indiscriminately with friend and foe, chiefly by means of public letters, in which he gave vent to an inimitable wit and satire. Especially well known is his quarrel with John Ruskin, who in his *Fors Clavigera* (1877) had given vent to his feelings over one of Whistler's "Nocturnes" in the following language: "I have seen and heard much of cockney impudence before now; but never expected to hear a coxcomb ask 200 guineas for flinging a pot of paint in the public's face." The artist promptly sued for damages, and in the celebrated trial which followed he was awarded one farthing, which coin he triumphantly wore as a watch charm ever afterward. He was no less known for his wit, which usually carried a personal sting, and he left behind a wealth of anecdote. To propagate his ideas he turned increasingly to literature, developing a style as well balanced as it is clear and incisive. *Ten o'Clock* (1888), a lecture delivered at that hour of night, is a statement of his artistic theories; his other works are *The Gentle Art of Making Enemies* (1890), in which he was past master, and the *Baronet and the Butterfly* (1890), an account of a celebrated quarrel. No artist ever had a more interesting signature than Whistler's butterfly, the movement of which suggests the sentiment of the painting or letter.

From the year 1859 Whistler resided chiefly in London, making frequent journeys to Paris, and journeying to Venice in 1880. In 1866, unexpectedly, he visited Valparaiso, Chile. It was before 1890 that he executed most of his paintings. Best known among them is the portrait of the "Artist's Mother" (Luxembourg) —an arrangement in gray and black, executed with rather more detail than most of his works, and a charming picture of placid domesticity. Of almost equal merit is his portrait of Carlyle (1872, Glasgow Museum), in which he has immortalized the thinker. His portrait of Miss Alexander (owned by W. C. Alexander), in gray and green, is delicate and subtle in execution. These portraits are not mere faces or figures, but rather figure paintings, with masterful well-arranged backgrounds. Other celebrated examples of female portraits are Rose Whistler (1862, Boston Museum); "The Yellow Buskin" (Wilstach collection, Philadelphia); "Miss Rosa Corder" (Frick collection, New York); "The Gold Girl, Connie Gilchrist" (Metropolitan Museum); "Lady in a Fur Jacket" (William Burrell); Lady Meux; and Miss Florence Leyland (Brooklyn Institute Museum). His portraits of men include those of his friend Théodore Duret and of Sir Henry Irving as Philip II of Spain (both in Metropolitan Museum); Comte de Montesquieu (Frick collection, New York); and the violinist Sarasate, an arrangement in black (Pittsburgh Academy). Among his celebrated figure subjects are "The Lange Leitzen" (1864, J. J. Johnson, Philadelphia); "At the Piano" (1867), showing the passing influence of Ros-

WHISTLER

PORTRAIT OF THE ARTIST'S MOTHER, FROM THE PAINTING IN THE LUXEMBOURG GALLERY, PARIS

setti; "A Princess of the Land of Porcelain" (1868, Freer collection, National Gallery, Washington); the "Music Room," a harmony in green and gold (Col. Frank J. Hecker, Detroit); and the wonderful "Symphony in White, No. 3" (Edmund Davis), almost Hellenic in spirit.

Few artists had as broad a range of subjects as Whistler. His landscapes portray the mysterious beauty of the night and the majesty of the ocean; who before him saw the splendor of the London fog? He discovered beauty in all about him, in the squalid quarters of London and in the commonplace of the drawing room as well as in the magic canals of Venice. Among his principal "Nocturnes" are "Cremorne Gardens, No. 2" (Metropolitan Museum); the "Falling Rockets" (Mrs. Samuel Untermyer, "Greystone," on the Hudson) (black and gold); "St. Mark's, Venice" (blue and gold); "Battersea Bridge" (blue and silver); "Thames in Ice" (National Gallery, Washington); "Chelsea Snow" (gray and gold); "Southampton Water" (Art Institute, Chicago). Among marine views are "Valparaiso Harbor" (Freer collection, National Gallery), a twilight scene in flesh color and green; "Blue Wave, Biarritz" (Alfred A. Pope); and "The Ocean" (gray and green), in the Frick collection. To these must be added some of the many views of London, like "Trafalgar Square," "Westminster" (Johnson collection, Philadelphia), and "Westminster Bridge" (Alfred A. Pope). Whistler also executed many fascinating water colors, and his Venetian pastels equal, in delicacy and refinement, anything that has yet been done in that medium. As a decorator Whistler was also important, and his soft, restful colors have exercised a wide influence upon household decoration. Among his best-known decorations are those for the music room of his friend Sarasate in white and clove color (Paris); and for the celebrated "Peacock Room" formerly in Mr. Leyland's London house, in blue and gold (now in the National Gallery, Washington).

For a long time Whistler did not meet with deserved recognition, but in 1887 he was elected president of the Royal Society of British Artists. Under his administration the quality of art exhibited by the society greatly improved, but its finances declined, and in 1888 Whistler and his following withdrew. He remarked, "The artists have come out, and the British remain." In the same year he married the widow of the architect E. W. Godwin, and she exercised a quieting influence on his life and character. The appreciation so long denied was fully meted out to him from 1889. He was made honorary member of the academies of Munich, Dresden, Rome, etc., Chevalier of the Legion of Honor, Knight of the Bavarian Order of St. Michael, and he received gold medals at the Paris Exposition, at Chicago, Philadelphia, Antwerp, Dresden, etc. During the years 1898–1901 he taught at intervals at the Académie Carmen, Paris, a school opened under his supervision, which in the early years was attended by large numbers of American students. These gradually dwindled down to such a small number that the school was closed. To this last period belong the "Master Smith" and the "Little Rose of Lyme Regis" (both in the Boston Museum); "The Little Blue Bonnet" (Herbert Pratt); "The Little Lady Sophie of Soho" (Freer collection, National Gallery, Washington). In 1892 he settled in Paris, but in 1895 returned to England because of Mrs. Whistler's ill health. After her death in 1896, except for short trips abroad, he lived mostly in London, where he died July 17, 1903.

Whistler holds a unique position in the development of art. He was essentially modern, and something of all the most modern tendencies of art centred in him, and yet he was absolutely independent of them all. An avowed realist, he differed from others in that nature merely supplied him the material for color harmonies. His paintings were often impressions, but, unlike the Impressionists, he was not primarily a painter of light, preferring sad colors. He resembled the Japanese in the peculiar decorative character of his work. The effect is subtle and dreamy, as of a vision rather than reality. Although he was a fine draftsman, color was to him the chief factor in painting, and not even Velazquez was a greater master of color values. His brush work was careful and painstaking, although in the finished painting no trace of effort can be seen. His influence has materially affected the British, especially the Glasgow school, the American, and even the French school. Although his theories of art were essentially cosmopolitan his ambition was for American art, and he greatly wished his pictures to come into American hands—a wish richly fulfilled. The most comprehensive collection of Whistler's work was made by Charles L. Freer of Detroit, Mich., who presented it in 1906 to the National Gallery, Washington. It contains half a hundred oil paintings, water colors, etchings, etc.

Bibliography. The authorized biography of Whistler is by E. R. and J. Pennell, *Life of James McNeill Whistler* (new ed., Philadelphia, 1911). Consult also: A. J. Eddy, *Recollections and Impressions of J. A. McNeill Whistler* (New York, 1903); Mortimer Menpes, *Whistler as I Knew Him* (ib., 1904); Théodore Duret, *Whistler* (Paris, 1904); Way and Dennis, *Art of James McNeill Whistler* (New York, 1905); Frederick Wedmore, *Whistler and Others* (ib., 1906); *Masters in Art*, vol. viii (Boston, 1907), containing a full bibliography; E. L. Cary, *The Works of J. McNeill Whistler* (New York, 1907); O. H. Bacher, *With Whistler in Venice* (ib., 1908); Samuel Hartmann, *The Whistler Book* (Boston, 1910); Frank Rutter, *Whistler* (New York, 1911); A. E. Gallatin, *Portraits and Caricatures of James McNeill Whistler: An Iconography* (ib., 1913); id., *Whistler's Portraits and other Modern Profiles* (2d ed., ib., 1913); id., *Notes on some Rare Portraits of Whistler* (ib., 1916). For his etchings consult *A Descriptive Catalogue of the Etchings and Drypoints of J. A. McNeill Whistler* (Chicago, 1909), and E. G. Kennedy, *Etchings of Whistler* (New York, 1910). Also D. C. Seitz, *Writings by and about James Abbott McNeill Whistler: A Bibliography* (New York, 1910), who also collected and arranged *Whistler Stories* (New York, 1913).

WHISTLER, or **WHISTLEWING.** See GOLDENEYE.

WHISTON, WILLIAM (1667–1752). A clergyman of the Church of England. He was born at Norton, in Leicestershire. He studied at home and in a school at Tamworth until 1686, when he went to Cambridge, where he distinguished himself, chiefly in mathematics. In 1690 he took his degree, and obtained a fellowship in 1691. In 1693 he became chaplain to John Moore, Bishop of Norwich, and in 1698 was presented to the living of Lowestoft,

in Suffolk. In 1696 appeared his *New Theory of the Earth*, a work which procured him a considerable reputation. In 1701 he was appointed deputy to Sir Isaac Newton, and in 1703 succeeded him in the Lucasian professorship at Cambridge. In addition to his duties he engaged in clerical work with much success as a preacher. The development of his theological opinions led him into Arian heresy, and his avowal of his views in his preaching and his writings led, in 1710, to expulsion from his professorship and the university. In 1711 appeared the most noted of his original writings, *An Historical Preface to Primitive Christianity Revived*. His subsequent prosecution in the Church courts dragged along for five years, when it was dropped. Whiston remained formally a member of the Church of England until 1747, when he joined the Baptists. Having no regular means of livelihood, he became reduced to great straits; but in disseminating his religious opinions he continued unwearied, and his publications were numerous. He also busied himself with scientific investigations, and he was one of the first persons to give lectures with experiment in London. In 1715 he instituted a society in London for promoting primitive Christianity, and the meetings were held at his home. He died Aug. 27, 1752. Of his many works his translation of Josephus is best known (1737; many subsequent editions). His *Memoirs* (1749) appeared during his life.

WHIT'AKER, Joseph (1820–95). An English publisher of theological works especially, and best known perhaps for his *Whitaker's Almanac*. From 1856 to 1859 he edited the *Gentleman's Magazine;* in 1858 he founded the monthly journal, *The Bookseller;* and 10 years later put out his first annual *Almanac*. *A Reference Catalogue of Current Literature* (1874) was periodically revised and enlarged. With one of his sons, Joseph Vernon Whitaker, he founded the *Stationery Trades Journal* in 1880.

WHIT'BY. A town in Ontario County, Ontario, Canada, on Lake Ontario, with harbor, and on the Grand Trunk and Canadian Pacific railways, 30 miles northeast of Toronto (Map: Ontario, G 6). It is the seat of Ontario Ladies' College. It has some manufactures. Pop., 1901, 2110; 1911, 2248.

WHITBY. A seaport and favorite watering-place in the North Riding of Yorkshire, England, on both sides of the mouth of the Esk, where it enters the North Sea, 50 miles northeast of York (Map: England, F 2). The old town, anciently called Streoneshalh, with its picturesque houses, rises in terraces on the cliff crowned by the noble ruins of the Benedictine abbey founded by St. Hilda about 657. Here lived and died Cædmon (q.v.). In 867 the abbey was burned by the Danes, who renamed the town Whitby (White town). In 1078 it was rebuilt by William de Percy as a monastery for men only. Hence the nuns of Whitby described by Sir Walter Scott in *Marmion* are a pure fiction. The magnificent ruins we now see belong of course to the second abbey, for the old buildings of wood and thatch must have been utterly destroyed. The new portion of the town is on the west cliff. A swivel bridge connects the two parts of the town, and admits vessels into the inner harbor. There are shipbuilding and repairing docks, rope and sail-making works, an active import and export trade, important herring fisheries, and a specialty is the manufacture of jet ornaments from a variety of petrified wood found in the vicinity. Pop., 1891, 13,075; 1901, 11,748; 1911, 11,139. Consult Robinson, *Whitby and its Abbey* (London, 1860), and see Wilfrid.

WHITCHER, hwich'ẽr, Frances Miriam (Berry) (1811–52). An American humorist, born at Whitestown, N. Y. She contributed poems and sketches to the newspapers and won much celebrity for her humorous creation, "The Widow Bedott." She married the Rev. Benjamin W. Whitcher, of Elmira, N. Y., in 1847, and it is said that the claims of people who thought she had used them as models drove her and her husband from his charge. Her chief book, *Widow Bedott Papers*, was gathered from her writings in 1855, and a coarsely amusing play was afterward made from it by D. R. Locke. Consult the memoir by M. L. W. Whitcher in Frances Whitcher's *Widow Spriggins* (New York, 1867).

WHITE, Andrew Dickson (1832–). An American educator, diplomat, and scholar, born at Homer, N. Y. He graduated at Yale in 1853, studied in Paris, and after serving as attaché to the United States legation at St. Petersburg during part of the Crimean War, did further graduate work at Berlin. In 1857 he became professor of history and English literature in the University of Michigan. Five years later his health compelled him to go abroad. From 1863 to 1867 he served as a member of the New York Senate. In the latter year he became president of Cornell University (q.v.), which he had helped to found, and occupied that position, together with the professorship of history, until 1885. Two years after his resignation he gave to the new school at Cornell, called in his honor the President White School of History and Political Science, his historical library, consisting of about 30,000 volumes and 10,000 pamphlets and manuscripts. The university, which received from him in all $300,000, owns a bronze statue of Dr. White, done by Karl Bitter. While president he had been one of the commissioners sent in 1871 to Santo Domingo to report on the desirability of annexing that island; in 1876 was chairman of the jury of public instruction at the Centennial Exposition; and in 1878 was honorary commissioner to the Paris Exposition, receiving the officer's cross of the Legion of Honor. Later he was Minister to Germany (1879–81) and to Russia (1892–94); served on the commission to investigate the Venezuela-Guiana boundary line (1896); from 1897 until 1902 was Ambassador to Germany; and in 1899 was made chairman of the American delegation to The Hague Peace Conference. He was elected to the American Academy of Arts and Letters, and was first president (1884) of the American Historical Association. He published: *Outlines of a Course of Lectures on History* (1861); *Syllabus of Lectures on Modern History* (1876); *The Warfare of Science* (1876), enlarged as *A History of the Warfare of Science with Theology in Christendom* (2 vols., 1896; new ed., 1913), and translated into French, Italian, Portuguese, and German; *Seven Great Statesmen in the Warfare of Humanity with Unreason* (1910); *The Work of Benjamin Hale* (1911). Consult his *Autobiography* (2 vols., New York, 1905).

WHITE, Bouck (1874–). An American Socialist and author, born at Middleburg, N. Y. He graduated from Harvard in 1896, and from Union Theological Seminary (New York) in

1902, for some years was a Congregational minister, and in 1908–13 was head resident of Trinity House, Brooklyn. Dismissed because of certain socialistic views, he organized the church of the Social Revolution in New York City. As a protest against the attitude of the Rockefeller interests towards the mine war in Colorado, White appeared (May, 10, 1914) at a service of the church to which the Rockefeller family belonged, in order to discuss the question, "Did Jesus teach the immorality of being rich?" Upon attempting to speak he was arrested, and soon after, on the charge of disorderly conduct, was sentenced to six months in the workhouse. For desecrating the national flag he was again sent to prison in 1916. His writings include: *Quo Vaditis* (1903); *The Book of Daniel Drew* (1910); *The Call of the Carpenter* (1911); *The Mixing* (1913); *The Carpenter and the Rich Man* (1914); *Letters from Prison* (1915).

WHITE, CHARLES ABIATHAR (1826–1910). An American geologist, born at North Dighton, Mass. He was State geologist of Iowa in 1866–70, and professor of natural history in the State University of Iowa in 1867–73, and in 1873–75 held a similar chair in Bowdoin College. He was geologist and paleontologist of the United States Geological Survey between 1874 and 1892, and after 1895 was an associate in paleontology at the United States National Museum. His writings comprise 238 titles. Those published between 1860 and 1885 were catalogued by J. B. Marcott (1885).

WHITE, CLAUDE GRAHAME-. See GRAHAME-WHITE, CLAUDE.

WHITE, DAVID (1862–). An American geologist, born at Palmyra, N. Y. He graduated at Cornell University in 1886, and in 1899 became a member of the United States Geological Survey, eventually rising to be chief geologist. He was also appointed in 1903 associate curator of paleobotany in the Smithsonian Institution. His numerous papers on geological and paleontological subjects were published in government reports and scientific reviews.

WHITE, EDWARD DOUGLASS (1845–). An American jurist, chief justice of the United States Supreme Court. He was born in Lafourche Parish, La., and was educated at Mount St. Mary's College (Emmitsburg, Md.), Georgetown College (Georgetown, D. C.), and the Jesuit College at New Orleans. He left college to enlist in the Confederate army, and served as a private during the latter part of the war. At its close he began the study of law in the office of Edward Bermudez, and in 1868 was admitted to the Louisiana bar. His rise to distinction in his profession was rapid. Entering politics as a Democrat, in the footsteps of his father, who had been seventh Governor of the State, he was elected State Senator for the term 1874–78. Under appointment of Governor Nichols, he was an associate justice of the Louisiana Supreme Court from 1878 to 1891. In 1891 he was elected to the United States Senate over H. C. Warmoth; but in 1894, after three years' service, he was appointed by President Cleveland an associate justice of the United States Supreme Court. He soon became known as one of the ablest members of the court, and many of his opinions, some of which were delivered without manuscript, were of fundamental importance. In 1910, to the general surprise (and approval) of the nation, President Taft, Republican, Protestant, and of northern interests, appointed to the chief justiceship the ex-Confederate soldier, Democrat, and Roman Catholic. Some of White's important opinions were on the Insular cases, *In re Neagle*, *Pacific States Telephone and Telegraph Co.* v. *Oregon*, and on the Standard Oil Company and American Tobacco Company cases of 1911. In the latter cases he expounded the famous light-of-reason doctrine to be used in interpreting the Sherman antitrust law. (See TRUSTS.) Important dissenting opinions were delivered in the Income Tax case of 1894, the Northern Securities (q.v.) case of 1904, and the Bakeshop cases.

WHITE, EDWIN (1817–77). An American historical and genre painter, born at South Hadley, Mass. He began to paint portraits at a very early age, and studied in Paris under Picot, and subsequently in Rome, Florence, and Düsseldorf. Returning to the United States in 1875, he settled in New York City. His genre paintings are marked by a fine feeling for color and a delicate and refined sentiment. His historical pictures deal principally with subjects of American history. Among the best are "Washington Resigning his Commission" (State House, Annapolis, Md.); the unfinished picture of the "Signing of the Compact on the Mayflower" (Yale College); "Thoughts of Liberia, Emancipation," and an "Old Woman Spinning" (Public Library, New York); and "The Antiquary" (Metropolitan Museum).

WHITE, SIR GEORGE STUART (1835–1912). A British soldier, born in County Antrim, Ireland. He enlisted in the army in 1853, and was made a captain in 1863 and major in 1873. In 1881 he became lieutenant colonel of the Gordon Highlanders and military secretary to the Viceroy of India, and in 1884–85 participated in the Nile expedition. He also took part in Lord Roberts's famous march to Kandahar In 1893–98 he was commander in chief of the forces in India. Participating in the Boer War, he conducted the defense of Ladysmith, which made him famous. He was promoted to lieutenant general in 1895 and later to general and to field marshal. See SOUTH AFRICAN WAR.

WHITE, GILBERT (1720–93). An English naturalist. He was born July 18, 1720, at Selborne, a secluded village of Hampshire, and grew up in Selborne, at the house known as The Wakes, famous as his lifelong home. He attended school for a short time at Farnham, and was afterward sent to the Basingstoke Grammar School. Late in 1739 he was admitted to Oriel College, Oxford, where he graduated in 1743, and was elected fellow. Ordained to the priesthood, he became curate at Swarraton, and subsequently at Selborne and Faringdon, a neighboring parish. He lived mostly at The Wakes, which he inherited in 1763. In 1752 he was made dean of Oriel. He died and was buried at Selborne.

In 1751 White began a *Garden Kalendar*, which was afterward elaborated into a *Naturalist's Journal*, wherein was recorded the temperature, the wind, and the weather for each day, the trees first in leaf, the plants first in flower, and the birds first to appear or disappear. The manuscripts of these diaries, from which extracts have been published, are in the British Museum. In 1767 White made the acquaintance of Thomas Pennant, one of the most distinguished naturalists of the eighteenth century, and the two men carried on a correspondence for nine years. White's part of this

correspondence and a series of letters to Daines Barrington, another naturalist, formed the basis of the famous *Natural History and Antiquities of Selborne* (1789). The book gives a careful description of the parish of Selborne, quaint and delightful accounts of trees, flowers, birds, etc. Since this volume made its appearance many treatises on natural history have appeared, but this has become a classic. White struck the exact mean between science and literature. Darwin praised the *Natural History* for accurate observation, and Lowell for its "open-air" quality. Others have been fascinated by the style, at once precise and natural. Editions of the *Natural History* are numerous. Perhaps the best is that by Thomas Bell (London, 1877), who bought The Wakes in 1840. Consult the standard biography, *The Life and Letters of Gilbert White of Selborne*, edited by his great-grandnephew, Rashleigh Holt-White (London, 1901), and H. C. Shelley, *Gilbert White and Selborne* (New York, 1906).

WHITE, Gleeson Joseph William (1851–98). An English writer on art, born at Christ Church, in Hampshire. He was educated at Christ Church School and afterward became a member of the Art Workers' Guild. In 1890 he came to New York City, where he conducted the *Art Amateur* (1891–92). Returning to England in 1893, he founded the *Studio*, which he edited for about a year, and to which he contributed up to the time of his death. Among his publications relative to art are: *Practical Designing* (1893; 3d ed., 1897); *Salisbury Cathedral* (1896); *English Illustrations in the Sixties* (1897); and *Master Painters of Great Britain* (4 vols., 1897–98). He also edited during his last years the "Ex Libris Series"; the "Connoisseur Series"; the "Pageant"; and, with E. T. Strange, Bell's "Cathedral Series." White was himself a designer of repute. In 1887 he edited *Ballades and Rondeaus*, a selection from Lang, Dobson, and others.

WHITE, Henry (1850–). An American diplomat, born in Baltimore. He was educated privately in the United States and France, and, possessed of large wealth, selected diplomacy for a career. He was secretary of legation at Vienna in 1883–84, was then transferred to London as second secretary, and became secretary in 1886. Frequently charged with important duties as chargé d'affaires, he was the American representative at the International Conference of 1886 which abolished sugar bounties. He was recalled by Cleveland in 1893, but was reappointed secretary of embassy at London in 1897, and served until 1905. By appointment of President Roosevelt he was Ambassador to Italy in 1905–07 and to France in 1907–09, and by appointment of Taft special ambassador to Chile in 1910. In 1906 he was selected to head the United States delegation to the Algeciras Conference respecting Moroccan affairs and, although American participation was regarded as contrary to the Washington-Jefferson policy of neutrality towards all European matters, his tact enabled him to exercise in some respects the influence of an umpire.

WHITE, Henry Kirke (1785–1806). An English poet, born at Nottingham, the son of a butcher of that place. At 15 he was apprenticed to an attorney, and he began to study by himself Latin and other languages. He also became a member of a literary society in Nottingham, and showed ability as a speaker. To the *Monthly Preceptor* he sent several poems which brought him attention. In 1803 he published *Clifton Grove, a Sketch in Verse, with Other Poems*, which secured him influential friends, notably Robert Southey and Charles Simeon of King's College, Cambridge. The latter obtained for him a sizarship in St. John's College, Cambridge. At the university he distinguished himself in the classics; but overstudy ruined his health and he died in his college rooms. In 1807 two volumes of his *Remains* were published by his friend Southey, to whom his manuscripts had been intrusted, prefaced by a memoir. Byron ranked White next to Chatterton. This position time has not confirmed.

WHITE, Henry Seely (1861–). An American mathematician, born at Cazenovia, N. Y. He graduated in 1882 from Wesleyan University, Conn., and later studied at Göttingen (Ph.D., 1891). He served as professor of pure mathematics (1894–1905) and also as secretary of the faculty (1903–05) at Northwestern University, and thenceforth as professor of mathematics at Vassar, in 1911–13 being also president of the Vassar Brothers Institution. In 1907–08 he held the presidency of the American Mathematical Society, of whose *Transactions* he was associate editor (1902–06) and editor after 1907, and in 1915 he was elected to the National Academy of Sciences. White made contributions on the theory of invariants, and on the geometry of curves and surfaces.

WHITE, Horace (1834–). An American journalist and financial expert, born at Colebrook, N. H. He graduated at Beloit College in 1853, and in 1854 became city editor of the Chicago *Evening Journal*. In 1856–57 he served as assistant secretary of the National Kansas Committee. As a reporter for the Chicago *Tribune* he accompanied Abraham Lincoln in 1858 in his campaign against Stephen A. Douglas, his account being published in Herndon's *Life of Lincoln*. From 1864 to 1874 he was editor in chief and one of the owners of the Chicago *Tribune*. In 1883 he bought an interest in the New York *Evening Post*, and in conjunction with Carl Schurz and Edwin L. Godkin assumed the control of its columns. In 1899 he succeeded Godkin as editor in chief and he held that position till his retirement in 1903. Widely known for his able discussions of currency and banking problems, he published: *Money and Banking* (1895; 5th ed., rev., 1914); a translation from the Greek of Appian's *Roman History* (2 vols., 1899); *Life of Lyman Trumbull* (1913).

WHITE, Horatio Stevens (1852–). An American German scholar, born in Syracuse, N. Y. He graduated at Harvard in 1873, studied for several years in Europe, and was admitted to the New York bar in 1878. In 1876–78 he was assistant professor of Greek and Latin at Cornell, where he afterward taught German, becoming head of his department in 1891, and also dean of the university faculty in 1896. In 1902 he was appointed professor of German at Harvard. From Glasgow University he received the degree of LL.D. Besides writing a number of magazine articles, he edited: *Selections from Lessing's Prose* (1888); *Selections from Heine's Poems* (1890); *Selections for German Prose Composition* (1891); *Deutsche Volkslieder* (1892). He was also the general editor of Appleton's "Twentieth Century Series of German Classics" (1901–05), and editor of Fiske's *Chess Tales and Chess Miscellanies* (1912).

WHITE, HUGH LAWSON (1773–1840). An American political leader, born in Iredell Co., N. C. He served against the Indians in Tennessee in 1792–93, and became private secretary to Governor Blount in the latter year, but soon went to Philadelphia to study. In 1796 he began the practice of law at Knoxville, Tenn. In 1801 he became judge of the Superior Court of Tennessee, and was a member of the State Senate in 1807 and 1809. From 1809 to 1815 he was judge of the Supreme Court, and from 1812 to 1827 was president of the Bank of Tennessee, which for a time was the only bank in the West which did not suspend specie payments. He was again a State Senator in 1817, and from 1821 to 1824 was a commissioner on the part of the United States to settle disputes growing out of the Spanish occupation of Florida. He succeeded General Jackson in the United States Senate in 1825, and served continuously until 1840, though offered the secretaryship of war in 1831. He soon became a leader in the Senate, opposed internal improvements by the Federal government, was instrumental in preventing the recharter of the United States Bank, and in 1829–30 was the author of the bill to remove the Indians west of the Mississippi. He was at first a strong supporter of Jackson, but by his independent course in favoring the bill to limit executive patronage, and especially by his opposition to Van Buren's succession to the presidency, the friendship was broken. In October, 1835, he was nominated for President by the Legislature of Tennessee, and in spite of President Jackson's vigorous personal efforts, carried the State in 1836 by more than 10,000 majority. He also carried Georgia and received altogether 26 electoral votes. He refused to vote for the resolution to expunge the Senate resolutions of censure against President Jackson, but was willing to rescind. By 1838 he declared himself a Whig. When the Democratic Legislature of Tennessee instructed him to vote for the sub-Treasury Bill, he refused and resigned. Judge White's stern sense of rectitude earned for him the appellation "The Cato of the United States." Consult Scott, *Memoir of Hugh Lawson White* (Philadelphia, 1856).

WHITE, ISRAEL C(HARLES) (1848–). An American geologist. He was born in Monongalia Co., W. Va., and was educated at West Virginia University (A.M., 1872), where he was professor of geology from 1877 to 1892. He resigned to take charge of a large petroleum business. Earlier he had been assistant geologist of the Pennsylvania Geological Survey (1875–84), and of the United States Geological Survey (1884–88), and in 1897 was appointed State geologist of West Virginia. White became recognized as an authority on coal, petroleum, and natural gas. With Prof. Edward Orton (q.v.) he developed the anticlinal theory of gas accumulation (see GAS, NATURAL, *Mode of Occurrence*). In 1908 he addressed the Conference of Governors at the White House, Washington, D. C. He published many papers and reports, the more extended of which are included in the publications of the West Virginia Geological Survey.

WHITE, JAMES (1863–). A Canadian geographer. He was born at Ingersoll, Ontario, and graduated at the Royal Military College, Kingston, in 1883. During 1884–94 he was engaged on government surveys in the Rocky Mountains and in Quebec and Ontario, and was geographer and chief draftsman of the Canadian Geological Survey (1894–99), and chief geographer of the Department of the Interior (1899–1912). In 1909 he was appointed secretary of the Royal Conservation Commission and in 1913 was promoted to assistant chairman and deputy head of the same. He edited the Canadian sections of numerous geographical works and published large scale maps and a relief map of Canada. His works include: *Altitude in Canada* (1901); *Dictionary of Altitudes* (1903); *Maps and Map Making in Canada* (1905); *Atlas of Canada* (1906); *The Ashburton Treaty* (1907); *Oregon and San Juan Boundaries* (1908); *The Labrador Boundary* (1909); *Derivations of Place Names in Canada* (1912).

WHITE, JAMES WILLIAM (1850–1916). An American surgeon, born in Philadelphia. After graduating M.D. from the University of Pennsylvania in 1871, he was a member of Prof. Louis Agassiz's staff in the Hassler expedition to the West Indies, the Straits of Magellan, and both coasts of South America (1871–72). Settling in Philadelphia, he there held several hospital positions, and also was connected with his alma mater successively, till his retirement, as professor of genito-urinary surgery, of clinical surgery, and as John Rhea Barton professor of surgery. During the early part of the European War he was connected with the American Ambulance Hospital in Paris. Aberdeen gave him its LL.D. He published, with W. W. Keen (q.v.), *American Textbook of Surgery* (1896) and, with Edward Martin, *Genito-Urinary Surgery* (1897), both standard works; also many other contributions to medical literature. Dr. White left $400,000 to the University of Pennsylvania, $150,000 of this to establish the J. William White chair of surgical research.

WHITE, J(OHN) CAMPBELL (1870–). An American religious leader and educator, brother of Wilbert W. White (q.v.). He was born in Wooster, Ohio, and graduated from the University of Wooster in 1890. After two years of experience as national college secretary of the Y. M. C. A. and as traveling secretary of the Student Volunteer Movement, he was general secretary of the Y. M. C. A. at Calcutta, India, till 1903, then secretary of the Ways and Means Committee of the United Presbyterian Church for three years. But he became particularly well known after 1907 as secretary of the Laymen's Missionary Movement. In 1916 he was chosen president of the University of Wooster.

WHITE, JOHN WILLIAMS (1849–). An American classical scholar, born in Cincinnati, Ohio. He graduated at Ohio Wesleyan University in 1868 and took his Ph.D. in 1877 at Harvard, where he was assistant professor of Greek from 1877 to 1884, and then professor till his retirement in 1909. In 1879 he was one of the prime movers in organizing the Archæological Institute of America. Later, he helped to establish the American School of Classical Studies at Athens; he was first chairman of the Managing Committee of the School (1881–86), and twice annual professor. He received honorary degrees from various American universities and the Litt.D. of Cambridge. He was author of a number of philological papers and editor of Greek texts for schools; also supervising editor of the *College Series of Greek Authors* (30 vols.). He published also *The Verse of Greek Comedy* (1912); *The Old Scholia on the Aves of Aristophanes* (1915). He was

a prominent champion of the "New Metric," whose cardinal principle is that, in the interpretation of the metres of classical Greek and Roman poetry, the main reliance must be the statements of the ancient metricians. See VERSIFICATION, *Greek and Latin*.

WHITE, JOSEPH BLANCO (1775–1841). A British writer on theological themes. He was born in Seville, Spain, of Irish and Spanish parentage. In 1800 he was ordained priest in the Roman Catholic church. But his views changed, and in 1810 he went to England. He settled in London, where for some years he conducted a monthly Spanish paper called *El Español*. On the cessation of the Peninsular War (1814), this publication came to an end; but meanwhile its services to the government secured for its editor a life pension of £250 per annum. For some time White lived at Oxford, where he qualified (1814) for the English church, but finally declared himself a Unitarian. Though in literary circles recognized as a man of fine talent, and known as a contributor to the *Quarterly* and to the *Westminster*, and to other periodicals, he scarcely succeeded in making a permanent impression on the public by any of his more formal publications. Of these the most important were: *Letters from Spain* (1822); *Practical and Internal Evidence Against Catholicism* (1825); *Poor Man's Preservation Against Popery* (1825); and *Second Travels of an Irish Gentleman in Search of a Religion* (1833). He died on May 20, 1841, in Liverpool. In 1845 appeared, under the editorship of J. H. Thom, his most striking work, *The Life of the Rev. Joseph Blanco White, Written by Himself, with Portions of His Correspondence*. White is likely to be longest remembered for a magnificent sonnet entitled "Night and Death."

WHITE, PEREGRINE (1620–1704). The first English child born within the limits of New England. He was born on the *Mayflower*, in Cape Cod harbor. After his father's death his mother married Gov. Edward Winslow, this being the first marriage in New England. Josiah Winslow (q.v.), first native Governor of Plymouth Colony, was his half brother. He held several military and civil offices.

WHITE, RICHARD GRANT (1821–85). An American Shakespearean scholar and linguistic critic, born in New York. A graduate of New York University (1839), he studied medicine, then law, was admitted to the bar (1845), became a journalist, and during the Civil War wrote a remarkable series of letters for the London *Spectator*, signed A Yankee, and an influential satirical parody, *The New Gospel of Peace*. He was for many years chief of the United States Revenue Marine Bureau in the district of New York. His chief books were: *Shakespeare's Scholar* (1854); a critical edition of *Shakespeare's Works* (1857–65); *Essay on the Authorship of the Three Parts of Henry VI* (1859); *Memoirs of William Shakespeare* (1865); *Studies in Shakespeare* (1885); and in the field of linguistics, *Words and Their Uses* (1870); *Every-Day English* (1881); and *England Without and Within* (1881). He edited also *The Riverside Shakespeare* (1883), and contributed frequently to literary periodicals. His novel, *The Fate of Mansfield Humphreys*, appeared the year before his death. White was dogmatic and inclined to controversy, but as a critic and man of letters did substantial work. See also WHITE, STANFORD.

WHITE, STANFORD (1853–1906). An American architect, son of Richard Grant White. He was born in New York City, was educated in private schools and by private tutors, studied architecture under Charles D. Gambrill and Henry H. Richardson (q.v.) and was chief assistant to the latter in the construction of Trinity Church, Boston. He continued his studies in Europe in 1878–80, and in 1881 united with Charles F. McKim and William R. Mead (qq.v.) to form the architectural firm of McKim, Mead & White. In association with this firm he designed, either wholly or in part, Madison Square Garden, the buildings of the Freundschaft, Century, and Metropolitan clubs, the Washington Arch, the Tiffany Apartments, the library of Columbia University, buildings for New York University, and the Madison Square Presbyterian Church (1906) in New York City; buildings for the University of Virginia; pedestals for a number of statues, including Saint-Gaudens's statue of Admiral Farragut, in Madison Square, New York, and numerous private residences. He was especially gifted in decorative design, having a keen sense of monumental as well as of picturesque effects and a remarkable taste in decorative detail and color effects. In June, 1906, he was killed, in the Madison Square Roof Garden, by Harry K. Thaw.

WHITE, STEWART EDWARD (1873–). An American author, born at Grand Rapids, Mich. He was educated at the University of Michigan, where he graduated in 1895, and at Columbia Law School. His stories, of which the setting, usually Western, is vividly sketched, include: *The Westerners* (1901); *The Claim Jumpers* (1901); *Conjurer's House* (1903); *The Forest* (1903); *Blazed Trail Stories* (1904); *The Mountains* (1904); *The Silent Places* (1904); *The Pass* (1906), with S. H. Adams; *The Mystery* (1907), with S. H. Adams; *The Riverman* (1908); *The Cabin* (1910); *The Land of Footprints* (1912); *African Camp Fires* (1913); *Gold* (1913); *Gray Dawn* (1915); *Rediscovered Country* (1915). Consult J. C. Underwood, *Literature and Insurgency* (New York, 1914).

WHITE, WILBERT WEBSTER (1863–). An American religious leader, born at Ashland, Ohio, brother of J. Campbell White (q.v.). He graduated from the University of Wooster in 1881, and in 1885 from Xenia Theological Seminary, where he was professor of Hebrew and Old Testament literature in 1890–95. For two years he taught at the Moody Bible Institute, Chicago, and then till 1900 was engaged in Bible work in India and England. Thenceforth he was president of the Bible Teachers Training School, New York City, which he built up to be one of the leading institutions of its kind. His writings include: *Thirty Studies in the Gospel by John* (1896); *Inductive Studies in the Minor Prophets* (1894); *Thirty Studies in Jeremiah* (1895); *Thirty Studies in the Revelation* (1897); *Studies in Old Testament Characters* (1900; 2d ed., 1904); *Availing Prayer* (1900); *Thirty Studies in the Gospel by Matthew* (1903).

WHITE, WILLIAM (1748–1836). An American bishop of the Episcopal church. He was born in Philadelphia and educated at what was then known as the College of Philadelphia. After making his theological studies, he went to England and was ordained deacon in 1770 and priest in 1772. Returning to America, he became rector of Christ Church and St. Peter's,

Philadelphia, and was chaplain to Congress in 1777. On the formal organization of the Episcopal church, he presided over the first General Convention (1785), and was the principal author of the constitution then adopted. In 1786 he was elected Bishop of Pennsylvania. During the rest of his life he held a commanding influence in the development of the church. His chief publications were *Memoirs of the Protestant Episcopal Church* (1820, revised 1880) and *Lectures on the Catechism* (1813). For his biography, consult B. Wilson (Philadelphia, 1839); and see EPISCOPAL CHURCH.

WHITE, WILLIAM ALANSON (1870–). An American neurologist and alienist. He was born in Brooklyn, N. Y., studied at Cornell from 1885 to 1889, and two years later graduated from the Long Island College Hospital. For nine years he was an assistant physician at the Binghamton (N. Y.) State Hospital, and from 1903 superintendent of the Government Hospital for the Insane at Washington. In the same year he accepted the post of professor of nervous and mental diseases at Georgetown University, and in 1904 a similar chair at George Washington University, lecturing besides at the Army Medical School. He published *Mental Mechanisms* (1911) and *Outlines of Psychiatry* (5th ed., rev., 1915), and also did important work in collaboration (see JELLIFFE, SMITH ELY).

WHITE, WILLIAM ALLEN (1868–). American journalist and author, born in Emporia, Kans., and educated at Emporia College and the University of Kansas. Upon leaving the university in 1890 he devoted himself to journalistic work, and in 1895 became proprietor and editor of the Emporia *Gazette* (daily and weekly), which he made one of the notable small papers of the country, distinguished for its editorials and its policies. An editorial published in August, 1896, entitled "What's the Matter with Kansas?" was reprinted throughout the country. For a time after 1906 he was a member of the staff of the *American Magazine*. In 1912 he became a member of the Progressive National Committee and chairman of its publicity committee. He was elected to the National Institute of Arts and Letters. His writings, for the most part collected stories or sketches, picture life in the mid-Western town with penetrating vision and broadly human outlook. They include: *The Real Issue* (1896); *The Court of Boyville* (1889); *Stratagems and Spoils* (1901); *In Our Town* (1906); *A Certain Rich Man* (1909); *The Old Order Changeth* (1910); *God's Puppets* (1916).

WHITE, SIR WILLIAM ARTHUR (1824–91). An English diplomat, born at Pulawy, Poland. He was educated at Trinity College, Cambridge, and in 1857 entered the British consular service as clerk to the consul general at Warsaw, was frequently acting consul general, and in 1861 became vice consul. In 1864 he was appointed consul at Danzig, and in 1875 was transferred to Belgrade as British agent and consul general. In this capacity he displayed wide knowledge of the Eastern question, and in 1879 was appointed Envoy Extraordinary and Minister Plenipotentiary at Bucharest, Rumania. In 1886 he was confirmed as Envoy Extraordinary at Constantinople. He exerted himself greatly to obtain the acceptance by the Great Powers of the annexation of eastern Rumelia to Bulgaria. At Constantinople his knowledge of languages and of Oriental diplomacy made him very successful. In 1888 he was made a G.C.B. and a member of the Imperial Privy Council.

WHITE, WILLIAM HALE. See RUTHERFORD, MARK.

WHITE, SIR WILLIAM HENRY (1845–1913). An English naval constructor, born at Devonport. Graduating at the Royal School of Naval Architecture in 1867, he entered the construction department of the Admiralty, rising to the rank of chief constructor in 1881. From 1870 to 1881 he was professor in the Royal School of Naval Architecture, reorganizing it when it was merged into the Royal Naval College in 1873. In 1883 he left the Admiralty and organized the shipbuilding department of Sir W. Armstrong, Mitchell, and Company, remaining in charge of it for two years, during which time he designed, among other vessels, the *Takachiho* (Japanese) and the *Charleston* (United States). These were regarded as most important developments in cruiser design and attracted wide attention. In 1885 he returned to the Admiralty as director of naval construction and continued at the head of that department for 17 years, during which he developed the battleship type which for two decades was adopted in nearly all navies. He retired on account of ill-health in 1902 and Parliament made him a special grant in recognition of his distinguished services. During his later years he was largely responsible for the adoption of turbine engines in large passenger steamers and fast cruisers. He became a member of the Royal Society in 1888, a K.C.B. in 1895, and was president of several of the great British engineering societies. His works include: *A Manual of Naval Architecture* (5th ed., 1900); *Architecture and Public Buildings* (1884); and *A Treatise on Shipbuilding*.

WHITE, SIR WILLIAM THOMAS (1866–). A Canadian financial expert and cabinet minister. He was born at Bronte, Ontario, graduated at Toronto University in 1895, and was admitted to the Ontario bar in 1899. He did not practice his profession, but after several years' newspaper work on the staff of the *Evening Telegram*, was employed in the assessment department of the city government, Toronto. He developed an unusual ability in financial affairs, was president of the National Trust Company in 1900–11, and during the discussion on the Taft-Fielding reciprocity agreement took a prominent part against that proposal and substantially contributed to the downfall of the Laurier administration. White had previously been a Liberal in politics, but in October, 1911, after the return of the Conservatives to power under Sir Robert Laird Borden, he was appointed Minister of Finance. In 1915 he was knighted.

WHITE ANT. See TERMITE.

WHIT'EAVES, JOSEPH FREDERICK (1835–1909). A Canadian paleontologist. He was born at Oxford, England, was educated there, and at London and Brighton, and made a special study of zoölogy and invertebrate paleontology. In 1861 he removed to Canada. He was scientific curator and recording secretary of the Natural History Society of Montreal in 1863–74, and made five deep-sea dredging expeditions to the gulf and river of St. Lawrence in 1867–73. He became a member of the Canada Geological Survey in 1875, paleontologist and zoölogist to the survey in 1876, and subsequently an assistant director. His publications include important articles on marine invertebrates, on the inverte-

brate fossils of the upper Cretaceous rocks of Vancouver, and other similar subjects. He was one of the original fellows of the Royal Society of Canada.

WHITEBAIT. The young of any kind of herring or related fish, much in request in Great Britain as a delicacy and sold in considerable quantity in the United States as well.

WHITE BASS, or WHITE PERCH. A striped bass (*Roccus chrysops*) of the Great Lakes and upper Mississippi region, which is silvery, tinged with golden below, and marked with narrow dusky lines on the sides. It prefers deep waters, and is good food. See Plate of BASS.

WHITE BAY. See MAGNOLIA.

WHITEBOYS. The name given to peasant associations in Ireland, formed after 1760, for the purpose of visiting revenge on landlords, tax collectors, and the clergy. The members committed many outrages on the property and persons of those against whom they entertained grievances. Their depredations took place at night and those engaged in them were protected by blackened faces and white garments. Similar organizations of a somewhat later period assumed the names of "Hearts of Steel," "Hearts of Oak," and "Rightboys." This form of popular justice was personified under the name of "Captain Rock."

WHITE BRANT. See SNOW GOOSE.

WHITECAPS. A general name derived from their disguise, for bodies of men in the United States who assume the function of administering punishment for real or fancied offenses against the community.

WHITE CEDAR. See CEDAR; CHINA TREE; LIBOCEDRUS.

WHITECHAPEL, hwīt'chăp'el. An eastern Parliamentary district of metropolitan London, England, originally named from a certain chapel within its limits. In early times all distances east of London were measured from this chapel. It is one of the poorest and most congested districts of the city. It is traversed by Whitechapel Road, and London Hospital and the Tower of London are within its limits. Pop., 1901, 78,758; 1911, 96,346.

WHITE CINNAMON. See CANELLA.

WHITE COMPANY, THE. A name assumed by various bands of thirteenth and fourteenth century freebooters. The first was organized and led by Folquet, Bishop of Toulouse, for the purpose of slaughtering heretics in France. A second commanded by Du Guesclin received its name from the white cross worn upon each member's shoulder. In 1366 he led his marauding company into Spain to support Henry of Trastamara against Pedro the Cruel. A third crossed from France into Italy, and under the banners of Milan and Florence, or as independent freebooters under the command of Sir John Hawkwood (q.v.) plundered the country until disbanded in 1391. Conan Doyle's *White Company* (1890) describes the Spanish campaign under Du Guesclin.

WHITE CROAKER. See QUEENFISH.

WHITE DAMP. See COAL, *Mining*.

WHITE DEVIL, THE, or VITTORIA COROMBONA. A tragedy by Webster, originally performed in 1608, published in 1612.

WHITE DIARRHŒA OF CHICKENS. See DIARRHŒA, WHITE, OF CHICKENS.

WHITE EAGLE, ORDER OF THE. A Servian order with five classes commemorating the establishment of the Servian Kingdom, founded by King Milan I in 1882. The decoration is a double-headed eagle of white enamel surmounted by a crown. The oval medallion is red and bears a white cross with flames. On the reverse are the initials M. I. crowned and the date of foundation. See Plate of Orders, under ORDERS.

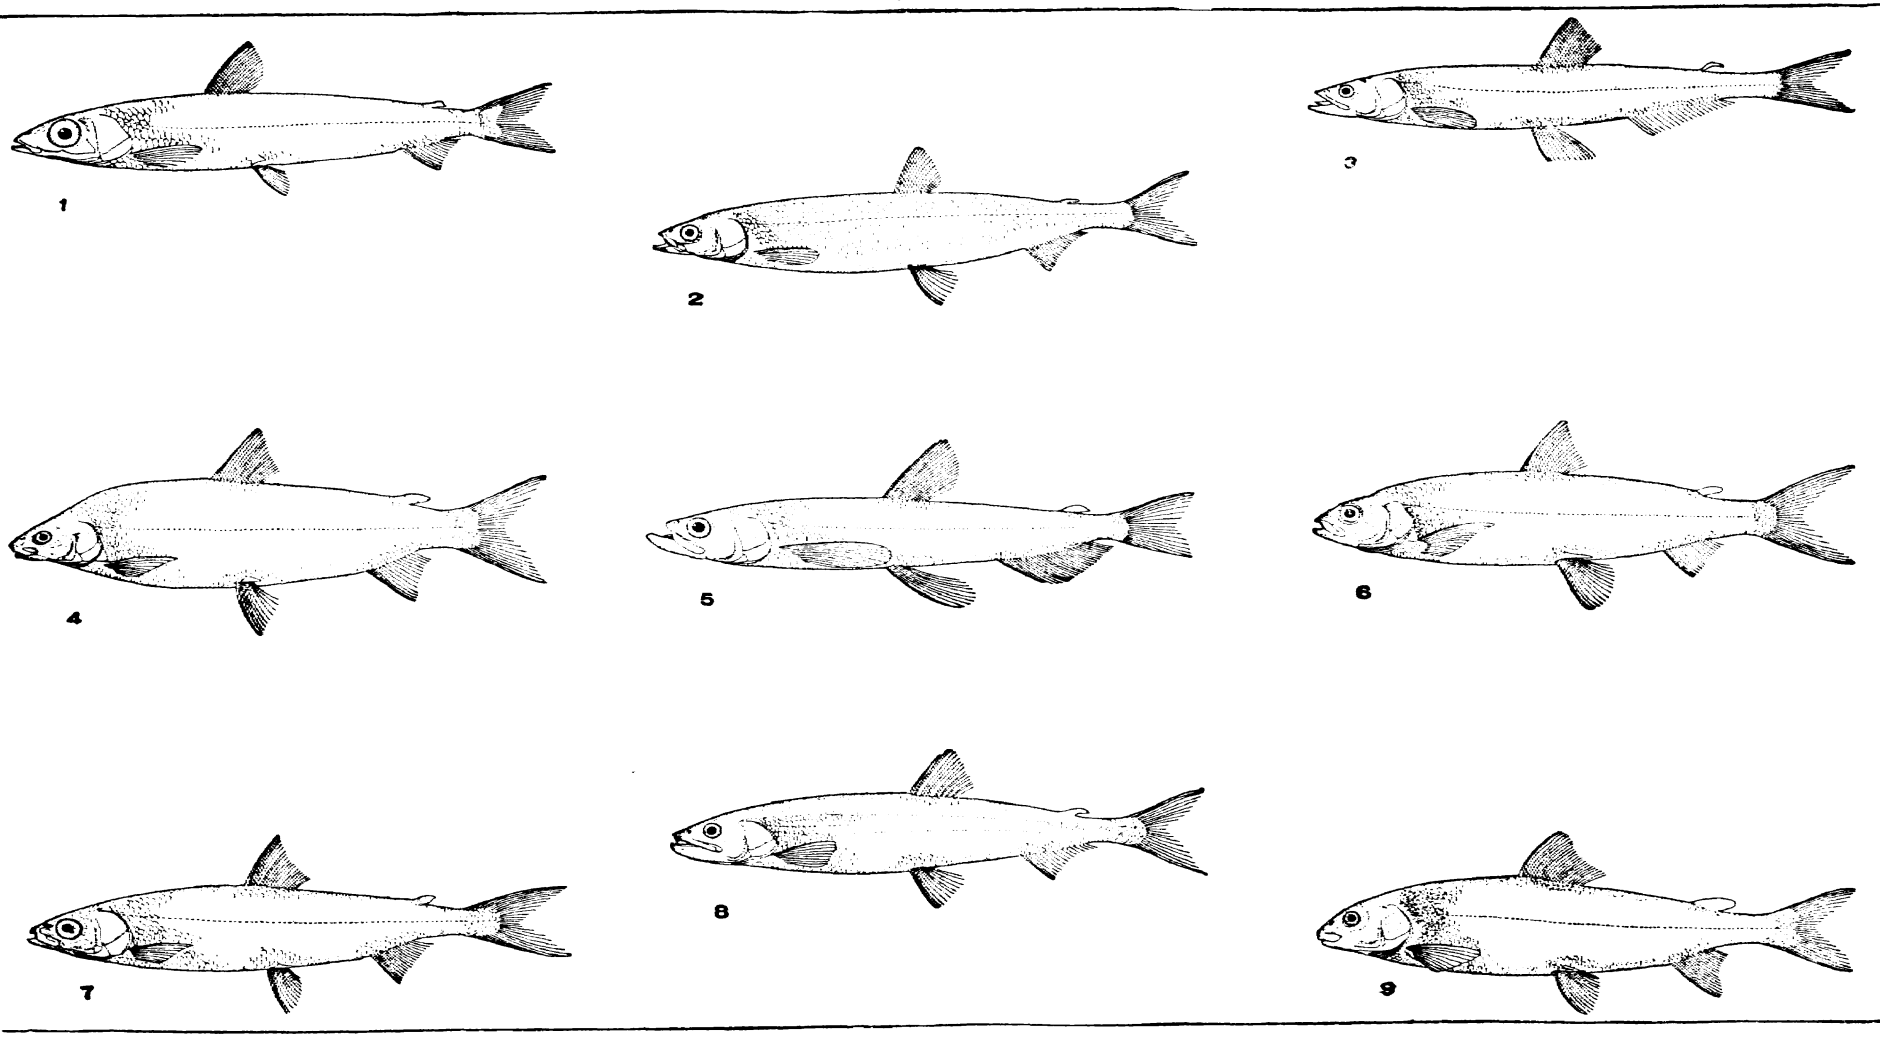
WHITE ELEPHANT. An infrequent albino type of Asiatic elephant which from its rarity is highly esteemed. Owing to the costly honors paid to such an animal, the term has become proverbial with the meaning of an expensive or unwelcome possession. The "Land of the White Elephant" is Siam.

WHITE ELEPHANT, ORDER OF THE. A Siamese order with five classes, founded in 1861. The decoration, which varies slightly for the different classes, is a circular medallion with the elephant in white enamel, surrounded by three wreaths of yellow, red, and green lotus blossoms. See Plate of Orders under ORDERS.

WHITE ESKIMOS, or BLOND ESKIMOS. The popular name for a group of Eskimo residing on both sides of Coronation Gulf between Canada and Victoria Island, discovered by Stefánsson in 1910. The peculiarity giving rise to this name is the frequent occurrence of light hair and gray or blue eyes in contrast to the universal black hair and dark eyes of all New World races. According to Stefánsson's data the form of head and face among these blond-like Eskimo inclined towards the European type, upon the basis of which he proposed the theory that the phenomenon was due to early mixture with Norse colonists from Greenland. Consult Stefánsson's *My Life with the Eskimo* (New York, 1912).

WHITE EYE, or GLASS EYE. The wall-eyed pike. See PIKE PERCH, and Plate of PERCHES.

WHITE EYE, or SILVER EYE. A general name for a large group of small, plainly dressed, titmouse-like birds of the genus *Zosterops*, the many species of which are scattered over the tropics of the Old World, especially in the East, where several species are confined to single islands. Nearly all are yellow on the under surface. They are somewhat doubtfully classified with the honey eaters (Meliphagidæ), and take their English name from the ring of white glistening feathers around the eye in most species. They go about in merry flocks, and have many interesting characteristics. Though mainly insectivorous, they feed upon fruits; some are known to the Australians as grape eaters. Consult Alfred Newton, *Dictionary of Birds* (New York, 1896), and authorities there. See Plate of WRENS, WARBLERS, ETC.



WHITE-EYED VIREO. See VIREO.

WHITE-EYELID MONKEY. See MANGABEY.

WHITE FALCON, ORDER OF THE. A grand-ducal order of Weimar, founded by Duke Ernest Augustus in 1732, and renewed in 1815 by Charles Augustus. In its present form it has four classes and a silver cross, added in 1878. The decoration, a green star of eight points, with red stars between the arms, bears a white falcon, and the motto, *Vigilando Ascendimus*, on a blue ground.

WHITEFIELD, whīt'fēld, GEORGE (1714–70). An English evangelist and founder of the Calvinistic Methodists. He was born at the Bell Inn, Gloucester, and attended a classical school for three years, where he distinguished himself more by histrionic achievements than by studious zeal. In 1732 he was admitted as a servi-

WHITEFISH, SMELTS, ETC.

1. EUROPEAN ARGENTINE (Argentina silus).
2. SURF SMELT (Mesopus pretiosus).
3. CANDLE-FISH or OOLACHAN (Thaleichthys Pacificus).
4. COMMON WHITEFISH (Coregonus clupeiformis).
5. CAPELIN (Mallotus villosus).
6. BLACKFIN (Argyrosomus nigripinnis).
7. CISCO or LAKE HERRING (Argyrosomus Artedi).
8. AMERICAN SMELT (Osmerus mordax).
9. ROCKY MOUNTAIN WHITEFISH (Coregonus Williamsoni).

tor at Pembroke College, Oxford, and graduated B.A. in 1736. At Oxford he met the Wesleys and with them founded the Holy Club. He was ordained deacon in 1736, and soon went to London. In 1738 he followed the Wesleys to the Georgia Plantations and remained four months, returning to England for his priest's orders and to collect money for an orphanage he had founded in the colony. He found that his association with the Wesleys had raised prejudice against him; nevertheless he was ordained priest by Bishop Benson (1739). Whitefield began open-air preaching at Moorfields, Kensington, Blackheath, and elsewhere, and after this seems to have preached by preference in the open air. Crowds came to hear him. In 1739, having collected more than £1000 for his orphanage, he returned to America. He landed at New York and proceeded to Georgia, preaching with great success on the way. The first brick of the orphan asylum was laid in March, 1740, and the name of Bethesda was given to the institution. He preached to large audiences in Savannah and also in Philadelphia and Boston, which he visited in 1740. His association with dissenters and unconventional ways of preaching and conducting services brought him into strained relations with the church, and about this time doctrinal differences separated him from Wesley. The two men differed widely in theology, Whitefield being a rigid Calvinist, but they continued friends nearly all their lives. In 1741 Whitefield went to England and preached with his usual zeal and eloquence, making tours into Wales and Scotland. He presided at the first conference of Calvinistic Methodists held at Watford in 1743, and at the second conference a few months later was chosen perpetual moderator in England.

In 1744 he again sailed for New York, and was again enthusiastically received, although his irregular ways brought opposition. In 1748 he visited the Bermudas for his health, and preached twice each day on the islands of the group. On his return to England in 1748 he found his congregation scattered. He was in pecuniary difficulties, as he had sold most of his property to help the Georgia orphanage. With the aid of friends, however, he gradually paid his debts. About this time the Countess of Huntingdon (q.v.) made him her chaplain and gave him the opportunity of preaching to certain of the nobility at her house. She helped him materially in his enterprises and built and endowed chapels to maintain his doctrines. In 1751 Whitefield visited Ireland and Scotland and made a fourth voyage to America. On his return to London he took up the project of a new tabernacle, which was opened June 10, 1753. After preaching in it a few times he went on another evangelistic tour in England, traveling 1200 miles and preaching many times. In 1754–55 he was again in America. In September, 1756, he opened a new chapel at Tottenham Court Road. He visited America for the sixth time in 1763–65. His health was failing and his power of preaching impaired. In October, 1765, he dedicated the Countess of Huntingdon's chapel at Bath, opened her college at Trevecca in August, 1768, and dedicated the chapel at Tunbridge Wells in July, 1769. Two or three months later he sailed for the seventh time for America. He went to Savannah, and preached much in Pennsylvania and New England. On Sept. 29, 1770, after preaching for two hours at Exeter, N. H., he went to Newburyport, Mass., where he died the next morning. He is buried in the Old South Church there. Whitefield is said to have preached more than 18,000 sermons. His great power was due to his delivery rather than to the matter of his discourses; his writings do not sustain the impression derived from accounts of his preaching. He was not an organizer, and his congregations soon scattered. Many of his converts united with the Methodists. A number of his sermons and journals were collected and published in six volumes (London, 1771–72). Many original letters of George Whitefield are in the Congressional Library. Consult: John Gillies, *Memoirs* (London, 1773); Luke Tyerman, *Life of George Whitefield* (2 vols., London, 1876–77), the most complete biography: also *Cambridge Modern History*, vol. vi (New York, 1909), containing a brief bibliography; L. F. Benson, *The English Hymn: Its Development and Use in Worship* (ib., 1915), and references under METHODISM; WESLEY, JOHN.

WHITEFISH. One of the many important fishes of the genus *Coregonus*, of the salmon family, of which about 15 species inhabit the lakes and streams of northern Europe, Asia, and America. They have an elongated, compressed body, with a conical head, projecting snout, and a small, toothless mouth. The scales are larger than in the other salmon, the caudal fin is deeply forked, and the dorsal fin is followed by an adipose dorsal. They are bluish olivaceous above, silvery on sides and below. The most familiar species is the common whitefish (*Coregonus clupeiformis*), which exists throughout the Great Lakes and adjacent waters, and is the most important fresh-water fish in America. The annual catch of whitefish in Canada and the United States is over 30,000,000 pounds, representing a value of more than $1,500,000. Whitefish reach a size of 20 pounds in rare cases, the average weight being about four pounds. They remain in deep water for the most part, but during the spawning season, which is in autumn, and at certain other times, for purposes which are not yet clear, they migrate to shallower water in great shoals. They live mainly on small crustaceans, mollusks, insects, and larvæ. A single fish will yield from 25,000 to 75,000 eggs, which are extensively propagated artificially by the United States Fish Commission.

The Rocky Mountain whitefish, or mountain herring (*Coregonus williamsoni*), is an excellent species numerous in clear streams from the Rocky Mountains to the Pacific coast; it is a favorite of anglers, as it will take a fly. The broad whitefish or muksun (*Coregonus kennicotti*) is the best known of several arctic species. The humpback (*Coregonus nelsoni*) is Alaskan. The Sault whitefish (*Coregonus labradoricus*) is a fine species numerous in all clear lakes and streams from Lake Winnipeg to Labrador and southward into the Adirondack and White mountains, where it is known as the "whiting of Lake Winnipiseogee." The lakes from New England northwestward to Alaska contain a valuable species of dark color (*Coregonus quadrilateralis*) called roundfish, shadwaiter, Menominee whitefish, pilot-fish, etc. The ciscoes (q.v.) constitute another and closely related group (the genus *Argyrosomus*), containing several useful species, as the cisco, blackfin, tullibee, and others (qq.v.). The inconnu is another whitefish, of the genus *Stenodus*.

Consult: Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1896);

id., *American Food and Game Fishes* (new ed., New York, 1914). See FISHERIES; SALMON; and Plate of WHITEFISH, ETC.

WHITEFRIARS. A region in London near Fleet Street, where a monastery of the Carmelites (q.v.) dating from the thirteenth century, formerly stood. Until the end of the seventeenth century it formed a place of sanctuary for debtors and criminals. See ALSATIA.

WHITE GOAT. See ROCKY MOUNTAIN WHITE GOAT.

WHITE GUM. See EUCALYPTUS.

WHITEHALL. A building, formerly a palace in London, once the residence of Hubert de Burgh; later (thirteenth century), of the archbishops of York, and known as York Palace. After the death of Wolsey, it became crown property, and was called Whitehall. After a fire in 1615, James I planned to replace it from designs by Inigo Jones, who conceived an enormous structure with seven courts, evidently inspired from Delorme's plans for the Tuileries (q.v.). Only the banqueting hall was built, the earliest specimen of Palladian architecture in England, and thus of great artistic importance despite its moderate size. The hall proper has ceiling paintings by Rubens representing the apotheosis of James I and scenes from the career of Charles I. The older parts of the palace were burned in 1691 and 1697. Whitehall was the scene of Wolsey's disgrace, Henry VIII's death, the execution of Charles I, who was led to the scaffold from the banqueting hall, and the deaths of Cromwell and Charles II. The hall now serves as a military and naval museum. The street leading from Trafalgar Square to Westminster, in which the palace stood, is known as Whitehall. It contains a number of public buildings, including the Horse Guards, Treasury, and new public offices.

WHITE HALL. A city in Greene Co., Ill., 66 miles north-northwest of St. Louis, Mo., on the Chicago and Alton, and the Chicago, Burlington, and Quincy railroads (Map: Illinois, D 7). There are flour mills, machine shops, a milk-condensing plant, and manufactories of sewer pipe, drain, tile, stoneware, etc. Pop., 1900, 2030; 1910, 2854.

WHITEHALL. A village in Washington Co., N. Y., 78 miles north of Albany, at the head of Lake Champlain, on the Champlain Canal, and on the Delaware and Hudson Railroad (Map: New York, G 3). It has large lumber interests, and is engaged in the manufacture of silk. There are also railroad shops and several smaller industrial establishments. Pop., 1900, 4377; 1910, 4917. Whitehall was settled in 1761 by Major Philip Skene, at the head of about 30 families, and in November, 1763, it was incorporated by patent. On the approach of the Revolutionary War Skene became a Loyalist, and in 1775 the Americans took possession of his property, at the same time that they seized Ticonderoga. An American garrison was stationed here from 1776 until the approach of Burgoyne's army, when the fort was blown up and the houses, mills, etc., were burned to prevent their falling into the hands of the enemy. At the close of the war the whole Skene property was sold to the highest bidder for £14 10s. In the War of 1812 the fort and blockhouse were rebuilt. The Champlain Canal was built from here to Fort Edward in 1819 and completed to Troy in 1824.

WHITE HART, THE. An historic inn in Southwark, London. It is said to have been a resort of Dick Turpin and is mentioned in Act IV, Scene 8 of Shakespeare's *Henry VI*, part ii.

WHITEHAVEN. A seaport in Cumberland, England, near the point where the estuary of the Solway Firth joins the Irish Sea, 36 miles southwest of Carlisle (Map: England, C 2). It has spacious streets, handsome shops and public buildings, and possesses a commodious harbor and docks. In the neighborhood are extensive collieries, iron and brass foundries, iron-smelting works, and manufactories for cordage, sail cloth, earthenware, etc. The town was founded in 1633. Pop., 1901, 19,325; 1911, 19,044.

WHITEHEAD, ALFRED NORTH (1861–). A British mathematician. He was born on the Isle of Thanet, and attended Sherborne School. Later he held a fellowship at Trinity College, Cambridge, where he became mathematical lecturer, and at various times was a member of the councils of Trinity, Girton, and Newnham colleges, Cambridge. Whitehead lectured on applied mathematics and mechanics at University College, London, in 1911–14, and thenceforth was professor of applied mechanics at the Imperial College of Science. In 1903 he was elected a fellow of the Royal Society, and in 1915 was chosen president of the Mathematical Association. Besides contributions to journals his publications include: *A Treatise on Universal Algebra* (1898), and *An Introduction to Mathematics* (1911).

WHITEHEAD, JOHN (?1740–1804). An English Wesleyan clergyman and physician. He was born in London, studied medicine, and became physician to the Bethlehem Hospital, Moorfields. He traveled as a Methodist preacher, 1764–69. For some years he was a Quaker, but returned to the Methodists. He was chief physician to both John and Charles Wesley in their last illnesses, and preached the funeral sermon of John Wesley. With Bishop Coke and Henry More he was appointed by Wesley as literary executor, but had a long dispute with the other executors as to the possession of the Wesley papers. This led to his expulsion from the membership of the church. He retained the papers, however, and published the *Lives of John and Charles Wesley* (1793; new eds., Boston, 1844, Auburn, 1854). In 1797 he returned the papers and was reinstated in his position in the church. He died in London.

WHITEHEAD, WILLIAM (1715–85). An English poet laureate, born at Cambridge, where his father was a baker. He was educated at Winchester School and at Clare Hall, Cambridge, graduating B.A. in 1739. In 1742 he was elected a fellow of his college. For many years he lived in the households of the Earl of Jersey and the Earl of Harcourt, with whose sons he made the Continental tour (1754–56). He was appointed secretary and registrar of the Order of the Bath, and in 1758 he succeeded Colley Cibber in the poet-laureateship. He died in London. Whitehead's birthday odes and other official poems were justly ridiculed by the poet Churchill (q.v.). His best work is to be found in his verse tales after the manner of La Fontaine. He also composed two respectable tragedies, *The Roman Father* (1750), and *Creusa, Queen of Athens* (1754); a comedy, *The School for Lovers* (1762); and a farce, *The Trip to Scotland* (1770), all of which met with some success. Consult his *Works*, edited with memoir by William Mason (3 vols., York, 1788). William

Whitehead is sometimes confounded with Paul Whitehead, the satirist, and member of the dissipated circle of politicians known as the monks of Medmenham Abbey. This latter Whitehead was also furiously attacked by Churchill. Consult the *Poems and Miscellaneous Compositions of P. Whitehead*, edited by Capt. E. Thompson (London, 1777).

WHITEHILL, CLARENCE (1871–). An American dramatic bass, born at Marengo, Iowa. Having studied with H. D. Phelps of Chicago he sang in various churches until, upon the advice of Madame Melba, he went to Paris, where under Giraudet and Sbriglia he prepared himself for the stage. In 1900 he made his début at Brussels as Nilakantha in Delibes' *Lakmé*. His success led to his engagement, the following year, at the Opéra Comique in Paris. With Cosima Wagner he studied the great Wagner parts (Wotan, Amfortas, Hans Sachs, Telramund), and appeared with marked success at Bayreuth and Covent Garden. After 1909 he sang with the Metropolitan and Chicago Opera companies, chiefly in Wagnerian rôles, and also sang in concert.

WHITE HOUSE. The official residence of the President of the United States, in Washington. The building is a two-story white freestone edifice, painted white, 170 by 86 feet, of dignified appearance, with an Ionic portico. It contains the private apartments of the President on the second floor and reception rooms on the first floor. Among the latter are the famous East Room, 80 by 40 feet, used for public receptions; the Blue Room, used for diplomatic and social functions; and the Red and Green rooms. The original executive mansion was begun in 1792 and first occupied by President Adams in 1800. It was burned by the British in 1814, and rebuilt in 1818. Plans for enlargement of the building have frequently been proposed. In 1903 the pressure of space was relieved by the erection of executive offices in the grounds, connected with the main building. The White House is surrounded by an attractive park, in which the Marine Band plays during the summer. Consult Esther Singleton, *Story of the White House* (2 vols., New York, 1907).

WHITE HOUSE OF THE CONFEDERACY. A house in Richmond, Va., the former residence of Jefferson Davis. It contains a collection of Confederate relics.

WHITEING, hwīt'ĭng, RICHARD (1840–). An English journalist and novelist, born in London. He began his career as journalist in 1866 with a series of satirical sketches contributed to the London *Evening Star*, afterward published as *Mr. Sprouts—His Opinions* (1867). Subsequently he served as editorial writer and correspondent on several of the English dailies, including the Manchester *Guardian* and the London *World*. He was for a while a leader writer on the London *Daily News*. In 1876 appeared his first novel, *The Democracy*, which was followed 12 years later by *The Island*. But he is best known for *No. 5 John Street* (1899), a vivid description of life in the London slums. Later he published: *The Life of Paris* (1900); *The Yellow Van* (1903); *Ring in the New* (1906); *All Moonshine* (1907); *Little People* (1908); *A Little Book about London* (1912); *My Harvest* (1914), autobiographical.

WHITE LADY. A spirit that, according to popular legend, appears in certain castles of German princes and nobles either by night or by day, when any important event is imminent, particularly the death of a member of the family. She is regarded as the ancestress of the race, appears always robed in white, and carries a bunch of keys at her side. The Hohenzollern family possesses a white lady. A similar legend was current in Scotland, where it was believed that many chiefs had some kind spirit to watch over their fortunes. The entire cycle may be traced back to a goddess of German mythology who influences birth and death, and presides over the household. Still more distinctly the appellation "white lady" as well as the name "Bertha" point back to the Germanic nature goddess Berchta (q.v.). Consult Minutoli, *Die weisse Frau* (Berlin, 1850); Kraussold, *Die weisse Frau und der Orlamünder Kindermord* (Erlangen, 1866); and Schrammen, *Die Schicksals- oder Totenfrau im Hause Hohenzollern* (Cologne, 1888).

WHITE LEAD. A name applied to the hydrated basic carbonate of lead [$2PbCO_3$, $Pb(OH)_2$] used in the manufacture of paints. White lead is usually made by one of the following processes, although there are many patented modifications: Dutch or Stack Process, German or Chamber Process, French or Thenard Process, and the Electrolytic Process.
